Introduction

This repair manual microfiche is to assist you in performing the necessary maintenance and repair work expertly and correctly. It must be placed at the disposal of shop foremen and mechanics, and will complement the practical and theoretical training offered by our Service Training Centre.

Since 1985 models there are two repair manuals.

- Repair manual to models
- Repair manual to construction groups

  The Construction Group Repair Manual consists of Groups 11, 12, 13, 23, 24 and 33.
  It is independent of models and describes repairing procedures on removed components and provides testing instructions and troubleshooting tables.

  A Model Repair Manual ('3' Series, '5' Series, '6' Series or '7' Series) contains all construction groups. The descriptions in the above mentioned construction groups refer chiefly to removing and installing or replacing procedures.

There are technical data and nominal value microfiches for specifications and adjusting values.

Application of this repair manual microfiche is in reference to a standard production car free from accident damage and not subsequently modified in any way.

The construction group system has been adopted from the flat rate manual.

The job numbers used in the text are meant for use as cross reference. They will frequently contain job procedures, which must not be used for extension of the flat rates. They are only provided to make finding of repair procedures easier.

The individual page numbering, for example 32 – 6, means:
32 - main group
6 - page number

The special tools essential for correct repair work are summarized on the special tool microfiche, Order No. 01 99 9 699 422. Their use is illustrated in the descriptions of the various repair jobs.

The removal work is described for each repair job in this manual. If installation does not take place in the reverse order of work, an "Installation" note is provided.

In addition to the improvements supplied to you regularly in the form of "Service Information", you are recommended to consult the parts microfiches for additional illustrated data.

General Information

PRECAUTIONS FOR WORKING WITH PARTS CONTAINING ASBESTOS

Inhaling asbestos dust could impair health. Conform with these safety precautions when working with asbestos parts.

- Only work outdoors or in well ventilated rooms.
- Only use manually operated or slow running equipment, with dust extracting equipment if necessary! Only operate fast running equipment with dust extracting attachments.
- Moisten parts prior to machining whenever possible.
- Never blow out brake and clutch parts.
- Moisten dust, fill in containers which can be sealed perfectly and scrap in a manner which prevents danger.
- Asbestos waste and scrapped parts must be collected in perfectly sealed containers marked accordingly and then eliminated without danger for human beings or the environment.

General Information

Important When Disconnecting Battery!

Unscrew ground lead on the ground connection **point when disconnecting** a battery. **Disconnection** will cancel the fault memories of control units. Consequently first read **fault memories** with the tester and print out faults when applicable.

Important With Connected Battery!

Working on components, electric lead connections, etc. could cause faults in the fault **memories** of concerned control units. If a repair job in the repair manual specifies dis**connection** of the battery, always conform with this in the interest of safety.

Windshield Wipers (Wiper Motor)!

Intermittent wiping and wiper speed 1 are switched off by a protector in case of failure. **The protector** remains active even after eliminating the fault. It can be cancelled by **turning the ignition off** (terminals 15 and R) for 3 minutes.

Windshield Wipers (Wiper Contact Pressure Motor)!

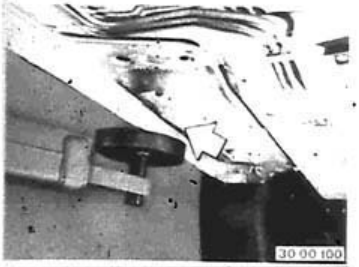
This wiper contact pressure motor is switched off by a protector in case of failure. The **protector** remains active even after eliminating the fault. To cancel the protector,

a) **disconnect** the battery for 30 seconds (caution: all fault memories are cancelled!)
   or
b) **operate** car for automatic cancellation.

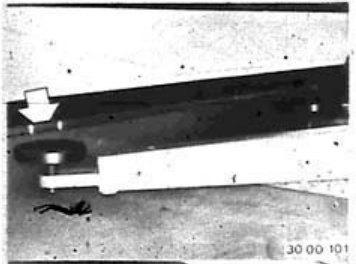
GENERAL INFORMATION

LIFTING CAR WITH A CAR HOIST

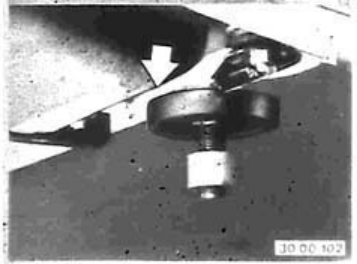
Before driving a car on the platform, make sure that there is sufficient space (clearance) between the hoist and car (if applicable, spoiler or splash guard, etc.).



Car hoists must conform with local and national legislative measures concerning accident prevention and maintenance.
Arms of a car hoist must always be applied only on the reinforced points of the frame members.
Make sure that the underside is not damaged.



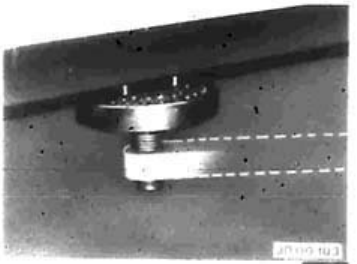
Front:
Apply rubber block of lifting arm on the front perpendicular reinforcement of the frame member, which is also provided for application of the car's jack.



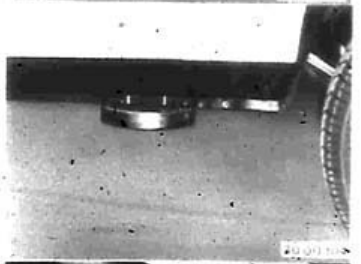
Rear:
Apply rubber block of lifting arm on the rear perpendicular reinforcement of the frame member, which is also provided for application of the car's jack.
Make sure that the underside of the fuel tank is not damaged.

LIFTING CAR WITH A GARAGE JACK

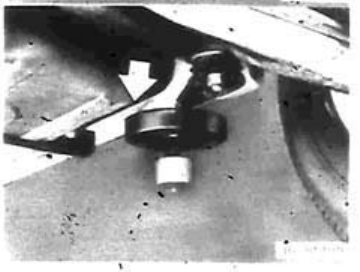
A garage jack may also be only applied for lifting the car on the same take-up points described for the car hoist.
A suitable liner (rubber, wood or plastic) must be used between the jack and car to avoid damage to the undercoating, frame members or floor plate.



Front Take-up Point



Rear Take-up Point



Caution!
Don't damage the fuel tank

TOWING

Always conform with local and national legislative measures concerning the towing of vehicles as applicable

Turn the ignition key to position "1" to unlock the steering wheel and be able to use the turn signals, horn and possibly windshield wipers.

Since the brake booster only works with the engine running, greater force will be required on the brake pedal of cars with a brake booster when the "engine is stopped".

The towing cable should be elastic to protect the towing and towed vehicles. Consequently only use plastic fiber cables or cables with elastic links.

Cars with Automatic Transmission

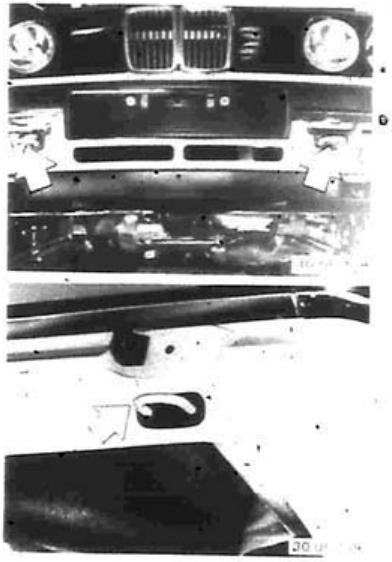
Selector lever in "N"

Max. towing speed:
50 km/h (30 mph).

Max. towing distance:
40 to 50 km (25 to 30 miles).

If the car has to be towed further than 50 km (30 miles) add an extra liter (2 pints) of ATF than the specified oil volume for automatics or remove the propeller shaft. After repairing the car it is absolutely essential to correct the ATF volume to the specified amount.

Important!
Cars with four driven wheels (325 iX) can be towed, if all 4 wheels are on the road or on the towing vehicle. Towing with one axle lifted is permitted only when the rear propeller shaft is removed with the front axle lifted, or the front propeller shaft with the rear axle lifted, since otherwise the central lock would be damaged.
Never run the engine of a car on which a propeller shaft has been removed!



Front Towing Eyes

Rear Towing Eye

BMW MAINTENANCE SYSTEM 00 00 009 Pre-delivery inspection	General information					Important information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Call faults in diagnosis system.						See operating instructions for BMW diagnosis system.
Brief test.						Connect BMW Service Tester.
Check / correct engine oil level.				Gr. 11		Use approved oil.
S 14 Engine: replace spark plugs.	Gr. 12	Gr. 12				
325 iX: Check / correct adjustment of throttle valve drive (not applicable since introduction of M 1.1).	Gr. 13		Gr. 13			
Check fuel pipes, tank and hoses for correct routing, condition and leaks.						Visual inspection.
Check / correct hydraulic fluid level in supply tank for brakes and clutch.				Gr. 34		Use approved brake fluid.
Check connections and lines of brake system for leaks, correct location and damage.						Visual inspection.
Check rim size, tire size and type as well as tire inflation pressure (including spare wheel).		Gr. 36		SI Gr. 36		
Check wheel bolts for specified tightening torque.		Gr. 36

BMW MAINTENANCE SYSTEM 00 00 009 Pre-delivery inspection	General information					Important information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Check / correct level and antifreeze concentration of washing fluid in supply tank for windshield and headlights(if installed in car: check / correct level of intensive cleaning fluid in supply tank).					+	
Check operation of windshield wipers/washer and aiming of spray nozzles; remove protective sleeves on wiper blades.					+	
Check acid level and charge of battery (as applicable, in trunk or underneath rear seat), correcting with distilled water when necessary. Charge battery when necessary.				Gr. 61/00	+	
Check lights: headlights/front fog lamps, parking lights, turn signals, tail lights, backup lights, rear fog lights, license plate lights, passenger compartment lights, glove box light, engine compartment light and trunk light.					+	
Check horns, headlight flasher and hazard warning lights.					+	
Check instrument and sign lights.					+	
Check control and warning lights in instrument cluster (ABS, airbag control lamp, etc.) and Check Control.					+	
Check heating, ventilating and blower.	Gr. 64					
Check operation of headlight cleaners and central locks.	Gr. 63				+	
Insert and check operation of cigar lighters.						

BMW MAINTENANCE SYSTEM 00 00 009 Pre-delivery inspection	General information					Important information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Check operation of other special equipment.						
Initialize sender of remote control system.						
Check data plate, vehicle identification and engine numbers.						
Compare ordered car equipment against delivered car equipment.						
Tune in radio station and check shielding with engine running while switching all electric equipment on and off.						
Mount hub caps, if applicable wheel ornamental rings and tailpipe extension.						
Place tools in toolbox and secure jack and wheel bolt wrench.						
Paste label for BMW Emergency Service on lid of toolbox.						
Place owner's manual/service booklet, list of BMW service stations and BMW emergency service stations, spare keys and key case in glove box.						
Stamp and insert service booklet.						

BMW MAINTENANCE SYSTEM 00 00 009 Pre-delivery inspection	General information					Important information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	

Check operation of engine, clutch, transmission, final drive, steering, foot and hand operated brakes. Cars with rear disc brakes: break in parking brake.

Check function of speedometer with odometer and daily trip recorder, tachometer (Economy Control), clock, temperature and fuel gages.

Check engine, transmission, steering, final drive, dust covers on drive shafts, fuel, clutch and brake systems for leaks.

Remove seat and other protective covers.

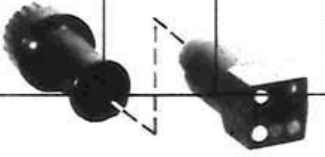
Reset the service indicator.

Important!
The service indicator (SI) *must* be reset after completion of the pre-delivery inspection as follows.
Switch off all electrical equipment.
Turn on ignition; do not run engine.
Plug SI-R* with adapter** for large (20-pin) diagnosis socket in diagnosis socket.
Push in and hold recessed, red INSPECTION button – green lamp (function control) comes on.
Red lamp also comes on after approx. 3 sec. and goes out after approx. 12 seconds.
Release inspection button – green lamp goes out.

Gradual introduction of new SI display with clock symbol and only one red diode light since January, 1986. Load and time memories are separated and resetting must be repeated to reset the time memory. The break before the second inspection reset must be at least 10 seconds long, but may be up to 17.5 hours after the first reset.

Check Service Indicator Display:
All five green diode lights must be on.
Yellow and possibly red diode lights as well as INSPECTION sign should go out.

* SI-R = Service Indicator Resetter, Order No. 62 1 100.
** Adapter, Order No. 62 1 140.



BMW MAINTENANCE SYSTEM 00 00 210 BMW Running-in Inspection at 2000 km (1200 mi.)	General Information					Important Information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Call faults in diagnosis system.						
Brief test.						See operating instructions of BMW Service Tester.
Replace engine oil and oil filter at operating temperature.	Gr. 11			Gr. 11	+	Use approved oil.
325 iX: Remove / install splash guard and check / correct adjustment of throttle valve drive (not applicable after introduction of M 1.1).	Gr. 13		Gr. 13			
Check / adjust valve clearance (excluding 324 d, td, S 14 and M 40 engines).	Gr. 11	Gr. 11				
Tighten nuts and bolts of steering, exhaust assembly, brakes and road wheels.		Gr. 18/32 34/36				Correct tightening torque.
Replace oil in manual transmission at operating temperature; check automatic transmission fluid level.	Gr. 23/24			Gr. 23/24	+	Use approved oil.
Replace oil in final drive at operating temperature.		Gr. 33		Gr. 33		Use approved oil.
325 iX: Replace oil in front axle final drive at operating temperature.	Gr. 31					
Replace oil in transfer box at operating temperature.	Gr. 27					
Final inspection with operating safety test, brakes, steering, control and warning lamps as well as check control reports.					+	

BMW MAINTENANCE SYSTEM 00 00 220 BMW Inspection I	General Information					
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	Important Information!
Call faults in diagnosis system.						See operating instructions of BMW diagnosis system.
Brief test.						See operating instructions of BMW Service Tester.
Replace engine oil and oil filter at operating temperature.	Gr. 11	Gr. 11		Gr. 11		Use approved oil.
Check / adjust valve clearance (excluding diesels and M 40).	Gr. 11	Gr. 11				
Replace spark plugs.		Gr. 12				
Check coolant hoses for leaks; check / correct coolant level and concentration.				Gr. 17		Replace coolant every 2 years at latest.
Check tightness and condition of all drive belts, tightening when necessary or replacing with separate invoicing.	Gr. 12/32/64					
325 IX: Check / correct adjustment of throttle valve drive (not applicable after introduction of M 1.1).	Gr. 13		Gr. 13			
Air cleaner: replace air filter cartridge. Replace filter cartridge more frequently when car is operated in dusty regions.	Gr. 13					

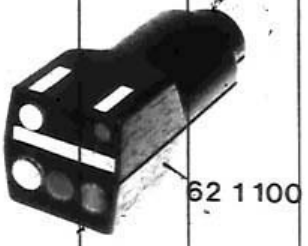
BMW MAINTENANCE SYSTEM 00 00 220 BMW Inspection I	General information					
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	Important information!
Check fuel pipes, tank and hoses for correct routing, condition and leaks. BMW Diesel Engine: Drain water trap (replacement intervals depending on country).	Gr. 13/16					
Check condition, routing, suspension and leakage of exhaust assembly.						
Check power steering for leaks; check / correct oil level.	Gr. 32			Gr. 32		Use approved oil.
Check / correct steering play. Check condition of tie rods and front axle joints. Check steering gear, steering linkage and coupling.	Gr. 32	Gr. 32				
Remove and install front and rear disc brake pads. Check total thickness. Replace pads when necessary. Check surface condition of brake discs. Check brake caliper dust covers for leaks. Lubricate centering pins of wheel rims with grease.	Gr. 34/36					Correct tightening torque for road wheel bolts.
Check connections and lines of brake system for leaks, damage and correct location (clean brake liners and drums and check for wear; check wheel brake cylinders and dust covers for leaks). Check movement of parking brake cables. Adjust parking brake.	Gr. 34					
Check / correct hydraulic fluid level in supply tank for brakes and clutch.	Gr. 34			Gr. 34		Use approved brake fluid. *Important!* Replace brake fluid every two years.

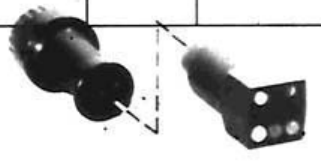
BMW MAINTENANCE SYSTEM 00 00 220 BMW Inspection I	General Information					Important Information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Check / correct tire inflation pressure (including spare wheel). Check condition of tires (if worn unevenly and customer approves, check and correct wheel alignment with separate invoicing).				SI Gr. 36		
Check all gearboxes for leaks.						Visual inspection.
Check lights: parking lights, turn signals, tail lights, stop lights, backup lights, rear fog lights, license plate lights, passenger compartment lights, glove box light, engine compartment light and trunk light.						
Check headlights and front fog lamps.						
Check horn, headlight flasher and hazard warning lights.						
Check instrument and sign lights.						
Check acid level in battery, correcting with distilled water if necessary.				Gr. 61	•	
Check condition and operation of seat belts.	Gr. 72					
Lubricate locks of doors, engine hood and trunk lid with oil or grease and check function.						

SI = Service Information

BMW MAINTENANCE SYSTEM 00 00 220 BMW Inspection I	General Information					Important Information!
	Repair Manual	Technical Data	Nominal Values	Operating Fluids	Owner's Manual	
Check / correct level and antifreeze concentration of washing fluid in supply tank for windshield and headlights. If installed, check / correct level of intensive cleaning fluid in supply tank.					+	
Check windshield wiping/washing system (wiper blades and spray nozzle aiming).					+	
Final inspection with operating safety test: brakes (with rear disc brakes: break in parking brake), steering or power steering, clutch or automatic transmission, coil springs and shock absorbers (visual inspection), control and warning lamps in instrument cluster (ABS, airbag, etc.), check control, mirrors and heater blower. Check operation of power steering.						
Important! Service Indicator (SI) must be reset after inspection I: Switch off all electrical equipment. Turn on ignition – do not run engine. Use SI-R* with adapter** for large (20-pin) diagnosis socket and plug in diagnosis socket. Push in and hold recessed, red INSPECTION button – green lamp (function control) comes on. Red lamp also comes on after approx. 3 sec. and goes out after approx. 12 seconds. Release INSPECTION button – green lamp goes out.						
Gradual introduction of a new SI display with clock symbol and only one red diode light since January, 1986. A clock symbol lights up together with the INSPECTION sign to announce a time-dependent inspection interval and has no influence on the green diode lights. When load and time dependent inspections occur together, resetting must be repeated after 10 seconds to cancel the clock symbol and INSPECTION sign.						
Checking Service Indicator (SI): All five green diode lights must be on. Yellow and possibly red diode lights as well as INSPECTION sign should go out.						

* SI-R = Service Indicator Resetter, Order No. 62 1 100.
** Adapter, Order No. 62 1 140.





BMW MAINTENANCE SYSTEM 00 00 230 BMW Inspection II = Inspection I + Additional Jobs	General Information					Important Information!

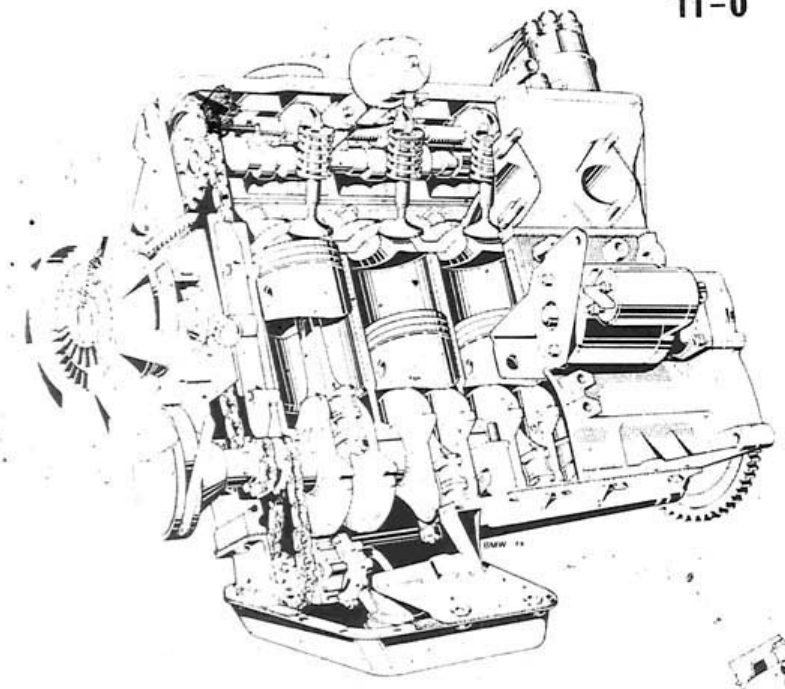
Model 324d, 324 td – **M21**.....

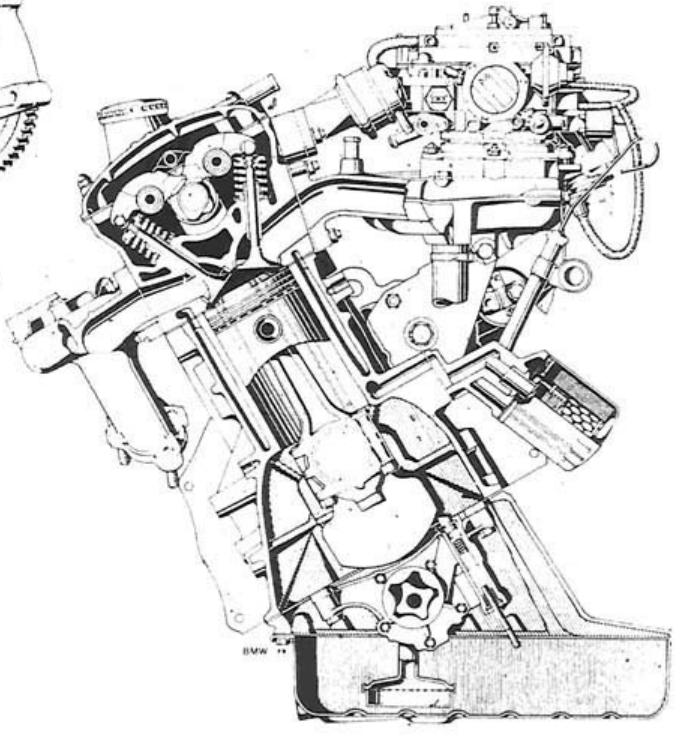
11 Engine

Models: 316 / 316i / 318i – Engine M10

11 00 006	Diagnosis with BMW Service Tester	see Nominal Value Microfiche
	Engine view	11- 0
039	Compression of all cylinders – check	11- 1
050	Engine – remove and install	11- 2
091	Engine – exchange	11- 6
11 12 000	Cylinder head cover – remove and install	11- 6
100	Cylinder head – remove and install	11- 7
11 13 010	Oil pan upper section – remove and install / replace	11- 11
020	Oil pan lower section – remove and install / replace	11- 11
	Emission control – layout drawing	
	BMW 318i – AUS/CH/S – beginning with 1984 models	11- 12
	BMW 318iA – AUS – beginning with 1984 models	11- 13
11 70 009	Emission control – check function	11- 15
11 72 140	Air pulse valves – replace	11- 17
11 74 545	Temperature switch – replace	11- 17
11 76 000	Catalytic converter – convert	11- 18
11 78 010	Oxygen sensor – check	11- 19
510	Oxygen sensor – replace	11- 19

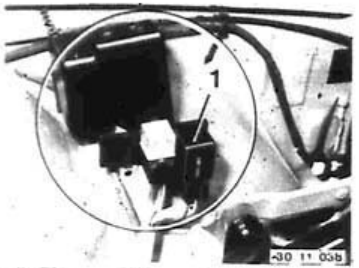


M 10 = Four cylinders
B = Gasoline
18 = Displacement (x 100)
V. = Carburetor
L. = L-Jetronic
A/C/S/U = Australia/Switzerland/Sweden/USA

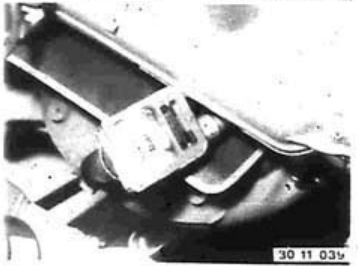


BMW 316 – M 10 B 18 V
316 i – M 10 B 18 L. U
318 i – M 10 B 18 L
318 i – M 10 B 18 L. U (Catalytic Converter)
318 i – M 10 B 18 L. U (Emission Reduction)

11 00 039 CHECKING COMPRESSION OF ALL CYLINDERS



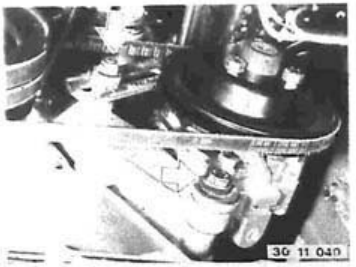
BMW 318 i:
Pull off relay (1) to avoid spill because of constant ejection from fuel injectors while operating the starter.



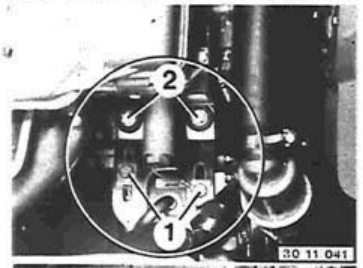
Pull off plug on ignition control unit.
Unscrew spark plugs.
Check compression*.
Installation:
Tightening torque***

* See Specifications
*** See Specifications of Gr. 12

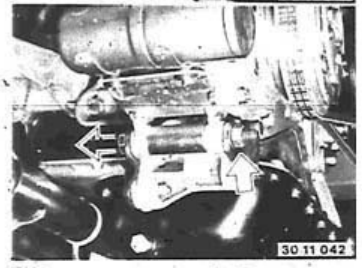
11 00 050 REMOVING AND INSTALLING ENGINE



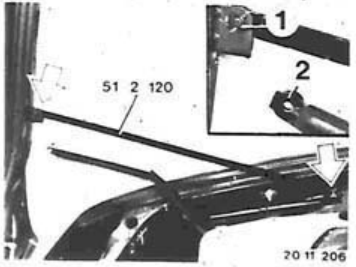
Remove transmission, see Group 23 or 24.
Cars with Power Steering:
Unscrew power steering pump.
Pressure hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



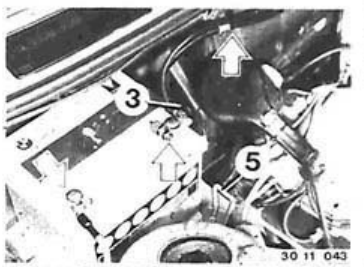
Cars with Air Conditioner:
Loosen bolts (1).
Unscrew bolts (2).



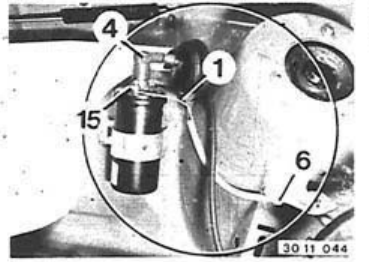
Unscrew bolt and take off compressor.
Refrigerant hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



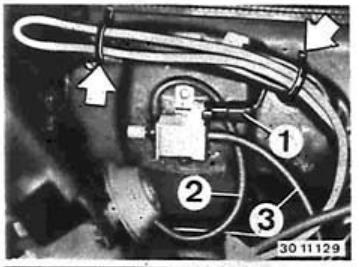
Remove radiator 17 11 000.
Disconnect prop and gas pressure props, and apply Special Tool 51 2 120 to hold engine hood.
Important!
Install fasteners (1).
Installation:
Insert plastic part (2).



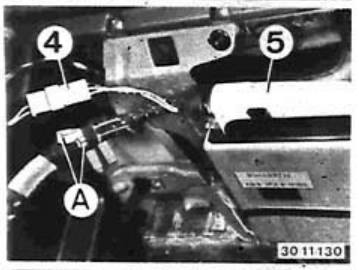
Disconnect negative and positive leads on battery.
Disconnect wire (3).
Unscrew ground wire (5).
Loosen wire straps.



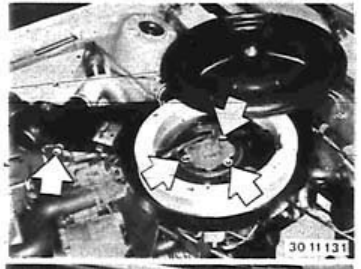
Pull off wire (4) on ignition coil and disconnect wires (1 and 15).
Loosen clips (6).



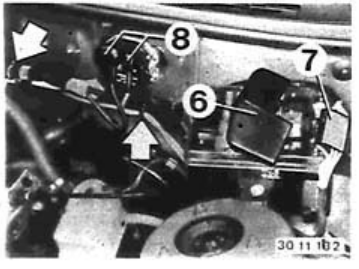
BMW 316:
Loosen wire straps.
Pull off plug (1) and vacuum hoses (2 and 3).
Installation:
Hose (2) to distributor.
Hose (3) to throttle.



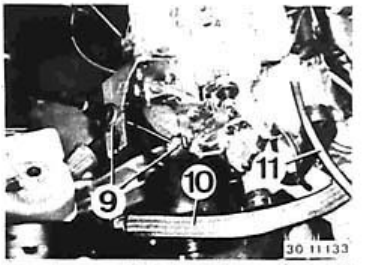
Remove trim panel in glove box.
Disconnect plug (4).
Pull off plug (5) on control unit and push wire harness into engine compartment.
Note:
See 13 00 054 for information on plug connection (A).



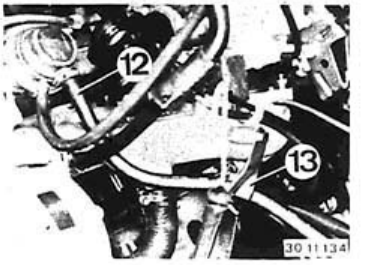
Remove air cleaner, see 13 71 000.



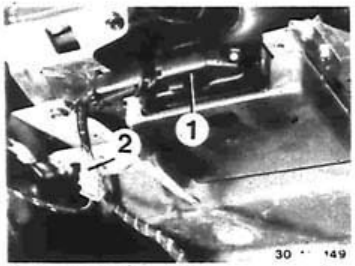
Lift off cap (6).
Lift out and disconnect plug (7).
Pull off plug (8) on ignition control unit.
Loosen wire straps.



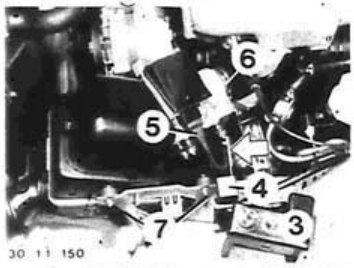
Disconnect throttle cable (9).
Disconnect vacuum hoses (10 and 11).
Installation:
Adjust throttle cable, see 35 41 421.



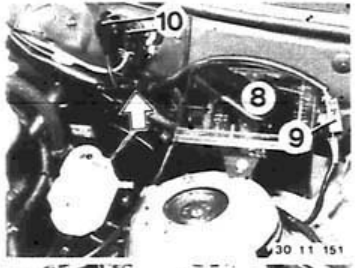
Disconnect fuel hose (12) and lift it out of holder (13).



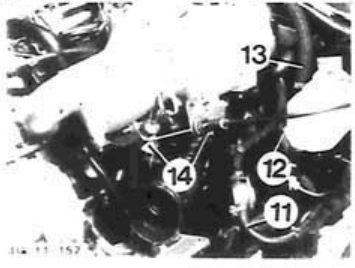
BMW 316 i, 318 i:
Remove trim panel in glove box.
Pull off plug (1) on L-Jetronic control unit.
Disconnect lead (2).
Push wire harness into engine compartment.



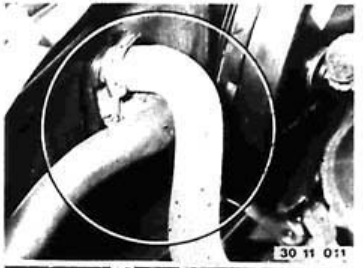
Lift off cap (3) and take out relay (4).
Pull off plug (5).
Loosen hose strap (6).
Loosen nuts (7) and remove air cleaner.



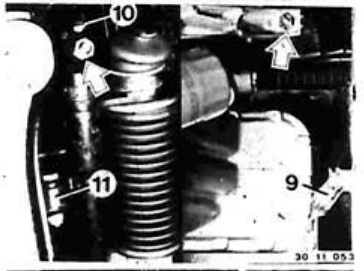
Lift off cap (8).
Lift out and disconnect plug (9).
Pull off plug (10) on ignition control unit.
Loosen wire straps.



Disconnect fuel hoses (11 and 12).
Pull off vacuum hose (13).
Disconnect throttle cable (14).
Installation:
Adjust throttle cable, see 35 41 421.



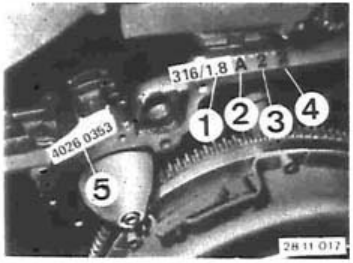
All Models:
Disconnect coolant hoses.



Unscrew ground strap (9) and both engine mounts.
Unscrew engine damper (11).
Installation:
Guide mandrel (10) into bore of axle carrier.
Tightening torque*.

Attach Special Tool on front and rear ends of engine and lift out engine.
Installation:
Adjust ignition timing 12 11 004.
Adjust engine idle speed / CO 13 00 054.

* See Specifications



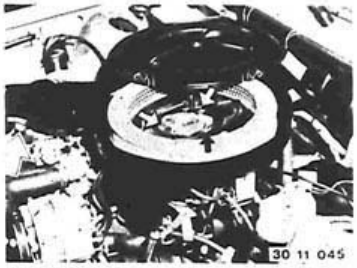
11 00 091 INSTALLING EXCHANGE ENGINE

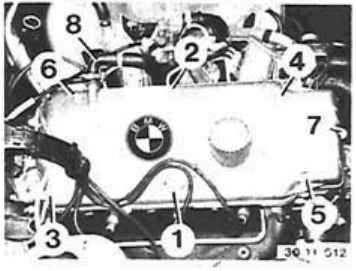
Remove engine 11 00 050.
Exchange Engine Identification on Crankcase:
1 = Type designation****
2 = "A" for exchange; "N" for new
3 = Manufacturing month
4 = Manufacturing year (1982)

Stamp engine number (5).

Drive in supplied oil dipstick guide tube (see 11 43 101) and transfer parts from old engine to exchange engine.
Fill engine with oil***
Important!
Cars with Automatic Transmission:
Remove pilot bearing in crankshaft, see 11 21 571.

Install engine.
If necessary, adjust ignition timing 12 11 004.
Adjust engine idle speed / CO – 13 00 054.





11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

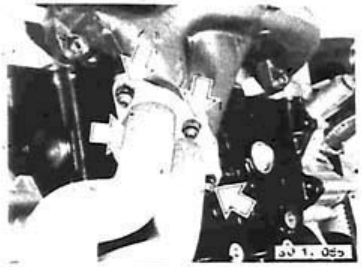
BMW 316:
Remove air cleaner, see 13 71 000.

Detach hose (8).
Remove cylinder head cover.
Installation:
Tighten nuts and bolts in order of 1 through 7.
Tightening torque*.
Also bolt holder for ignition lead.
Check gasket, replacing if necessary.

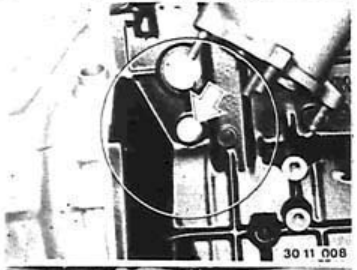
* See Specifications
*** See Service Information of Group 00
**** See BMW Technik + Service Information of Group 11

* See Specifications

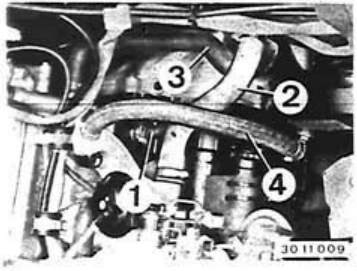
11 12 100 . REMOVING AND INSTALLING CYLINDER HEAD



Unscrew exhaust pipes on exhaust manifold and pipe clamp on transmission.
Installation:
Check gasket, replacing if necessary.
Coat studs with copper paste "CRC"**.
Replace self-locking nuts.
Tightening torque*.



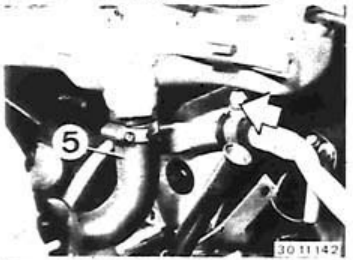
Disconnect battery ground lead.
Unscrew plug and drain coolant.
Installation:
Add coolant*** and bleed cooling system 17 00 039.
Replace engine oil***.



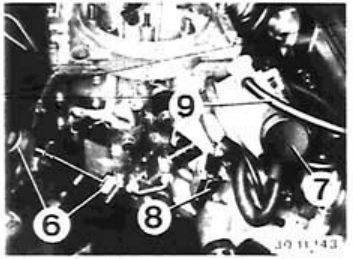
Remove air cleaner, see 13 71 000.
Disconnect coolant hoses (1 ... 3).
Pull off vacuum hose (4).
Installation:
Use new squeeze-hose clamps.

* See Specifications
** Source: HWB
*** See Service Information of Gr. 00

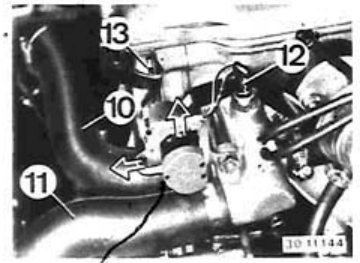
BMW 316:
Disconnect fuel hose (1).
Unscrew holder (2).
Pull off plugs (3 and 4) and loosen clips.
Disconnect wires on alternator and starter.



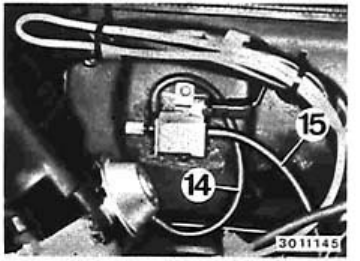
Disconnect water hose (5).
Unscrew intake manifold support.



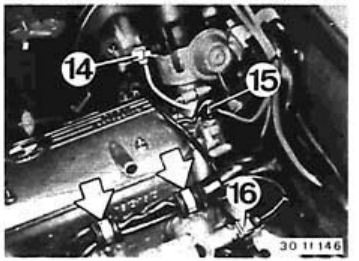
Disconnect throttle cable (6).
Pull off plug (7).
Disconnect plugs (8).
Pull off vacuum hose (9).
Installation:
Adjust throttle cable, see 35 41 421.



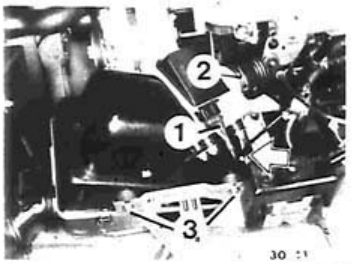
Disconnect water hoses (10 and 11).
Detach diagnosis socket.
Pull off plug (12).
Unscrew ground wire (13).



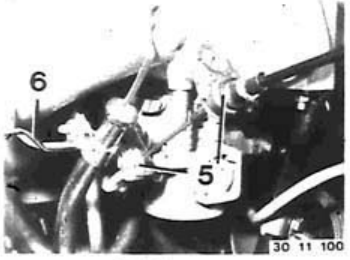
Pull off vacuum hoses (14 and 15).
Installation:
Hose (14) to distributor.
Hose (15) to throttle.



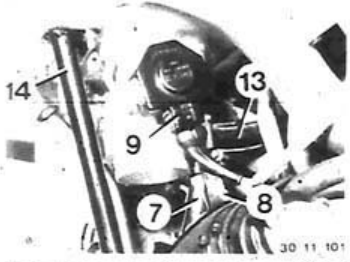
Take off distributor cap and pull off spark plug connectors.
Unscrew plug (14) and pull off plugs (15 and 16).
Disconnect and pull out wire harness.



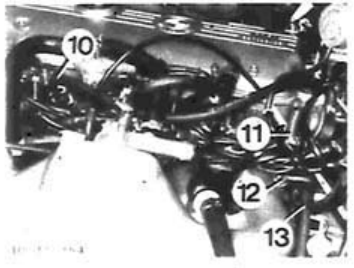
BMW 316 i, 318 i:
Pull off plug (1).
Loosen hose strap (2).
Loosen nuts (3) and remove air cleaner.



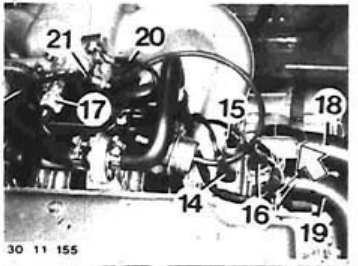
Disconnect throttle cable (5)
Unscrew holder (6).
Installation:
Adjust throttle cable, see 35 41 421



Disconnect water hoses (7 and 8).
Pull off plug (9).
Pull off vacuum hose (13).
Unscrew support (14).

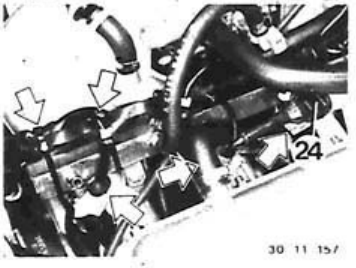


Disconnect fuel hoses (10 and 11).
Unscrew holder (12).
Installation:
Mount ground wire (13) with holder (12).

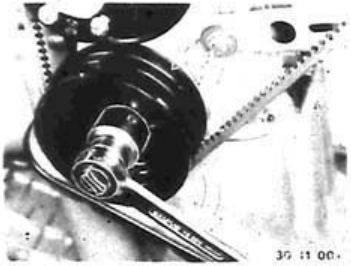


Disconnect diagnosis plug.
Pull off plugs (14 ... 17).
Disconnect wires on alternator.
Disconnect water hoses (18 and 19).
Unscrew ground strap (20).
Cars with Automatic Transmission:
Disconnect throttle cable (21).
Installation:
Adjust throttle cable 24 00 004.

Take off distributor cap and pull off spark plug connectors.
Disconnect plugs (22 and 23).
Disconnect wires.

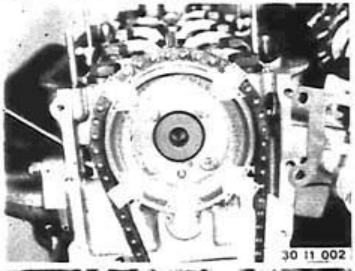


Pull off plug (24).
Disconnect wires on starter.
Pull off plugs on fuel injectors and loosen wire straps.
Pull out wire harness.

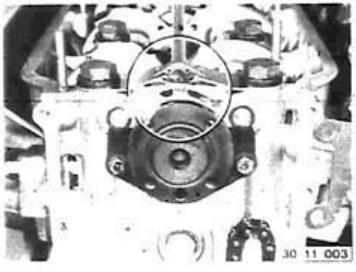


All Models:

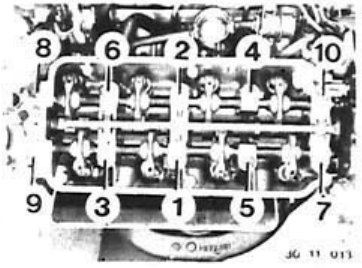
Remove upper timing case cover 11 14 100.
Remove distributor 12 11 060.
Turn cylinder no. 1 to TDC.
Cast tab is then aligned with notch in pulley.



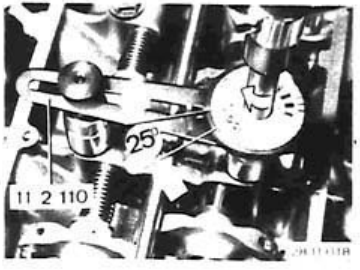
Remove chain tensioner piston 11 31 090.
Take off sprocket.
Caution!
Never crank an engine after removing the timing chain.
Installation:
Mount timing chain that bore for dowel pin faces down.
Tightening torque*.



Installation:
Prior to mounting the cylinder head, turn camshaft that notch in camshaft flange is aligned with cast tab on cylinder head.
Cylinder no. 1 is at TDC.
Install the timing chain in this position, too.



Unscrew cylinder head bolts in order of 10 through 1.
Lift off cylinder head.
Installation:
Keep oil out of cavities since otherwise bolts tightened to the specified torque would not exert sufficient pressure on the cylinder head and in addition the crankcase might crack.
Clean cylinder head bolts.
Lubricate threads and bearing surface of bolt heads with a light coat of oil.
Replace cylinder head gasket, see 11 12 101.



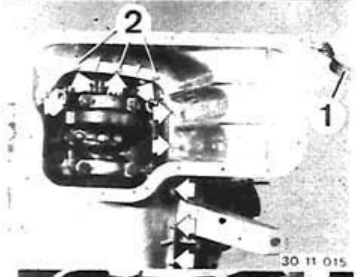
Tighten bolts in order of 1 through 10 in three steps*.
Adjust valve clearance, see 11 34 004.
Adjust ignition timing, see 12 11 004.
Adjust engine idle speed/CO, see 13 00 054.
In the 3rd step (cylinder head cover taken off again after running engine warm) tighten cylinder head bolts to specified torque angle with Special Tool 11 2 110 regardless of the engine temperature.
Note:
Cylinder head bolts are not tightened again after 1,000 km (600 miles).

* See Specifications

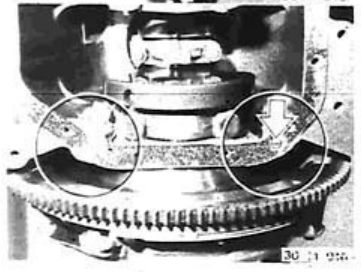
* See Specifications

11 13 010 REMOVING AND INSTALLING OR REPLACING OIL PAN UPPER SECTION

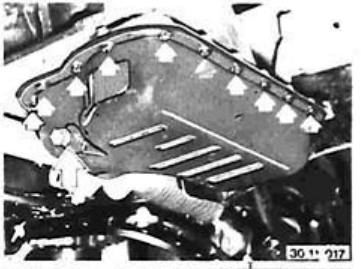
Pull out oil dipstick.
Unscrew oil pan lower section 11 13 020.
Remove oil pump 11 41 000.
Unscrew reinforcement plate.



Unscrew ground strap (1).
Unscrew oil pan bolts and remove oil pan upper section.
Installation:
Install bolts (2) with Loctite No. 270**.



Installation:
Clean sealing surfaces.
Replace oil pan gasket.
Coat mating surfaces on timing case cover and end cover with a brush-on universal sealing compound**.



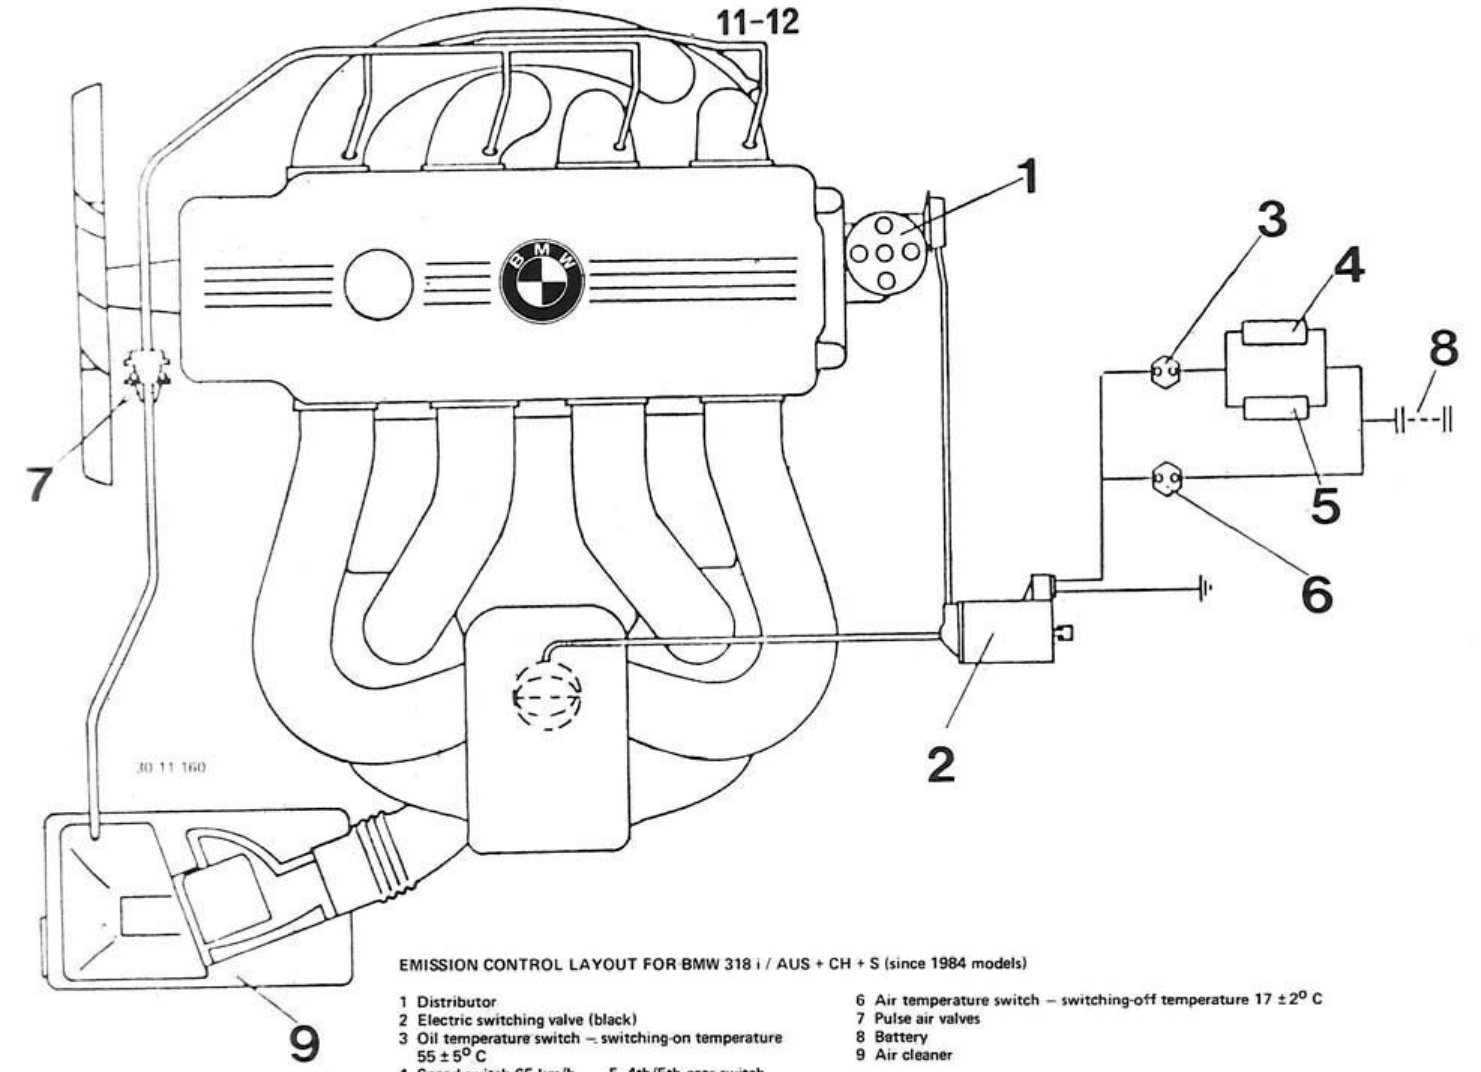
11 13 020 REMOVING AND INSTALLING OR REPLACING OIL PAN LOWER SECTION

Drain engine oil.
Unscrew oil pan bolts.
Installation:
Add engine oil***.

Take off oil pan.
Installation:
Replace gasket.

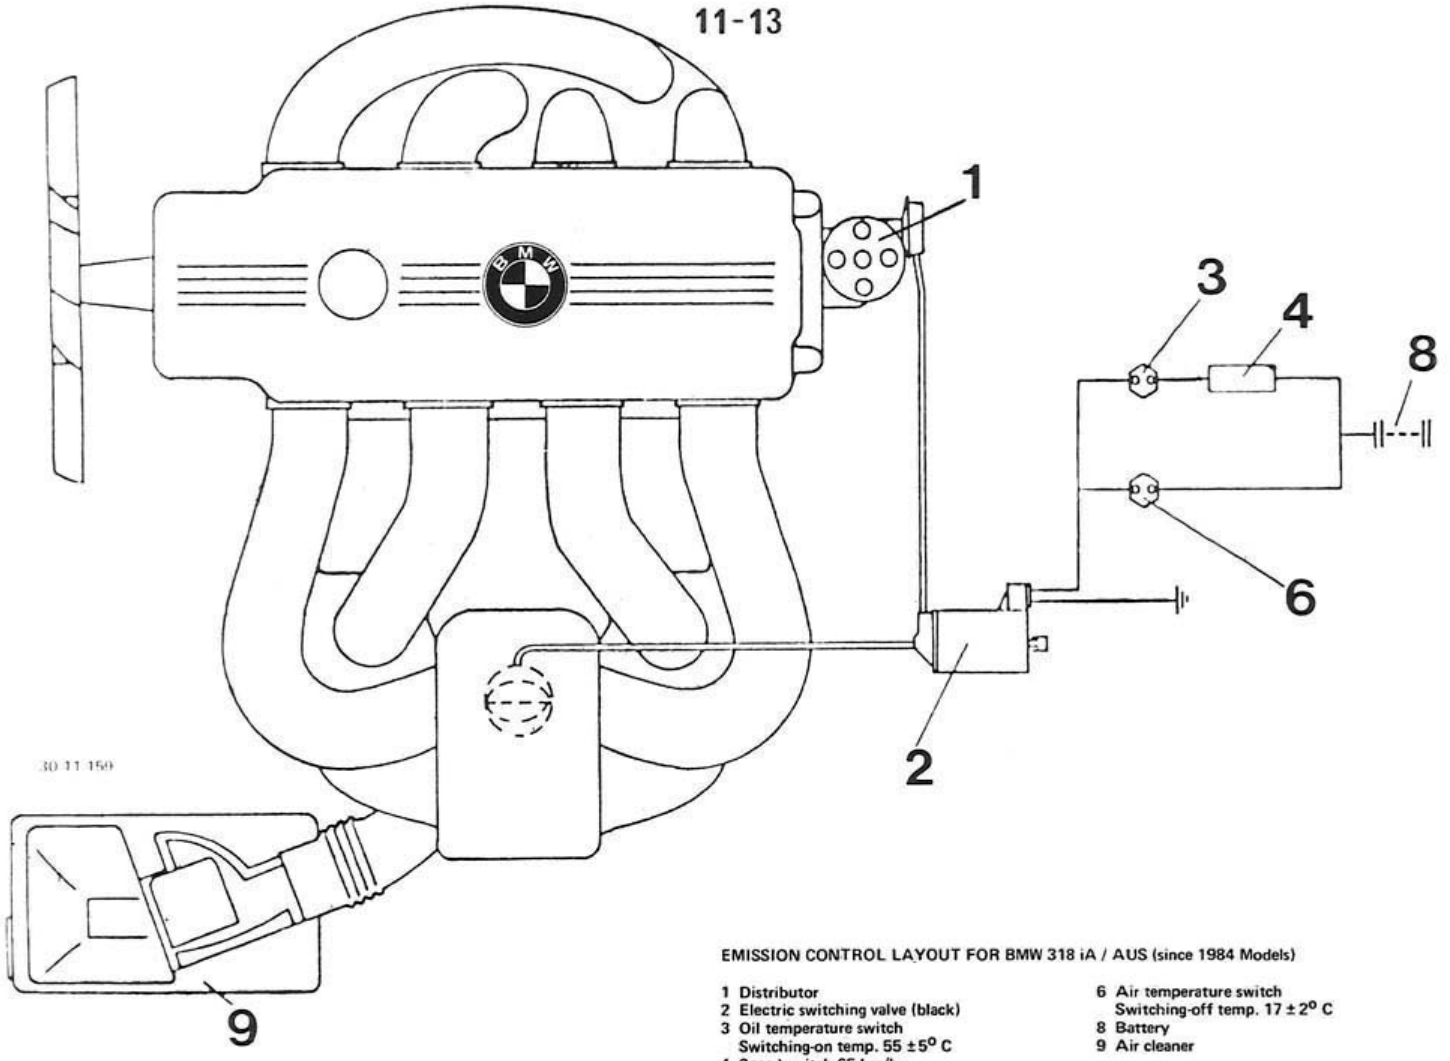
** Source: HWB

*** See Service Information of Group 00



EMISSION CONTROL LAYOUT FOR BMW 318 i / AUS + CH + S (since 1984 models)

1 Distributor
2 Electric switching valve (black)
3 Oil temperature switch – switching-on temperature 55 ± 5° C
4 Speed switch 65 km/h
5 4th/5th gear switch
6 Air temperature switch – switching-off temperature 17 ± 2° C
7 Pulse air valves
8 Battery
9 Air cleaner

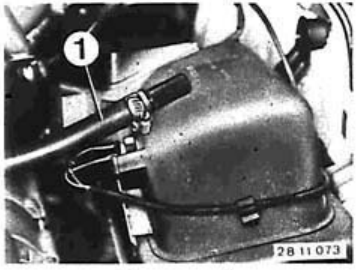


EMISSION CONTROL LAYOUT FOR BMW 318 iA / AUS (since 1984 Models)

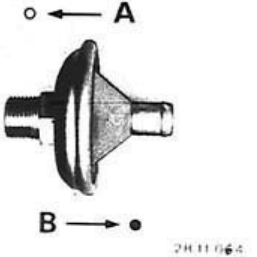
1 Distributor
2 Electric switching valve (black)
3 Oil temperature switch
Switching-on temp. 55 ± 5° C
4 Speed switch 65 km/h
6 Air temperature switch
Switching-off temp. 17 ± 2° C
8 Battery
9 Air cleaner

11 70 009 CHECKING FUNCTION OF EMISSION CONTROL

Pulse Air Valves:
Fresh air is delivered into the exhaust manifold to afterburn exhaust gas and consequently have optimum CO/HC emission.
Fresh air is taken in from the air cleaner via pulse air valves by vacuum, which is produced by pressure pulses in the exhaust manifold.

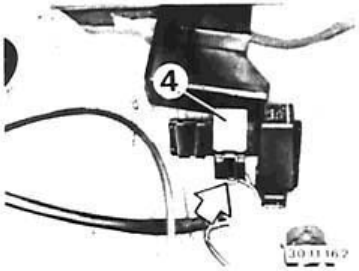


Checking Pulse Air Valves (7):
Check CO level 13 00 054.
The CO level in exhaust gas must always be lower with hose (1) connected on air cleaner than with hose (1) disconnected and plugged – see nominal value microfiche.

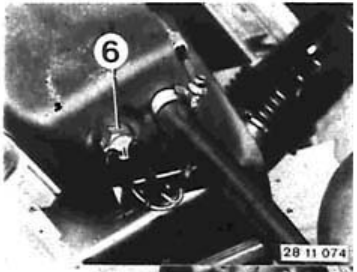


Remove pulse air valves 11 72 140.
Check pulse air valves for leaks by blowing in air.
Valves must be open in exhaust direction (A) and completely closed in direction (B).

Vacuum Advance Control – Since 1984 Mod.:
Vacuum advance control on the distributor is operated by an electric switching valve.
Conditions:
- air temp. below 17° C (63° F)
  or
- oil temp. above 55° C (131° F) and
  - road speed above 65 km/h (40 mph)
    or
  - 4th/5th gear engaged

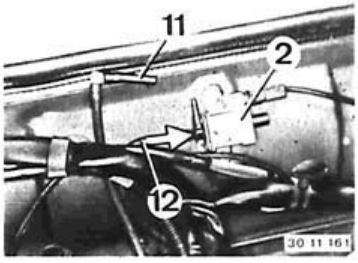


Checking Speed Switch/Switching Relay (4):
Simulate road speeds according to speedometer test, see 62 12 .
Relay switches at road speeds above 65 km/h (40 mph) – brown/red wire produces ground pulse.



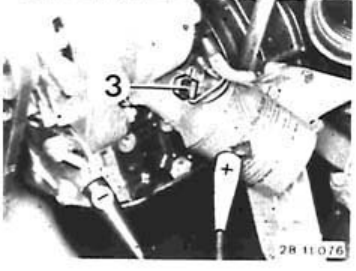
Checking Temperature Switches:
Check temperature switches according to table (11 74 040).

Air temperature switch (6) –
switched off above 17° C (63° F) – no flow.



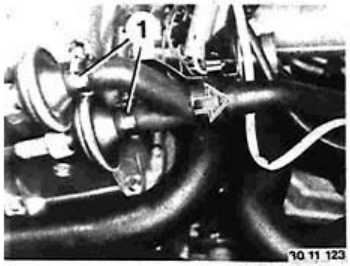
Checking Black Electric Switching Valve (2):
Engine stopped – ignition on.
Pull off hose (11) on distributor and blow air into hose (12) from the throttle housing.
Electric switching valve switches to air flow:
- at air temp. below 17° C (63° F) or
- with bridged air temperature switch.

Oil temperature switch (3) –
switched on above 55° C (131° F) – flow.

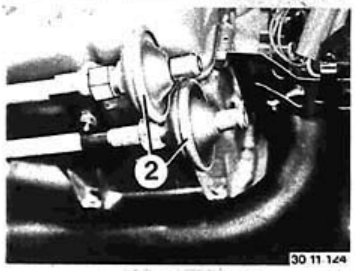


Checking 4th/5th Gear Switch (5):
Engine stopped – ignition on.
Connect green/red wire from oil temperature switch (3) on voltmeter positive (BMW service tester).
Negative = car ground.
Fourth/fifth gear switch is okay, if voltage is displayed with 4th/5th gears engaged.

11 72 140 REPLACING PULSE AIR VALVES



Testing – see 11 70 009.
Loosen clamps (1) and pull off hose.



Unscrew pulse air valve (2).
Installation:
Tightening torque*

Important!
Only install pulse air valves with code 7.209850.01 ...

11 74 545 REPLACING TEMPERATURE SWITCH

Check flow of temperature switch.

Temp. Switch On/Off Temp. in °C	BMW No.	Upper Section Color
17° C (air) 12/17 ±2	1 279 718	blue
55° C (oil) 55/35 ±5	1 706 078	black
70° C (coolant) 70/40 ±5	1 285 018	red

Unscrew temperature switch.
Installation:
Replace seal (1).
Add coolant 17 00 039.

* See Specifications

11 76 000 SERVICE INSTALLING CATALYTIC CONVERTER – In Cars Prepared for Catalytic Converter Operation –

– Operate car on several tanks of unleaded gasoline prior to installation

or

– pump out leaded gasoline**, fill tank with unleaded gasoline and run engine several minutes before installing the catalytic converter and oxygen sensor.

– Fill spare fuel canister with unleaded gasoline.

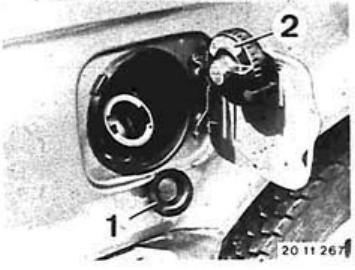
– Do not perform any test steps with cylinder shutoff when performing the BMW Service Test, see nominal value microfiche.

Remove exhaust assembly – see Group 18.
Install catalytic converter – see 11 76 010.
Exchange exhaust carrier on transmission.
Install oxygen sensor – see 11 78 510.

BMW 318 i Before 9/85:
Disconnect green plug on engine wire harness in glove box when operating car with a catalytic converter.

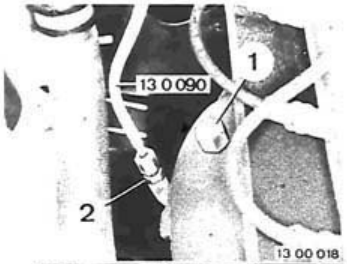
BMW 318 i Since 1986 Model:
Exchange the power divider (black) installed in cars prepared for catalytic converter operation against the ballast resistor (gray) and connect it with the gray plug.

black = 0 280 101 005
gray = 0 280 101 006



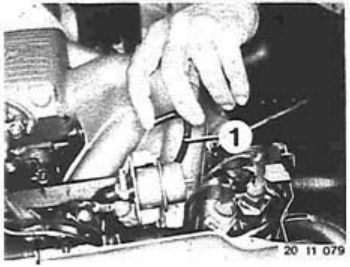
Install reducer (1) in fuel tank filler neck and paste on label (2) (unleaded gasoline).
Adjust engine idle speed and CO level – see Group 13.
Check function of oxygen sensor – see 11 78 010.

** Caution – danger of fire!



11 78 010 CHECKING FUNCTION OF OXYGEN SENSOR

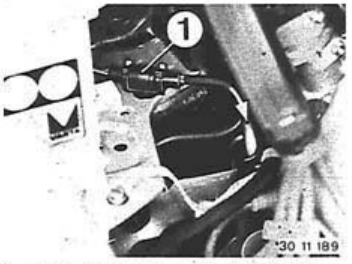
Counterhold on hexagon (2), unscrew plug (1) and screw on Special Tool 13 0 090.
Measure CO level:
Specification: 0.2 to 1.2 % by volume.
Refer to 13 00 054 for additional information.



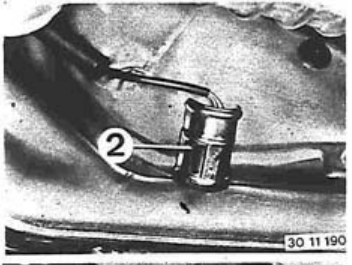
Pull off and plug vacuum hose (1) on pressure regulator.
CO level rises briefly and is regulated back to the original value immediately – oxygen sensor is working properly.
Defective:
Check power supply to oxygen sensor via relay according to the wiring diagram.
Refer to Group 13 for additional information.

11 78 510 REPLACING OXYGEN SENSOR

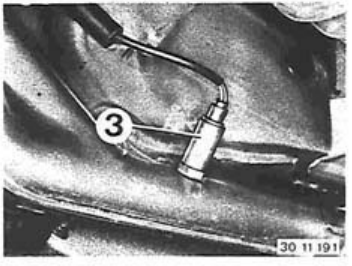
- Do not clean the oxygen sensor and never let it come in contact with a lubricant.
- Only use Anti-Seize** on the threads.
- Protect oxygen sensor when undercoating the car.



Disconnect plug (1).



Pull off plate (2).



Unscrew oxygen sensor (3).
Installation:
Coat threads with Anti-Seize**.
Tightening torque*

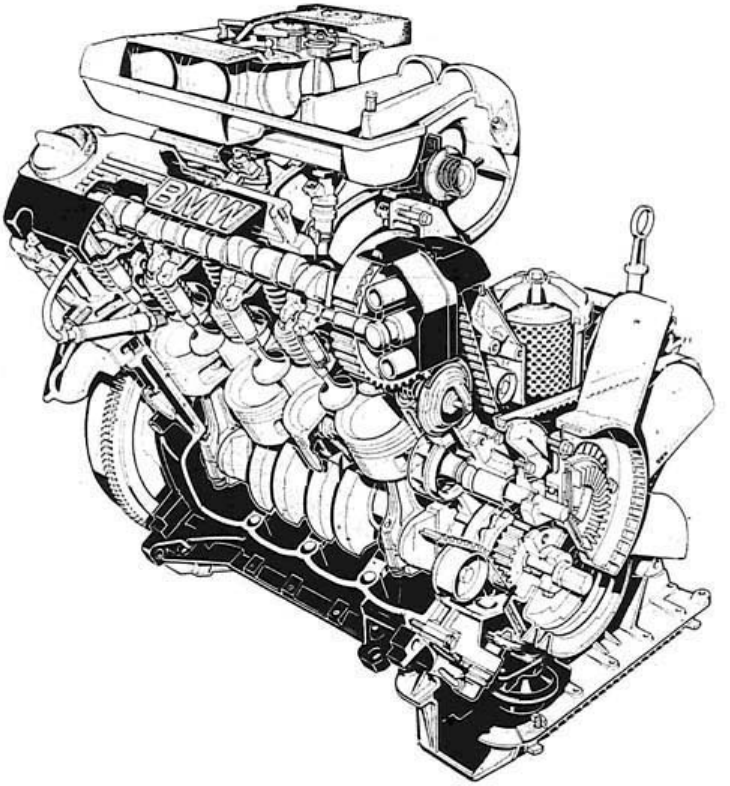
* See Specifications
** Source: HWB

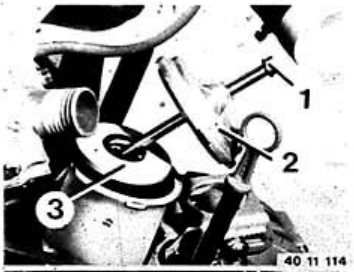
11 Engine

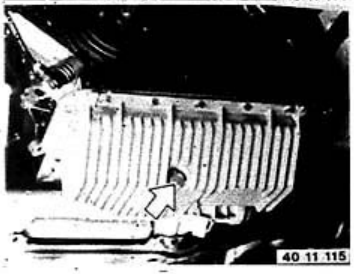
Engine M40

	Engine view (section drawing)	11- 21
00 11 209	Engine oil and oil filter – replace	11- 22
11 00 039	Compression of all cylinders – check	11- 22
050	Engine – remove and install	11- 23
11 12 101	Cylinder head gasket – replace	11- 26
245	Radial oil seal for camshaft – replace	11- 29
11 13 010	Oil pan – remove and install	11- 30
11 14 151	Crankshaft radial oil seal (clutch end) – replace	11- 31
175	Front end cover – remove and install	11- 32
180	Radial oil seal in front end cover – replace	11- 33
11 31 110	Toothed drive belt – replace	11- 34
11 51 000	Water pump – remove and install	11- 37
11 52 000	Fan – remove and install	11- 38
020	Fan clutch – replace	11- 38

SECTION VIEW DRAWING OF M 40 ENGINE





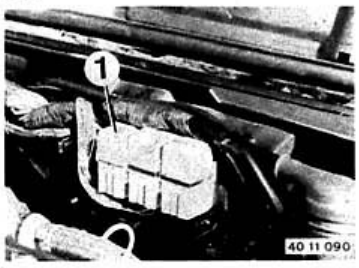


00 11 209 REPLACING ENGINE OIL AND OIL FILTER

Unscrew bolt (1) and take off oil filter cover (2) (oil runs from oil filter into oil pan).
Remove oil filter cartridge (3).

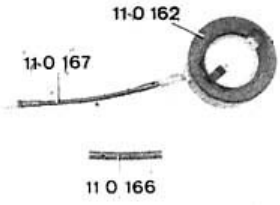
Remove oil drain plug after oil in oil filter housing has drained or draw out oil.

Install new oil filter cartridge.
Mount oil filter cover and tighten bolt with torque of 30 Nm (22 ft. lbs.).
Pour in engine oil.
Start and run engine at high speed (about 2500 rpm) until oil control lamp goes out (about 5 seconds).
Stop engine and check oil level.

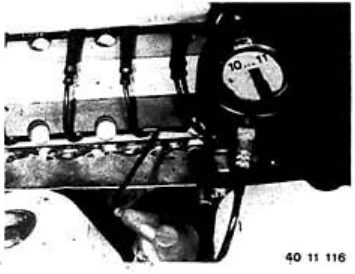


11 00 039 CHECKING COMPRESSION OF ALL CYLINDERS

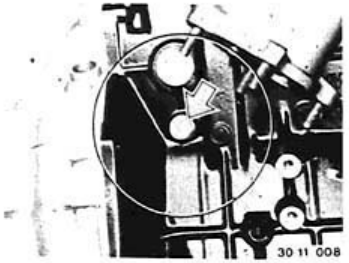
Lift out cover and pull off master relay (1).



Unscrew all spark plugs – see 12 12 011.
Screw Special Tool 11 0 166 in spark plug tapped bore by hand and connect compression tester.

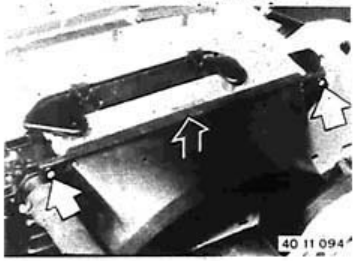


Press down on accelerator pedal and operate starter until the compression stops rising.
The values of all cylinders should not differ by more than 0.5 bar (7 psi).
Nominal value: 10 to 11 bar (142 to 156 psi).



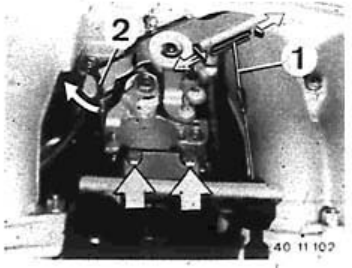
11 00 050 REMOVING AND INSTALLING ENGINE

Remove transmission – see Gr. 23 or 24.
Remove engine splash guard.
Drain coolant.
Fill and bleed cooling system – see Gr. 17.

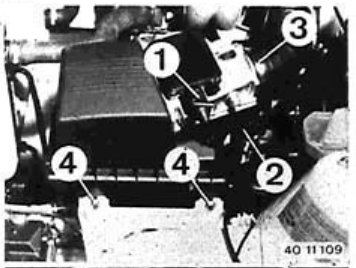


Remove fan – see 11 52 000.
Lift out expansion rivets on left and right sides, and take out fan cowl from above.

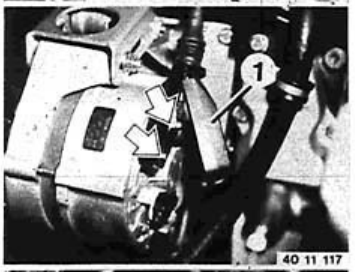
Cars with Air Conditioner:
Unscrew and place air conditioner compressor aside – refrigerant hoses remain connected.
Cars with Power Steering:
Unscrew and suspend power steering pump from car on piece of wire – hydraulic pipes remain connected.



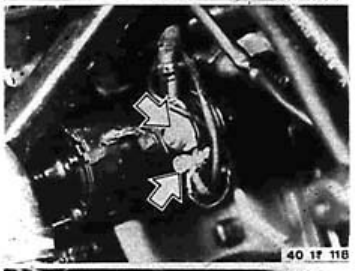
Take off cover and disconnect cables (1) and (2) = cars with automatic transmission.
Unscrew bolts (3) and place cables with holder aside.



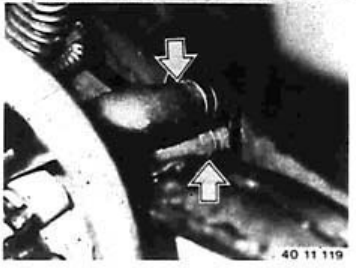
Pull off plugs (1 and 2).
Loosen hose clamp (3) and pull off intake air hose.
Unscrew nuts (4) and remove air cleaner.



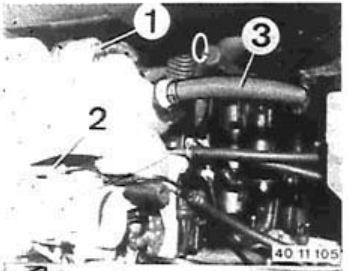
Take off cover (1) and disconnect leads on alternator.



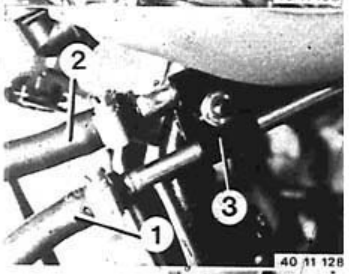
Disconnect leads on starter.



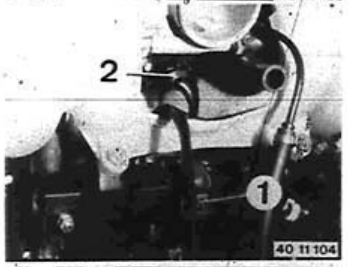
Loosen hose clamps and pull off heater hoses.



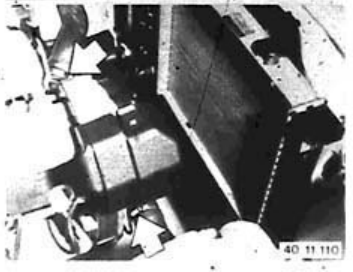
Pull off plug (1) on idle speed control and vacuum hoses (2 and 3).
Note:
Hose 2 – carbon canister
Hose 3 – brake booster



Unscrew fuel pipes (1 and 2).
Unscrew nut and take off holder (3).
Note:
Pipe 1 – feed
Pipe 2 – return

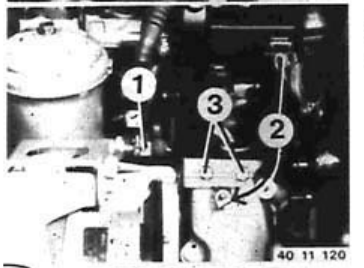


Pull off plugs (1 and 2).
Note:
Plug 1 – fuel injectors
Plug 2 – throttle valve switch

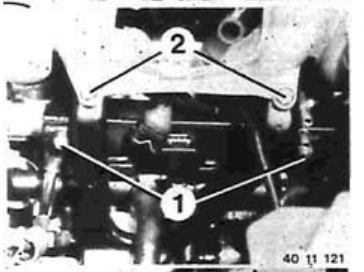


Loosen hose clamps and pull off radiator hoses.

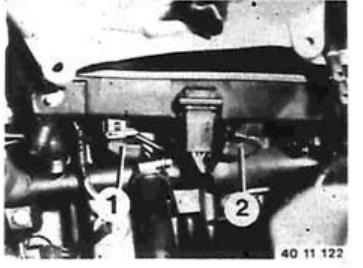
Loosen hose clamp and pull hose off of brake fluid tank.



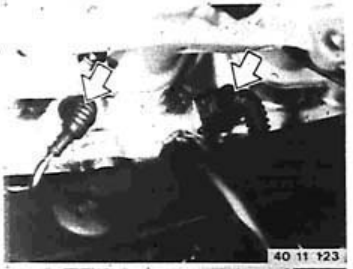
Pull off plug (1).
Loosen clamp (2).
Unscrew bolts (3).



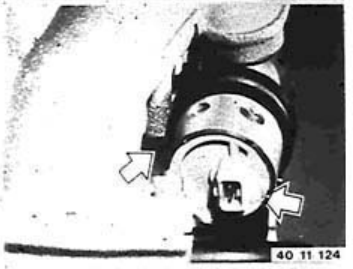
Unscrew nuts (1).
Unscrew bolts (2) and take off manifold support.



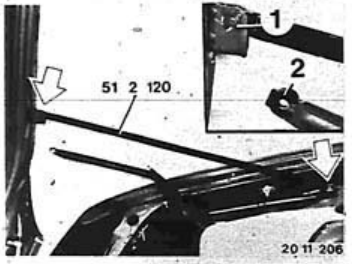
Pull off plugs (1 and 2).
Note:
Plug 1 – reference mark sender
Plug 2 – cylinder identification



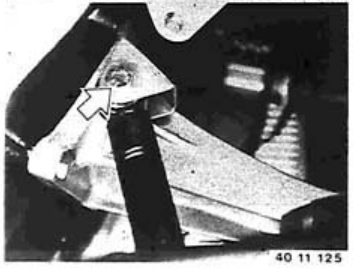
Pull off plugs on temperature sensors.



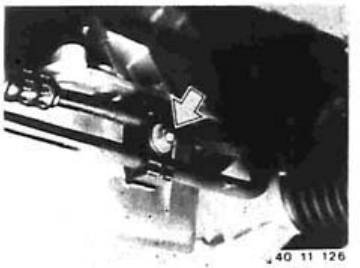
Unscrew idle speed control.



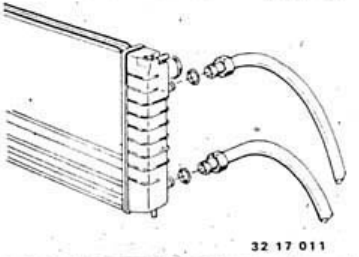
Disconnect prop and gas pressure springs, and install Special Tool 51 2 120.
Caution!
Use retainer (1).
Installation:
Insert plastic part (2).



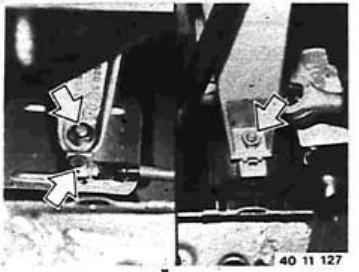
Unscrew engine damper on console.



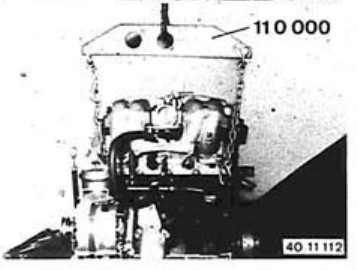
Cars with Automatic Transmission:
Unscrew oil pipes on oil sump.



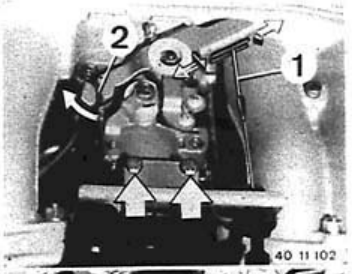
Unscrew oil pipes on oil cooler.
Installation:
Check gaskets, replacing if necessary.
Tightening torque: 25 Nm (18 ft. lbs.).



Disconnect ground lead on engine carrier.
Unscrew left and right engine mounts.
Installation:
Tightening torque for rubber mounts to engine carrier: 45 Nm (32.5 ft. lbs.).



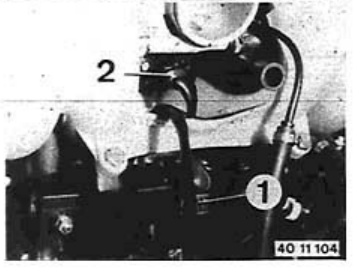
Lift out engine with Special Tool 11 0 000.
Note:
A removed engine with installed hydraulic valve adjusting elements must not remain upside down longer than 10 minutes, since otherwise oil would run out of these elements and they could no longer be used.



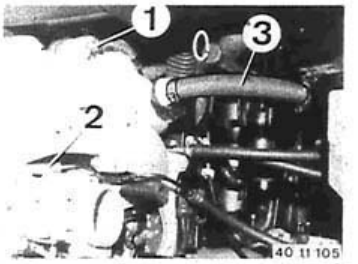
11 12 101 REPLACING CYLINDER HEAD GASKET

Remove toothed drive belt – see 11 31 110.
Take off cover and disconnect cables (1) and (2) (= cars with automatic transmission).
Unscrew bolts (3) and place cables with holder aside.

Loosen hose clamps and take off intake air hose.
Pull off plug (1) on air flow sensor and plug (2) on tank venting valve.

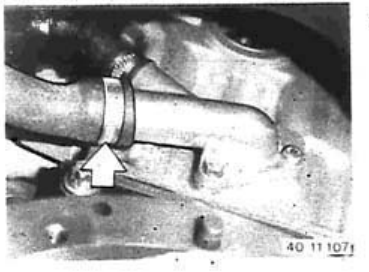


Pull off plugs (1 and 2).
Note:
Plug 1 – fuel injectors
Plug 2 – throttle valve switch

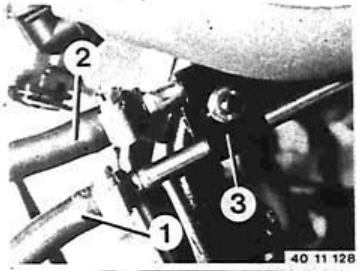


Pull off plug (1) on idle control as well as vacuum hoses (2 and 3).
Note:
Hose 2 – carbon canister
Hose 3 – brake booster

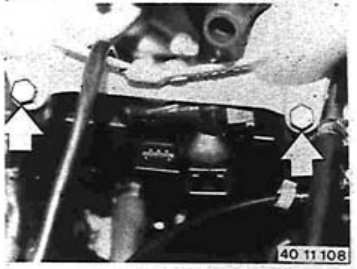
Loosen hose clamp and pull off preheating hose.



Loosen hose clamp and pull off heater hose.

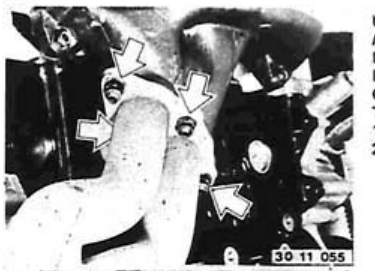


Disconnect fuel pipes (1 and 2).
Unscrew nut and take off holder (3).
Note:
Pipe 1 – feed
Pipe 2 – return

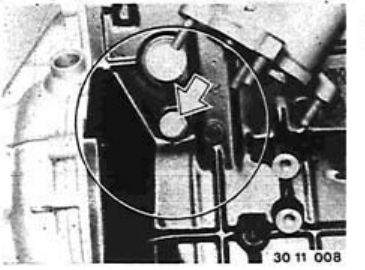


Unscrew mounting bolts for manifold support.

Loosen hose clamp and pull off radiator hose.

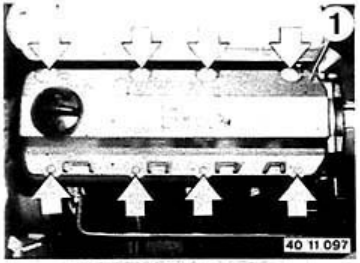


Unscrew exhaust pipe on exhaust manifold.
Installation:
Replace gasket and self-locking nuts.
Replace gasket and self-locking nuts.
Coat threads with copper paste "CRC"**.
Tightening torque:
1. Initial torque 30 Nm (22 ft. lbs.)
2. Final torque 50 Nm (36 ft. lbs.)

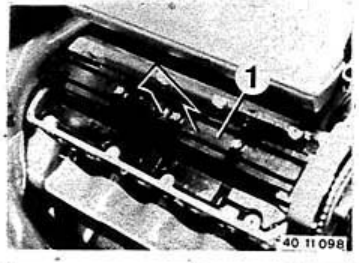


Unscrew plug and let coolant run out of engine.

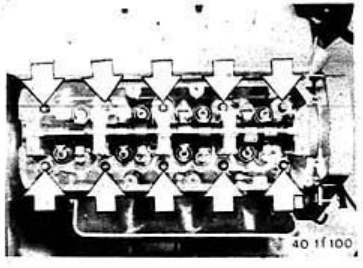
** Source of Supply: HWB



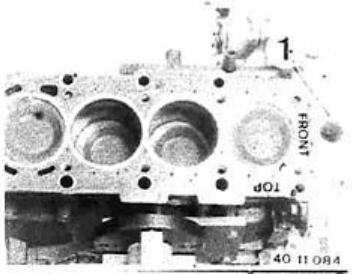
Pull off breather hose (1).
Unscrew bolts from outside to inside and take off cylinder head cover.
Installatiop:
Check gasket, replacing if necessary.
Tighten bolts crosswise from inside to outside.
Tightening torque: 9 Nm (6,5 ft. lbs.).



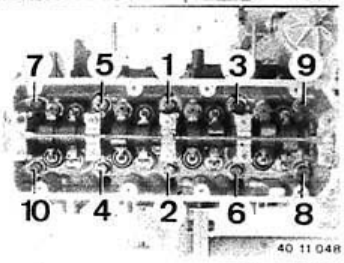
Take off camshaft cover (1).



Unscrew cylinder head bolts from outside to inside and take off cylinder head.

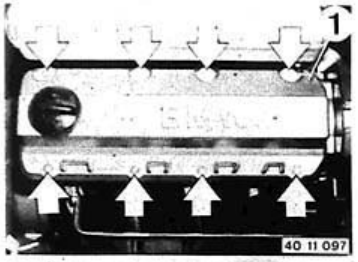


Installation:
Clean sealing surfaces on cylinder head and crankcase, removing pieces of gasket with a gasket remover** and hard wood scraper if necessary, making sure that pieces of gasket do not fall into oil bores or cooling ducts.
Install new cylinder head gasket with "TOP" facing up and "FRONT" facing toothed drive belt end.
Replace o-ring (1).



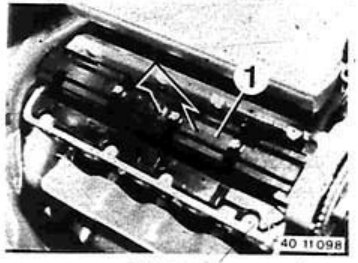
Mount cylinder head and tighten new bolts (lubricated lightly with oil) in order of 1 to 10 in three steps.
Step 1: 33 Nm (24 ft. lbs.) torque
Step 2: 93° torque angle
Step 3: 93° torque angle
Important!
Cylinder head bolts must always be replaced.
Keep oil out of cavities in engine block (danger of cracking block, wrong tightening torque values).

** Source of Supply: HWB

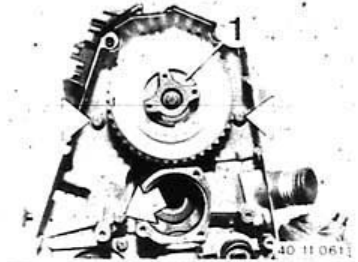


11 12 245 REPLACING RADIAL OIL SEAL FOR CAMSHAFT

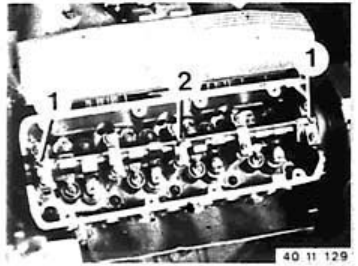
Remove toothed drive belt – see 11 31 110.
Pull off breather hose (1).
Unscrew bolts from outside to inside and take off cylinder head cover.
Installation:
Check gasket, replacing if necessary.
Tighten bolts from inside to outside with torque of 9 Nm (6.5 ft. lbs.).



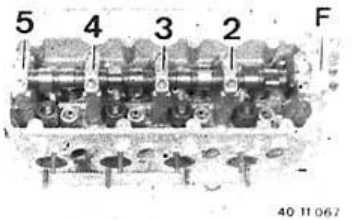
Take off camshaft cover (1).



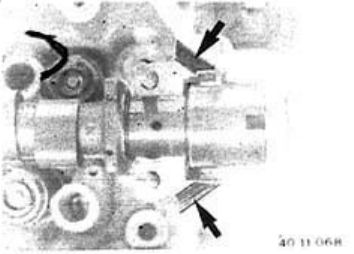
Unscrew camshaft sprocket (1).
Unscrew bolts and take off housing.



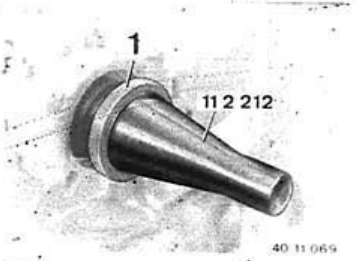
Unscrew bolts (1 and 2) and take off oil pipe.
Installation:
Replace gasket between hollow union bolt (2) and pipe.
Tightening torque:
Bolts (1) = 5.5 Nm (4 ft. lbs.)
Bolt (2) = 11 Nm (8 ft. lbs.)



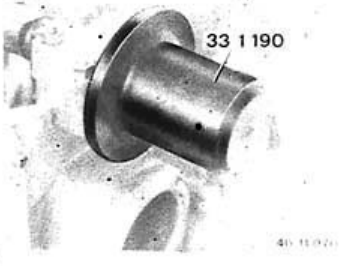
Unscrew camshaft bearing cap (F) and remove radial oil seal.



Apply a thin coat of non-hardening sealing compound** on bearing surface of bearing cap and mount bearing cap.
Installation:
Tightening torque: 11 Nm (8 ft. lbs.).

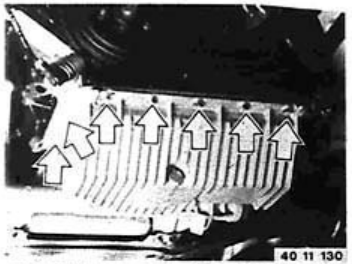


Lubricate sealing lip of new radial oil seal in oil.
Apply Special Tool 11 2 121 on camshaft and push on seal (1) as far as possible.



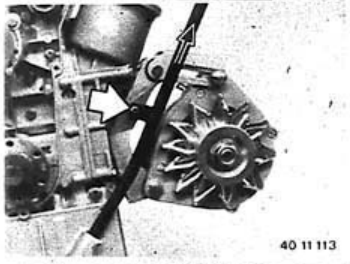
Drive in radial oil seal against stop with Special Tool 33 1 190.

** Source of Supply: HWB

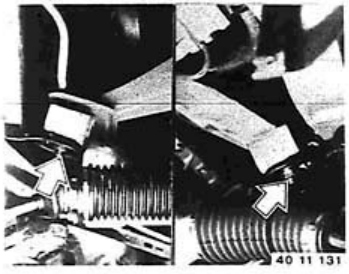


11 13 010 REMOVING AND INSTALLING OIL PAN

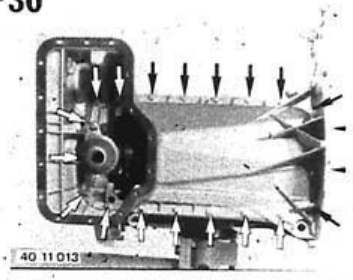
Unscrew engine splash guard.
Drain engine oil – see 00 11 209.
Unscrew bolts and take off lower oil pan section.
Installation:
Replace gasket.
Tighten bolts with torque of 9 Nm (6.5 ft. lbs.).



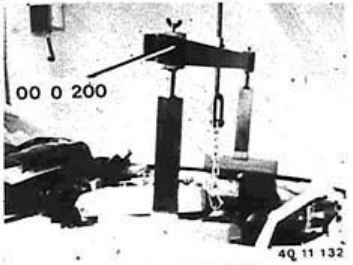
Unscrew bolt and pull out oil dipstick guide tube from above.
Installation:
Check O-rings, replacing if necessary.



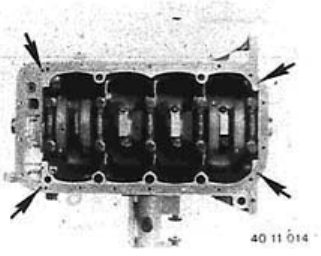
Unscrew nuts of engine mounts on left and right sides.



Unscrew oil pan bolts.
Installation:
Tightening torque: 9 Nm (6.5 ft. lbs.).

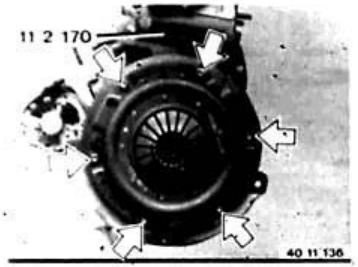


Mount Special Tool 00 0 200 on engine and lift engine enough, that oil pan can be removed forward.



Installation:
Replace gasket.
Fill holes provided for this purpose in the oil pan gasket at the transition of front and rear end covers to the crankcase with a non-hardening sealing compound**.

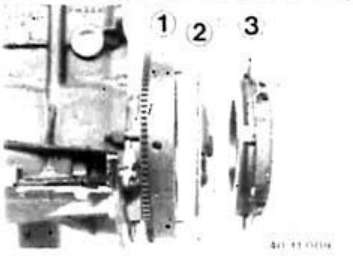
** Source of Supply: HWB



11 14 151 REPLACING CRANKSHAFT RADIAL OIL SEAL (Clutch End)

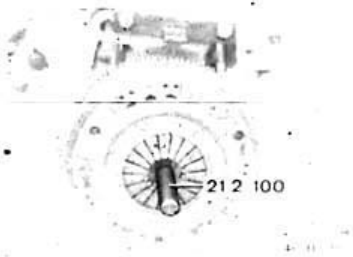
Remove transmission – see Gr. 23/24.

Hold flywheel with Special Tool 11 2 170 and unscrew bolts uniformly. Take off pressure plate and drive plate.



Installation:
1 Flywheel
2 Drive plate
3 Pressure plate

Install drive plate with flatter side facing flywheel.

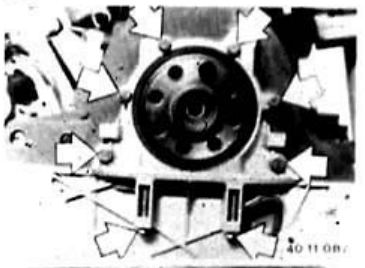


Center drive plate with Special Tool 21 2 100 and tighten bolts uniformly. Tightening torque = 23 Nm (17 ft. lbs.).

Unscrew bolts and take off flywheel.

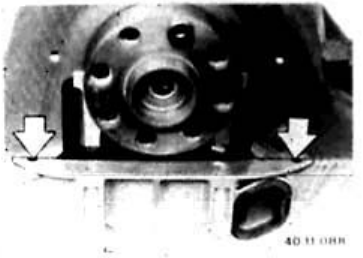
Installation:
Clean threads and install bolts with a bolt cement**.
Tightening torque = 130 Nm (94 ft. lbs.).

** Source of Supply: HWB

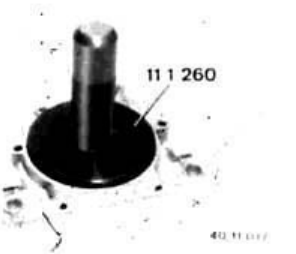


Unscrew bolts and take off end cover.

Note:
Oil pan bolts may be loosened slightly to make removal and installation easier.
If applicable, separate oil pan gasket from cover with a knife.



Installation:
Replace cover gasket, cutting it to length if necessary.
If applicable, replace damaged oil pan gasket.
Apply a thin coat of non-hardening sealing compound** on crankcase/oil pan joints.

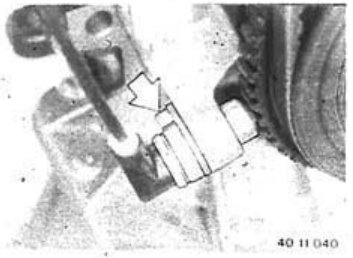


Lift out old radial oil seal and drive in new seal with Special Tool 11 1 260.

Apply Special Tool 11 2 213 on crankshaft.
Lubricate sealing lip of seal with oil.
Mount and bolt cover.
Tightening torque:
M 6 9 Nm (6.5 ft. lbs.)
M 8 22 Nm (16 ft. lbs.)

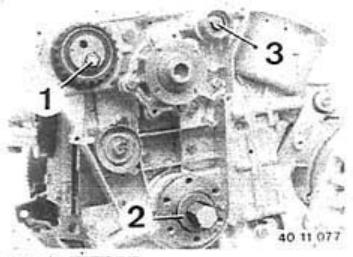
Note:
Watch out for oil pan gasket while mounting cover.

** Source of Supply: HWB



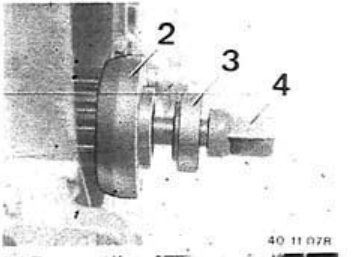
11 14 175 REMOVING AND INSTALLING FRONT END COVER

Remove toothed drive belt – see 11 31 110.
Drain engine oil.
Unscrew reference mark sender.

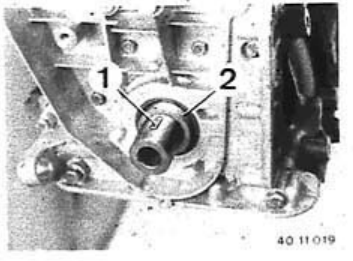


Remove tensioning roller (1), drive gear (2) and steadying roller (3).

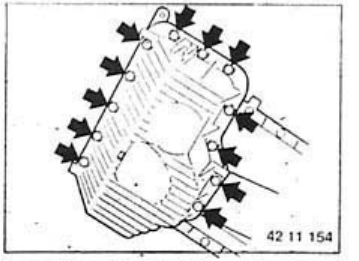
Note:
Use Special Tool 11 2 150 for removal of drive gear (2) – also refer to 11 14 180.



Installation:
Position drive gear (2) that its groove is aligned with woodruff key and install on crankshaft.
Install washer (3) with shoulder against drive gear and tighten bolt (4).
Tightening torque: 310 Nm (224 ft. lbs.).
Screw on nut for tensioning roller only finger tight.

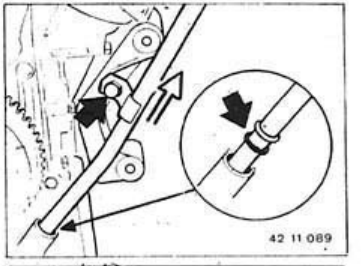


Lift out woodruff key (1) and pull off ring.



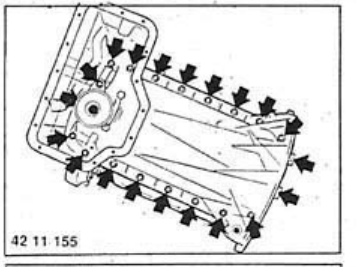
Unscrew bolts and take off lower oil pan section.

Installation:
Replace gasket.
Tightening torque = 9 Nm (6.5 ft. lbs.).

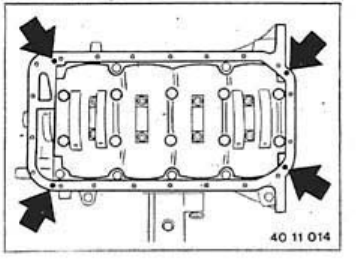


Unscrew and pull out oil dipstick.

Installation:
Replace seal.

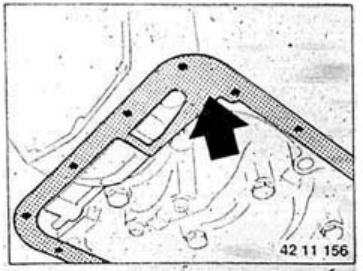


Unscrew bolts and lower oil pan.

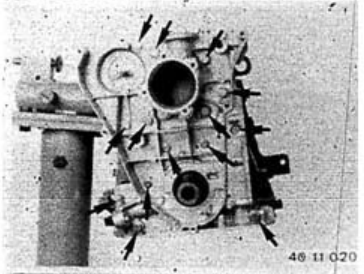


Installation:
Replace gasket.
Apply permanently elastic sealing compound 3 Bond 1207B black** on joints between front timing case and rear end cover.
Tightening torque = 9 Nm (6.5 ft. lbs.).

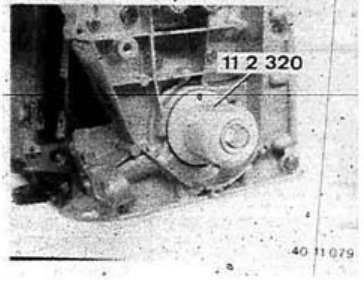
** Source of Supply: HWB



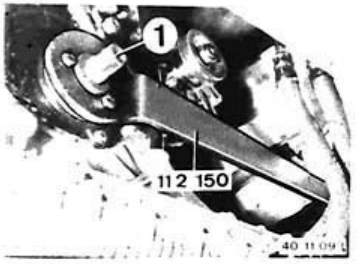
Installation:
Make sure gasket is not installed inversed.



Unscrew all mounting bolts of the end cover and take off cover.

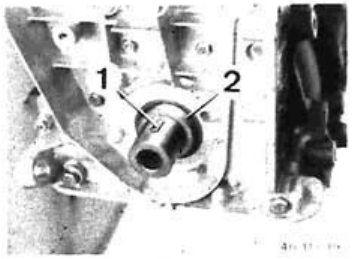


Installation:
Replace O-ring between cover and cylinder head.
Replace cover gasket.
Mount end cover.
Tightening torque:
M 6 = 9 Nm (6.5 ft. lbs.)
M 8 = 22 Nm (16 ft. lbs.)
Drive in new radial oil seal against the stop with Special Tool 11 2 320.
Lubricate sealing lip of radial oil seal with oil.

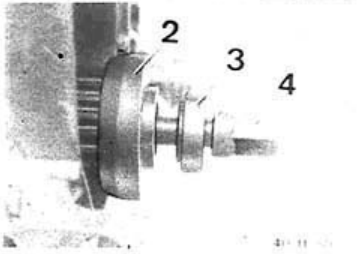


11 14 180 REPLACING RADIAL OIL SEAL IN FRONT END COVER

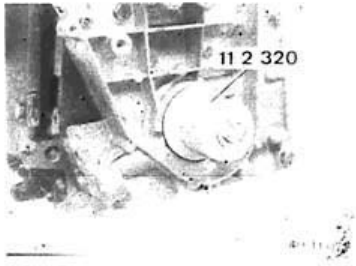
Unscrew engine splash guard.
Hold engine with Special Tool 11 2 150 (don't bear on oil pan) and loosen bolt (1).
Installation:
Tightening torque: 310 Nm (224 ft. lbs.).



Lift out woodruff key (1).
Pull off thrust ring (2), with a double claw puller if necessary.

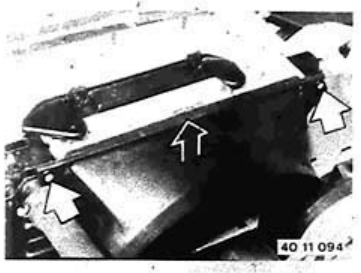


Remove toothed drive belt – see 11 31 110.
Unscrew drive sprocket (2).
Installation:
Align drive sprocket (2) with groove for woodruff key and slide on.
Install washer (3) with shoulder against the drive sprocket and screw on bolt (4) finger tight.



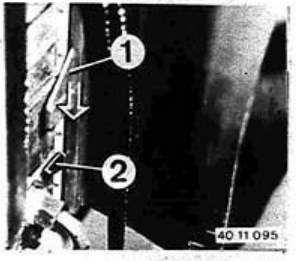
Lubricate sealing lip of new radial oil seal.
Press in radial oil seal against stop with Special Tool 11 2 320.

Pull off seal with Special Tool 11 2 310.
Note:
Screw special tool into seal firmly.



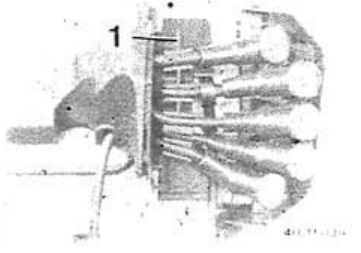
11 31 110 REPLACING TOOTHED DRIVE BELT

Remove fan (see 11 52 000).
Lift out expander rivets on left and right sides and pull out fan cowl from above.

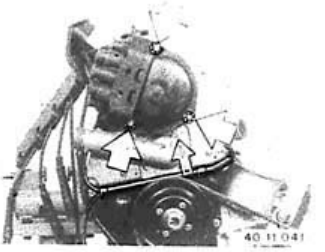


Installation:
Guide left and right tabs (1) into holders (2) while inserting the fan cowl.

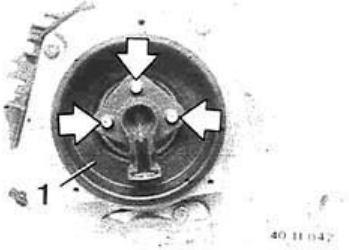
Pull off spark plug connectors.
Take off cover (1) and pry out electric lead duct (2) with a screwdriver.



Installation:
Place ignition leads assorted in guides on insulator (1).

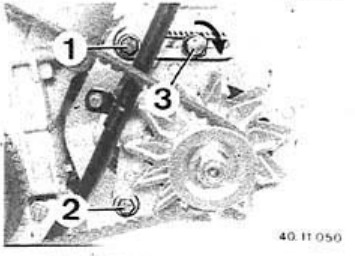


Lift out electric lead duct on face.
Unscrew screws on distributor cap and take off ignition tackle.

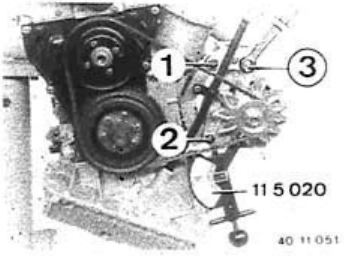


Unscrew screws and take off distributor finger and then remove cover (1) afterwards.

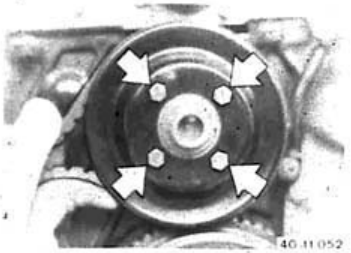
Installation:
Check O-ring on cover, replacing if necessary.



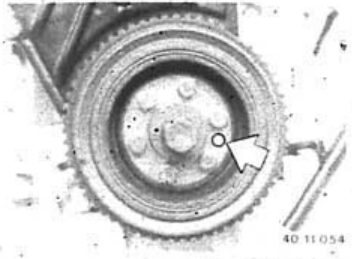
Loosen bolt (1).
Loosen nuts on bolts (2 and 3) and loosen the drive belt by turning bolt (3) in direction of the arrow.
Take off drive belt.



Installation:
Adjust tightness of drive belt by turning bolt (3) in direction of arrow with Special Tool 11 5 020.
Tighten nuts on bolts (3 and 2) and bolt (1).



Counterhold pulley with the drive belt, unscrew bolts and take off pulley.

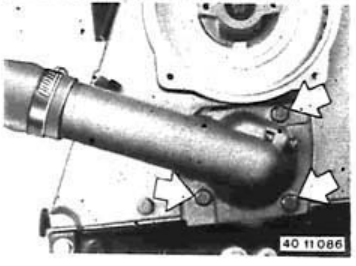


Unscrew bolts on vibration damper and take off vibration damper.

Installation:
Align dowel pin bore in vibration damper with the dowel pin precisely.
Tightening torque = 23 Nm (17 ft. lbs.).

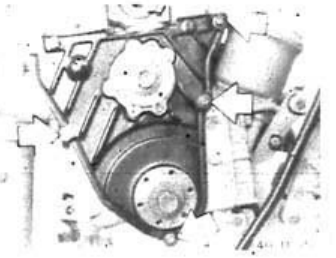
Drain coolant.

Note:
Fill and bleed cooling system – see Group 17.



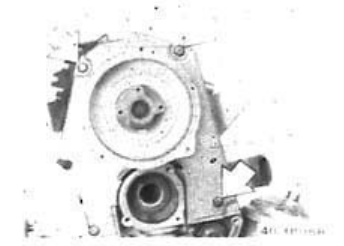
Unscrew screws.
Take off thermostat housing and thermostat.

Installation:
Check O-ring (1), replacing if necessary.
Insert thermostat with the O-ring facing the housing.



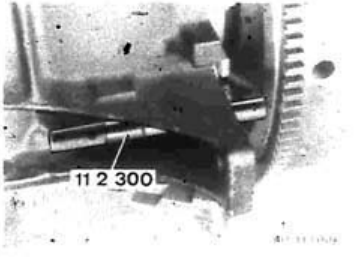
Unscrew screws and take off lower toothed drive belt cover.

Installation:
Check gasket, replacing if necessary.



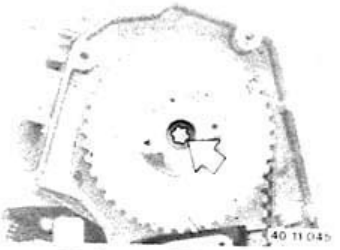
Unscrew screws and take off upper toothed drive belt cover.

Installation:
Check that dowel sleeves are installed and seated correctly in the area of the upper bolts.

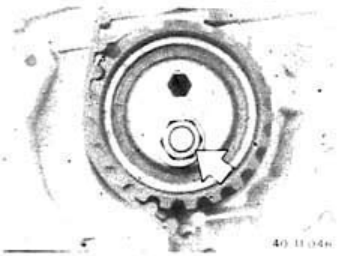


Turn crankshaft to move valves of cylinder no. 1 to TDC.
Hold crankshaft in TDC with Special Tool 11 2 300.

Caution!
Remove special tool before operating the engine.

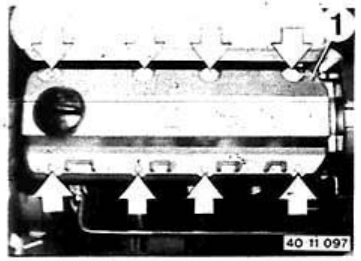


Loosen mounting bolt on camshaft sprocket.



Loosen nut on tensioning roller and take off toothed drive belt.

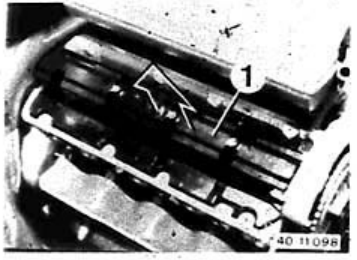
Note:
Always replaced an used toothed drive belt after loosening the tensioning roller, regardless of the mileage.



Installing and Tightening Toothed Drive Belt:

Pull off vent hose, unscrew bolts and take off cylinder head cover.

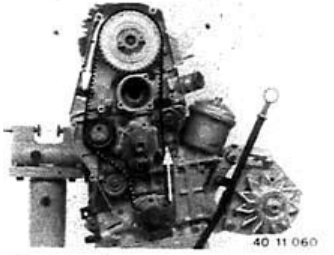
Installation:
Check gasket, replacing if necessary. Tighten bolts crosswise from inside to outside.
Tightening torque = 9 Nm (6.5 ft. lbs.).



Remove camshaft cover (1).

Installation:
Hold camshaft in TDC position (valves of cylinder no. 4 overlap) with Special Tool 11 3 190.

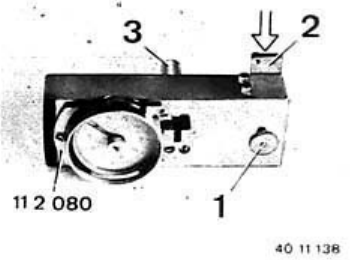
Bolt on camshaft sprocket with an initial torque of 1 to 3 Nm (0.7 to 2.1 ft. lbs.) so that it can still be turned without play and turn in engine's direction of rotation against the stop (tab in groove).



Mount tensioning roller that it can still be turned with a slight tightening torque of approx. 1 Nm (0.7 ft. lbs.).

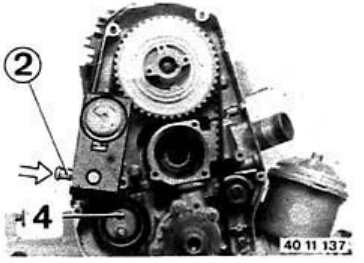
Mount toothed drive belt while pulling from the crankshaft sprocket to the tensioning roller.

Center toothed drive belt on the camshaft sprocket.

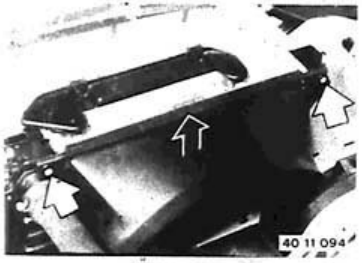


Preparing Special Tool 11 2 080 for Measuring Tightness (also Refer to Operating Instructions for 11 2 080):

Pull up lockpin (1) and move bearing pins to maximum opening width with slide (2).
Set dial gage needle to "0" and line up drag needle with the gage needle.
Apply tester on toothed drive belt in such a manner that the center bearing pin (3) bears in one of the teeth gaps.

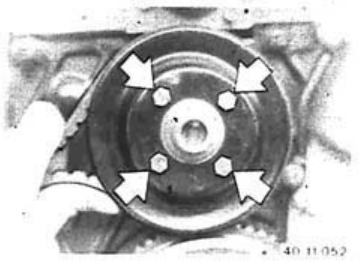


Push in slide (2) until engagment of the lockpin is noticed and adjust the toothed drive belt's tightness by turning the tensioning roller (4).
Specification: 32 ± 2 scale graduations.
Tighten the tensioning roller with 22 Nm (16 ft. lbs.) and the camshaft sprocket with 63 Nm (46 ft. lbs.) torque.

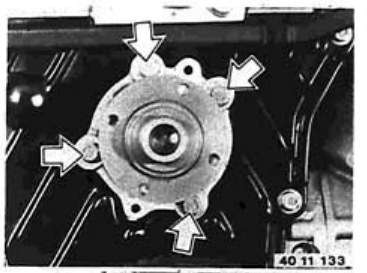


11 51 000 REMOVING AND INSTALLING WATER PUMP

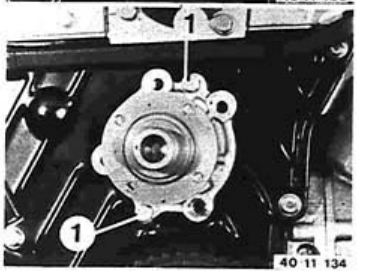
Remove fan – see 11 52 000.
Lift out expansion rivets on left and right sides.
Remove fan cowl from above.



Remove drive belt – see Group 12.
Hold pulley on drive belt.
Unscrew bolts and take off pulley.

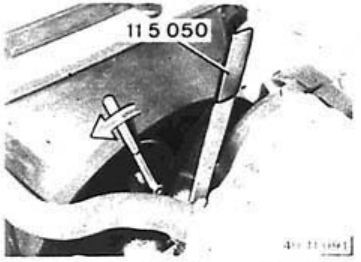


Unscrew bolts.



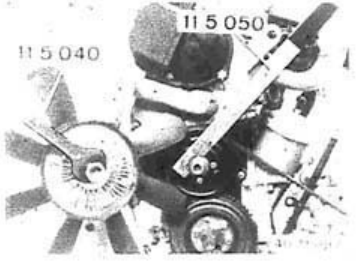
Screw two bolts in tapped holes (1) and press off water pump uniformly.
Installation:
Replace O-ring, coating with a lubricant** to make installation easier.
Tightening torque: 9 Nm (6.5 ft. lbs.).

** Source of Supply: HWB

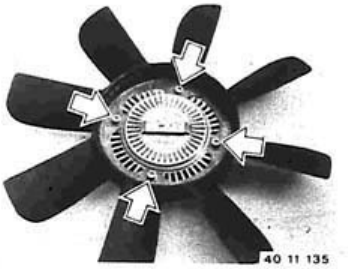


11 52 000 REMOVING AND INSTALLING FAN

Hold pulley with Special Tool 11 5 050 and unscrew coupling nut.
Important!
Left-hand threads – turn nut clockwise to unscrew nut.



Installation:
Tighten fan with Special Tool 11 5 040.
40 Nm (29 ft. lbs.) tightening torque with Special Tool 11 5 040 is equal to a setting of 30 Nm (22 ft. lbs.) on torque wrench.



11 52 020 REPLACING FAN CLUTCH

Remove fan – see 11 52 000.
Unscrew mounting bolts and take off fan clutch.
Installation:
Tightening torque: 9 Nm (6.5 ft. lbs.).

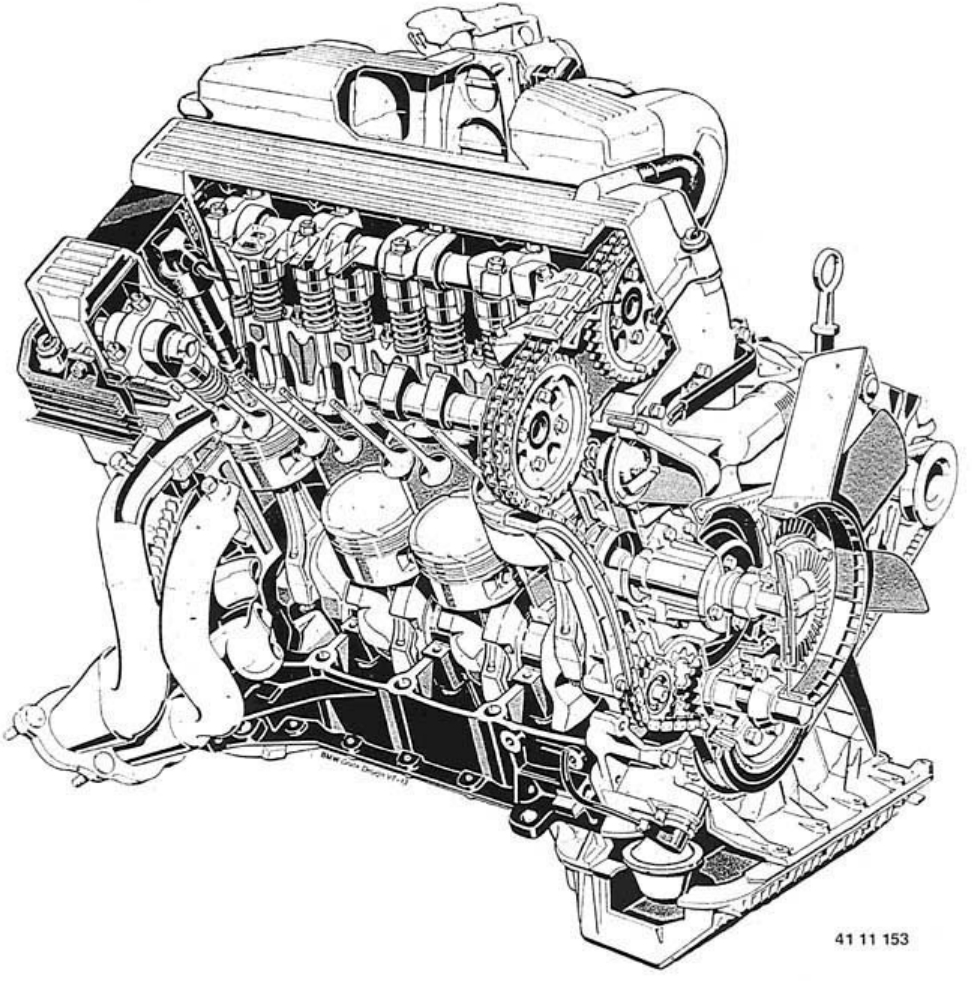
Replace fan clutch, if
a) it has axial or radial play,
b) it is losing oil or
c) is hard to turn (fan of a stopped engine must be easy to turn).

11 Engine

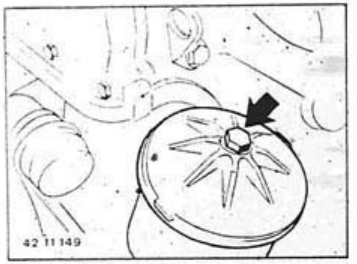
Model: 318is – Engine M42

	View of M42 engine	11-	00/42.0
00 11 . . .	Engine oil and oil filter – replace	11-	00/42.1
11 00 039	Compression – check	11-	00/42.2
050	Engine – remove and install	11-	00/42.3
11 14 115	Timing case, lower – remove and install / seal or replace	11-	14/42.1

SECTION DRAWING OF M 42 ENGINE



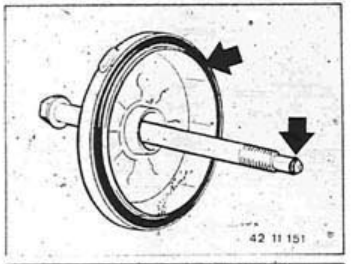
41 11 153



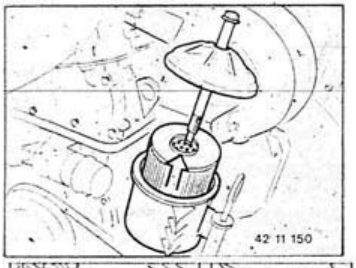
M 42 Engine
00 11 ... REPLACING ENGINE OIL AND OIL FILTER

Unscrew oil filter cover (oil in filter housing runs into oil pan).

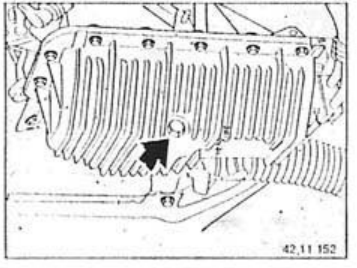
Installation:
Tightening torque = 30 Nm (22 ft. lbs.).



Installation:
Replace seal in cover and on bolt.



Remove oil filter cartridge.

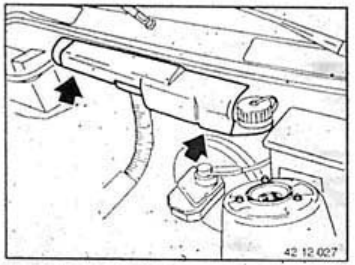


Remove oil drain plug or draw off oil after oil has run out of the oil filter housing.

Installation:
Tightening torque = 32 ± 4 Nm (23 ± 3 ft. lbs.).

Pour in engine oil .
Start engine and run at high speed (approx. 2,500 rpm) until the oil control lamp goes out (approx. 5 seconds).
Stop engine and check oil level (car on level surface).

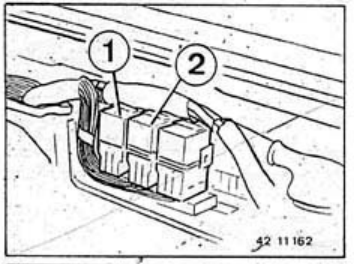
* **Oil grade - see Operating Fluids**
Oil volume - see Specifications



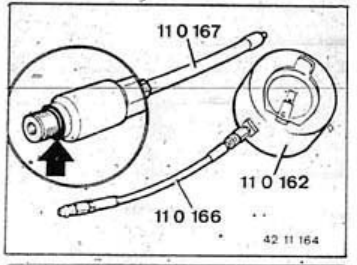
M 42 Engine
11 00 039 CHECKING COMPRESSION

Testing Conditions:
Battery in perfect condition – check acid density if necessary.
Engine temperature = max. 35° C (95° F) coolant temperature.

Remove cover.



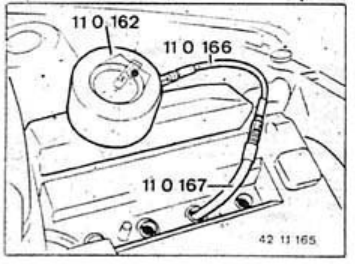
Pull off master relay (1) and fuel pump relay (2).



Unscrew all spark plugs (also refer to 12 12 011).

Screw Special Tool 11 0 166 in tapped bore of spark plug by hand and connect the compression tester.

Note:
Check that seal is in perfect condition.



Floor accelerator pedal and operate starter for so long, until the compression no longer rises.
Value of all cylinders should not differ by more than 0.5 bar (7 psi).
Specification: 10 to 11 bar (142 to 156 psi).

M 42 Engine

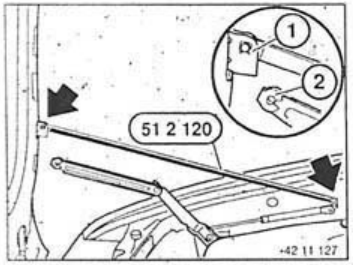
11 00 050 REMOVING AND INSTALLING ENGINE

Disconnect battery ground lead.

Removing Transmission:

Remove transmission – see Group 23 or 24.

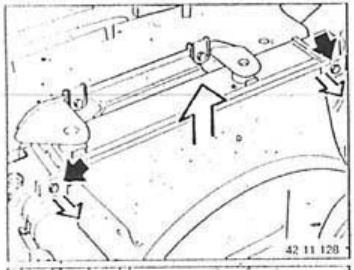
Unscrew splash guard.



Disconnect prop and gas pressure spring, and apply Special Tool 51 2 120.

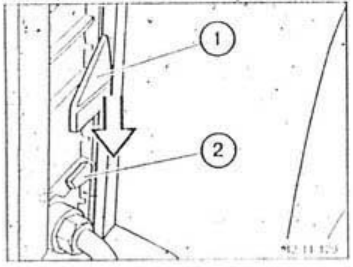
Caution!
Use lock (1).

Installation:
Insert plastic part (2).

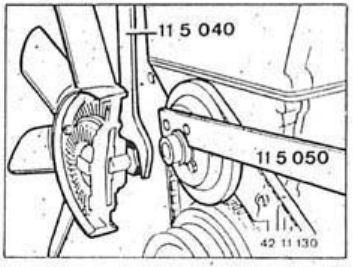


Removing Fan Cowl:

Lift out expander rivets on left and right sides and remove fan cowl from above.



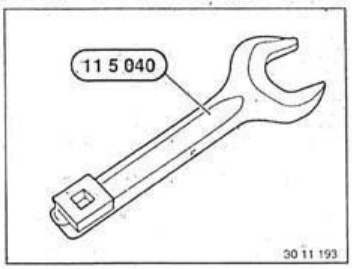
Installation:
Engage left and right tabs (1) in holders (2) while inserting the fan cowl.



Removing Fan:

Counterhold pulley with Special Tool 11 5 050 and unscrew nut on fan.

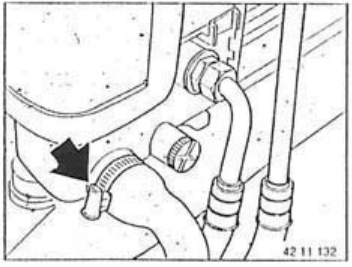
Important!
Left-hand threads – turn nut clockwise to unscrew.



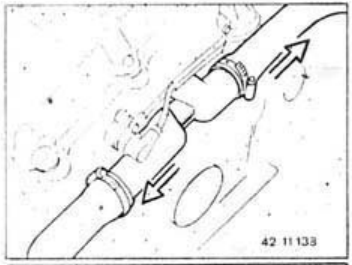
Installation:
Tighten fan nut with Special Tool 11 5 040.
40 Nm (29 ft. lbs.) tightening torque is equal to 30 Nm (22 ft. lbs.) setting on torque wrench.

Disconnecting Coolant Hoses:

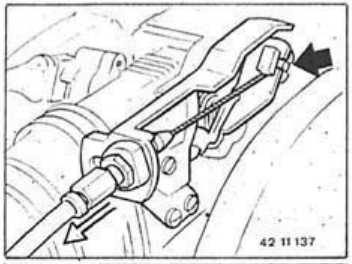
Drain coolant on engine block.



Loosen hose clamp and pull off hose on expansion tank at bottom.

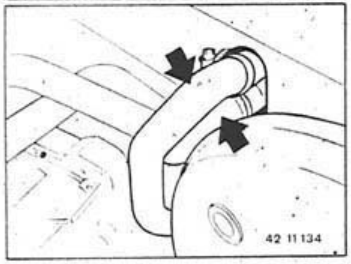


Disconnect coolant hoses on engine.



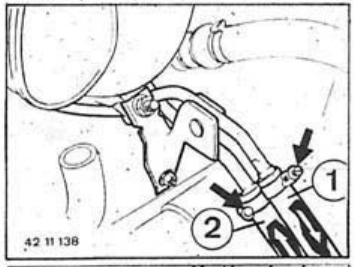
<u>Disconnecting Throttle Cable:</u>

Unclip cable.
Pull out cable with rubber holder.



Disconnect heater hoses on splash wall.

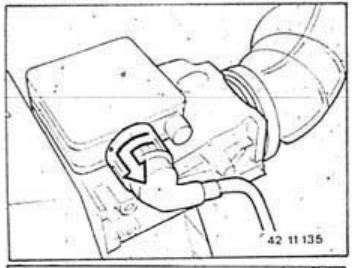
Installation:
Fill and bleed cooling system – see Group 17.



<u>Disconnecting Fuel Pipes:</u>

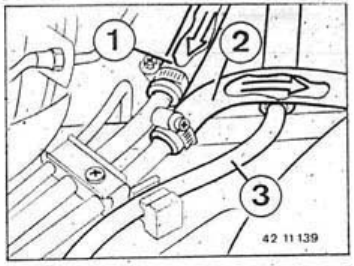
Unscrew fuel pipes.

Installation;
Top (1) = return
Bottom (2) = feed (from filter)



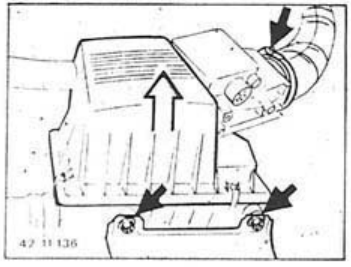
<u>Removing Air Cleaner and Air Flow Sensor:</u>

Disconnect plug.

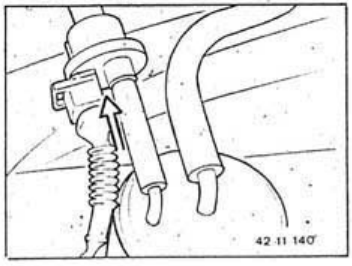


Arrangement of Tank Pipes on Engine Carrier:

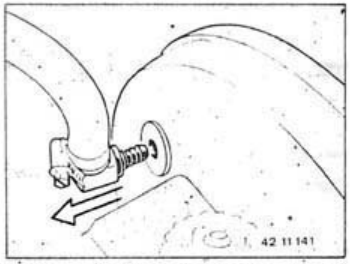
(1) = return
(2) = feed (to filter)
(3) = tank vent



Loosen hose clamp and unscrew mounting screws.
Lift off air cleaner with air flow sensor.

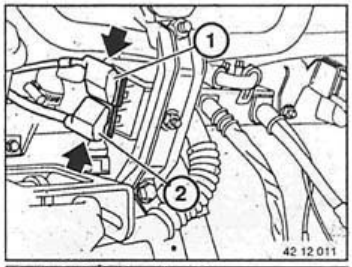


Pull off hose to filter for tank venting.



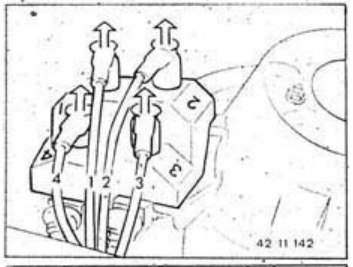
Disconnecting Vacuum Hose for Brake Booster:

Pull out connector on brake booster.



Disconnect both plugs on electric lead duct.

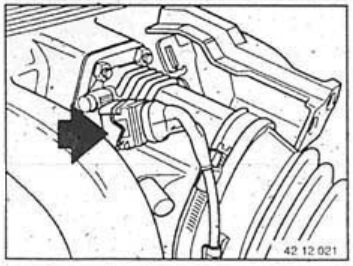
(1) = cylinder identifying sender (constant ignition distributor)
(2) = pulse sender for DME



Disconnecting Engine Wire Harness on Engine:

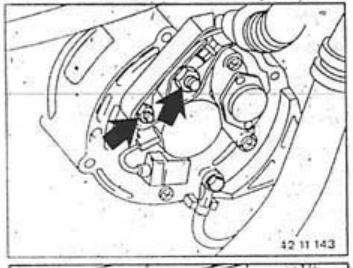
Pull off ignition leads on ignition coil.

Installation:
Numbers for the firing order are located on the leads and cap.

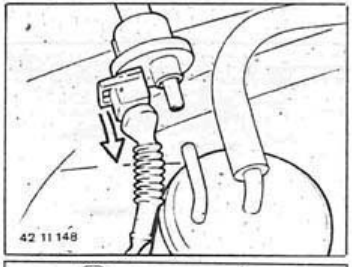


Pull off throttle valve potentiometer pug.

Location:
An throttle valve neck.

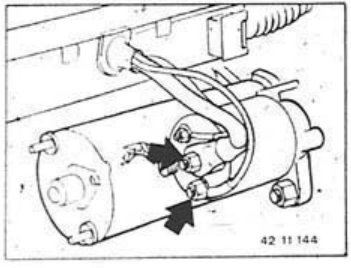


Unscrew connections on alternator.

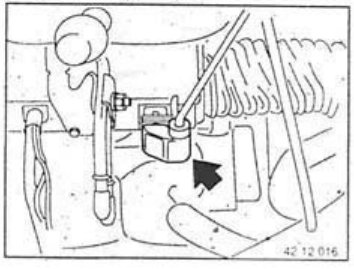


Pull off tank venting valve plug.

Location:
Next to air cleaner.

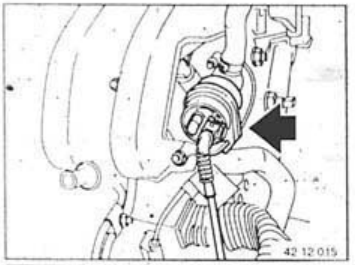


Unscrew connections on starter.



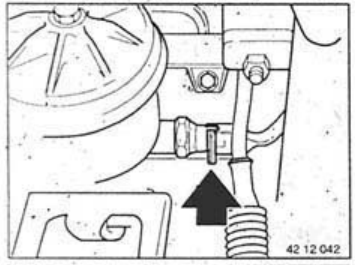
Pull off plug for fuel injectors.

Location:
On end of electric lead duct, close to the fuel pipes.



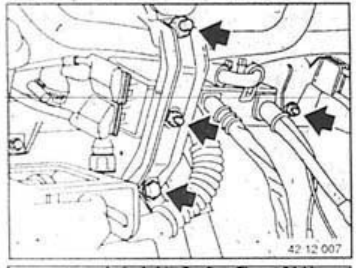
Pull off plug for idle speed control.

Location:
Am rear intake manifold.

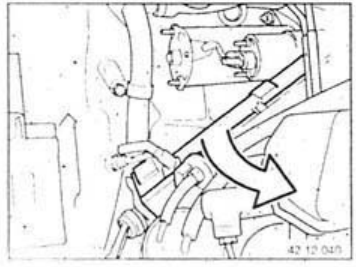


Pull off plug on oil pressure switch.

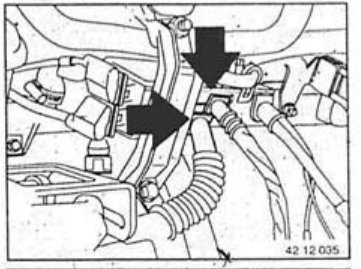
Location:
On oil filter.



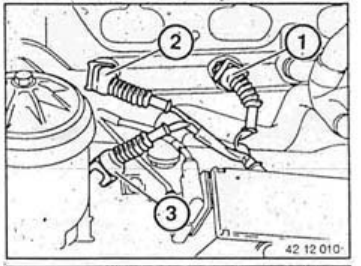
Unscrew supports for intake manifolds front and rear.



Take electric lead duct off of the engine.



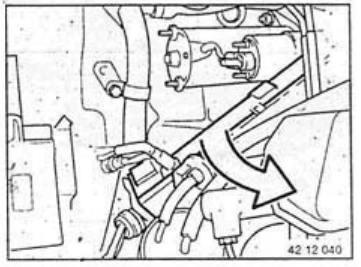
Important!
Make sure that rubber grommets of electric lead openings are clipped in the electric lead duct correctly when mounting the electric lead duct.



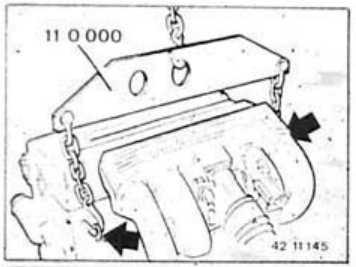
Pull off plugs (1 and 2).

Important!
Don't mix up plugs.

(1) = Coolant temperature gage sender
(2) = Coolant temperature sensor - DME
(3) = Oil pressure switch

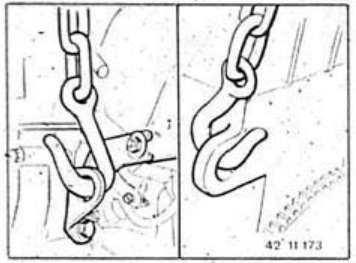


Disconnect electric lead duct and wire harness on engine and lay aside.

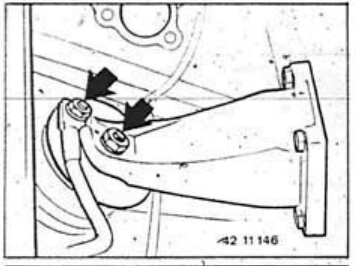


Lifting Out Engine:

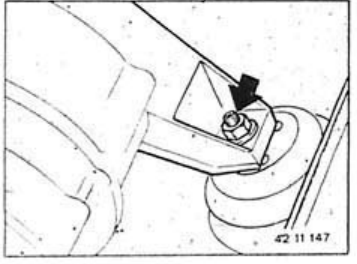
Connect Special Tool 11 0 000 on engine.



Arrangement of Suspension Front and Rear



Unscrew engine mount and ground lead on right-hand side.



Unscrew left engine mount.

Lift out engine.

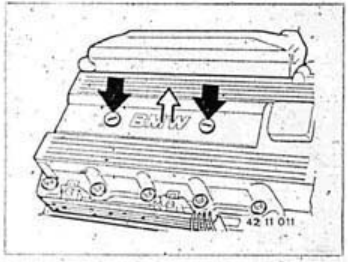
M 42 Engine

11 14 115 REMOVING AND INSTALLING/ SEALING OR REPLACING LOWER TIMING CASE

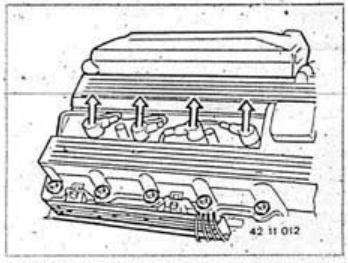
Note:
The timing case can be removed together with the integrated oil pump without removal of the cylinder head by application of Special Tool 11 2 330.
Disconnect battery ground lead.
Remove fan and fan cowl.
Remove splash guard.
Drain coolant.

<u>Removing Cylinder Head Cover:</u>

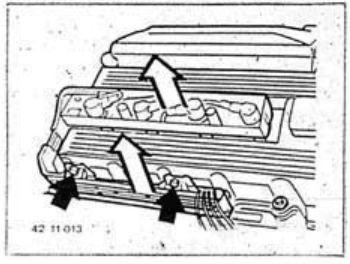
Unscrew cover for ignition coil.

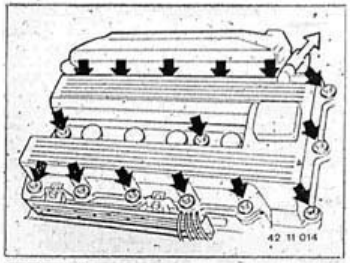


Pull off spark plug connectors.



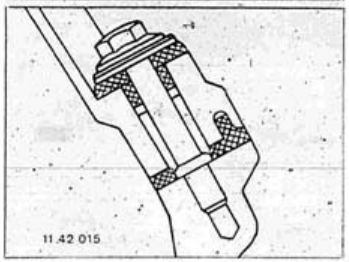
Loosen both nuts.
Lift out complete ignition tackle.



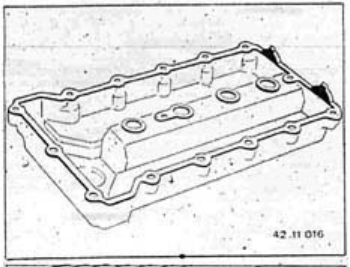


Pull off hose.
Unscrew cylinder head cover.

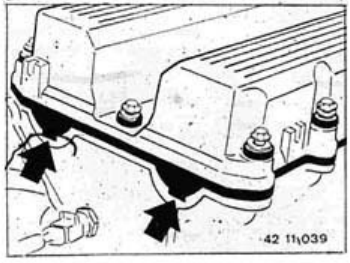
Installation:
Tightening torque .



Note:
The cylinder head cover has rubber mounts and gaskets to separate it from the cylinder head vibrations. Check arrangement of rubber mounts.

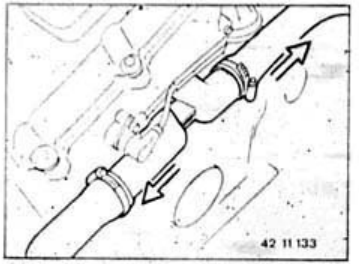


Installation:
Check gaskets, replacing if necessary.



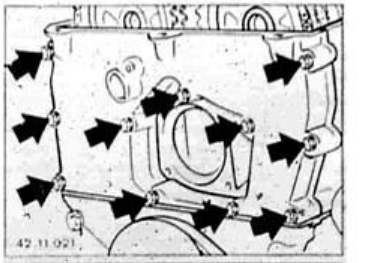
Installation:
Check for correct fit of gasket on back of the cylinder head when mounting the cylinder head cover.

*** See Specifications**

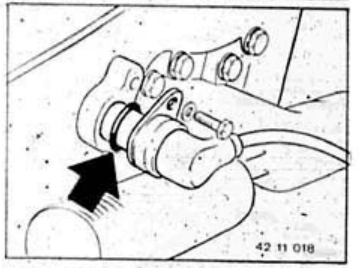


Removing Upper Timing Case Cover:

Disconnect coolant hoses on engine.

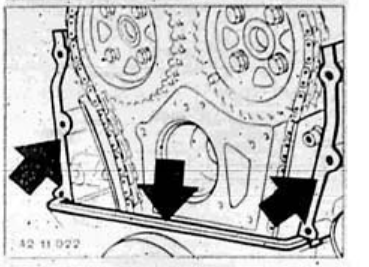


Unscrew upper timing case cover.

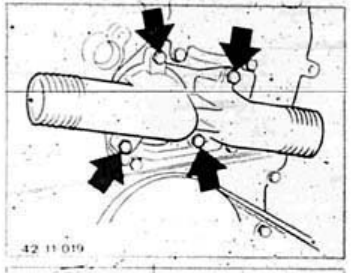


Unscrew sender.

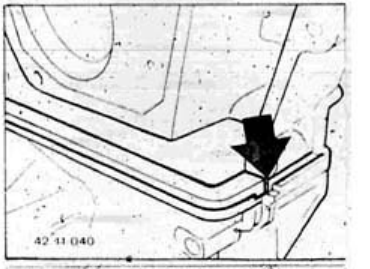
Installation:
Check seal, replacing if necessary.



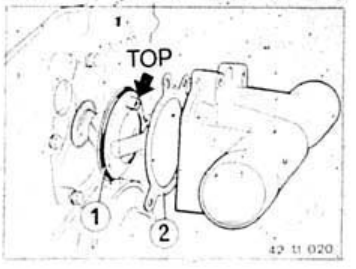
Installation:
Replace gaskets.



Remove thermostat housing and thermostat.

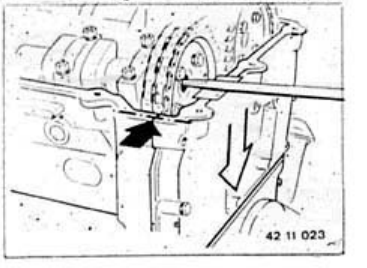


Installation:
Fill butt joints between gaskets with a black permanently elastic sealing compound, 3 Bond 1207B .



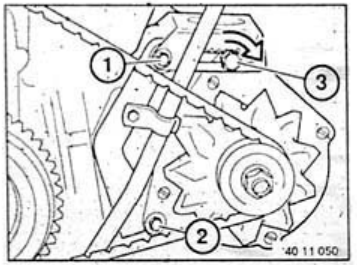
Installation:
Vent faces up.
Replace O-ring.
Coat O-ring lightly with glycerine.

(1) = O-ring
(2) = Gasket



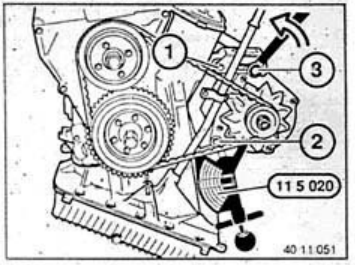
Installation:
Install two bolts.
Press down on timing case until the upper edge of the cover is in the same plane of the cylinder head.
Be careful not to damage sealing surfaces.
Install and tighten all bolts.
Tightening torque .

* **See Specifications**
** **Source of Supply: HWB**

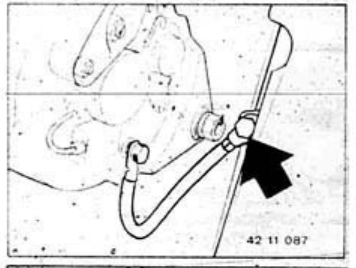


Removing Drive Belt:

Loosen bolt (1).
Loosen nuts on bolts (2 and 3) and loosen the drive belt by turning bolt (3) in direction of the arrow.
Take off drive belt.

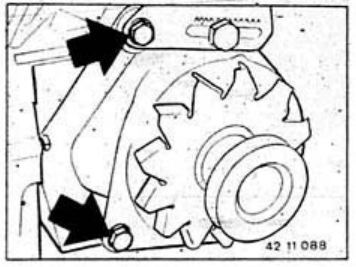


Installation:
Adjust tightness of drive belt by turning bolt (3) in direction of the arrow with Special Tool 11 5 020.
Tighten nut on bolt (3).
Tighten bolts (1 and 2).



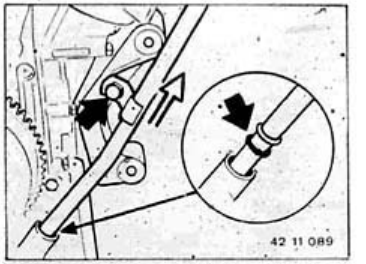
Removing Alternator:

Unscrew ground strap.



Unscrew bolts and take off alternator.

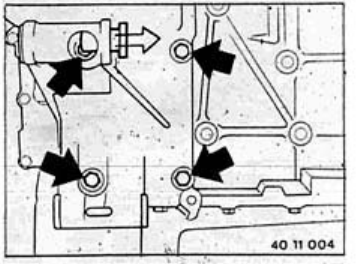
Installation:
Tightening torque = 22 Nm (16 ft. lbs.).



Removing Alternator Console:

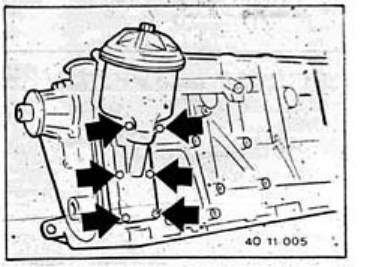
Unscrew and pull out oil dipstick.

Installation:
Replace seal.



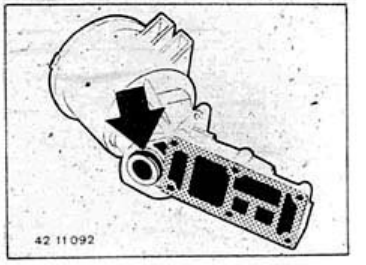
Press out sleeve.
Unscrew bolts and take off console.

Installation:
Tightening torque = 22 Nm (16 ft. lbs.).



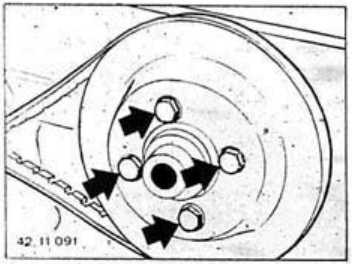
Removing Oil Filter Housing:

Unscrew screws and take off oil filter housing.



Installation:
Replace O-ring and gasket.
Coat O-ring with a lubricant.**
Tightening torque = 9 Nm (6.5 ft. lbs.).

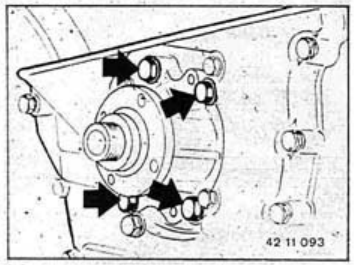
**** Source of Supply: HWB**



Removing Water Pump:

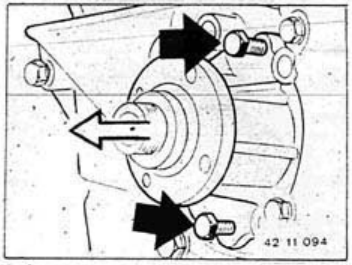
Counterhold pulley with the drive belt and unscrew bolts.

Installation:
Tightening torque = 9 Nm (6.5 ft. lbs.).

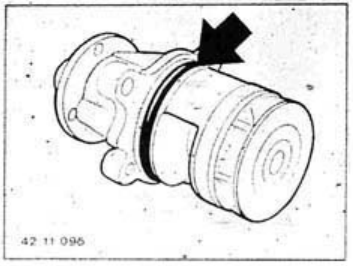


Unscrew bolts.

Installation:
Tightening torque = 9 Nm (6.5 ft. lbs.).

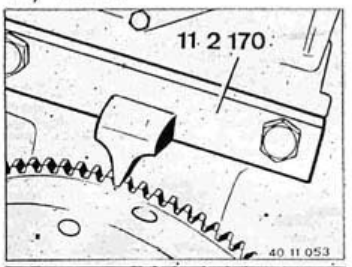


Screw two M 6 screws in tapped bores (1) and press water pump out of the end cover uniformly.



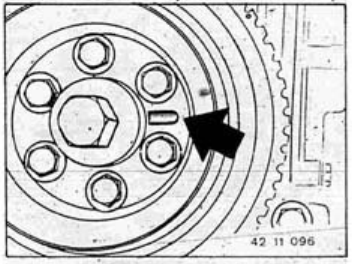
Installation:
Replace O-ring and coat with a lubricant.**
Tightening torque = 9 Nm (6.5 ft. lbs.).

**** Source of Supply: HWB**



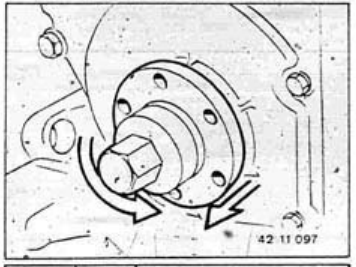
Removing Vibration Damper:

Hold engine with Special Tool 11 2 170.



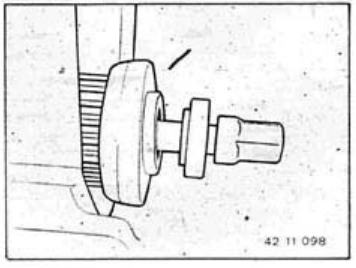
Unscrew bolts on vibration damper and take off vibration damper.

Installation:
Align dowel pin bore in vibration damper with the dowel pin.
Tightening torque = 23 Nm (17 ft. lbs.).

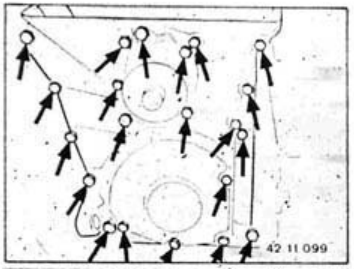


Removing Hub for Vibration Damper:

Hold flywheel with Special Tool 11 2 170.
Unscrew central bolt.
Take off washer and hub.



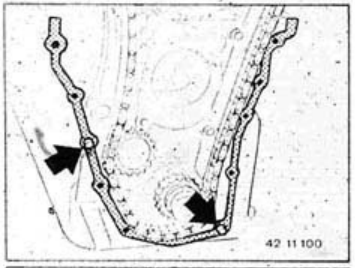
Installation:
Align groove of hub with woodruff key.
Shoulder of washer faces the hub.
Tightening torque of central bolt = 310 Nm (224 ft. lbs.).



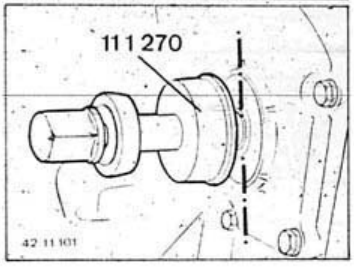
Removing Lower Timing Case Cover:

Unscrew screws.
Lift off timing case cover.

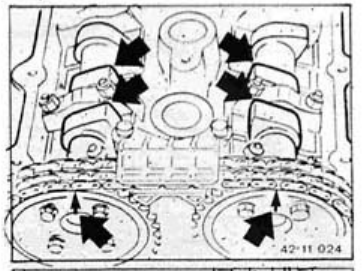
Note:
The timing case cover can also be removed without removal of the water pump.



Installation:
Replace gaskets.
Check dowel sleeves.

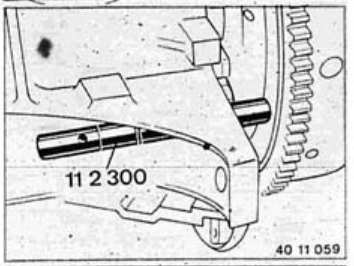


Installation:
Press in new radial oil seal flush with pressure ring from Special Tool 11 1 270 together with the central bolt and washer, with the timing case cover mounted.



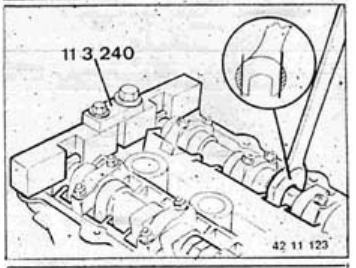
Removing Timing Chain and Guides:

Turn engine in direction of rotation until the peaks of intake and exhaust cams for cylinder no. 1 face each other. Arrows on sprockets face up.



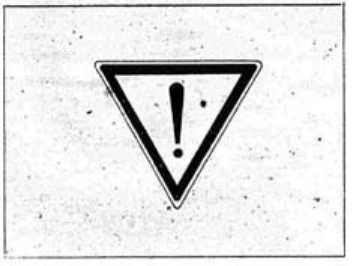
Installation:
Hold crankshaft in TDC position with Special Tool 11 2 300.

Caution!
Remove special tool before operating the engine.

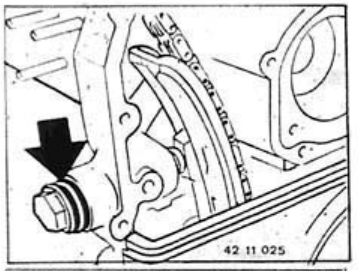


Installation:
Align and hold camshaft with Special Tool 11 3 240.
Camshafts can be turned on the hexagon with a 27 mm wrench.

Important!
Don't damage the bearing bar.
If applicable, grind off sides of fork wrench as shown.



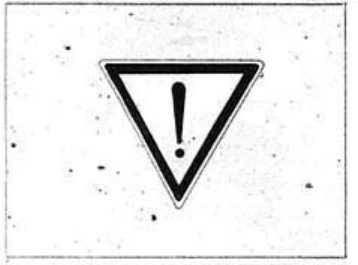
Important!
If the camshaft position has to be corrected so much to have valves for cylinders 1 and 4 move, turn crankshaft about 90° from TDC in engine's direction of rotation first and then turn back again only after turning the camshaft. This prevents contact between valves and pistons.
Install and unlock the chain tensioner after assembling. Press chain tensioner against the timing chain.
Recheck the camshaft adjustment.



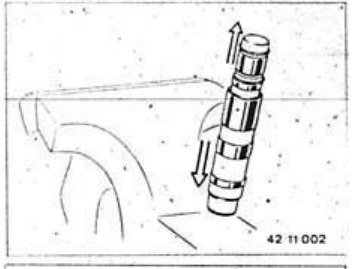
Remove chain tensioner.

Installation:
Tightening torque*.

Caution!
Chain tensioner is without oil as a new part or after disassembling.
To guarantee correct funtioning engine operated initially must be run at 3500 rpm approx. 20 seconds.

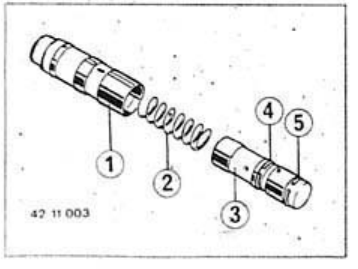


Installation – Important!
The hydraulic plunger of the chain tensioner must be adjusted to the basic position (transporting position of new chain tensioners) prior to installation or each time after loosening the plug.
Reason:
The hydraulic plunger is locked after running out and can no longer be pressed back.
This could cause lack of spring effect and breaking of chain and tensioner.

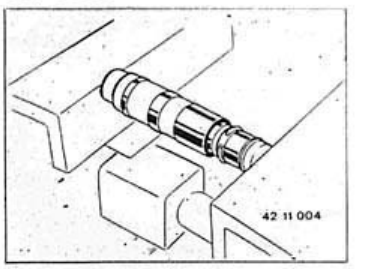


Installation:
Adjusting Hydraulic Plunger to Installed Basic Position:

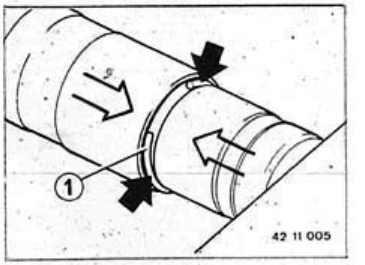
Knock on chain tensioner with the outer sleeve on a hard surface (vise anvil).
This causes the piston to snap out of the arrest.



Installation:
Arrangement of Parts
(1) = Sleeve
(2) = Spring
(3) = Hydraulic piston
(4) = Circlip
(5) = Circlip

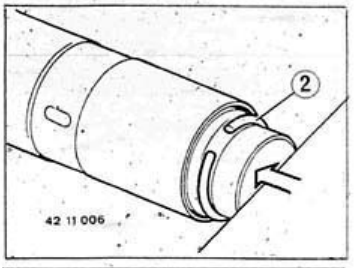


Installation:
Compress and clamp chain tensioner in a vise (fitted with soft jaws).

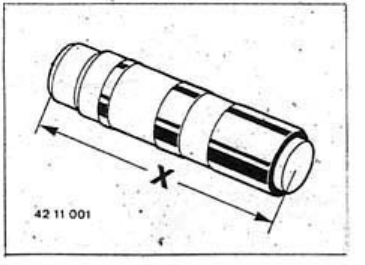


Installation:
Compress chain tensioner.

Important!
Insert circlip (1) in slip bevel of the sleeve.

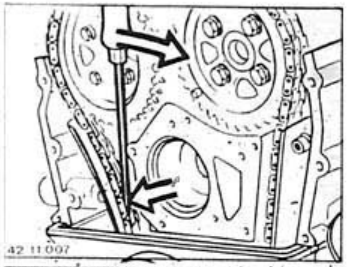


Installation:
Compress chain tensioner further until circlip (2) is heard to engage.
Loosen vise.
The chain tensioner must remain in transporting position.

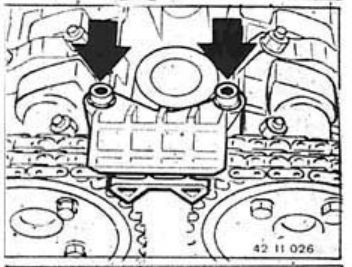


Installation:
The hydraulic piston will run out again, if the "catch point" was exceeded or not reached.
The chain tensioner must then be disassembled again and the procedures repeated.

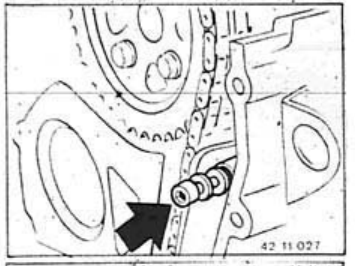
X = 68.5 mm (2.697").



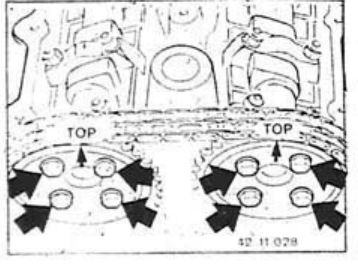
Installation:
Install chain tensioner.
Press the chain tensioning rail against the hydraulic piston briefly until the tensioning element is released.



Unscrew upper chain guide.



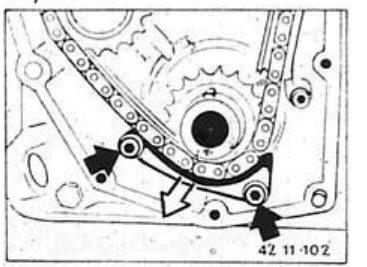
Unscrew top bolt on right chain guide.



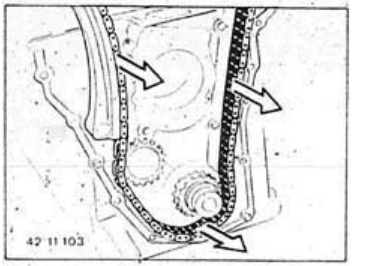
Unscrew chain sprockets.

Installation:
Arrwos on chain sprockets face up.
Tightening torque*.

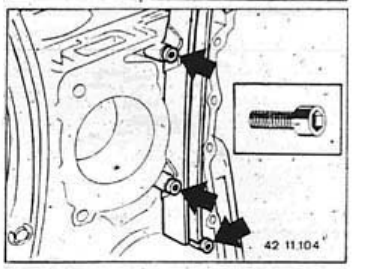
*** See Specifications**



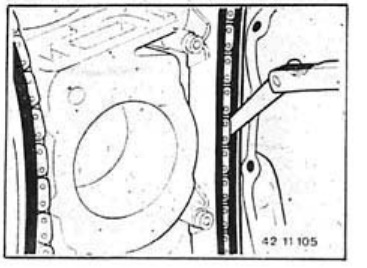
Unscrew lower guide.



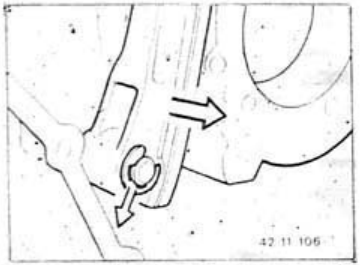
Lift out chain.



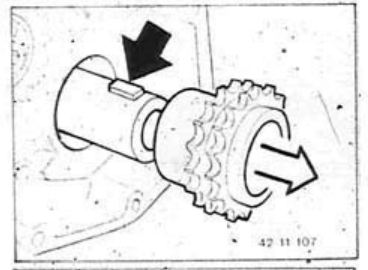
Remove chain guide.



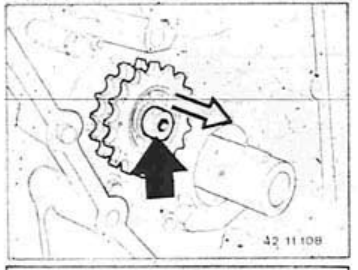
Installation:
Align and bolt down chain guides only after installation of the cylinder head and entire chain system.



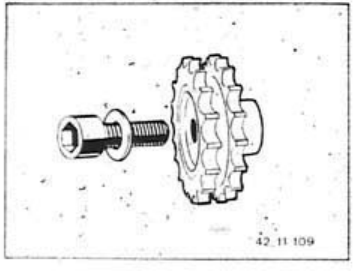
If applicable, remove tensioning rail.



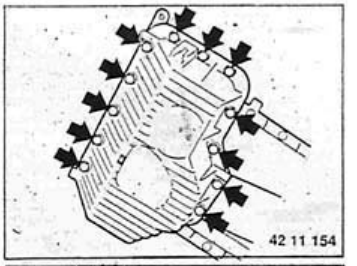
Pull sprocket off of crankshaft.
Lift out woodruff key.



If applicable, remove reversing roller.



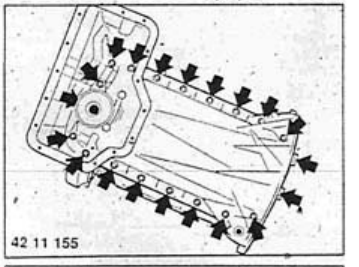
Note:
The reversing roller can only be replaced complete with bearings.



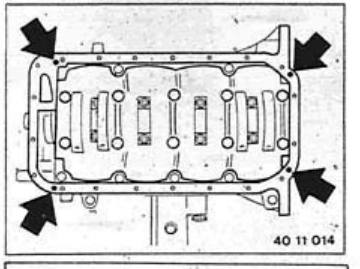
<u>Lowering Oil Pan:</u>

Unscrew bolts and take off lower oil pan section.

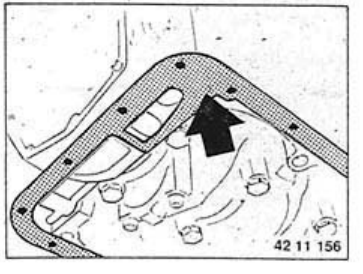
Installation:
Replace gasket.
Tightening torque = 9 Nm (6.5 ft. lbs.).



Unscrew bolts and lower oil pan up to the front axle carrier.

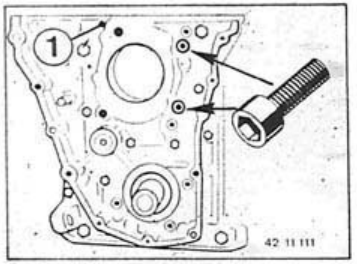


Installation:
Replace gasket.
Fill in joints between the front timing case and rear end cover with a black permanently elastic sealing compound, 3 Bond 1207B**.
Tightening torque = 9 Nm (6.5 ft. lbs.).



Installation:
Don't install the gasket inversed.

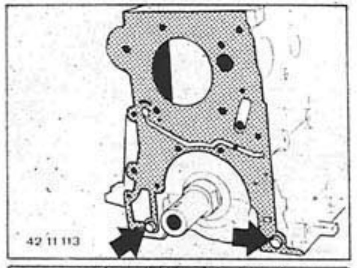
** Source of Supply: HWB



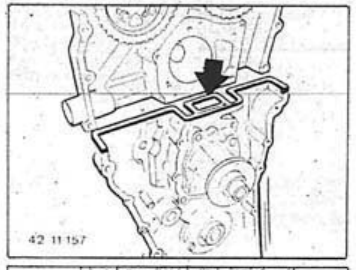
Removing Timing Case with Oil Pump:

Unscrew all bolts.
Lift off timing case.

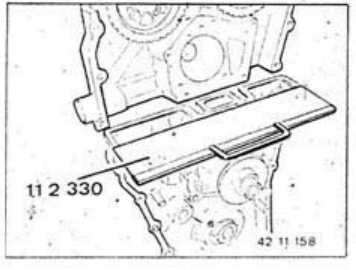
Installation:
Check arrangement of socket head bolts.
Top left bore (1) is not used.
Tighten all bolts uniformly.
Tightening torque*.



Installation:
Replace gasket.
Check dowel sleeves.

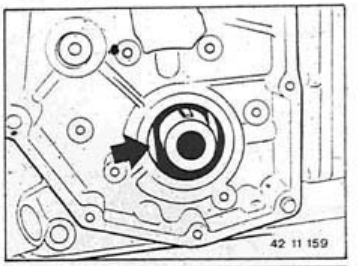


Installation:
Place rubber seal on timing case.

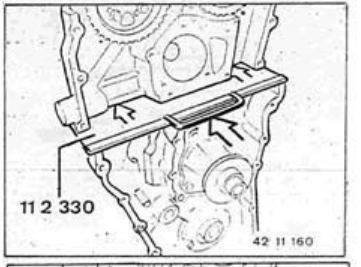


Installation:
Coat top surface of gasket and both sides of Special Tool 11 2 330 with grease.

*** See Specifications**

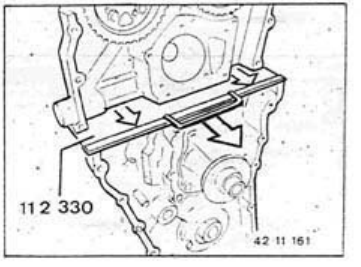


Installation:
Align oil pump with crankshaft.



Installation:
Place Special Tool 11 2 330 on the rubber seal and insert timing case together with the special tool.

Note:
Press up timing case until the oil pump slides on to the crankshaft.



Installation:
Install timing case bolts only finger tight and pull out the special tool carefully.
Recheck seating of the gasket.

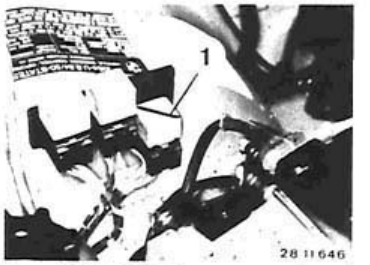
11 00 039 CHECKING COMPRESSION OF ALL CYLINDERS

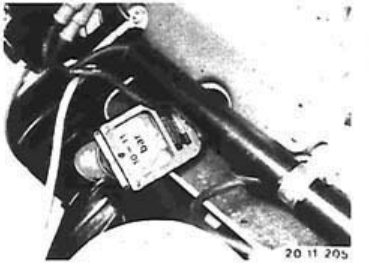
Distributor Engine:

Pull off relay (1) to avoid flooding from constant ejection of fuel injectors while operating the starter.
Pull off plug on ignition control unit.



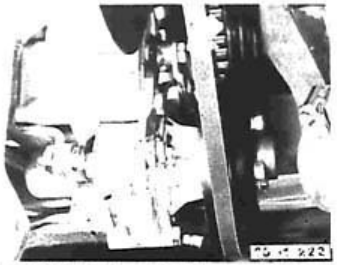
DME Engine:

Pull off master relay (1).



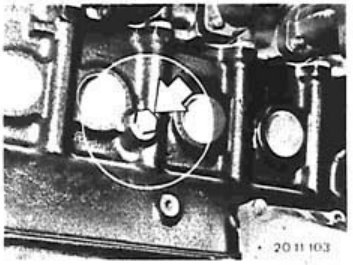
Unscrew spark plugs
Check compression*
Installation:
Tightening torque***

* See Specifications
*** See Specifications of Gr. 12

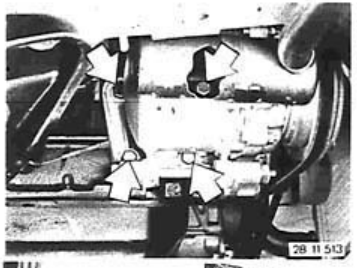


11 00 050 REMOVING AND INSTALLING ENGINE

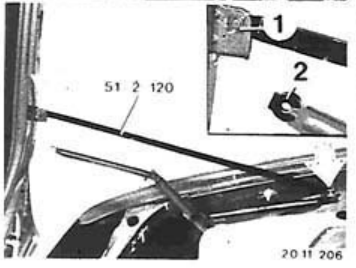
Remove transmission, see Gr. 23 or 24.
Cars with Power Steering:
Unscrew power steering pump.
Pressure hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



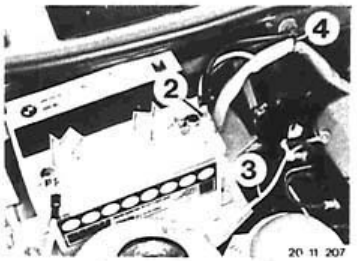
Unscrew plug and drain coolant.
Remove radiator 17 11 000.



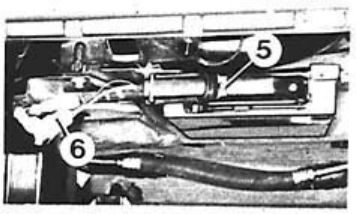
Cars with Air Conditioner:
Unscrew compressor.
Refrigerant hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



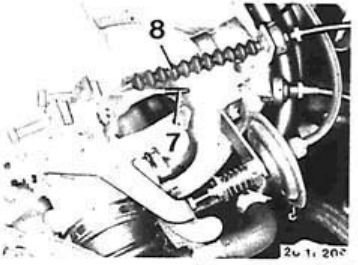
Disconnect prop and gas pressure props, and apply Special Tool 51 2 120.
Caution!
Use locks (1).
Installation:
Insert plastic part (2).



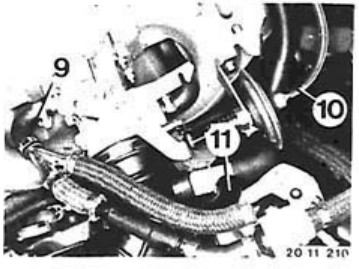
M 20 B 20 / B 23:
Disconnect negative and positive leads on battery.
Disconnect lead (2).
Unscrew ground wire (3).
Loosen wire strap (4).



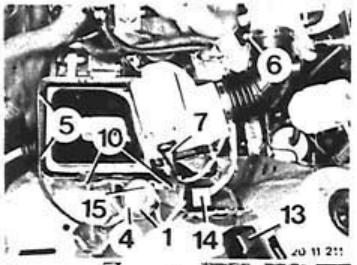
Remove trim panel in glove box.
Pull off plug (5) on control unit.
Disconnect wire (6).
Push out wire harness into engine compartment.



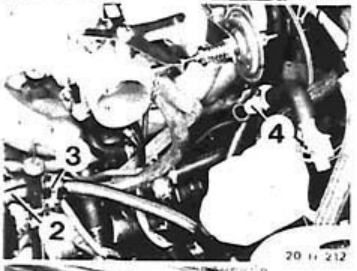
Detach throttle cable (7).
Cars with Cruise Control:
Detach cruise control cable (8).
Installation:
Adjust throttle cable, see 35 41 421.
Adjust cruise control cable, see Group 65.



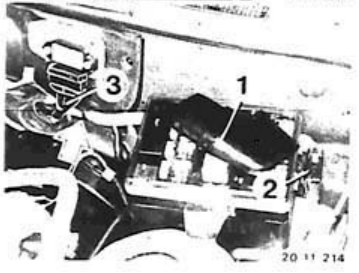
Detach hose (9).
Pull off hoses (10 and 11).



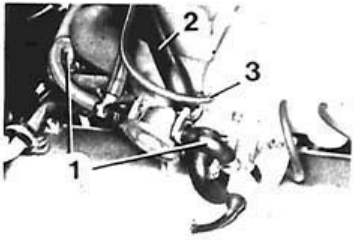
Pull off wire (4) on ignition coil.
Disconnect wires (1 and 15).
Lift off cap (13) and remove relay (14).
Pull off plug (7).
Unscrew wire harness on air cleaner housing.
Loosen clamp (6).
Lift wire (4) out of clamps (5).
Unscrew nuts (10) and remove air cleaner with air flow sensor.



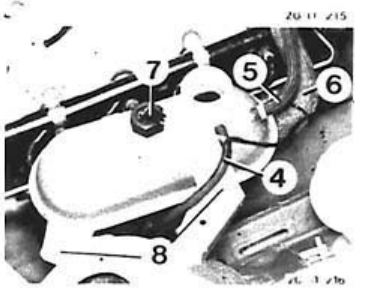
Detach fuel line (2) and holder (3)
Pull off hose (4) on air valve.



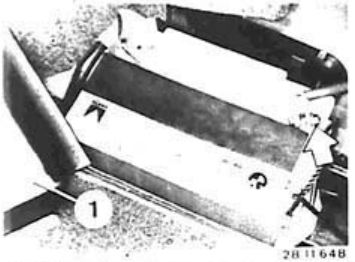
Lift off cap (1).
Lift out and disconnect plug (2).
Remove rubber guard on TCI control unit and pull off plug (3).
Loosen wire straps.



Detach fuel line (1).
Detach hoses (2 and 3).

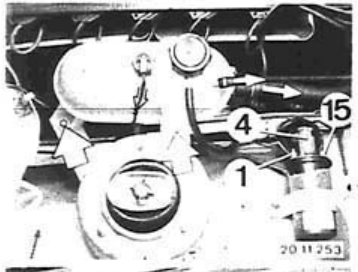


Detach hoses (4 ... 6).
Pull off plug (7).
Unscrew bolts (8) and remove expansion tank.
Installation:
Use new squeeze-hose clamp:

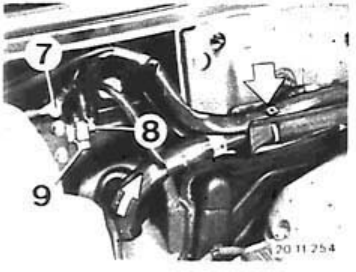


M 20 B 25:
Open trunk lid.
Unscrew cover (1).
Disconnect battery ground lead.

Remove trim panel in glove box.
Pull off plug (2) on control unit.
Disconnect plug (3).
Cars with Automatic Transmission:
Disconnect plug for car wire harness.

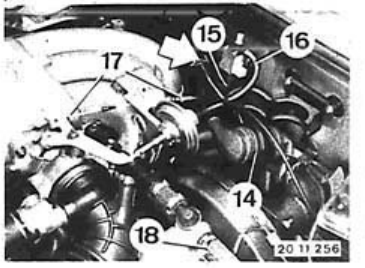


Remove coolant expansion tank.
Pull off wire (4) on ignition coil.
Disconnect wires (1 and 15).
Disconnect wire harness,
Installation:
Use a new squeeze-hose clamp.

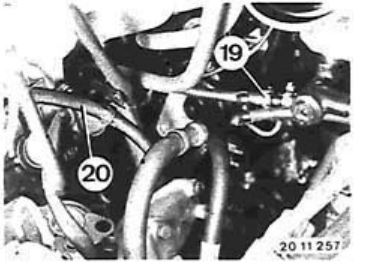


Disconnect wires (7 and 8).
Unscrew positive pole (9).
Loosen wire straps and pull out wire harness into the engine compartment.
Installation:
7 = Engine electrical system
8 = Car electrical system

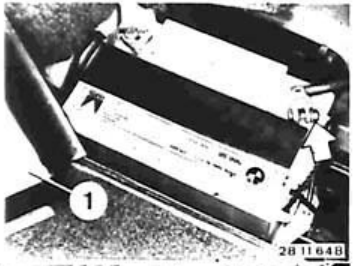
Lift out relay (10).
Pull off plug (11).
Loosen clamp (12).
Disconnect wire harness.
Unscrew nuts (13) and remove air cleaner with air flow sensor.



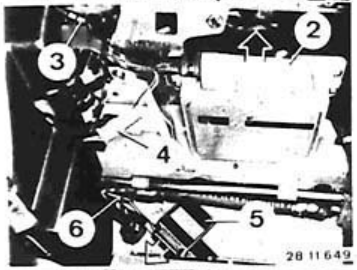
Lift out and disconnect plug (14).
Disconnect wire harness.
Pull off vacuum hoses (15 and 16).
Disconnect throttle cable (17).
Cars with Cruise Control:
Disconnect cruise control cable.
Pull off vacuum hose (18).
Installation:
Adjust throttle cable – see 35 41 421.
Adjust cruise control cable – see Group 65.
Use a new squeeze-hose clamp.
Screw-on cap (14) locks in final position.



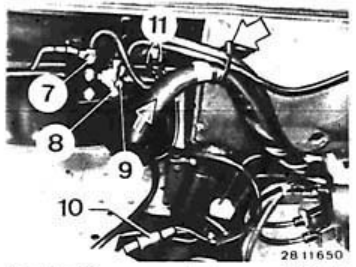
Disconnect fuel lines (19 and 20).



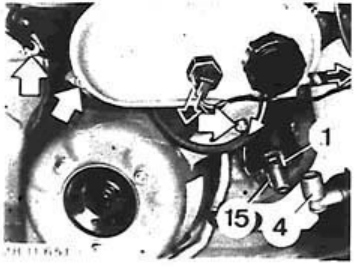
M 20 B 27:
Open trunk lid.
Unscrew cover (1).
Disconnect battery ground lead.



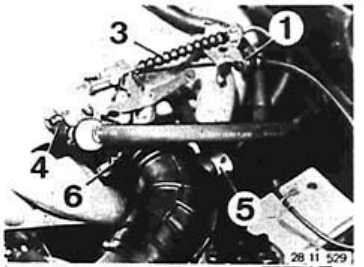
Remove trim panel in glove box.
Pull off plug (2) on control unit.
Disconnect plugs (3 and 4).
Unscrew idle control unit (5) and pull off plug.
Cars with Automatic Transmission:
Disconnect plug (6) for car wire harness.



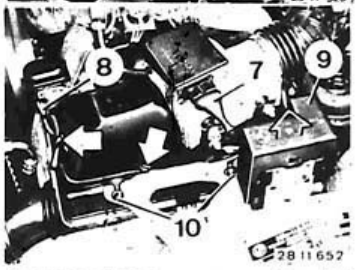
Disconnect wires (7 ... 9).
Lift out and disconnect oxygen sensor plug (10).
Pull off plug (11) on temperature sensor.
Loosen wire straps and pull out wire harness into engine compartment.
Installation:
7 = Engine electrical system
9 = Car electrical system



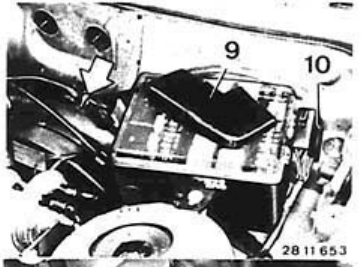
Remove coolant expansion tank.
Pull off wire (4) on ignition coil.
Disconnect wires (1 and 15).
Disconnect wire harness.
Installation:
Use new squeeze-hose clamps.



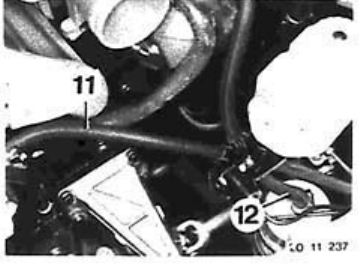
Disconnect throttle cable (1).
Cars with Cruise Control:
Disconnect cruise control cable (3).
Pull off vacuum hose (4) and hose (5).
Loosen clamp (6).
Installation:
Adjust throttle cable, see 35 41 421.
Adjust cruise control cable, see Group 65.



Pull off plugs (7 and 8).
Lift out relay (9).
Disconnect wire harness.
Unscrew nuts (10) and remove air cleaner with air flow sensor.



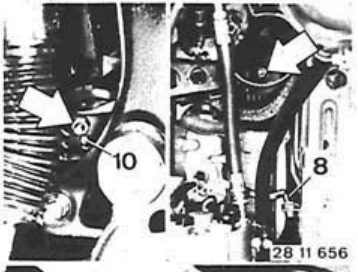
Pull off cap (9) and disconnect plug (10).
Disconnect wire harness.



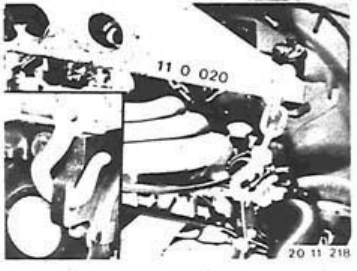
Disconnect fuel lines (11 and 12).

All Models:

Detach water hoses for heater.

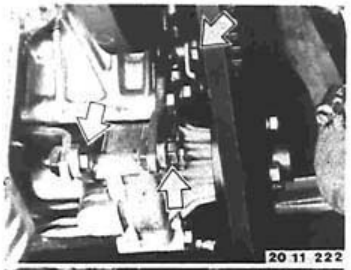


Unscrew ground strap (8) and both engine mounts.
Installation:
Guide mandrel (10) into bore of axle carrier.
Tightening torque .



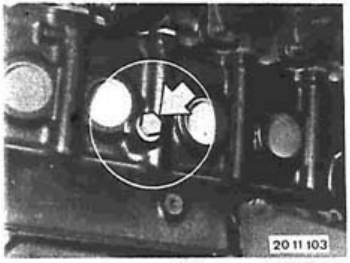
Attach Special Tool 11 0 020 on front and rear ends of engine, and lift out engine.
Installation:
Adjust ignition timing 12 11 004.
Adjust engine idle speed / CO 13 00 054.

* See Specifications

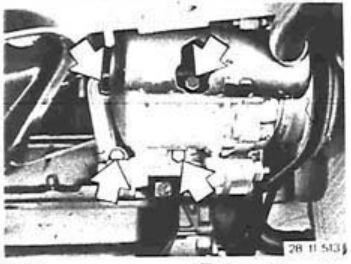


11 00 050 REMOVING AND INSTALLING ENGINE

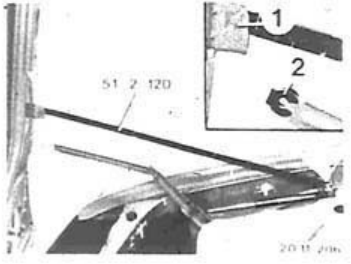
Since 1988 Models:
Disconnect battery ground lead.
Remove transmission - see Gr. 23/24.
Cars with Power Steering:
Unscrew power steering pump.
Hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



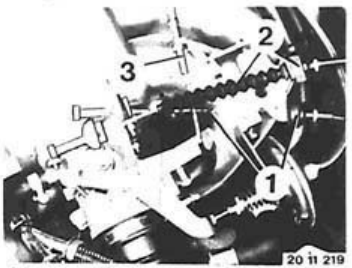
Unscrew plug and drain coolant.
Remove radiator - see 17 11 000.
Remove fan - see 11 52 000.



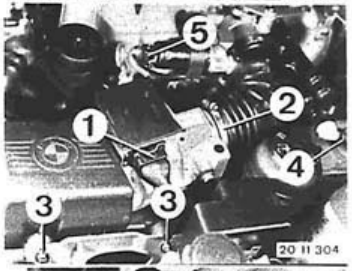
Cars with Air Conditioner:
Unscrew compressor.
Hoses remain connected on compressor.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



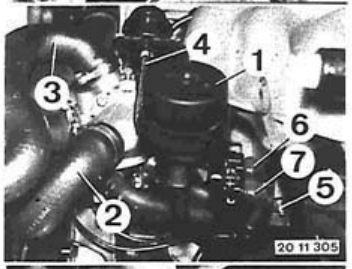
Disconnect support and gas pressure prop, and prop engine hood with Special Tool 51 2 120.
Caution!
Use retainer (1).
Installation:
Insert plastic part (2).



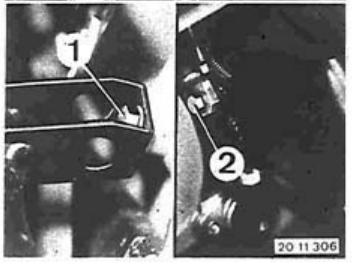
Disconnect throttle cable (1).
Cars with Cruise Control:
Disconnect cruise control cable (2).
Cars with Automatic Transmission:
Disconnect throttle cable (3).
Installation:
Adjust throttle cable - see Gr. 35.
Adjust cruise control cable - see Gr. 65.
Adjust throttle cable - see Gr. 24.



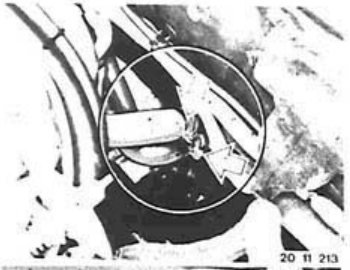
Pull off plug (1).
Loosen clamp (2).
Unscrew nuts (3) and lift out air cleaner with air flow sensor.
Pull off hose (4).
Pull off plug (5).



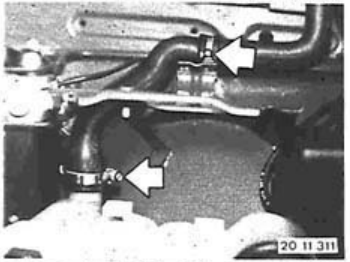
Disconnect diagnosis plug (1).
Disconnect hoses (2 and 3).
Unscrew fuel pipe (4).
Loosen holder (5).
Loosen fuel hose clamp.
Disconnect plugs (6 and 7).
Unscrew holder for oil dipstick guide tube.



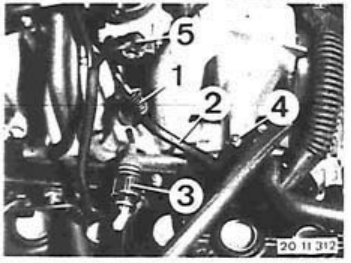
Unscrew bolts (1 and 2) for water pipe and take off water pipe.



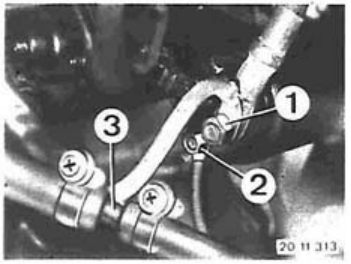
Disconnect water hoses for heater.



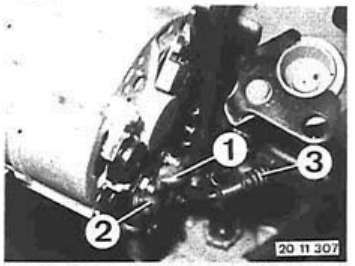
Disconnect coolant hose.



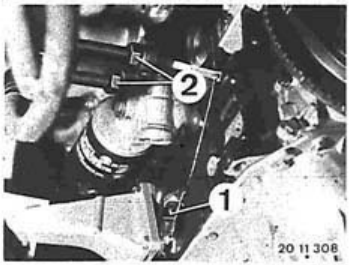
Pull off plug (1).
Pull off fuel hose (2).
Pull off plug (3).
Pull off mounting bolt (4).
Pull off plug (5).



Disconnect electric leads (1 and 2) on starter and lift out starter.
Disconnect fuel pipe (3).

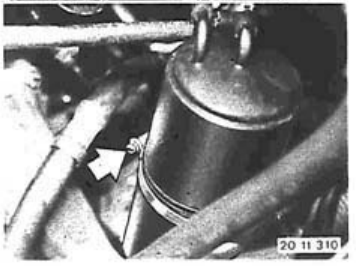


Pull off rubber caps (1 and 2) and unscrew electric leads on alternator.
Disconnect plug (3).



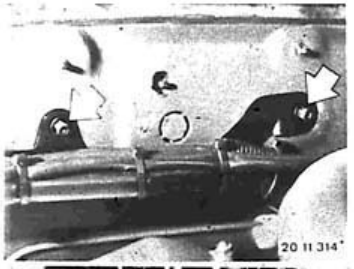
Pull off ignition lead on ignition coil.
Pull off plug (1) on oil pressure switch.
Loosen wire clip underneath distributor and pull out electric leads to left side of engine.
Disconnect pipes (2) for oil cooler.
Installation:
Check gaskets, replacing if necessary.
Tightening torque .

Take off cover on relay box.
Lift out relay with socket and place aside on engine together with wire harness.

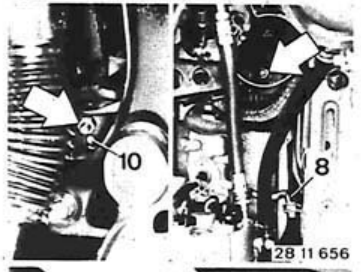


Loosen clamp and remove carbon canister.
Place electric lead connector aside past the oil dipstick guide tube.

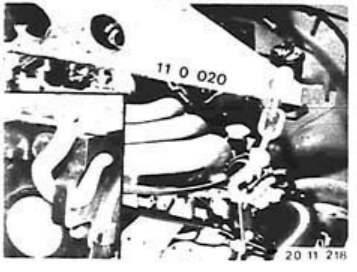
* See Specifications



Unscrew bolts.

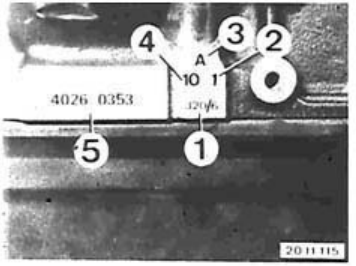


Unscrew ground strap (8) and both engine mounts.
Installation:
Insert guide (10) into bore in axle carrier.
Tightening torque*.



Attach Special Tool 11 0 020 on front and rear ends of engine.
Lift out engine.

* See Specifications



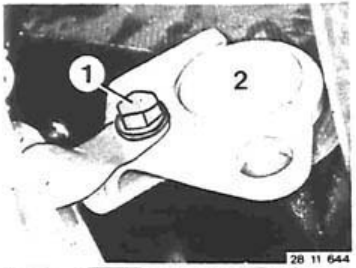
11 00 091 INSTALLING EXCHANGE ENGINE

Remove engine 11 00 050.
Exchange Engine Identification on Crankcase:
1 = Type designation/displacement****
2 = Manufacturing year (1981)
3 = "A" for exchange; "N" for new
4 = Manufacturing month
Stamp engine number (5).

Drive in supplied oil dipstick guide tube (see 11 43 101).
Transfer parts from old to new engine.
Add engine oil***
Important!
Remove pilot bearing in crankshaft of cars with an automatic transmission – see 11 21 571.

Install engine.
Adjust ignition timing 12 11 004.
Adjust engine idle speed / CO – 13 00 054.

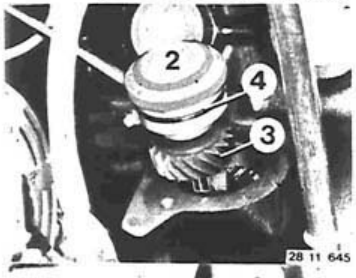
* See Specifications
*** See Service Information of Group 00
**** See BMW Technik and Service Information of Group 11



11 11 160 REPLACING BEARING FOR OIL PUMP DRIVE SHAFT

Remove oil pump 11 41 000.

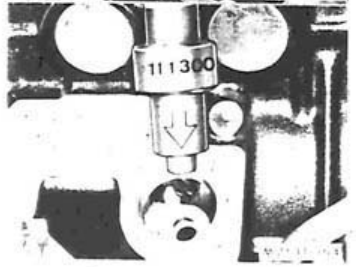
DME Engine:
Unscrew bolt (1) and take off cap (2).



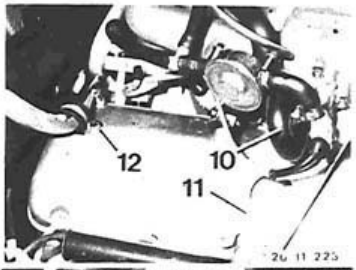
Remove gear (3).
Installation:
Open end of gear shaft faces down.
Check seal (4), replacing if necessary.

M 20 B 20 / B 23:
Remove distributor, see Group 12.

All Models:
Drive out needle bearing from bottom to top with Special Tool 11 1 310.

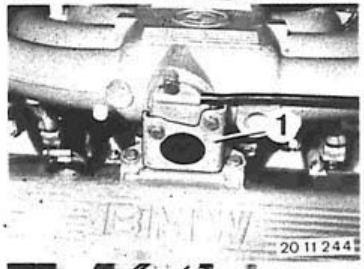


Installation:
Lubricate needle bearing with grease.
Drive in needle bearing against stop with Special Tool 11 1 300.

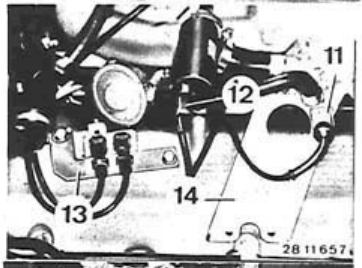


11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

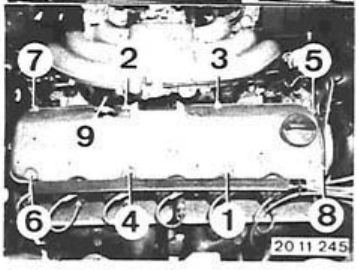
M 20 B 20 / B 23:
Pull off hose (10).
Unscrew support (11).
Unscrew clamp (12).



M 20 B 25:
Unscrew support (1).

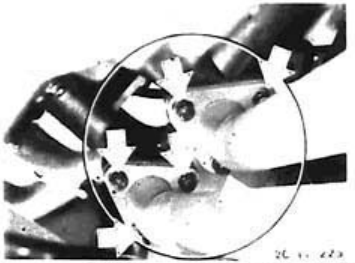


M 20 B 27:
Pull off plugs (11 and 12).
Unscrew holder (13).
Unscrew support (14).



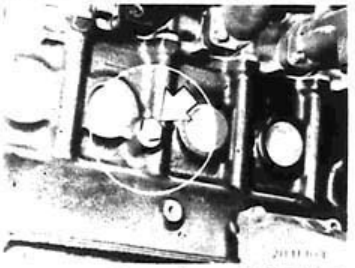
All Models:
Disconnect hose (9).
Unscrew nuts (1 ... 8) and take off cover.
Installation:
Check gasket, replacing if necessary.
Screw on ground strap with nut (6).
Tighten nuts in order of 1 through 8.
Tightening torque*.

* See Specifications

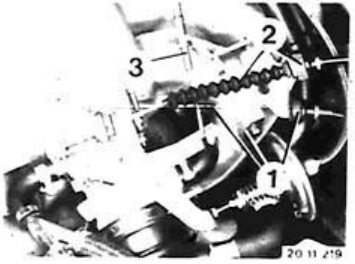


11 12 100 REMOVING AND INSTALLING CYLINDER HEAD

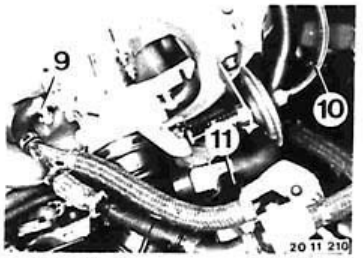
Unscrew exhaust pipes on exhaust manifolds and pipe clamp on transmission.
Installation:
Check gaskets, replacing if necessary.
Coat studs with copper paste "CRC"***
Replace self-locking nuts.
Tightening torque*



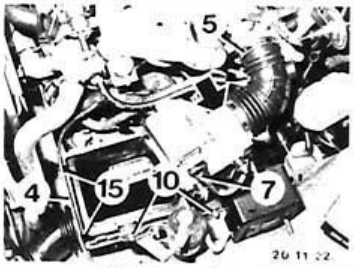
Unscrew plug and drain coolant.
Disconnect battery ground lead.
Installation:
Fill cooling system with coolant*** and bleed 17 00 039.
Replace engine oil***



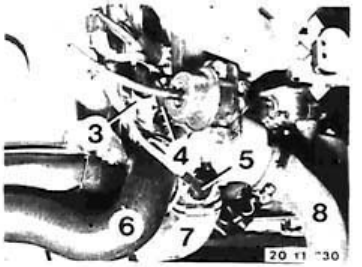
Disconnect throttle cable (1).
Cars with Cruise Control:
Disconnect cruise control cable (2).
Cars with Automatic Transmission:
Disconnect throttle cable (3).
Installation:
Adjust throttle cable, see 35 41 421.
Adjust cruise control cable, see Group 65.
Adjust throttle cable, see Group 24.



M 20 B 20 / B 23:
Detach hose (9).
Pull off hoses (10 and 11).

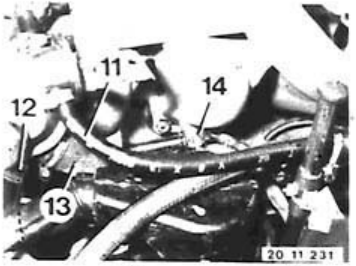


Loosen hose clamp (5).
Pull off plug (7).
Lift wire (4) out of clips (15).
Unscrew wire harness on air cleaner housing.
Unscrew nuts (10) and remove air cleaner with air flow sensor.

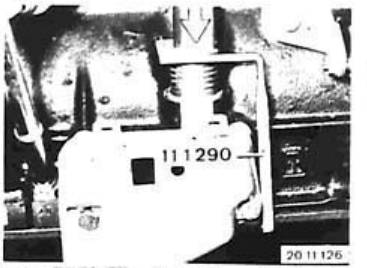


Detach diagnosis socket.
Pull off plugs (3 ... 5).
Detach hoses (6 ... 8).

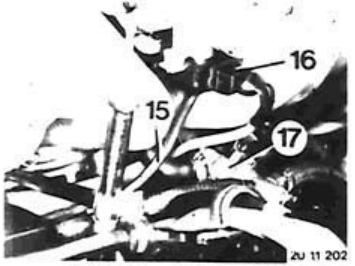
* See Specifications
** Source: HWB
*** See Service Information of Gr. 00



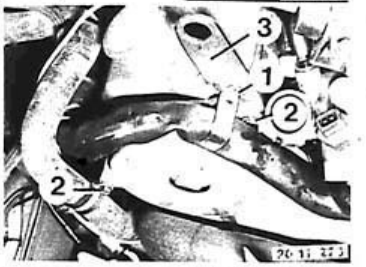
Pull off fuel line (11).
Disconnect water hose (12) for air valve and water hose (13) for heater.
Unscrew nut (14).



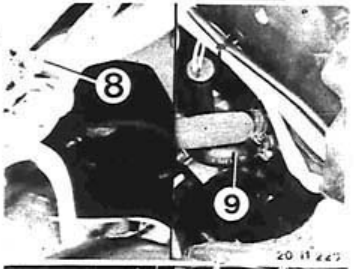
Press down vent tube and arrest with Special Tool 11 1 290.
Installation:
Check seal, replacing if necessary.
Check for correct fit of vent tube after removing Special Tool 11 1 290.



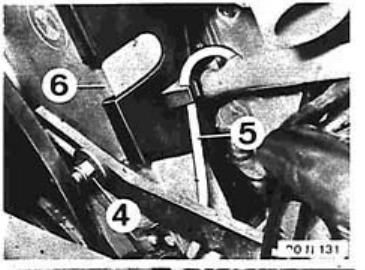
Pull off vacuum hose (15) for distributor and plug (16).
Unscrew holder for air valve (17) on intake manifold.



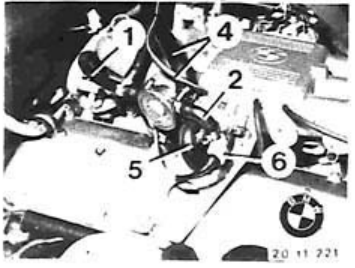
Pull off spark plug connectors.
Remove cylinder head cover 11 12 000.
Loosen clamp (1) and lay ignition leads aside.
Unscrew bolts (2) and remove suspension eye (3).



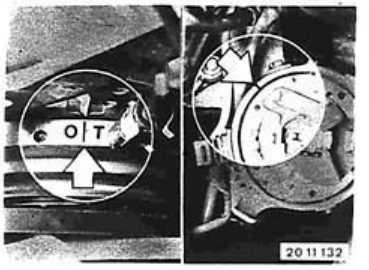
Unscrew holder (8).
Disconnect hose (9).
Pull off plugs on fuel injectors (1/2/3) and oil pressure switch.
Guide out wire harness underneath the intake manifold.



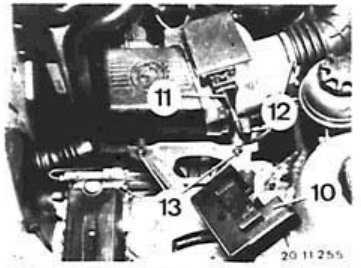
Unscrew nut (4).
Lift out TDC sensor (5).
Remove guard (6).
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



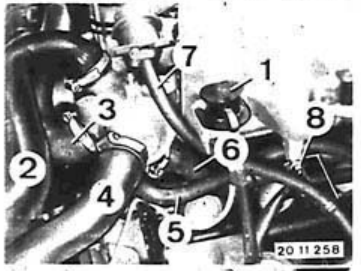
Disconnect fuel lines (1 and 2).
Disconnect air hoses (4 and 5).
Run out air hose (5) underneath intake manifold to the throttle bypass valve.
Pull off plug (6) and plugs on fuel injectors (4/5/6).



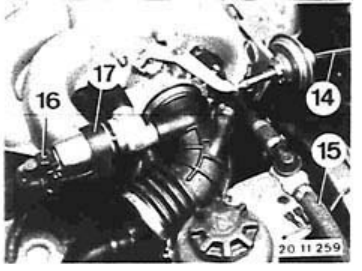
Set cylinder no. 1 to TDC = speed governor aligned with notch in distributor housing.
Caution!
Engine may only be cranked on the adapter after removing the spark plugs.



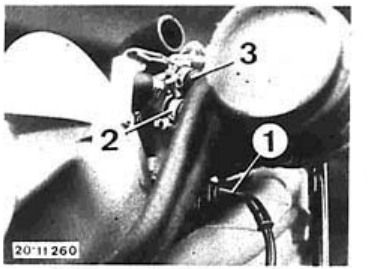
M 20 B 25:
Lift out relay (10).
Pull off plug (11).
Loosen clamp (12).
Disconnect wire harness.
Unscrew nuts (13) and remove air cleaner with air flow sensor.



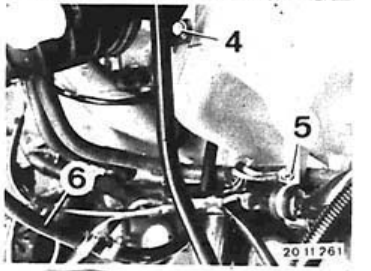
Remove diagnosis plug (1).
Disconnect water hoses (2 ... 6).
Pull off fuel line (7).
Unscrew holder (8).



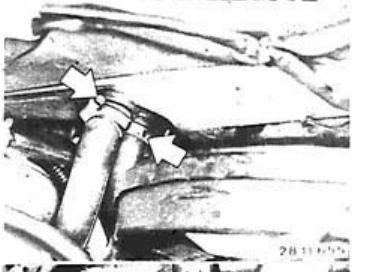
Pull off hose (15).
Pull off plug (16).
Remove idle positioner (17).
Cars with All Wheel Drive:
Pull off hose (14).



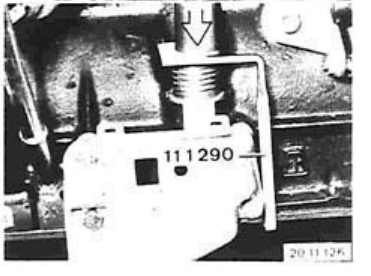
Pull off plug (1).
Disconnect hoses (2 and 3).



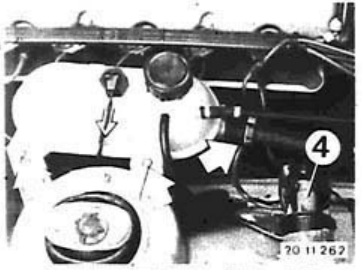
Unscrew oil test pipe (4).
Unscrew holder (5).
Disconnect fuel hose (6).



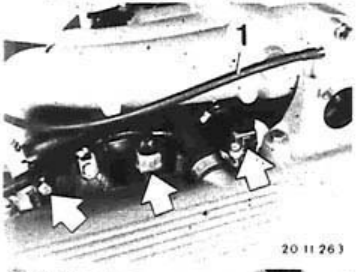
Disconnect water hoses for heater.



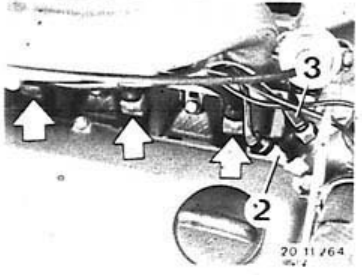
Press down vent tube and arrest with Special Tool 11 1 290.
Installation:
Check seal replacing if necessary.
Check for correct fit of vent tube after removing the Special Tool 11 1 290.



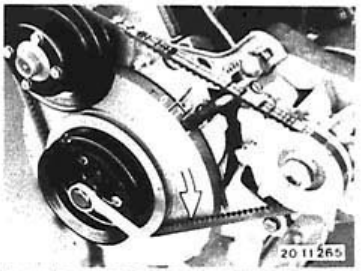
Pull off wire (4) on ignition coil.
Unscrew coolant expansion tank.



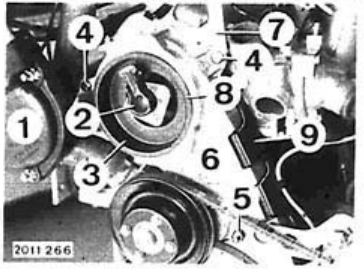
Pull off plugs on fuel injectors 4/5/6 and pull out wire harness.
Cars with All Wheel Drive:
Pull off hose (1).



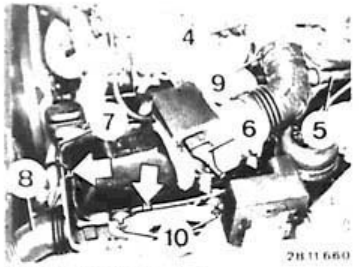
Pull off plugs (2 and 3).
Pull off wires on oil pressure switch.
Pull off plugs on fuel injectors 1/2/3.
Disconnect wire harness and pull through to left side.



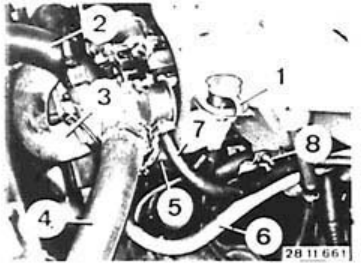
Remove cylinder head cover – 11 12 000.
Turn crankshaft until cylinder no. 1 is set to TDC and valves in cylinder no. 6 overlap.



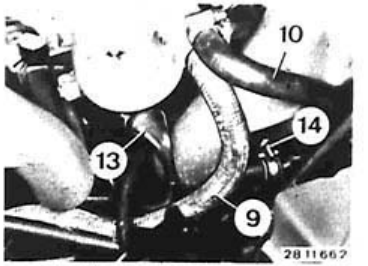
Unscrew distributor cap (1).
Unscrew distributor arm (2).
Remove cover (3).
Unscrew bolts (4).
Unscrew nut (5).
Remove cover (6).
Installation:
Screw on holder (7).
Check rubber ring (8).
Insert rubber cover (9).



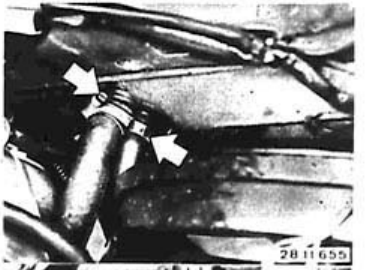
M 20 B 27:
Pull off vacuum hose (4) and hose (5).
Pull off plugs (6 and 7) and disconnect wire harness.
Pull out hose (8) and loosen hose clamp (9).
Unscrew nuts (10) and remove air cleaner with air flow sensor.



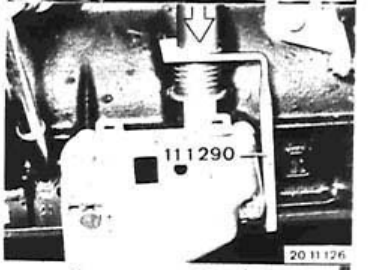
Remove diagnosis plug (1).
Disconnect water hoses (2 ... 6).
Pull off fuel line (7).
Unscrew holder (8).



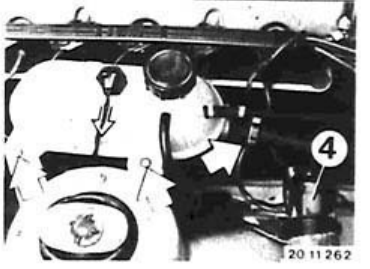
Disconnect hoses (9 10).
Pull off plug (13).
Unscrew holder (14).



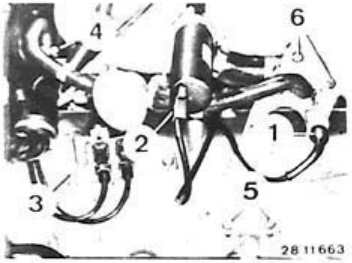
Disconnect water hoses for heater.



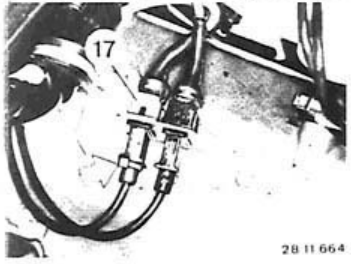
Press down vent tube and arrest with Special Tool 11 1 290.
Installation:
Check seal, replacing if necessary.
Check for correct fit of vent tube after removing the Special Tool 11 1 290.



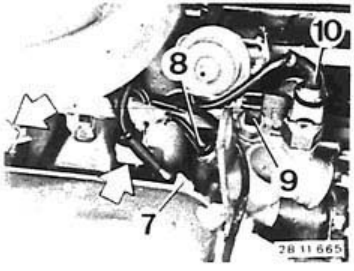
Pull off wire (4) on ignition coil.
Unscrew coolant expansion tank.



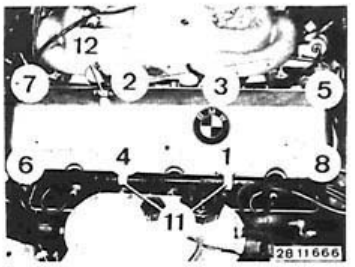
Pull off plugs (1 and 2).
Unscrew holder (3).
Pull off fuel line (4).
Unscrew support (5) with flange (6).
Pull off plugs on fuel injectors (4/5/6).
Installation:
Check gasket, replacing if necessary.



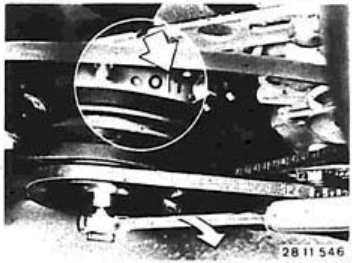
Installation:
Connect DME plugs for reference mark and speed sensor signals in such a manner, that gray plug (17) is connected with a plug marked with a ring.



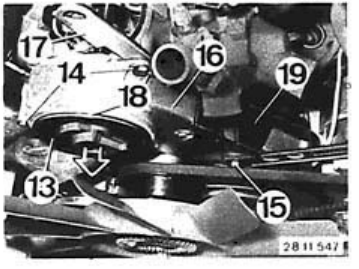
Pull off plugs on fuel injectors (1/2/3) and plugs (7 ... 10).
Pull off wire on oil pressure switch.
Disconnect wire harness and pull out to the left side.



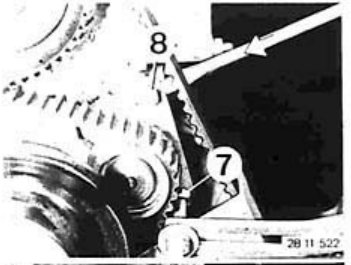
Pull off spark plug connectors.
Disconnect ignition lead tube (11).
Disconnect vent hose (12).
Unscrew nuts (1 ... 8) and take off cylinder head.
Installation:
Check gasket, replacing if necessary.
Tighten nuts in order of 1 through 8.



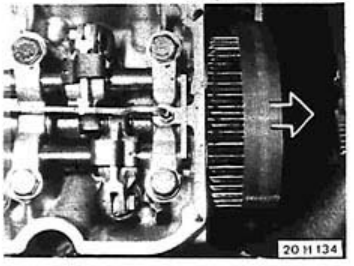
Turn crankshaft to set cylinder no. 1 to TDC = valves of cylinder no. 6 overlapping.
Take off distributor cap.



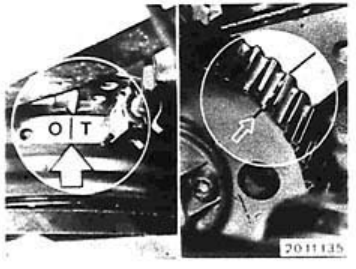
Take off distributor rotor.
Unscrew adapter (12).
Remove cover (13).
Unscrew screws (14).
Unscrew nut (15).
Remove cover (16).
Installation:
Screw on holder (17).
Check rubber ring (18).
Insert rubber cover (19).



All Models:
Loosen bolts (7 and 8).
Press in tensioning roller.
Tighten bolt (8).

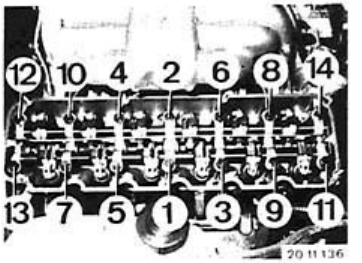


Take toothed drive belt off of camshaft sprocket.
Caution!
Never crank engine after removing belt.
Installation:
Always replace an used belt after loosening the tensioning roller, regardless of the mileage***
Replace toothed drive belt – see 11 31 110.

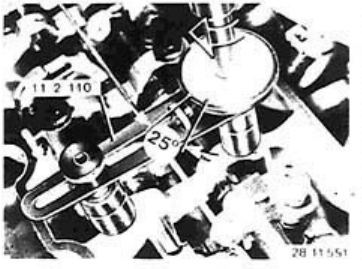


Installation:
Turn in camshaft prior to mounting the cylinder head in such a manner, that mark on camshaft sprocket points to mark on cylinder head.
Cylinder no. 1 is at TDC.
Also install toothed drive belt in this position.

*** See Service Information of Gr. 11

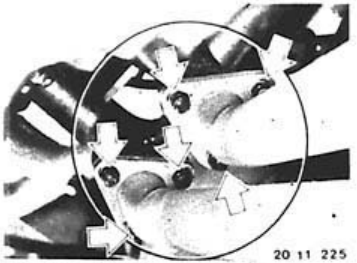


Unscrew bolts in order of 14 through 1 and take off cylinder head.
Installation:
Keep oil out of cavities, since otherwise bolts tightened with specified torque might not exert sufficient force on the cylinder head.
In addition, the crankcase could be cracked.
Clean cylinder head bolts.
Lubricate threads and bearing surfaces of bolt heads with oil lightly.
Replace cylinder head gasket see 11 12 101.



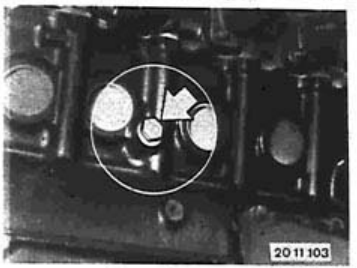
Tighten bolts in order of 1 through 14 in three steps.
Tightening torque*.
Adjust valve clearance – see 11 34 004.
Adjust ignition timing – see 12 11 004.
Adjust engine idle speed and CO level – see 13 00 054.
In the 3rd step (cylinder head cover removed again after running engine warm) tighten the cylinder head bolts to specified torque angle with Special Tool 11 2 110 regardless of the engine temperature.
Note:
Cylinder head does not have to be tightened after 1,000 km (600 miles).

* See Specifications

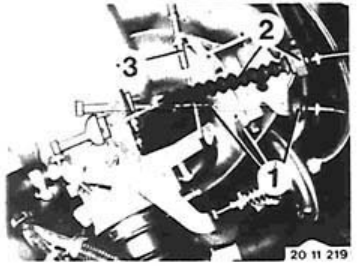


11 12 100 REMOVING AND INSTALLING CYLINDER HEAD

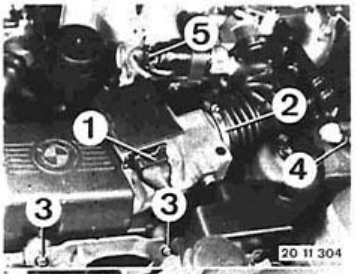
Since 1988 Models:
Disconnect battery ground lead.
Disconnect oxygen sensor plug.
Unscrew exhaust pipes on exhaust manifolds and holder on transmission.
Installation:
Check gaskets, replacing if necessary.
Coat studs with copper paste "CRC"**.
Replace self-locking nuts.
Tightening torque*.



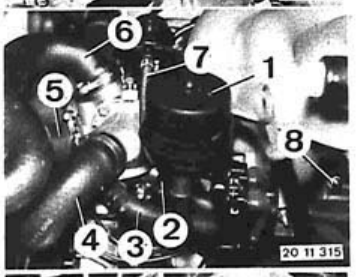
Unscrew plug and drain coolant.
Installation:
Pour in coolant*** and bleed cooling system – see 17 00 039.
Replace engine oil***.



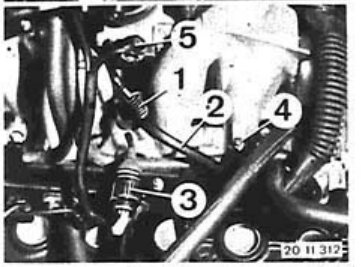
Disconnect accelerator cable (1).
Cars with Cruise Control:
Disconnect cruise control cable (2).
Cars with Automatic Transmission:
Disconnect throttle cable (3).
Installation:
Adjust accelerator cable – see Group 35.
Adjust cruise control cable – see Group 65.
Adjust throttle cable – see Group 24.



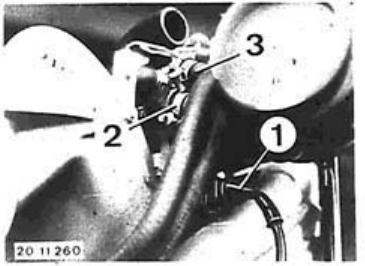
Pull off plug (1).
Loosen clamp (2).
Unscrew nuts (3) and lift out air cleaner with air flow sensor.
Pull off hose (4).
Pull off plug (5).



Disconnect diagnosis plug (1).
Disconnect hoses (2 ... 6).
Disconnect fuel hose (7).
Unscrew holder (8).

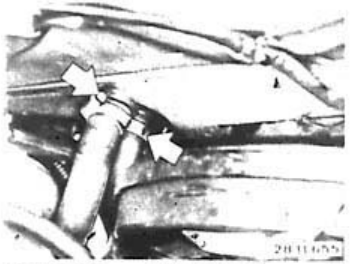


Pull off plug (1).
Pull off fuel hose (2).
Disconnect plug (3).
Unscrew bolt (4).

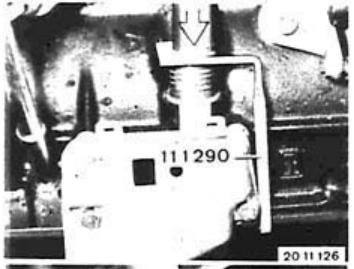


Pull off plug (1).
Disconnect hoses (2 and 3).

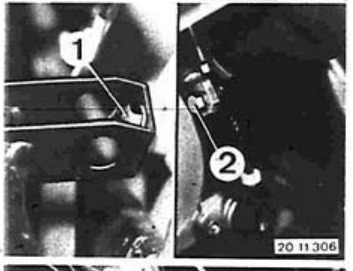
*. See Specifications
** Source of Supply: HWB
*** See Service Information of Gr. 00



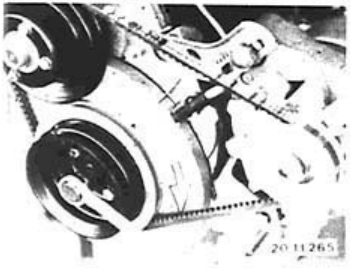
Disconnect water hoses for heater.



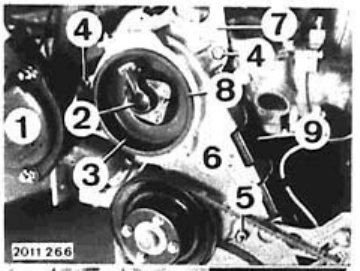
Press down on breather pipe and lock with Special Tool 11 1 290.
Installation:
Check seal, replacing if necessary.
Check for correct seating of breather pipe after removal of Special Tool 11 1 290.



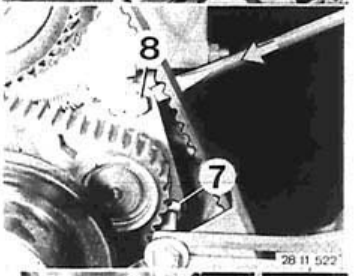
Pull off ignition leads on ignition coil.
Remove fan – see 11 52 000.
Unscrew water pipe mounting bolts (1 and 2) and take off water pipe.



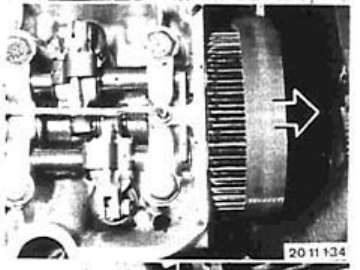
Remove cylinder head cover – see 11 12 000.
Set cylinder no. 1 to TDC by turning crankshaft (valves of cylinder no. 6 overlap).



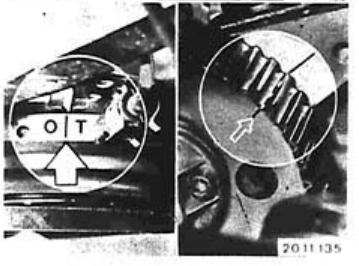
Unscrew distributor cap (1).
Unscrew distributor rotor (2).
Remove cover (3).
Unscrew bolts (4).
Unscrew nut (5).
Remove protective cover (6).
Take off clip underneath distributor and place electric leads in front of pulley.
Installation:
Screw on holder (7).
Check rubber ring (8).
Insert rubber cover (9).



Loosen bolts (7 and 8).
Press in tensioning roller.
Tighten bolt (8).

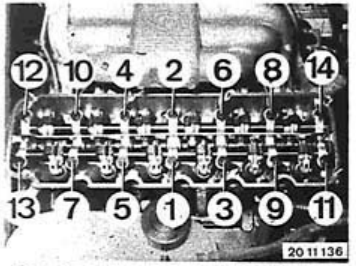


Take toothed drive belt off of camshaft sprocket.
Caution!
Never crank engine after removing belt.
Installation:
Always replace an used toothed drive belt after loosening, regardless of the mileage***.
Replace toothed drive belt - see 11 31 110.



Installation:
Turn in camshaft prior to mounting the cylinder head in such a manner, that mark on camshaft sprocket points to mark on cylinder head.
Cylinder no. 1 is in TDC.
Mount the toothed drive belt in this position.

*** See Service Information of Group 11



Unscrew bolts in order of 14 through 1 and take off cylinder head.

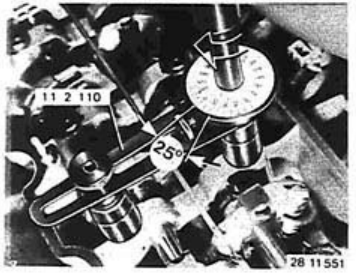
Installation:

Keep oil out of cavities, since otherwise bolts tightened with specified torque might not exert sufficient force on the cylinder head. In addition, the crankcase could be cracked.

Clean cylinder head bolts.

Lubricate threads and bearing surfaces of bolt heads with oil lightly.

Replace cylinder head gasket – see 11-12 101.



Tighten bolts in order of 1 through 14 in three steps.

Tightening torque*.

Adjust valve clearance – see 11 34 004.

Adjust ignition timing – see 12 11 004.

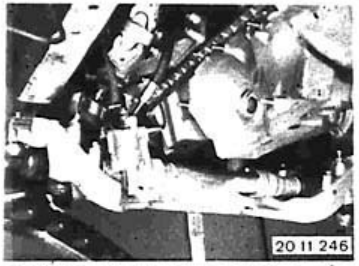
Adjust engine idle speed and CO level – see 13 00 054.

In 3rd step (cylinder head cover removed again after running engine warm) tighten cylinder head bolts to specified torque angle with Special Tool 11 2 110, regardless of the engine temperature.

Note:

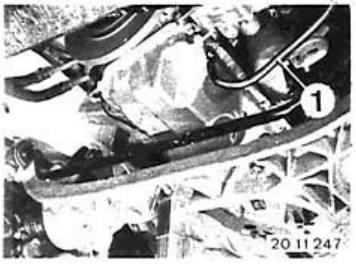
Cylinder head is not retightened after 1,000 km (600 miles).

* See Specifications

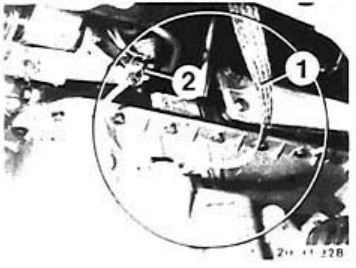


11 13 000 REMOVING AND INSTALLING OIL PAN

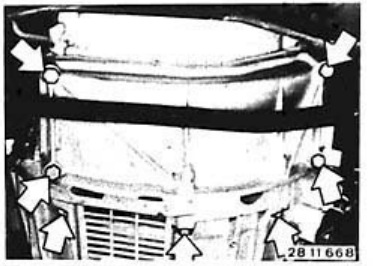
All Wheel Drive:
Lower front axle carrier and remove front axle final drive – see Group 31.



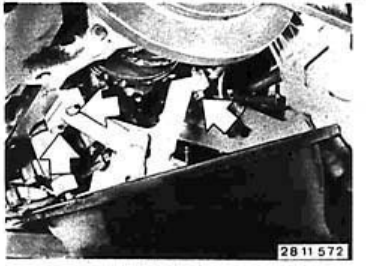
Disconnect ground wire (1).



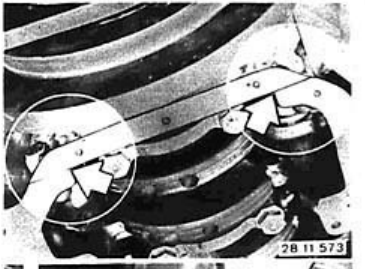
Rear wheel drive:
Unscrew steering gear on front axle carrier, see 32 11 . . ..
Disconnect ground wire (1).
Lift wire (2) out of holder and disconnect.



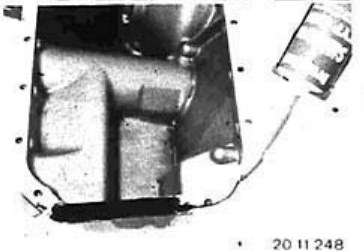
All models:
Unscrew reinforcement plate.
Drain oil.
Installation:
Add engine oil***.



Unscrew oil pan.
Detach pressure relief valve and oil pump.
Remove oil pan.
Installation:
Insert drive shaft for oil pump (see 11 41 000).
Replace gasket.

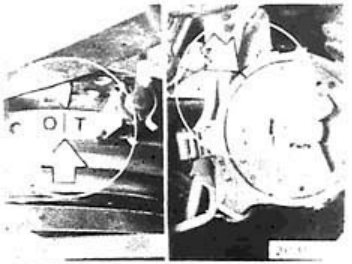


Installation:
Clean sealing surfaces.
Apply coat of brush-on universal sealing compound / Three Bond Silicon 1207** on joint surfaces of timing case cover and end cover.



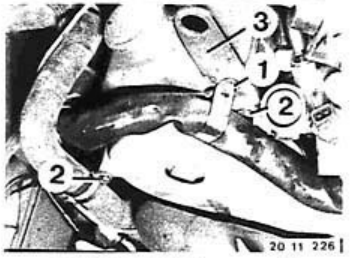
All Wheel Drive:
Oil pan is sealed with Three Bond Silicone 1207**.
Only apply a small amount of this sealing compound and spread it uniformly, to avoid having it get into the engine oil and plugging the oil filter screen.

** Source: HWB
*** See Service Information of Group 00

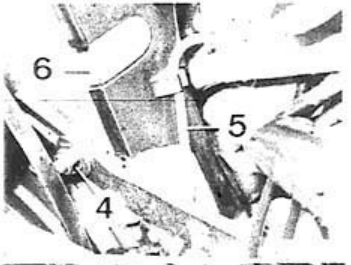


11 31 110 REPLACING TOOTHED DRIVE BELT

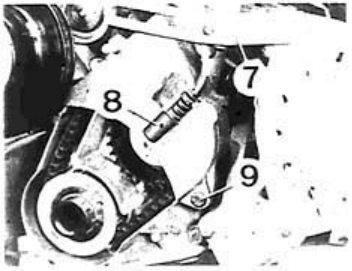
Important!
Always replace an used toothed drive belt, regardless of the mileage, each time the tensioning roller had been loosened***.
Distributor Engine:
Set cylinder no. 1 to TDC – speed governor aligned with notch in distributor housing.



Loosen clamp (1).
Remove bolt (2) and take off suspension eye (3).

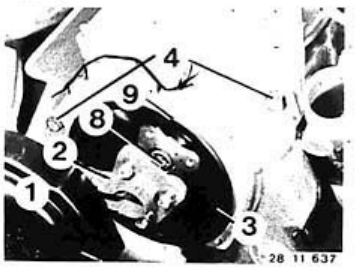


Unscrew nut (4).
Lift out TDC sender electric lead (5).
Remove protective cover (6).
Remove vibration damper – see 11 23 010.

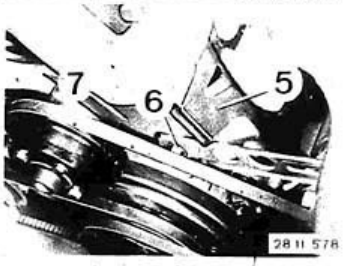


Two Piece Hub/Sprocket:
Remove hub for vibration damper – see 11 23 031.
Swing away clamping bar (7).
Lift out TDC sender (8).
Unscrew bolt (9) and take off protective cover.

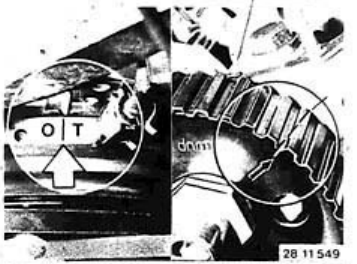
*** See Service Information of Gr. 11



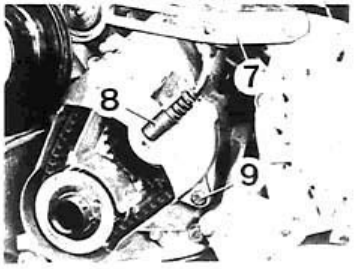
DME Engine:
Unscrew distributor cap (1).
Unscrew distributor rotor (2).
Older Version:
Unscrew adapter (8).
Remove cover (3).
Unscrew bolts (4).
Installation:
Check seal (9), replacing if necessary.
Tightening torque*.



Take off rubber guard (5).
Unscrew nut (6).
Remove protective cover (7).
Install adapter (8).

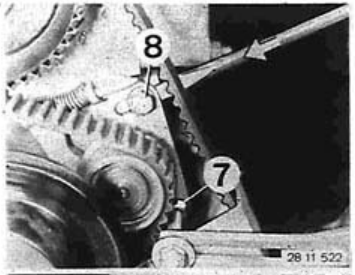


Set cylinder no. 1 to TDC by turning the crankshaft – arrow on camshaft sprocket points to mark on cylinder head.
Remove vibration damper – see 11 23 010.

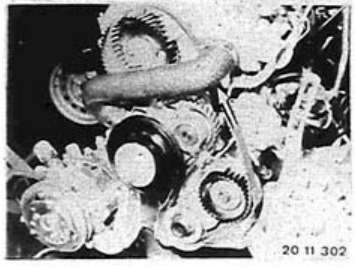


Two Piece Hub/Sprocket:
Remove hub for vibration damper – see 11 23 031.
Swing away clamping bar (7).
Lift out TDC sender (8).
Unscrew bolt (9) and take off protective cover.

* See Specifications

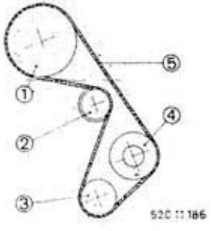


All:
Loosen bolts (7 and 8).
Press in tensioning roller.
Tighten bolt (8).
Take off toothed drive belt.

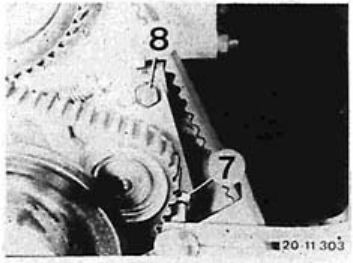


Installation:
There are different toothed belt versions.
1. Sprockets with Square Profile:
   A. Square profile with 111 teeth
   B. Square profile with 110 teeth ("Z 127") with modified spring and tensioning roller with code "Z 127".
2. Sprockets with Semi-round Profile:
   A. Semi-round profile with 128 teeth
   B. Semi-round profile with 127 teeth ("Z 127") and tensioning roller with code "Z 127".

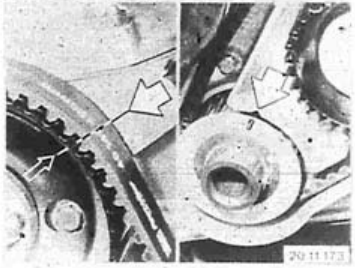
Versions A must be converted to B***.
Install toothed drive belt in opposite direction of engine's turning direction, starting on the crankshaft sprocket.



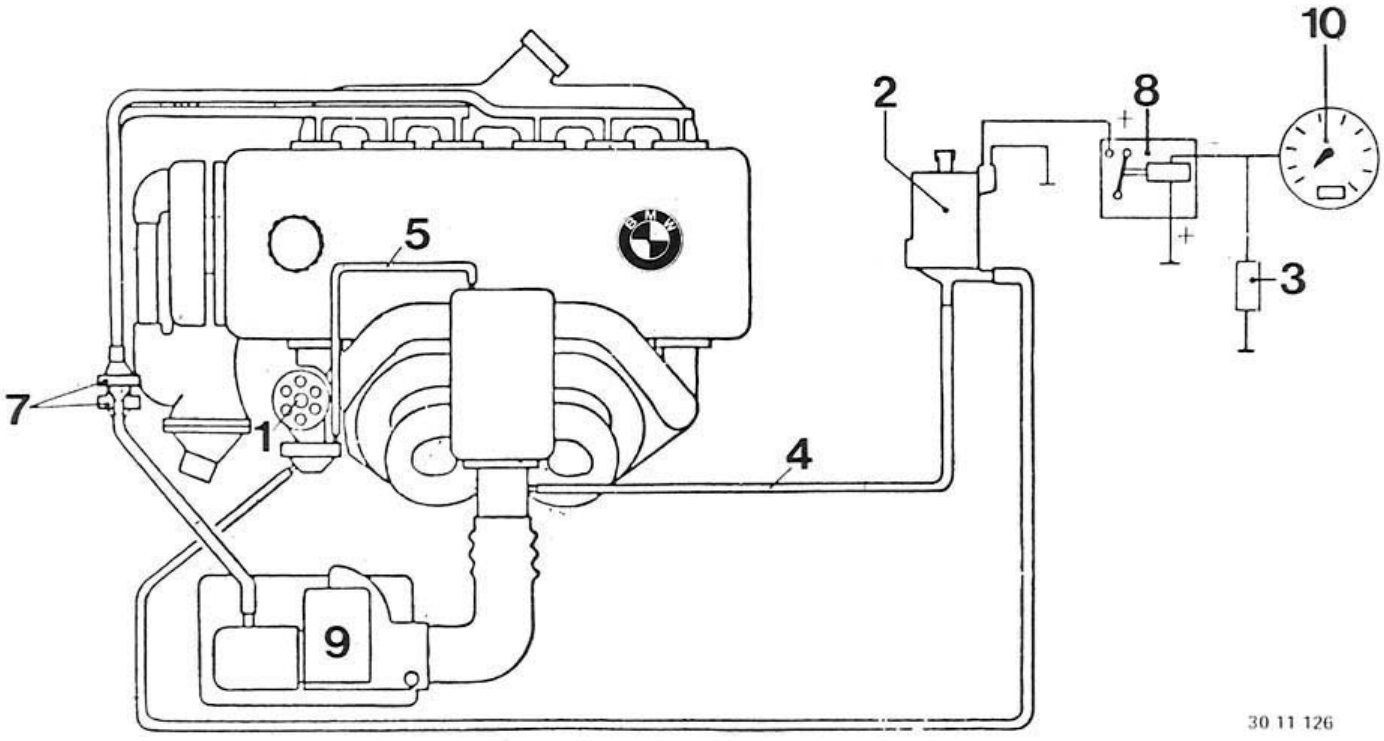
Toothed Drive Belt Assembly:
1 Camshaft sprocket
2 Tensioning roller
3 Crankshaft sprocket
4 Intermediate shaft sprocket
5 Toothed belt



Tightening Toothed Drive Belt:
Loosen bolt (8) – spring force must move the tensioning roller.
Crank engine once in running direction up to TDC mark (toothed drive belt tightened on its own).
Check timing (with crankshaft in TDC position mark on camshaft sprocket must be precisely aligned with mark on cylinder head).
Tighten tensioner (first bolt (8) and then bolt (7)).
Install a label showing date and mileage on the cylinder head cover after finishing work.

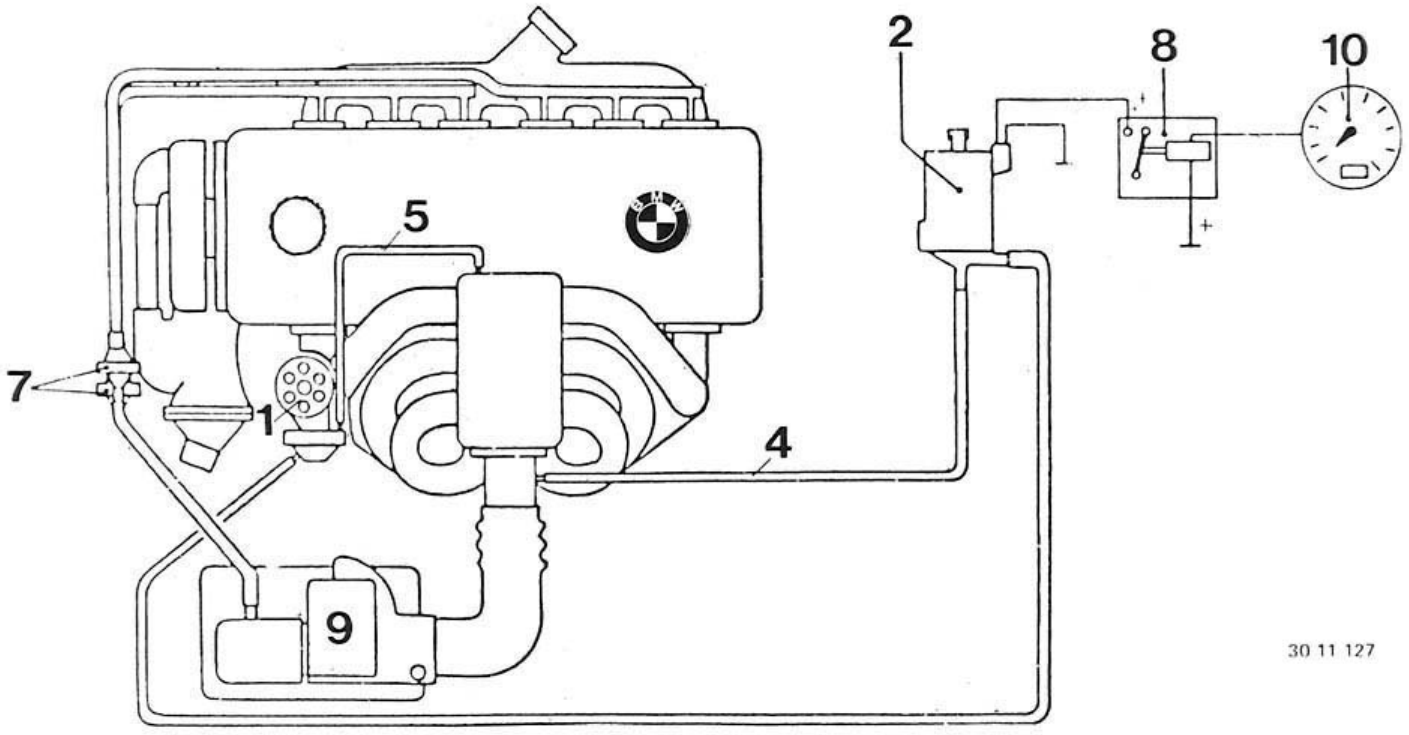


*** See Service Information of Gr. 11



EMISSION CONTROL LAYOUT DRAWING FOR BMW 320 i / 323 i (AUS + CH + S) – since 1984 Models

1 Distributor
2 Electric switching valve (black – 7.20939.13)
3 Fourth/fifth gear switch
4 Vacuum advance control (black)
5 Vacuum retard control (white)
7 Pulse air valves
8 Switching relay
Activated: at road speed > 65 km/h (40 mph) or in 4th/5th gear
9 Air cleaner
10 Speedometer

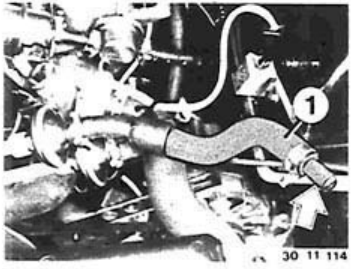


EMISSION CONTROL LAYOUT DRAWING FOR BMW 320 iA / 323 iA (AUS + CH + S) – since 1984 Models

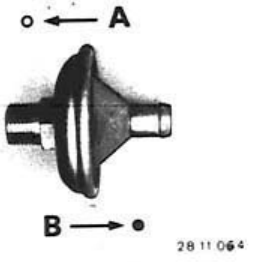
1 Distributor
2 Electric switching valve (black – 7.20939.13)
4 Vacuum advance control (black)
5 Vacuum retard control (white)
7 Pulse air valves
8 Switching relay (activated at road speed > 65 km/h or 40 mph)
9 Air cleaner
10 Speedometer

11 70 009 CHECKING FUNCTION OF EMISSION CONTROL

Pulse Air Valves:
Fresh air is delivered into the exhaust manifolds to afterburn exhaust gas and in this manner reduce CO/HC.
Fresh air is drawn in from the air cleaner via pulse air valves by vacuum, which is produced by pressure pulses in the exhaust manifold.

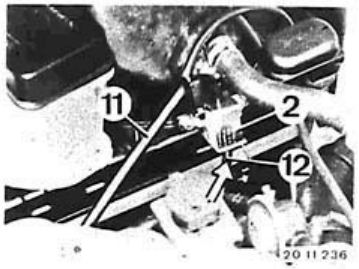


Checking Pulse Air Valves (7):
Check CO level, see 13 00 054.
The CO level in exhaust gas must always be lower with hose (1) connected on the air cleaner, as when hose (1) is disconnected and plugged – see nominal value microfiche.

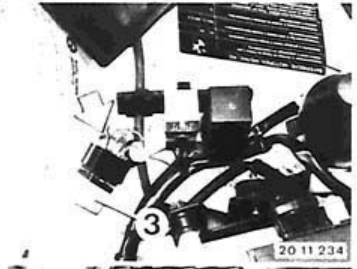


Remove pulse air valves 11 72 140.
Check pulse air valves for leaks by blowing in air.
Air must flow in exhaust direction (A) and valves must be absolutely tight in direction (B).

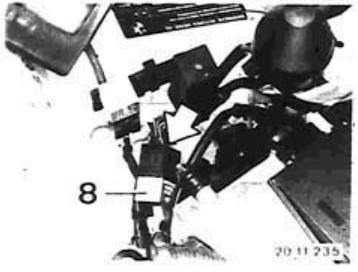
Vacuum Advance Control – Since 1984 Models:
The vacuum advance control on the distributor is operated by an electric switching valve.
Conditions:
– road speed above 65 km/h (40 mph) or
– 4th/5th gear engaged.



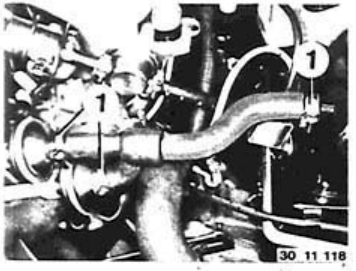
Checking Black Electric Switching Valve (2):
Engine stopped – ignition on.
Pull off hose (11) from distributor and blow air into hose (12) from throttle housing.
Electric switching valve (2) switches to air flow with engaged 4th/5th gears.



Checking Fourth/Fifth Gear Switch / Switching Relay (3):
Engine stopped – ignition on.
The fourth/fifth gear switch is okay, if relay (3) switches with engaged 4th/5th gears – green/red wire produces positive pulses and brown/red wire negative (ground) pulses.

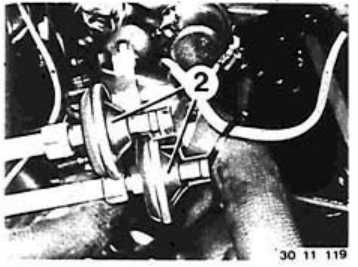


Checking Speed Switch / Switching Relay (8):
Simulate road speeds according to speedometer test, see 62 12 . . ..
Relay (8) switches with road speeds above 65 km/h (40 mph) – brown/red wire produces negative (ground) pulses.



11 72 140 REPLACING PULSE AIR VALVES

Testing – see 11 70 009.
Loosen clamps (1) and pull off hose.



Unscrew pulse air valves (2).
Installation:
Tightening torque*.

20 11 070

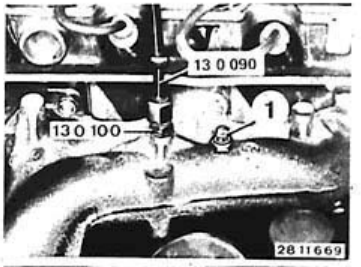
Important!
Only install pulse air valves with code 7.20985.00 . . ..

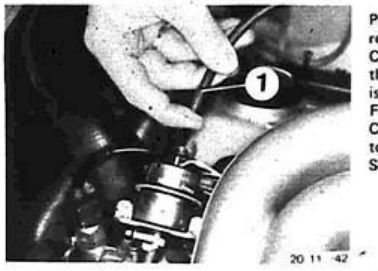
* See Specifications

11 76 000 CONVERTING CAR TO CATALYTIC CONVERTER – Cars Prepared for Catalytic Converter –

Drive car on several tanks of unleaded gasoline prior to conversion
or
pump out leaded gasoline** and run engine minutes after filling tank with unleaded gasoline prior to installation of the catalytic converter and oxygen sensor.
Fill fuel canister with unleaded gasoline.
Don't perform any test steps with cylinder shutoff during check with BMW Service Tester – see nominal value microfiche.

Remove exhaust assembly – see Gr. 18.
Install catalytic converter – see Group 18.
Exchange exhaust carrier on transmission.
Install oxygen sensor – see 11 78 510.
Insert adapter (1) in fuel filler neck and install unleaded gasoline label (2).
Adjust engine idle speed and CO level – see Group 13.
Check function of oxygen sensor – see 11 78 010.

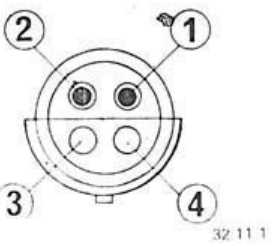




11 78 010 CHECKING FUNCTION OF OXYGEN SENSOR

Up To 11/86 Models:
Unscrew plug (1).
Screw in Special Tool 13 0 100 and connect Special Tool 12 0 090.
Connect BMW Service Tester.
Measure CO level.
Nominal value: 0.2 to 1.2 % by volume.
See 13 00 054 for additional information.

Pull off and plug vacuum hose (1) on pressure regulator.
CO level rises briefly and is regulated back to the original value immediately – oxygen sensor is working.
Faulty:
Check power supply of oxygen sensor via relay to the wiring diagram.
See Group 13 for additional information.



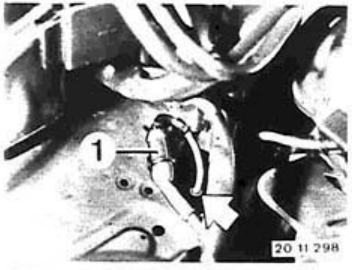
Since 12/86 Models:
A. Checking Heating:
Disconnect oxygen sensor plug.
Connect ohmmeter on 3 and 4 (white lead) and measure resistance.
Nominal value: < 5 ohms.
1 = Plug for sensor ground voltage
2 = Plug for sensor positive voltage
3 = Socket for sensor heating
4 = Socket for sensor heating

B. Checking Signal Voltage:
Perform "oxygen sensor voltage" status call in scope of DME self-diagnosis.
Value is measured at idle speed with oxygen sensor connected and should be between 0.05 and 0.85 V.
Oxygen sensor is not working or is faulty, if a constant voltage between 0.3 and 0.5 V is measured.

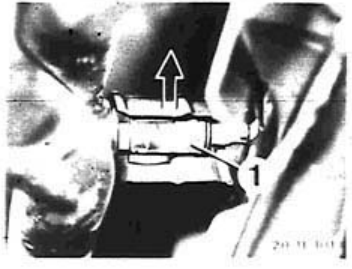
** Conform with fire prevention specifications

11 78 510 REPLACING OXYGEN SENSOR

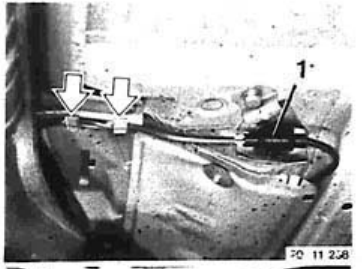
Never clean oxygen sensor or have it come in contact with any lubricants.
Only use Anti-Seize** on threads.
Protect oxygen sensor when undercoating car.



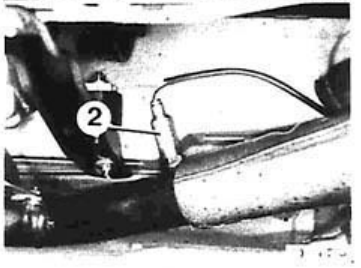
M 20 B 20 / B 25:
Disconnect plug (1) and lift lead out of clip.



Pull off cover and remove oxygen sensor (1).



M 20 B 27:
Disconnect plug (1).
Lift out electric lead.
Installation:
Seal off plug connection (1) against spray water with an universal sealing compound**.



Unscrew oxygen sensor (2).

All Models:
Installation:
Coat threads with Anti-Seize**.
Tighten oxygen sensor with Special Tool 11 7 020.
Tightening torque*.

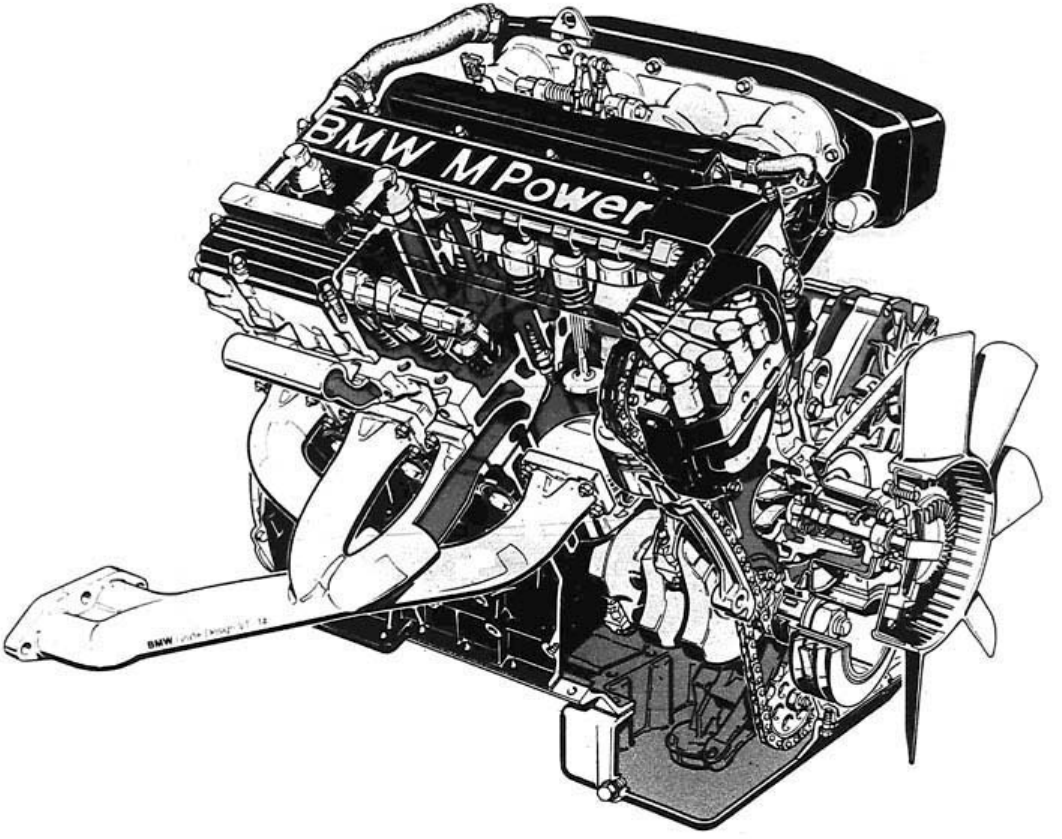
** Source of Supply: HWB

* See Specifications
** Source of Supply: HWB

11 Engine

Engine M3 / 320is

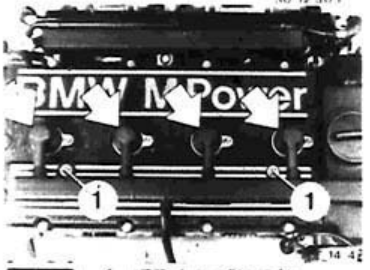
	Engine view	11- 100
11 00 039	Compression of all cylinders – check	11- 101
050	Engine – remove and install	11- 102
11 12 000	Cylinder head cover – remove and install	11- 105
100	Cylinder head – remove and install	11- 106
11 13 010	Oil pan upper section – remove and install	11- 109
020	Oil pan lower section – remove and install	11- 109



BMW 320 is - Engine S 14 B 20
BMW M 3 - Engine S 14 B 23

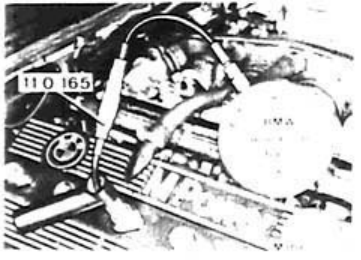
11 00 039 CHECKING COMPRESSION OF ALL CYLINDERS

Unscrew trim panel and pull off master relay (2).

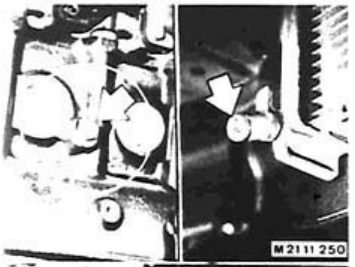


Unscrew nuts (1) on ignition lead pipe and pull off spark plug connectors.

Unscrew spark plugs with Special Tool 12 1 160.
Installation:
Tightening torque: 20 Nm (14.5 ft. lbs.).

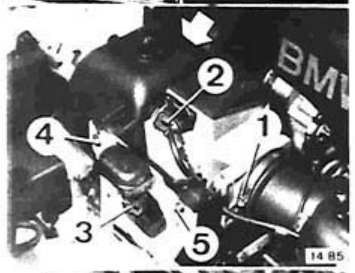


Screw in testing adapter, Special Tool 11 0 165, and connect compression tester.
Press down on accelerator pedal and operate starter until the compression stops rising.
The value of all cylinders should not deviate by more than 0.5 bar (7 psi).
Specification: 10 to 11 bar (142 to 156 psi).

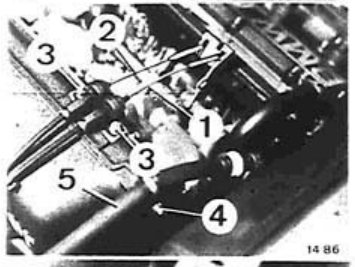


11 00 050 REMOVING AND INSTALLING ENGINE

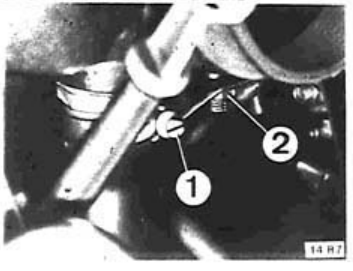
Disconnect battery ground lead.
Remove transmission - see Gr. 23.
Unscrew splash guard.
Drain coolant on engine and radiator.
Installation:
Fill and bleed cooling system - see Gr. 17.



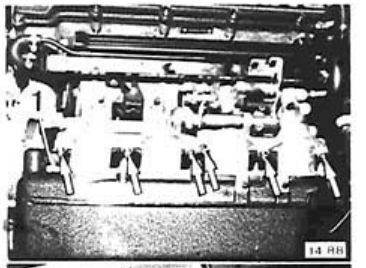
Loosen hose clamp (1) and hose clamp for the intake hose (next to radiator) and pull off hoses.
Pull off plugs (2 and 3) and place electric leads aside.
Loosen nuts (4 and 5) and remove air cleaner.



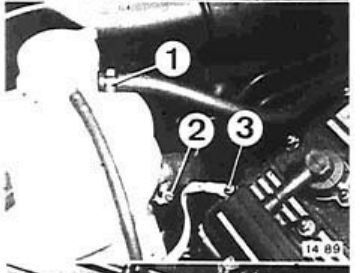
Disconnect throttle cable (1) and cruise control cable (2).
Unscrew nuts (3) on holder and place cables with holder aside.
Unscrew nut (4), pull off clamp and lift vacuum hose (5) out of brake booster.



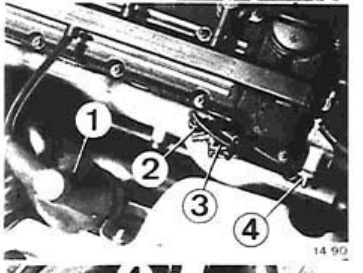
Loosen hose clamp (1) and pull hose off of intake manifold.
Unscrew nut (2) on intake manifold support.



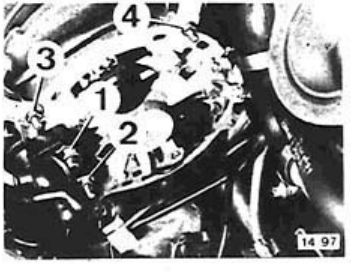
Loosen hose clamp (1) and pull off hose.
Unscrew nuts and take off air intake manifold.
Installation:
Check O-rings, replacing if necessary.
Tightening torque: 9 Nm (6.5 ft. lbs.).



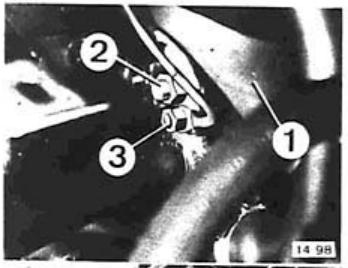
Loosen hose clamps (1 and 2) and pull hoses off of coolant expansion tank.
Unscrew nut (3) and take off ground strap.



Pull ignition lead (1) off of ignition coil.
Pull off plugs (2 and 3).
Unscrew nut (4) and place electric lead on opposite end of engine.

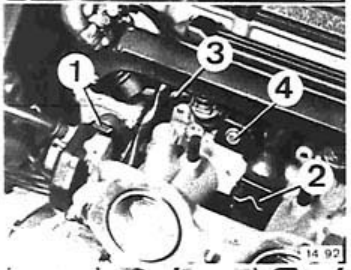


Disconnect electric leads (1 and 2) on alternator.
Unscrew nuts (3 and 4) and take off electric leads.

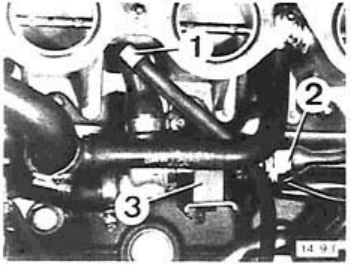


Unscrew cover (1).
Disconnect electric leads (2 and 3) on starter.

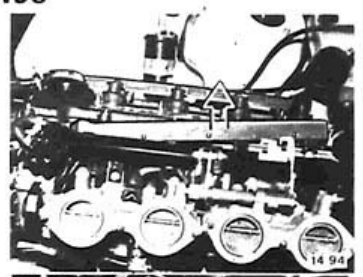
Pull off plugs (1 and 2) and unclip electric leads in holders.
Disconnect electric lead (3) on oil pan (pull off plug and unscrew holder) and take out lead from above.



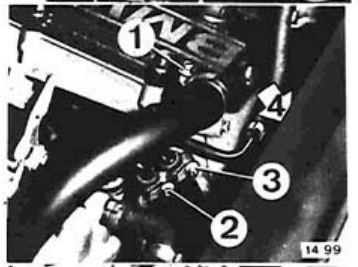
Pull off plugs (1 and 2).
Pull off vacuum hose (3) on pressure regulator.
Unscrew screw (4) and take off electric lead with holder.



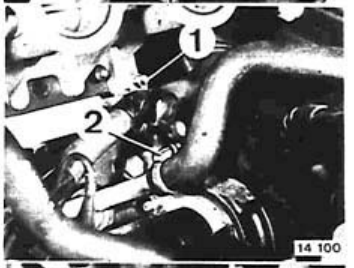
Pull off vacuum hose (1) and pull it out of the intake manifold support.
Pull off plug (2).
Lift out rubber holder (3).
Place idle speed control aside and take the engine wire harness located behind it out of the holders.



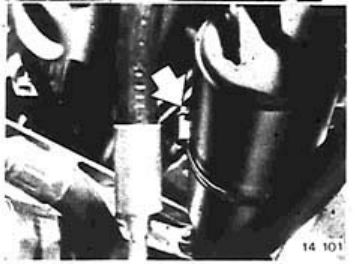
Pull off plug plate on fuel injectors and place aside next to the pressure regulator.



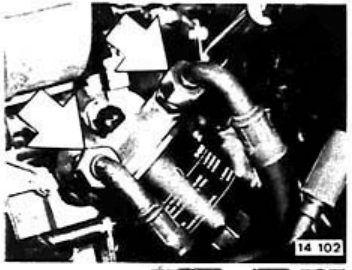
Loosen clamp (1) and pull off breather hose.
Disconnect fuel hoses (2 and 3) on the injection pipe.
Disconnect heater hose (4) on cylinder head.
Installation:
Don't mix up hoses (2 and 3).



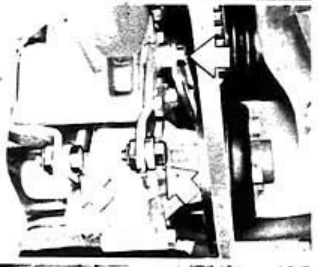
Loosen clamp (1) and place engine wire harness aside.
Loosen hose clamp (2) and pull off heater hose.



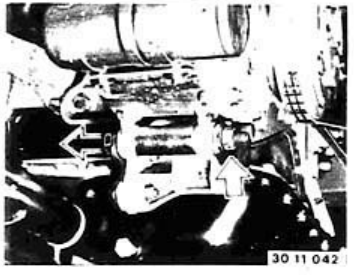
Loosen clamp and place carbon filter aside (hoses can remain connected).



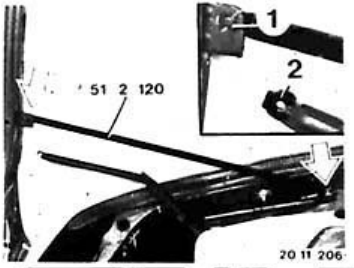
Disconnect both oil cooler hoses on the oil filter housing.
Remove fan - see 11 52 000.
Remove radiator - see Gr. 17.
Disconnect ground lead on oil pan.
Installation:
Tightening torque for oil cooler hose coupling nuts: 35 Nm (25 ft. lbs.).



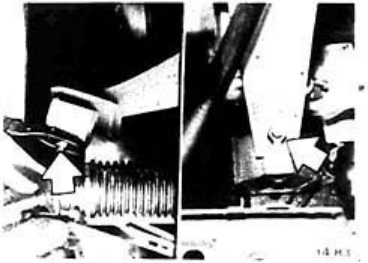
Unscrew power steering pump on holder (hydraulic hoses remain connected) and suspend it from car aside with a piece of wire.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 021.



Unscrew air conditioner compressor on holder (refrigerant hoses remain connected) and suspend it from car aside with a piece of wire.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 021.



Disconnect support and gas pressure prop, and prop up engine hood with Special Tool 51 2 120.
Caution!
Use retainer (1).
Installation:
Insert plastic part (2).

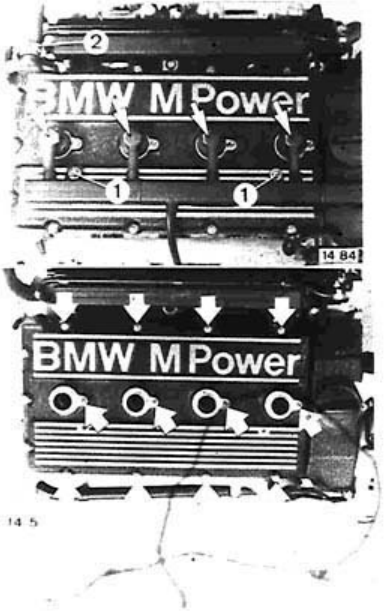


Unscrew engine mounts on front axle carrier.

left -	unscrew at top
	loosen at bottom
right -	loosen at top
	unscrew at bottom

Installation:
Tightening torque: 45 Nm (32.5 ft. lbs.).

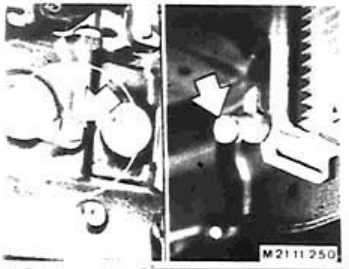
Attach Special Tool 11 0 000 on engine and lift out engine.



11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

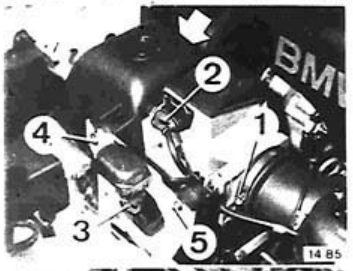
Unscrew nuts (1).
Pull off spark plug connectors.
Take off ignition lead pipe.
Loosen hose clamp (2) and pull off breather hose.

Unscrew nuts and take off cylinder head cover.
Installation:
Check gaskets, replacing if necessary.

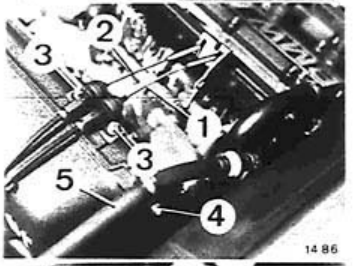


11 12 100 REMOVING AND INSTALLING CYLINDER HEAD

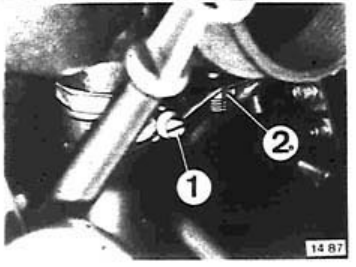
Disconnect battery ground lead.
Unscrew splash guard.
Drain coolant on engine and radiator.
Installation:
Fill and bleed cooling system - see Gr. 17.



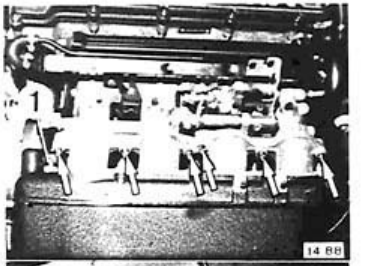
Loosen hose clamp (1) and hose clamp for the intake hose (next to radiator), and pull off hoses.
Pull off plugs (2 and 3) and place electric leads aside.
Loosen nuts (4 and 5) and remove air cleaner.



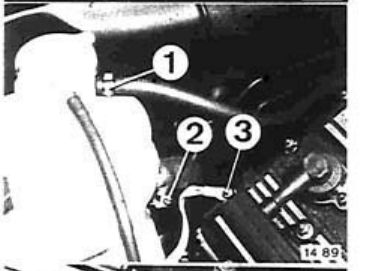
Disconnect throttle cable (1) and cruise control cable (2).
Unscrew nuts (2) on holder and place cables with holder side.
Unscrew nut (3), pull off clamp and lift vacuum hose (4) out of brake booster.



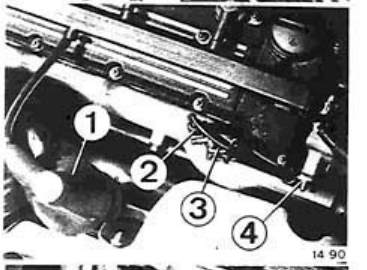
Loosen hose clamp (1) and pull hose off of intake manifold.
Unscrew nut (2) on intake manifold support.



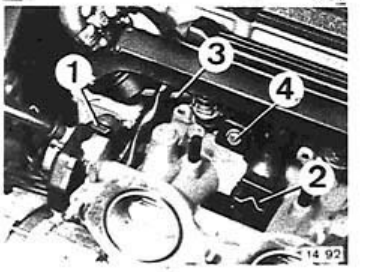
Loosen hose clamp (1) and pull off hose.
Unscrew nuts and take off intake manifold.
Installation:
Check O-rings, replacing if necessary.
Tightening torque: 9 Nm (6.5 ft. lbs.).



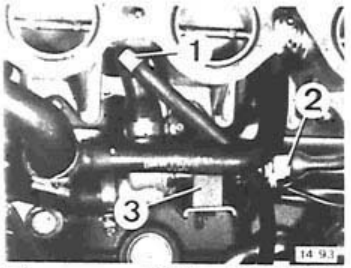
Loosen hose clamps (1 and 2) and pull hoses off of coolant expansion tank.
Unscrew nut (3) and take off ground strap.



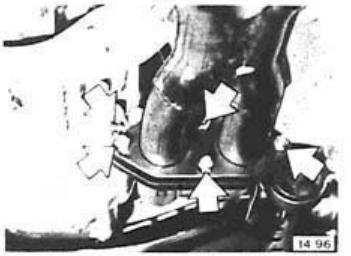
Pull ignition lead (1) off of ignition coil.
Pull off plugs (2 and 3).
Unscrew nut (4) and place electric lead on opposite end of engine.



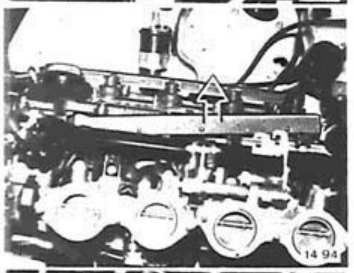
Pull off plugs (1 and 2).
Pull vacuum hose (3) off of pressure regulator.
Unscrew screw (4) and take off electric lead with holder.



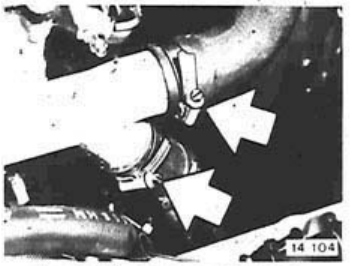
Pull off vacuum hose (1) and plug (2).
Lift ot rubber holder (3).
Place idle speed control aside and take engine wire harness located behind it out of holder.



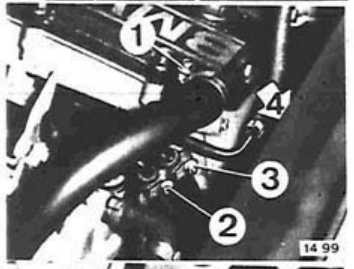
Unscrew flange bolts.
Disconnect oxygen sensor plug.
Installation:
Replace gaskets.
Replace self-locking nuts.
Tightening torque: 50 Nm (36 ft. lbs.).



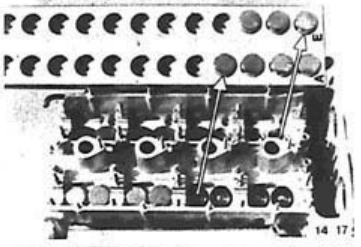
Pull off plug plate on fuel injectors and place aside next to the pressure regulator.



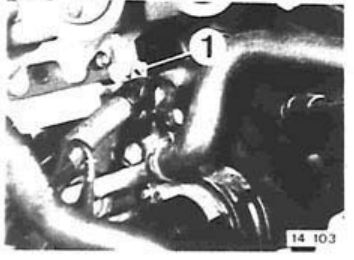
Loosen hose clamps and pull off radiator hoses.



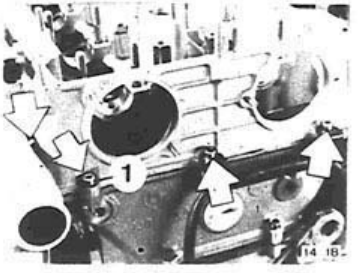
Loosen clamp (1) and pull off breather hose.
Disconnect fuel hoses (2 and 3) on the injection pipe.
Disconnect heater hose (4) on the cylinder head.
Installation:
Don't mix up hoses (2 and 3).



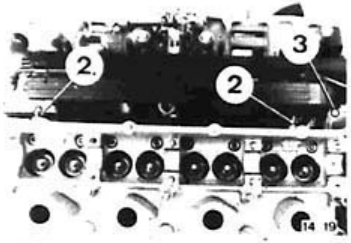
Remove camshaft - see 11 31 000.
Pull out cam followers and place in tray, Special Tool 11 3 030.
Installation:
Install cam followers in same positions.



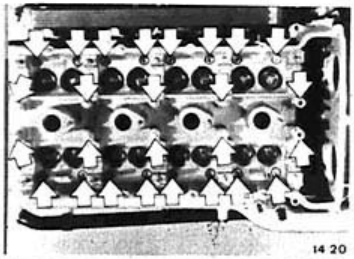
Loosen clamp (1) and pull off of cylinder head.



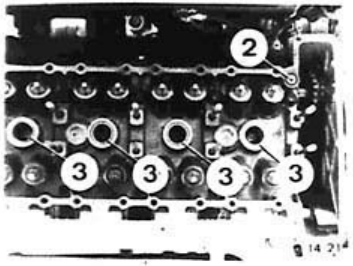
Unscrew bolts.
Installation:
Longer bolt (1) is required to secure the shaft for the upper tensioning rail.



Disconnect pipe (2).
Unscrew bolt (3).



Unscrew timing case.

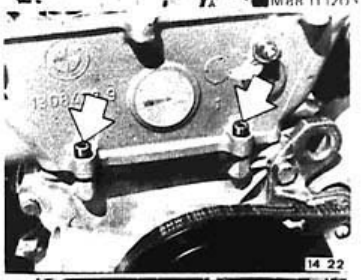


Installation:
Replace O-ring (2) in oil bore.
Check O-rings (3), replacing if necessary.
Coat sealing surfaces with Three Bond 12 07**.
Tighten bolts uniformly.
Tightening torque:
M 7 = 15 + 2 Nm (11 + 1.4 ft. lbs.)
M 8 = 21 + 1 Nm (15 + 0.7 ft. lbs.)

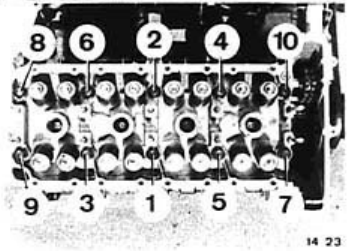
<u>Measuring Play of Cam Followers:</u>
Measure diameter of cam follower with a micrometer.

** Source of Supply: HWB

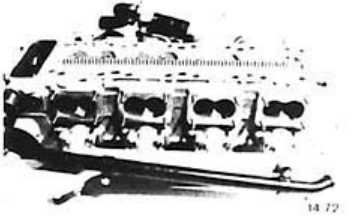
Set internal calipers to zero on the micrometer with the measured cam follower diameter.
Measure diameter of cam follower bore.
Compare measured cam follower play with specified play.
Cam follower play/installed distance:
0.0025 to 0.066 mm (0.0001 to 0.0026").



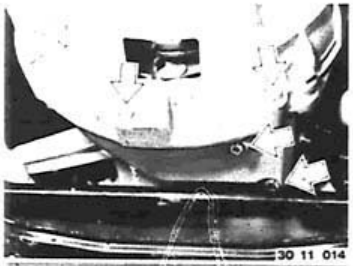
Unscrew bolts.



Unscrew cylinder head bolts in order of 10 through 1 and lift off cylinder head.
Installation:
Clean cavities in crankcase/cylinder head bolts - lubricate cylinder head bolts with oil.
Clean sealing surfaces on cylinder head and crankcase thoroughly - use a gasket remover** and hard wood scraper.
Check levelness with a standard steel ruler.
Replace cylinder head gasket.
Check tensioning rail location while mounting the cylinder head.
Tighten bolts in three steps in order of 1 through 10.
Step 1 = 50 + 2 Nm (36 + 1.4 ft. lbs.).
Step 2 = 80 + 2 Nm (58 + 1.4 ft. lbs.).
Wait 15 minutes!
Step 3 = 100 + 2 Nm (72 + 1.4 ft. lbs.).

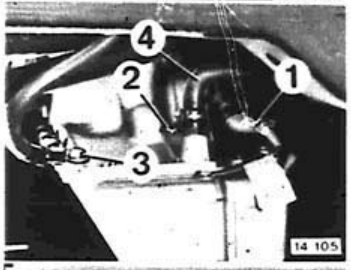


** Source of Supply: HWB

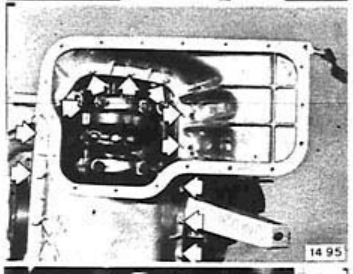


11 13 010 REMOVING AND INSTALLING OIL PAN UPPER SECTION

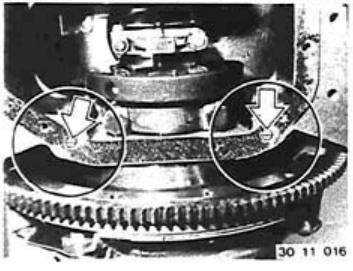
Pull out oil dipstick.
Remove oil pan lower section - see 11 13 020.
Remove oil pump - see 11 41 000.
Unscrew reinforcement shell.



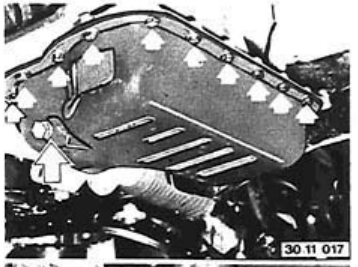
Disconnect plug (1).
Unscrew holder (2) and ground lead (3).
Loosen clamp and pull off breather hose (4).



Unscrew oil pan bolts and remove oil pan upper section.
Installation:
Tightening torque: 10 Nm (7 ft. lbs.).

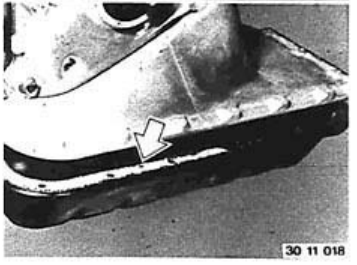


Installation:
Clean sealing surface.
Replace oil pan gasket.
Coat joint on timing case cover and end cover with a brush-on universal sealing compound**.



11 13 020 REMOVING AND INSTALLING OIL PAN LOWER SECTION

Unscrew splash guard.
Drain engine oil.
Unscrew oil pan bolts.
Installation:
Pour in engine oil***.
Tightening torque:
33 Nm (24 ft. lbs.) for oil drain plug
10 Nm (7 ft. lbs.) for oil pan bolts



Take off oil pan.
Installation:
Replace gasket.

** Source of Supply: HWB

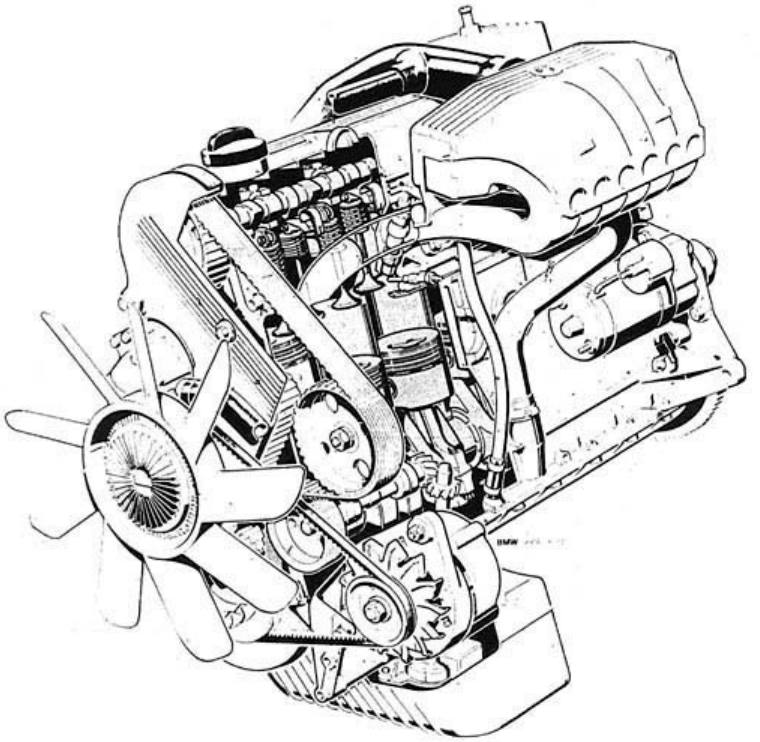
*** See Service Information of Gr. 00

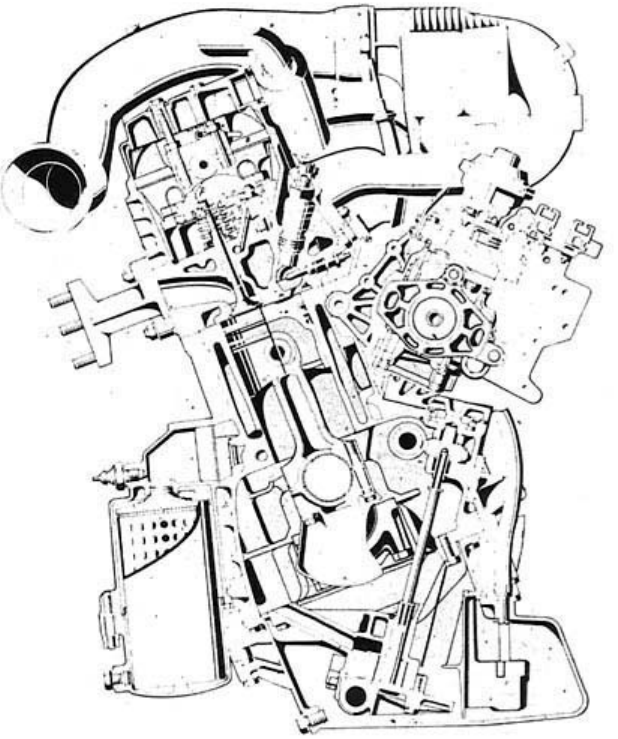
11 Engine

Models: 324d, 324td

	Engine view	11- 250
	Working instructions	11- 250a
11 00 039	Compression – check	11- 251
050	Engine – remove and install (BMW 324d)	11- 252
050	Engine – remove and install (BMW 324td)	11- 253a
091	Engine – exchange	11- 254
11 11 160	Bearing for oil pump drive shaft – replace	11- 255
11 12 000	Cylinder head cover – remove and install	11- 255
100	Cylinder head – remove and install (BMW 324d)	11- 256
100	Cylinder head – remove and install (BMW 324td)	11- 258a
11 13 000	Oil pan – remove and install	11- 259
11 61 050	Intake air manifold – remove and install	11- 260
11 65 015	Bearing play of turbocharger – check	11- 261
018	Charging pressure of turbocharger – check	11- 261
020	Turbocharger – remove and install	11- 262
059	Bypass regulator for turbocharger – check and adjust	11- 263
. . .	Charge pressure sensor – check	11- 264
11 66 000	Vacuum pump – remove and install	11- 265

M 21 = Small six cylinder
D = Diesel
24 = Displacement (x 100)
W = Swirl chamber



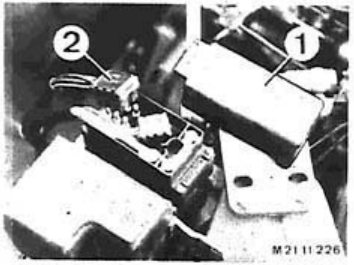


BMW 324 d -- M 21 D 24 W

WORKING INSTRUCTIONS

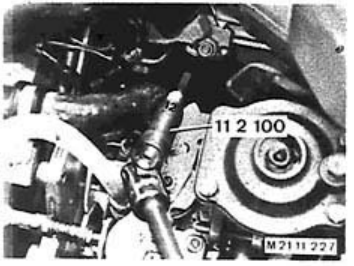
concerning cleanliness on fuel system.

- Clean area around repair point thoroughly – before disconnecting lines, switches, etc..
- Place removed parts on a clean surface only and cover with plastic sheet – never use rags losing lint!
- Cover or insert plugs in open lines and components immediately.
- Only install cleaned parts.
  Take new spare parts out of their packaging only briefly before installation.
- Keep diesel fuel off of coolant hoses – if applicable, wash off immediately with water.

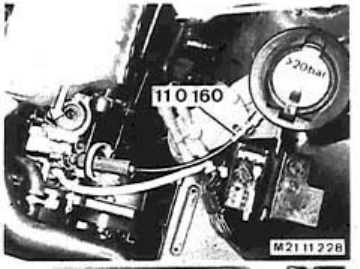


11 00 039 CHECKING COMPRESSION

Testing Conditions:
Battery in perfect condition – check acid density if necessary.
Coolant temperature of engine max. 35° C (95° F).
Lift off cover (1) and pull plug (2) off of pre-heating time control unit (control unit in 324 td cars is on right-hand side of firewall).



Unscrew heater plugs with Special Tool 11 2 100 – see Group 12.
Installation:
Screw in heater plugs with copper paste CRC**.
Tightening torque***.

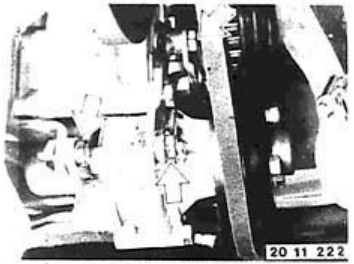


Screw in Special Tool 11 0 160 together with an adapter completely and tighten by hand finger tight.
BMW 324 d:
Press manual stop lever forward and measure compression*.
Note:
Operate starter so long until pressure stops rising – compression tester has deflected.

BMW 324 td:
Pull off master relay (1) and measure compression*.
Note:
Operate starter so long until pressure stops rising – compression tester has deflected.

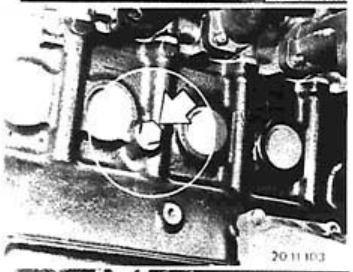
** Source of Supply: HWB
*** See Specifications of Gr. 12 / 23

* See Specifications

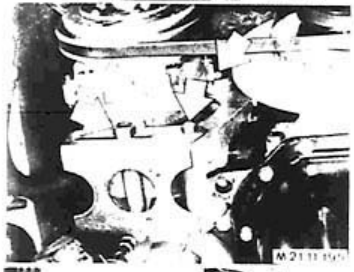


11 00 050 REMOVING AND INSTALLING ENGINE – BMW 324 d –

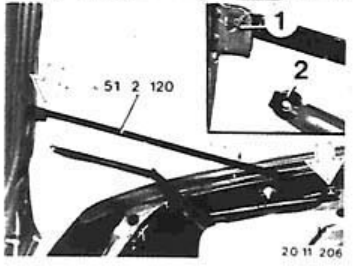
Remove transmission – see Gr. 23 or 24.
Cars with Power Steering:
Unscrew power steering pump – hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



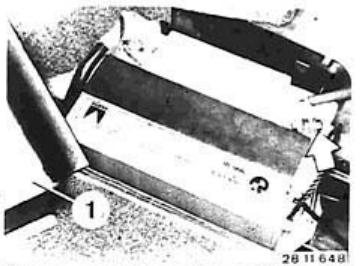
Unscrew plug and drain coolant.
Remove radiator – see 17 11 000.



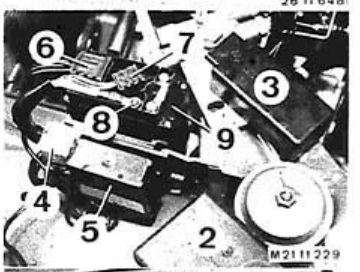
Cars with Air Conditioner:
Unscrew compressor – refrigerant hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



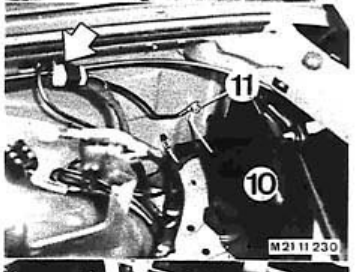
Disconnect prop and gas pressure springs, and hold engine hood with Special Tool 51 2 120.
Caution!
Use retainer (1).
Installation:
Insert plastic part (2).



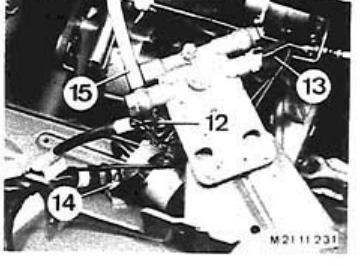
Raise trunk lid.
Take off cover (1) and disconnect ground lead on battery.



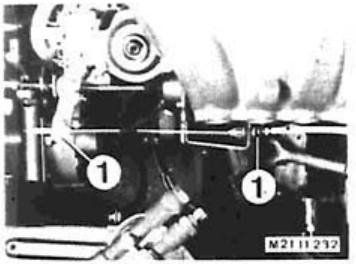
Take off covers (2 and 3).
Lift out relays (4 and 5) and pull off of relay socket.
Pull off plugs (6 and 7).
Unscrew electric lead (8).
Remove preheating time control unit (9).



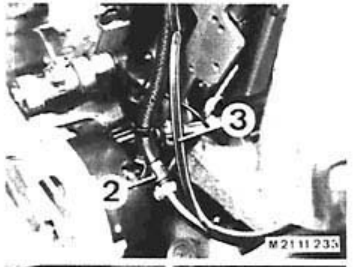
Remove cover (10).
Unscrew ground lead (11) and disconnect electric lead.



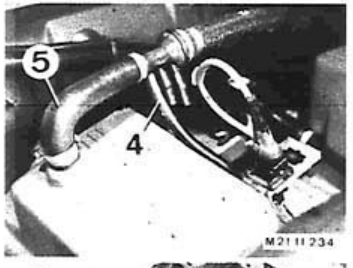
Pull off plugs (12 and 13).
Unscrew wire harness (14).
Disconnect fuel hose (15).
Installation:
Check seals, replacing if necessary.
Bleed fuel system – see 13 51 320.



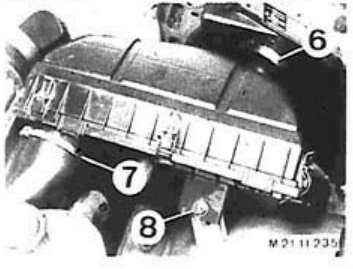
Disconnect throttle cable (1).
Installation:
Adjust throttle cable, see Group 35.



Disconnect fuel hose (2).
Pull off hose (3).

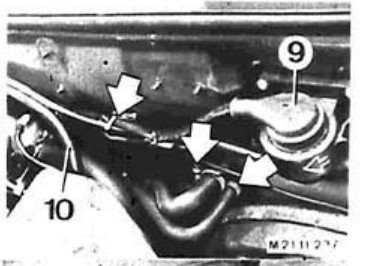


Pull off hoses (4 and 5).

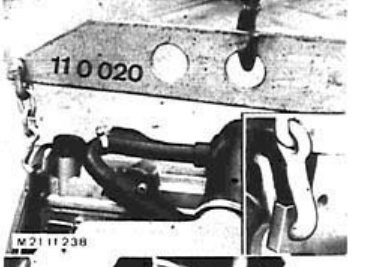


Remove hose (6).
Loosen clamp (7).
Unscrew nut (8) and remove air cleaner.

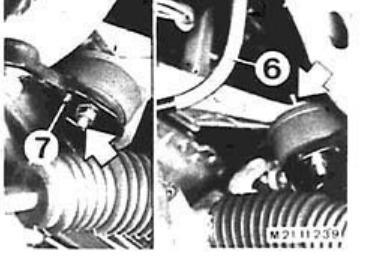
Remove expansion tank
Installation:
Replace squeeze hose clamp



Lift out and disconnect engine plug (9)
Disconnect wires.
Unscrew positive wire (10) on starter.
Disconnect wires.
Disconnect water hoses for heater.
Installation:
Screw on cap (9) locks in final position.

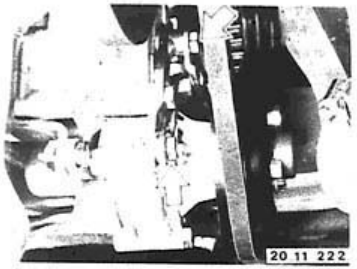


Attach Special Tool 11 0 020.



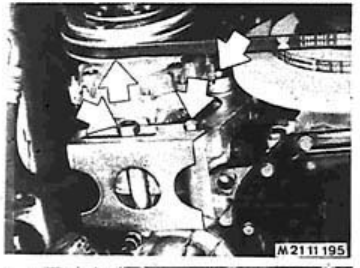
Unscrew ground strap (6) and both engine mounts.
Installation:
Guide mandrel (7) into bore of axle carrier
Tightening torque*.
Check engine operation 13 00 050

* See Specifications

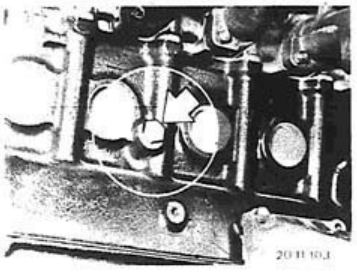


11 00 050 REMOVING AND INSTALLING ENGINE
– BMW 324 td –

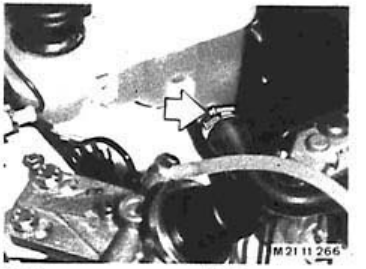
Disconnect battery.
Remove transmission – see Gr. 23 or 24.
Cars with Power Steering:
Unscrew power steering pump – hoses remain connected.
Installation:
Check drive belt tightness with Special Tool 11 5 020.



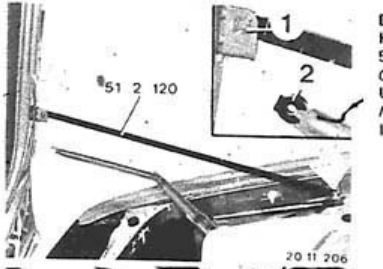
Cars with Air Conditioner:
Unscrew compressor – refrigerant hoses remain connected.
Installation:
Check drive belt tightness with Special Tool 11 5 020.



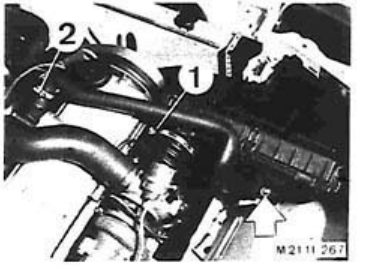
Unscrew bolt and drain coolant.
Remove radiator – see 17 11 000.



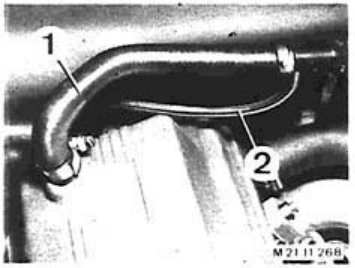
Loosen clamp and pull off coolant hose on expansion tank.



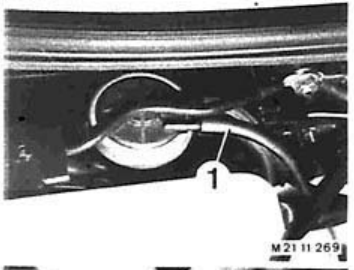
Disconnect prop and gas pressure springs.
Hold up engine hood with Special Tool 51 2 120.
Caution!
Use retainers (1).
Installation:
Insert plastic part (2).



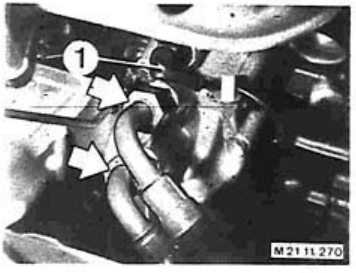
Loosen hose clamps (1 and 2) and pull off hoses.
Unscrew nut and remove air cleaner.



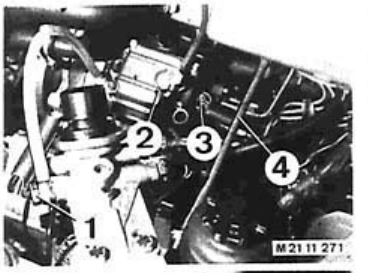
Loosen clamp and pull off hose (1) on cylinder head cover.
Pull off vacuum hose (2).



Pull off vacuum hose (1).

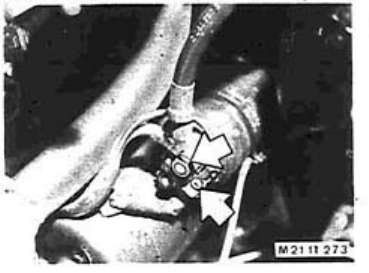


Pull off plug (1) on oil pressure switch and place leads on other side of engine.
Unscrew oil cooler pipes.



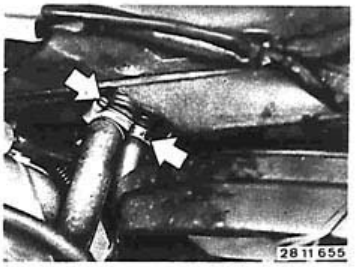
Disconnect fuel pipes (1 and 2).
Unscrew nut (3) and take off electric lead.
Pull off vacuum hose (4).
Installation:
Check seals, replacing if necessary.
Bleed fuel system – see 13 51 320.

Pull off plug (1) on charging air temperature sensor.
Loosen clamp (2).

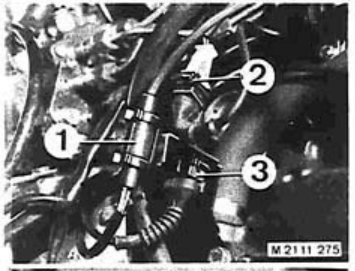


Disconnect connecting wire on starter.

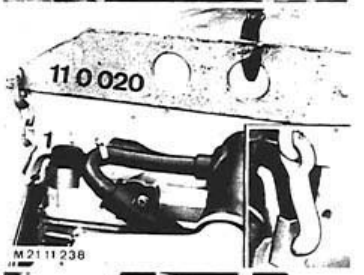
Disconnect plug (1).
Disconnect electric leads (2 and 3) on alternator.
If applicable, disconnect plug for oil level switch.



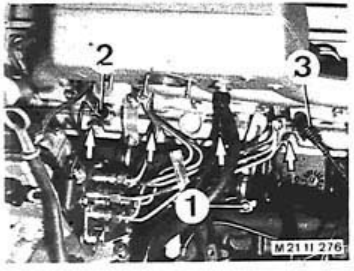
Disconnect heater hoses.



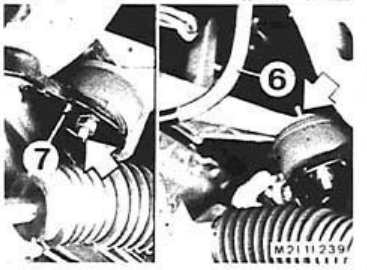
Disconnect plugs (1 ... 3).



Attach Special Tool 11 0 020 on engine.

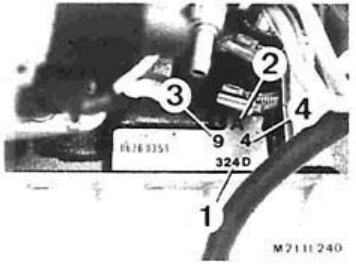


Loosen clamp (1).
Pull off plugs (2 and 3) on temperature sensors.
Disconnect all electric leads on heater plugs.
Cut off wire straps and take wire harness off of engine.



Unscrew ground strap (6) and both engine mounts.
Lift out engine.
Installation:
Insert guide (7) in bore of axle carrier.
Tightening torque*.
Check engine running – see 13 00 050.

* See Specifications



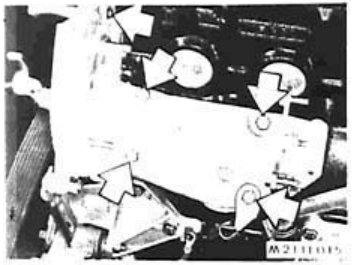
11 00 091 REPLACING ENGINE WITH AN EXCHANGE ENGINE

Remove engine 11 00 050.
Exchange Engine Identification on Crankcase:
1 = Type****
2 = "A" for exchange or "N" for new
3 = Manufacturing month
4 = Manufacturing year (1984)

Die stamp engine number.
Transfer parts from old to new engine.

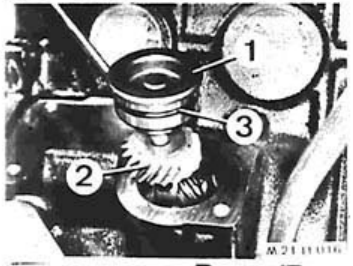
Add engine oil***
Important!
Remove pilot bearing in crankshaft, see 11 21 571, if car has an automatic transmission.
Install engine.
Check static adjustment of injection pump, see 13 51 005.
Check engine operation 13 00 050.

* See Specifications
*** See Service Information of Group 00
**** See BMW Technik and Service Information of Group 11



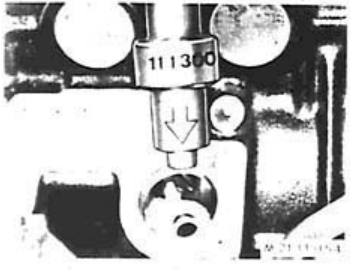
11 11 160 REPLACING BEARINGS FOR OIL PUMP DRIVE SHAFT

Remove oil pump 11 41 000.
Remove injection pump see Gr. 13.
Unscrew console.

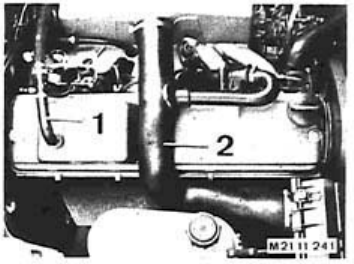


Take off cover (1).
Remove gear (2).
Installation:
Open end of gear shaft faces down.
Checking bearing in cover (1) and seal (3), replacing if necessary.

Drive out needle bearing from bottom to top with Special Tool 11 1 310.

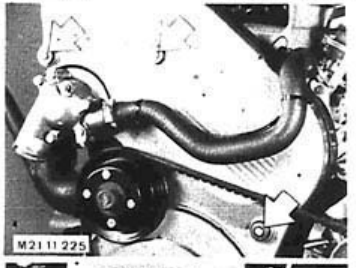


Installation:
Lubricate needle bearing with grease.
Drive in needle bearing against stop with Special Tool 11 1 300.

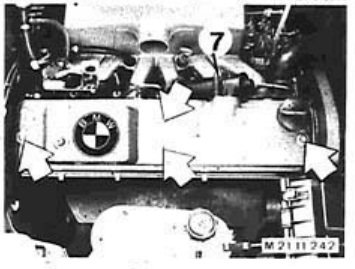


11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

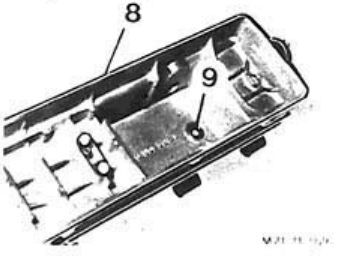
Detach hoses (1 ... 2).



Loosen screws of cover.
Installation:
First tighten screws of cylinder head cover and then protective cover.

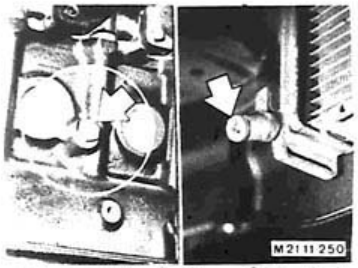


Detach oil trap (7).
Unscrew dowel sleeves and take off cylinder head cover.
Installation:
Screw in dowel sleeves with seals.
Check seal on oil trap, replacing if necessary.



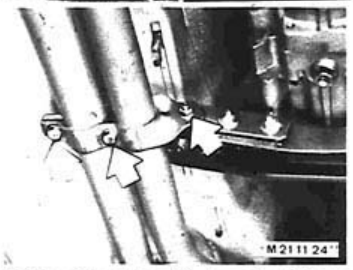
Installation:
Check cylinder head cover gasket (8) and rubber ring (9), replacing if necessary.
Place rubber ring (9) in cover and lubricate with oil.
Tightening torque*.

* See Specifications

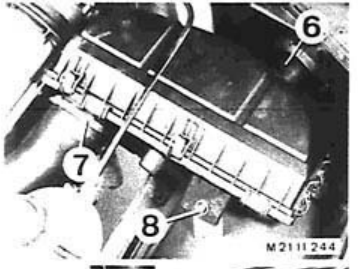


11 12 100 REMOVING AND INSTALLING CYLINDER HEAD – BMW 324 d –

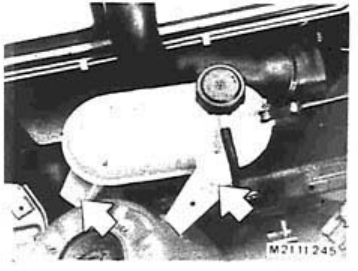
Disconnect battery ground lead.
Drain coolant in engine block and radiator.
Installation:
Pour in coolant*** and bleed cooling system, see Group 17.
Replace engine oil ***



Unscrew pipe clamp on transmission.

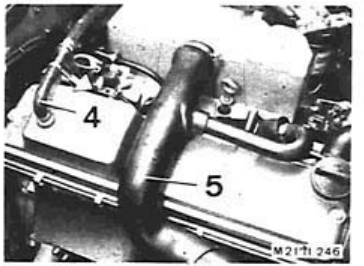


Remove hose (6).
Unscrew clamp (7).
Unscrew nut (8) and remove air cleaner.

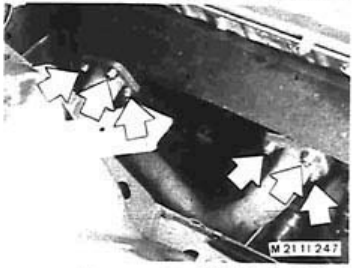


Unscrew expansion tank and place aside.

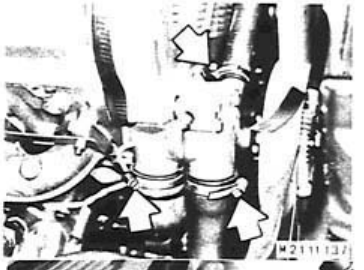
*** See Service Information of Gr. 00



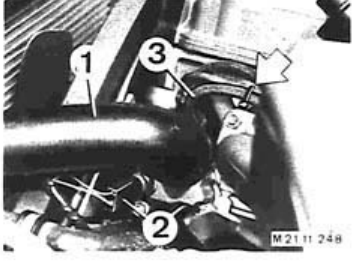
Disconnect hoses (4 and 5)



Unscrew exhaust pipes on exhaust manifold.
Installation:
Check gaskets, replacing if necessary.
Coat studs with copper paste "CRC"**
Replace self-locking nuts.
Tightening torque*.

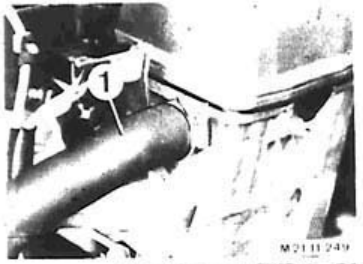


Remove fan, see 11 52 000.
Disconnect hoses.

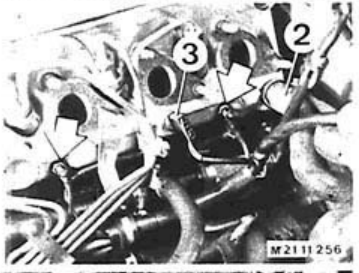


Disconnect hose (1).
Pull off plug (2).
Pull off leak line (3) and unscrew on injection line.

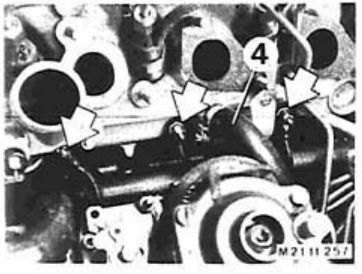
* See Specifications
** Source of Supply: HWB



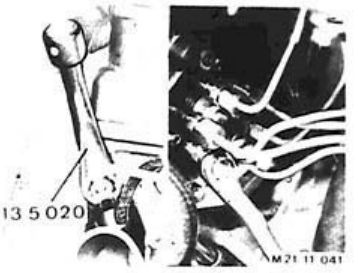
Pull off hose (1).
Remove intake air manifold – see 11 61 050.
Note:
Check/adjust static injection pump setting (see Group 13) before installing the intake manifold.



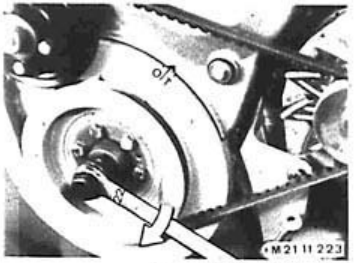
Disconnect hose (2).
Pull off plug (3).
Unscrew wires on glow plugs.



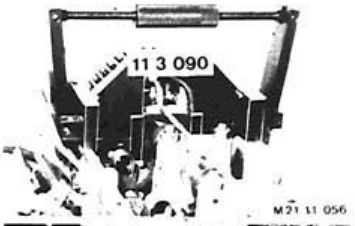
Disconnect hose (4).
Unscrew wires on glow plugs.



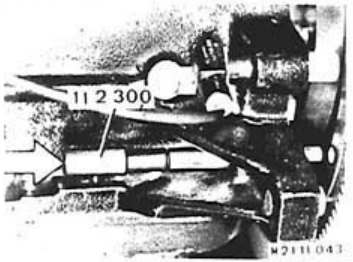
Unscrew injection lines on fuel nozzles and injection pump with Special Tool 13 5 020.
Plug openings with caps.
Take off cylinder head cover, see 11 12 000.
Installation:
Tightening torque = 20 to 25 Nm (15 to 18 ft. lbs.).
Bleed fuel system 13 51 320.



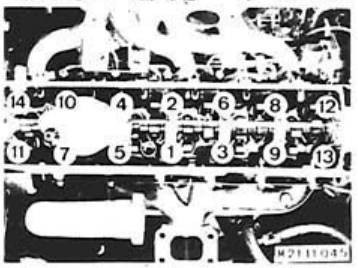
Turn cylinder no. 1 to TDC – cylinder no. 6 overlaps.



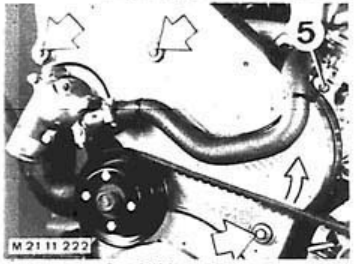
Installation:
Turn camshaft to overlap valves of cylinder no. 6 and hold camshaft with Special Tool 11 3 090 before mounting the cylinder head.
Install and tighten toothed belt, see 11 31 110.



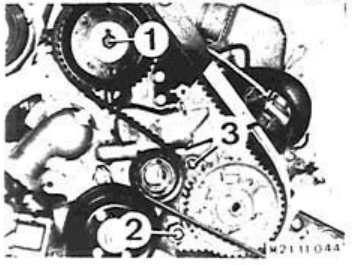
Hold crankshaft with Special Tool 11 2 300.



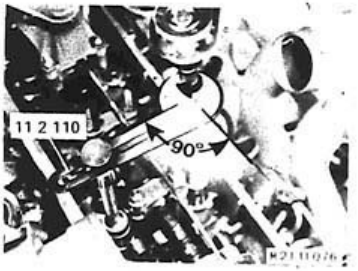
Unscrew bolts in order of 14 through 1 and take off cylinder head.
Installation:
Keep oil out of cavities since otherwise bolts tightened to correct torque might not exert sufficient pressure on cylinder and, in addition, cause cracks in crankcase.
Clean cylinder head bolts.
Lubricate threads and bearing surfaces of bolt heads with light coat of oil.
Replace cylinder head gasket – measure piston protrusion, see 11 12 101.



Detach hose (5) and protective cover.
Installation:
First tighten cylinder head cover and then protective cover.

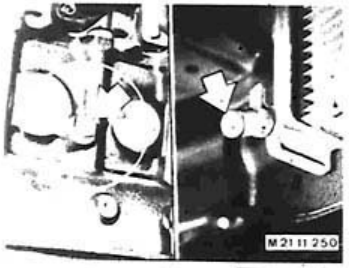


Loosen bolts (1 and 2) and nut (3).
Untighten toothed belt and take off of camshaft sprocket.



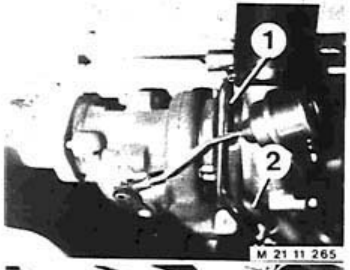
Tighten bolts in 3 steps in order of 1 through 14 to specified torque*.
Adjust valve clearance 11 34 004.
Check static adjustment of injection pump, see 13 51 005.
In 3rd step (cylinder head cover removed again after running engine warm) tighten cylinder head bolts to torque angle* with Special Tool 11 2 110 regardless of engine temperature.

* See Specifications

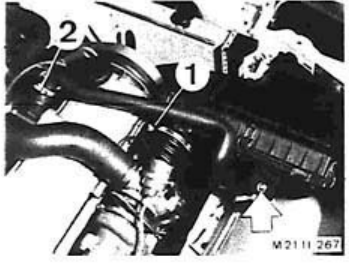


11 12 100 REMOVING AND INSTALLING CYLINDER HEAD
– BMW 324 td –

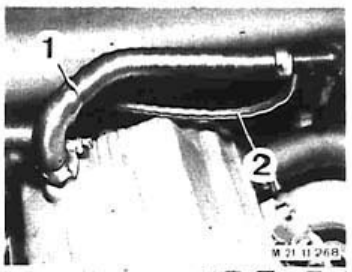
Disconnect battery ground lead.
Drain coolant in engine block and radiator.
Installation:
Pour in coolant*** and bleed cooling system – see Group 17.
Replace engine oil***



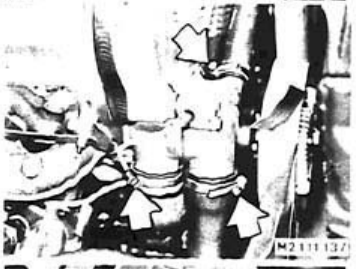
Unscrew exhaust pipe on turbocharger and holder on transmission.
Disconnect pipes (1 and 2) on turbocharger.
Also disconnect pipe (1) on engine block.
Installation:
Check gaskets, replacing if necessary.
Coat studs with copper paste "CRC"***
Replace self-locking nuts.
Tightening torque*



Loosen hose clamps (1 ... 2) and pull off hoses.
Unscrew nut and remove air cleaner.



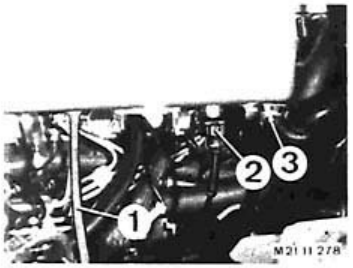
Loosen clamp and pull off hose (1) on cylinder head cover.
Pull off vacuum hose (2).



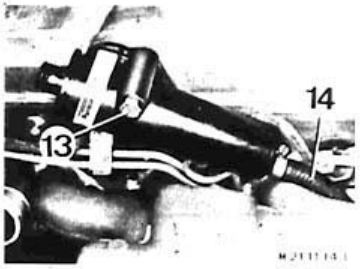
Remove fan – see 11 52 000.
Disconnect coolant hoses on thermostat housing.

Loosen hose clamp and pull off coolant hose (1).
Pull off leak hose (2) and disconnect on injection pipe.

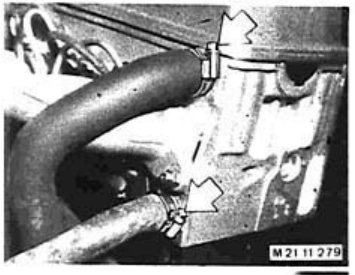
* See Specifications
** Source of Supply: HWB
*** See Service Information of Gr. 00



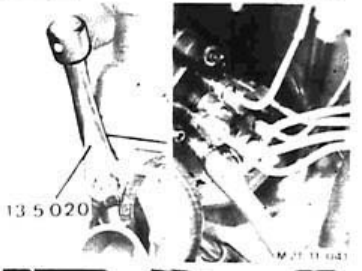
Pull off vacuum hose (1) and plug (2).
Loosen clamp (3).



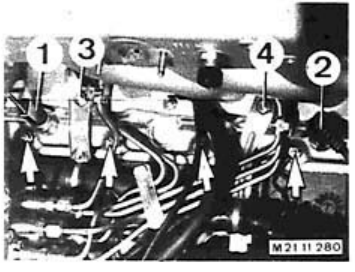
Unscrew oil trap (13)
Pull off hose (14)
Installation
Check seal, replacing if necessary



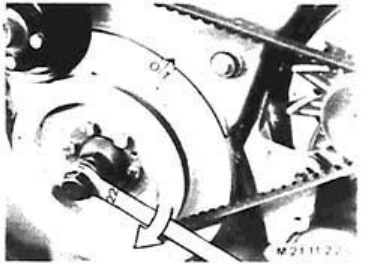
Loosen hose clamps and pull off hoses.



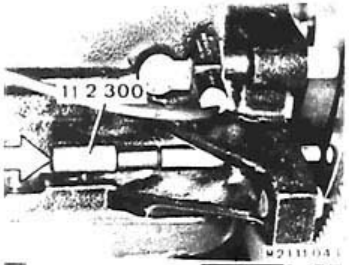
Unscrew injection pipes on fuel injectors and injection pump with Special Tool 13 5 020.
Install protective caps.
Remove cylinder head cover see 11 12 000
Installation
Tightening torque: 20 to 25 Nm (14.5 to 18 ft. lbs.).
Bleed fuel system - see 13 51 320.



Pull off plugs (1 and 2) on temperature sensors.
Unscrew holders (3 and 4) on cylinder head.
Disconnect all leads on heater plugs.

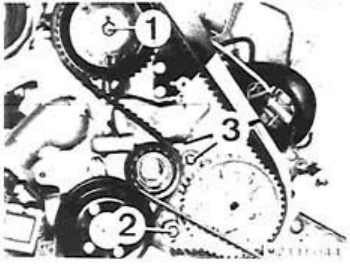


Turn cylinder no. 1 to TDC valve in cylinder no. 6 overlap.

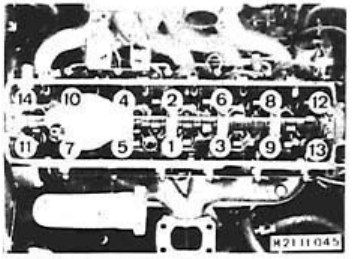


Hold crankshaft with Special Tool 11 2 300.
Caution!
Remove special tool before operating engine again.

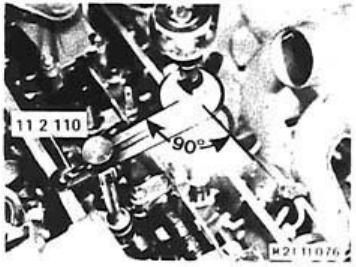
Disconnect hose (5).
Remove protective cover.
Installation:
First tighten the cylinder head cover and then the protective cover.



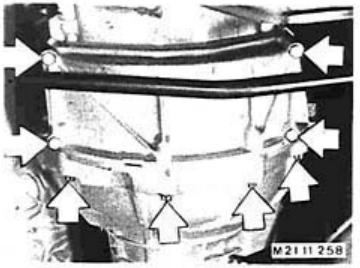
Loosen bolts (1 and 2) and nut (3).
Loosen and take toothed drive belt off of the camshaft sprocket.
Installation:
Install and tighten toothed drive belt – see 11 31 110 in Construction Group Repair Manual.



Unscrew bolts in order of 14 through 1 and take off cylinder head.
Installation:
Keep oil out of cavities (danger of cracking block, wrong torque values).
Clean cylinder head bolts.
Lubricate threads and bearing surfaces of bolt heads with oil lightly.
Replace cylinder head gasket.
Measure piston protrusion see 11 12 101.
Tighten bolts in order of 1 through 14 in three steps.
Tightening torque*
Adjust valve clearance – see 11 34 004.
Check static injection pump adjustment see 13 51 005.
In 3rd step (cylinder head cover removed again after running engine warm) tighten cylinder head bolts to specified torque angle with Special Tool 11 2 110 regardless of the engine temperature.

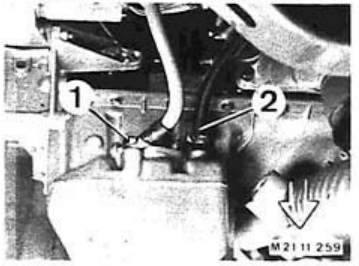


* See Specifications



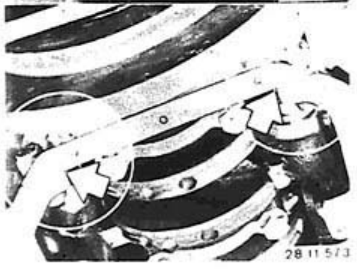
11 13 000 REMOVING AND INSTALLING OIL PAN

Unscrew reinforcement plate.
Drain oil.
Installation:
Pour in engine oil***.



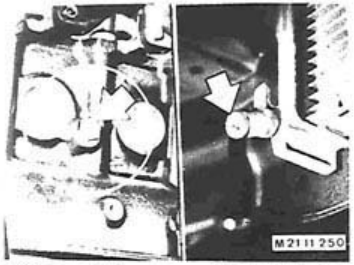
Unscrew steering gear on front axle carrier, see Group 32.
Disconnect ground wire (1).
Disconnect hose (2).
Unscrew oil pan.

Detach oil pump and remove oil pan.
Installation:
Insert oil pump drive shaft, see 11 41 000.
Replace gasket.



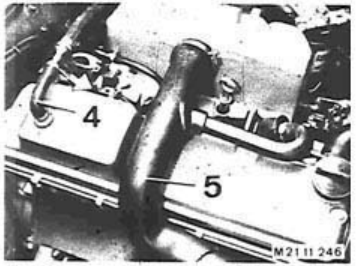
Installation:
Clean sealing surfaces.
Coat mating surfaces on timing case cover and end cover with a brush-on universal sealing compound / Three Bond Silicon 1207**.

** Source: HWB
*** See Service Information of Gr. 00

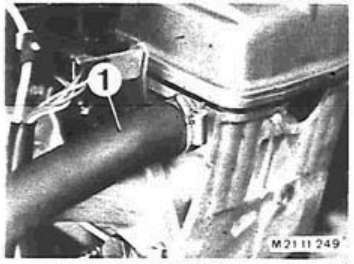


11 61 050 REMOVING AND INSTALLING INTAKE AIR MANIFOLD

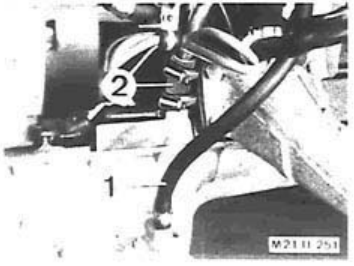
Disconnect battery ground lead.
Drain coolant in engine block and radiator.
Installation:
Pour in coolant*** and bleed cooling system, see Group 17.



Disconnect hoses (4 and 5).

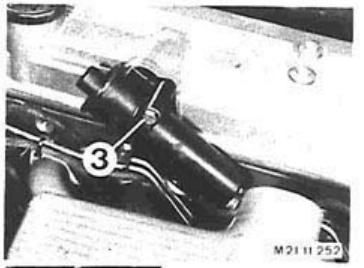


Pull off hose (1).

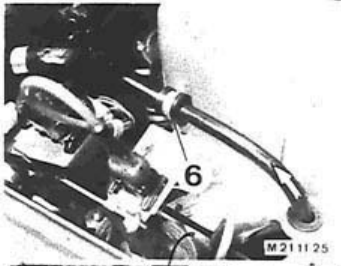


Unscrew hose (1) on oil pan.
Unscrew oil test pipe (2) and pull out from above.

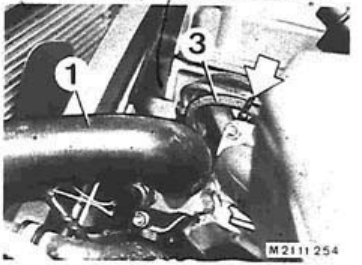
*** See Service Information of Gr. 00



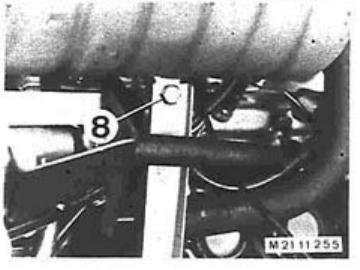
Unscrew oil trap (3) and pull out from above.
Installation:
Check seal, replacing if necessary.



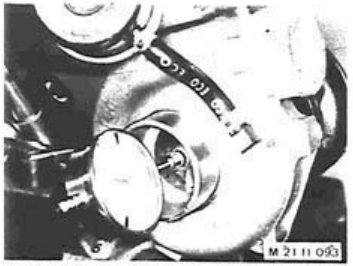
Loosen clamp (6) and disconnect positive wire for starter.

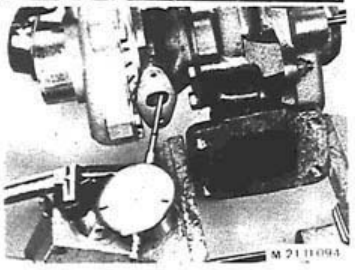


Remove hose (1).
Pull off leak line (3) and unscrew on injection line.



Unscrew manifold support (8) and manifold.
Installation:
Replace gaskets.





11 65 015 CHECKING BEARING PLAY OF TURBOCHARGER

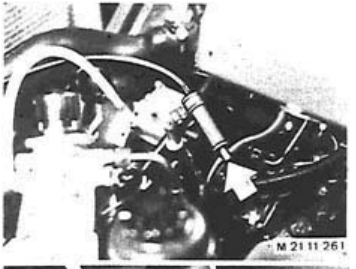
Excessive bearing play could be the cause for excessive oil in the turbocharger (which will be noticed on blue smoke) or noise.
Axial play: max. 0.15 mm (0.006").
Apply dial gage on turbocharger shaft and move shaft from stop to stop without turning.

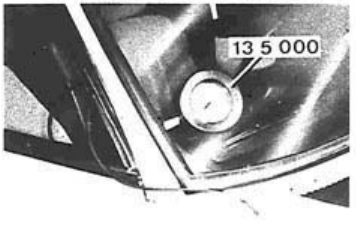
Radial play: max. 0.8 mm (0.031").
Apply dial gage on turbocharger shaft. Move turbocharger shaft from stop to stop on both ends simultaneously while turning.

11 65 018 CHECKING CHARGING PRESSURE OF TURBOCHARGER

Checking on Dynamometer Stand:
Check with help of DDE self-diagnosis (call status lists).

Operate car in load range.
Take charging pressure (absolute value including atmospheric pressure) from the charging pressure sensor display.
Specification: max. 1850 + 50 mbar.





Checking in Test Drive:
Connect pressure tester, Special Tool 13 5 000, between the intake manifold and charging pressure sensor, and place in the passenger compartment.
Make sure that the hose is not pinched.
Check charging pressure by driving car in load range (braking).
Specification:
Measured charging pressure + atmospheric pressure (see 11 65 . . .) = max. 1850 + 50 mbar.

Possible Faults When Charging Pressure Is Not Correct:
Bypass regulator (see 11 65 059).
Charging pressure sensor (see 11 65 ...)
Pressure converter (see 11 65 . . .).
Hose connections (check for leaks with a spray).
Turbocharger (shaft turns too hard, bypass).

M 21 11 3/2

11 65 020 REMOVING AND INSTALLING TURBOCHARGER

The turbocharger receives oil from the engine oil circuit. The following points are important to guarantee sufficient lubrication for the fast running turbocharger.

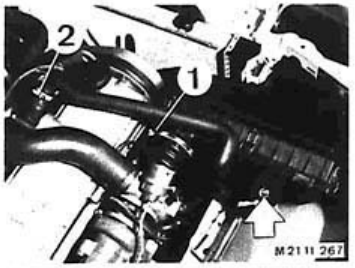
- Engine oil circuit in perfect condition (specified engine oil, oil level, crankcase venting, etc.).
- Engine not raced before building up engine oil pressure (control lamp) – engine also not stopped at high speed (turbocharger keeps on running).
- Engine not started immediately after an oil change, but instead oil pressure built up first by cranking engine with the starter (fuel shutoff electric lead disconnected – see 11 00 039).
- Excessively old engine oil could cause carbonization of the turbocharger. Carbonization could be seen on the turbocharger shaft after removing the oil pipe. In this case the engine oil and oil filter have to be replaced.

Important When Working on Turbocharger:

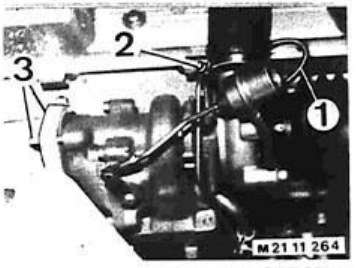
Even the most minute particles of dirt could lead to destruction of the turbocharger – therefore never operate engine without the air filter.

- If the hose on the control valve is disconnected, this could lead to overcharging and destruction of the engine when operated in full load range.

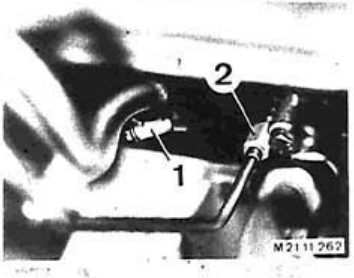
The turbocharger may not be repaired.



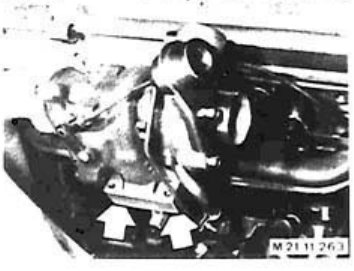
Remove air cleaner.
Disconnect hoses (1 and 2).
Unscrew nut (3) and remove air cleaner housing.



Unscrew exhaust pipe on turbocharger.
Disconnect hoses (1 and 2).
Unscrew nuts (3).
Installation:
Replace self-locking nuts.
Check gasket, replacing if necessary.
Coat studs with copper paste "CRC"**.
Tightening torque*.



Unscrew oil pipes (1 and 2).
Installation:
Replace seals.
Tightening torque*.
Check engine oil level, correcting if necessary.

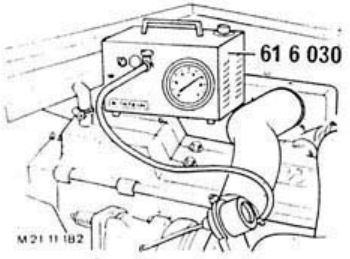


Unscrew bolts and remove turbocharger.
Installation:
Check levelness of sealing surface.
Tightening torque*.

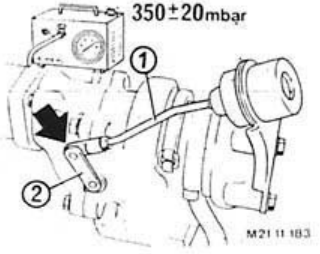
* See Specifications
** Source of Supply: HWB

11 65 059 CHECKING AND ADJUSTING BYPASS REGULATOR FOR TURBOCHARGER

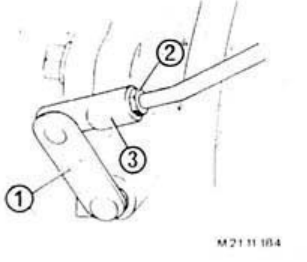
The regulating valve limits charging pressure. A regulating valve opening too early will be noticed by a drop in power and an excessively rich mixture (soot in exhaust gas). A bypass valve opening too late will cause excessive charging pressure.
Excessive charging pressure leads to overheating of the engine.



Checking:
Connect vacuum pump, Special Tool 61 6 030, on the bypass regulator.



Produce a vacuum of 350 +/- 20 mbar with the vacuum pump.
Regulating rod (1) should just barely be moved without tension by the bypass plate lever (2) with this vacuum.



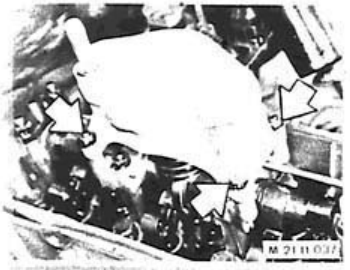
Adjusting:
Disconnect regulating rod on lever (1).
Loosen lock nut (2).
Adjust regulating rod by turning connector (3).

11 65 . . . CHECKING CHARGE PRESSURE SENSOR

The charge pressure sensor can be checked with DDE self-diagnosis by calling the status list. The charge pressure sensor of a stopped engine must display the actual atmospheric pressure.

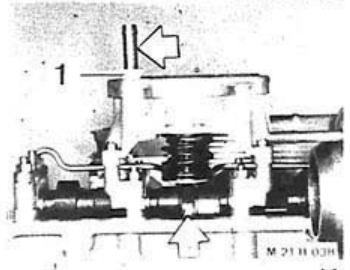
The table shown below contains only reference values. These values must be allocated a tolerance of ± 70 mbar due to fluctuations in the weather situation.

Altitude in mtr.	Atmospheric Pressure in mbar
0	1000
500	950
1000	900
1500	850
2000	800



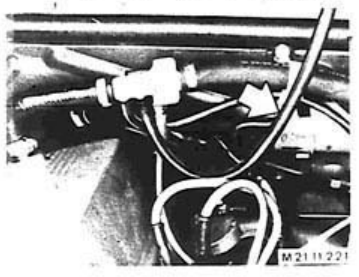
11 66 000 REMOVING AND INSTALLING VACUUM PUMP

Remove cylinder head cover – see 11 12 000.
Turn cam for vacuum pump to face down.
Unscrew nuts and take off vacuum pump.



Installation.
Mount vacuum pump that pipe connector is at rear and cam runs in opening of plunger.
Insert seal (1).

Caution!
Never run engine without mounted vacuum pump – loose cam ring.



Checking Vacuum Pump Pressure and Restrictor:
Connect BMW SERVICE TESTER on restrictor and measure pressure with engine running.

* See Specifications

12 Engine Electrical Equipment

Model: 316 Engine M10 B18 Carburettor
318i M10 B18 Injection
320i M20 B20
325i M20 B25
325e M20 B27

Primary signal of direct ignition (without distributor) – check 12- 119/3
Secondary signal of direct ignition (without distributor) – check 12- 119/3
011 Ignition coil – replace 12- 119/4
12 14 . . . Pulse sender – replace 12- 120
150 Cylinder identifying sender (RZV) – replace (M42) 12- 120/1
155 Pulse sender on vibration damper – replace (M42) 12- 120/1
160 Speed sender – replace and adjust (diesel M21) 12- 121
12 31 020 Alternator – remove and install 12- 140
020 Alternator – remove and install (M42) 12- 140/1
299 Alternator drive belt – check and tighten 12- 141
12 41 020 Starter – remove and install 12- 142
020 Starter – remove and install (M42) 12- 142/1
12 72 . . . Pedal value sender – remove and install / replace (DDE) 12- 143
. . . Accelerator pedal- with electronic engine power control – adjust 12- 143

WORKING INSTRUCTIONS FOR ENGINE ELECTRICAL AND IGNITION SYSTEMS
(TCI = Transistor Coil Ignition and DME = Digital Motor Electronics)

- Always disconnect the battery or interrupt power supply to the control unit and ignition coil when working on the electrical system, charging the battery or welding on the car – danger from primary and secondary voltage in engine and general electrical equipment (e.g. alternator).

  Never start the engine after removing the distributor cap or disconnecting the wire on ignition coil terminal 4 – pull off plug on ignition control unit.

- Never disconnect the battery or wires on the alternator and starter while the engine is running.

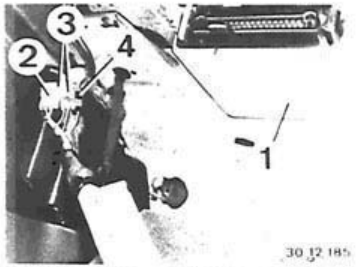
- Only use specified original BMW parts.

  Never connect a shielded capacitor or test lamp on terminal 1 of the ignition coil.

  Never connect terminal 1 of the ignition coil with ground or B +. Consequently when service installing a burglar alarm system, the terminal 1 wire must not be used for starter interlocking.

- Pull off the control unit plug in cars with TCI or the fuel injection master relay (relay 2) in cars with DME when checking the compression.

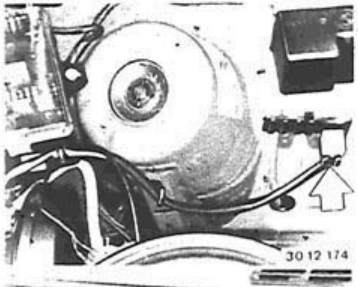
  The secondary (high voltage) side of the ignition system must be shielded with at least 4 k-ohms, whereby the original distributor rotor with 1 k-ohm must be installed. Never use a 5 k-ohm distributor rotor for interference suppression of a radio or communication set!



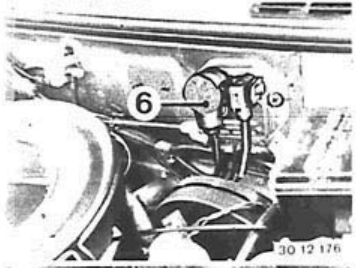
ENGINE ELECTRICAL SYSTEM

BMW 316:

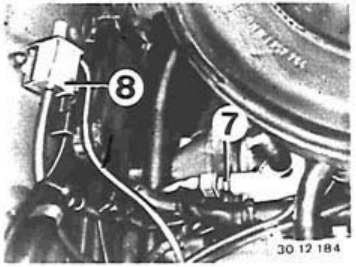
1 Control unit for 2 BE carburetor
2 Plug for main wire harness
3 Plug for speed booster (white)
4 Plug for a/c compressor (black)



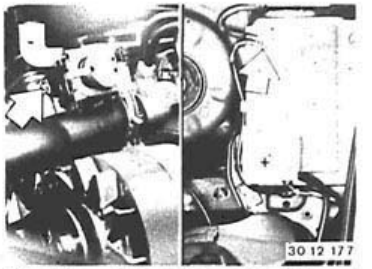
Relay for carburetor control unit.



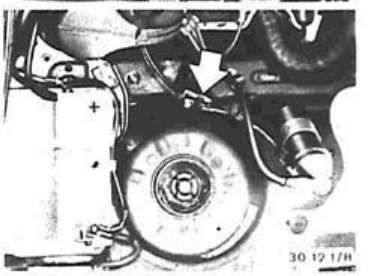
6 TCIi-S control unit
(S = ignition timing retard for starting)



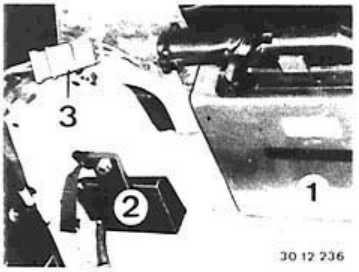
7 Air temperature sensor for 2 BE carburetor
8 Solenoid for ignition switch-over



Ground point for engine electrical system.



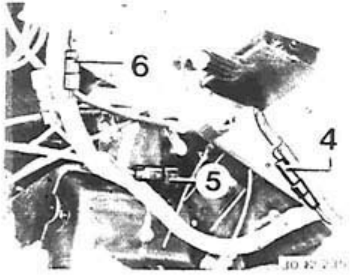
Plug for air conditioner compressor.



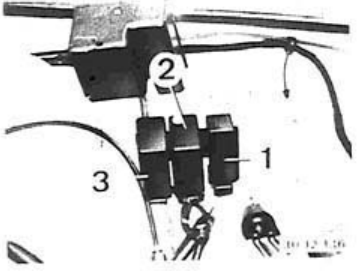
ENGINE ELECTRICAL SYSTEM

BMW 318 i:

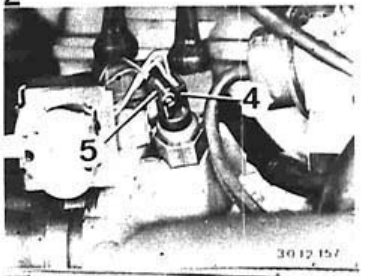
1 Control unit – L-Jetronic (see Gr. 13)
2 Control unit – idle speed regulation (see Gr. 13) .
3 Plug for car electrical system, fuel pump relay



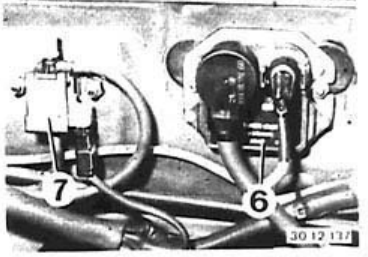
4 Plug (white) for different transmissions (wire colors: green/yellow – yellow/blue)
– disconnected in cars with automatic transmission (mixture leaned)
– connected in cars with manual transmission
5 Plug (black) for air conditioner (wire colors: blue/white)
6 Plug (red) for control unit coding (wire colors: brown/violet)



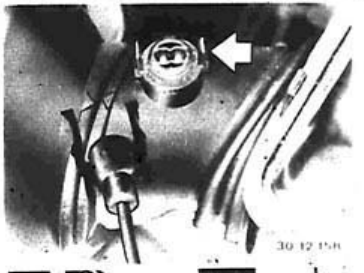
1 Relay for fuel injection, fuel pump
2 Relay for idle speed stabilization (see Gr. 13)
3 Relay for ignition switch-over



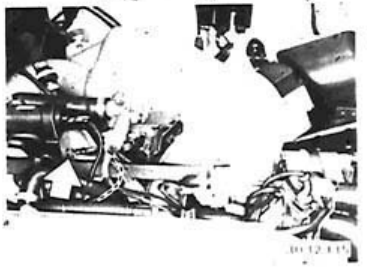
4 Temperature transmitter
5 Temperature switch for ignition switch over and idle speed regulation



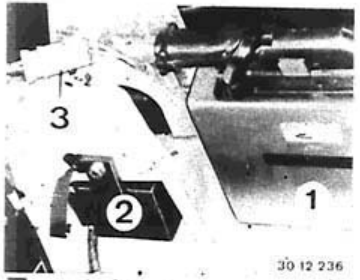
6 Control unit – TSZ-S
7 Ignition switch-over solenoid valve



Air temperature sensor for ignition switch-over



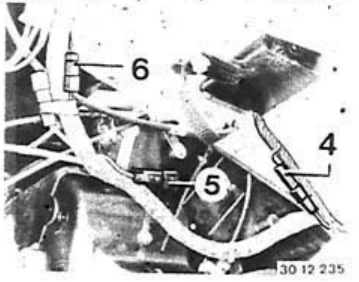
Ground point for engine electrical system



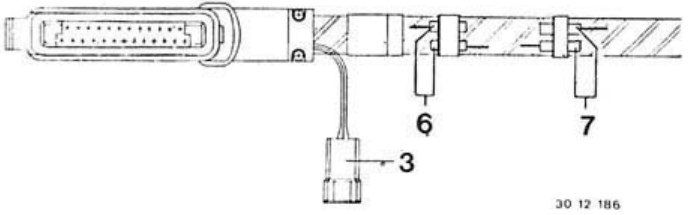
ENGINE ELECTRICAL SYSTEM

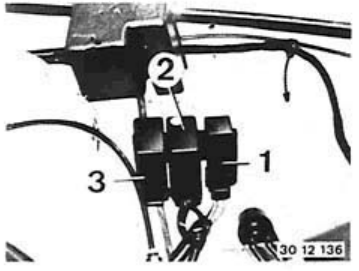
BMW 318 i Cat. Conv.:

1 Control unit – L-Jetronic (see Gr. 13)
2 Control unit – idle speed regulation (see Gr. 13)
3 Plug for car electrical system, fuel pump relay

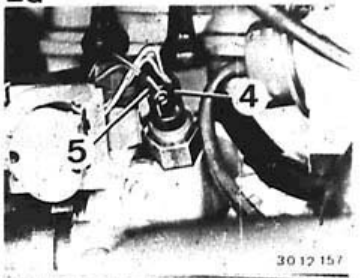


4 Plug for mixture control (white)
– disconnected in cars with automatic transmission (mixture leaned)
– connected in cars with manual transmission (mixture richer)
5 Plug for air conditioner (black)
6 Plug for control unit – coding – plug is always disconnected (red)
7 Plug for catalytic converter (green)
– connected in cars prepared for catalytic converter operation (since 3/85)

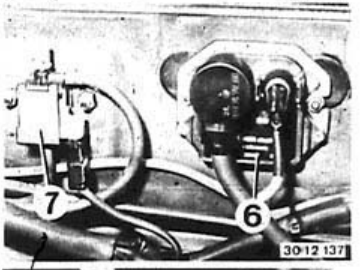




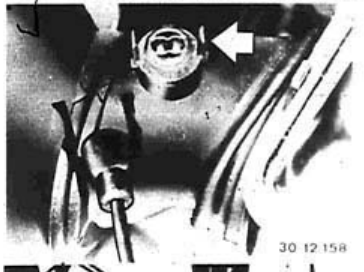
1 Relay for fuel injection, fuel pump and oxygen sensor heating
2 Relay for idle speed regulation (see Gr. 13)
Since 1986 Model:
Making relay – only with air conditioner – switches off coasting shutoff when air conditioner is operated.
3 Relay for ignition switch-over



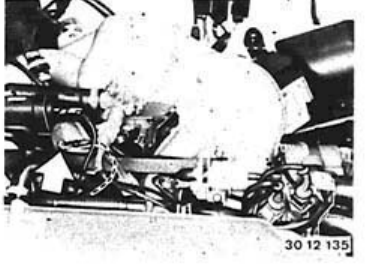
4 Temperature transmitter
5 Temperature switch for ignition switch-over and idle speed regulation



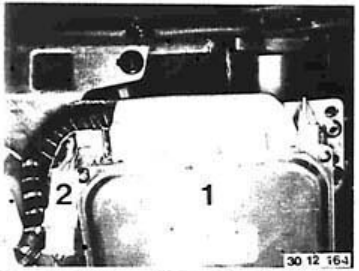
6 Control unit – TSZi-S
7 Ignition switch-over solenoid valve



Air temperature sensor for ignition switch-over

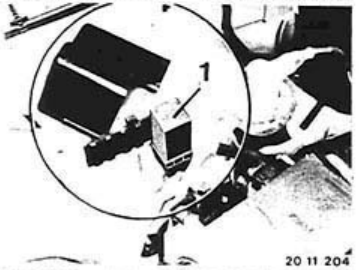


Ground point for engine electrical system

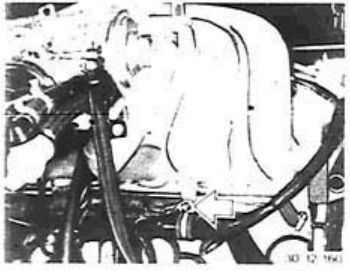


ENGINE ELECTRICAL SYSTEM

BMW 320 i / 323 i:
1 Control unit for L-Jetronic
2 Plug connection for car electrical system and fuel pump relay

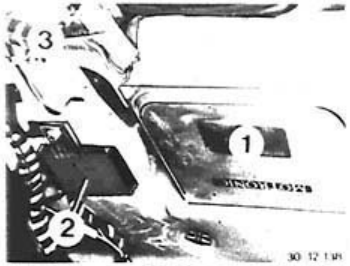


Relay for fuel injection and fuel pump

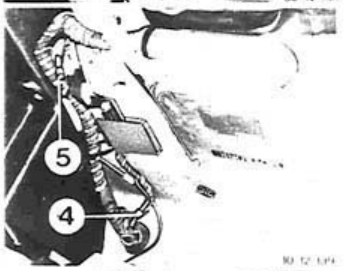


Ground point for engine electrical system

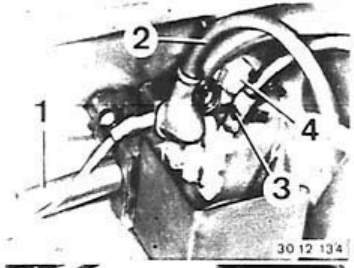
ENGINE ELECTRICAL SYSTEM



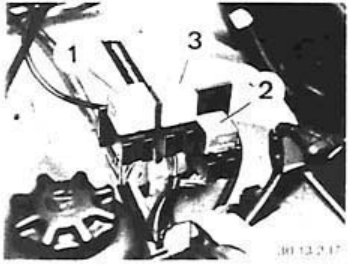
BMW 325 e Cat. Conv. Before 1986 Model:
1 Control unit for L-Jetronic (see Gr. 13)
2 Control unit for idle speed regulation (see Gr. 13)
3 Plug connection for car electrical system, fuel pump relay



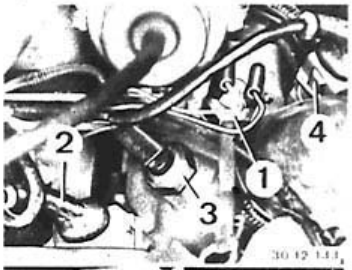
4 Plug connection for mixture control
– disconnected in cars with automatic transmission (leaner mixture)
– connected in cars with manual transmission (richer mixture)
5 Plug connection for air conditioner



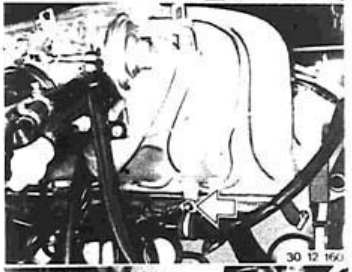
1 Battery positive lead
2 To engine electrical system
3 To car electrical system
4 0° C (32° F) switch for idle speed regulation



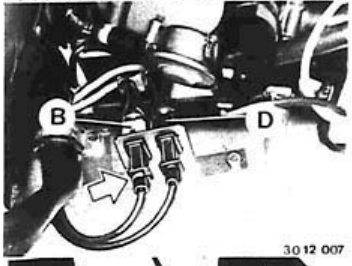
Relay 1 for fuel pump
Relay 2 for fuel injection
Relay 3 for oxygen sensor heating



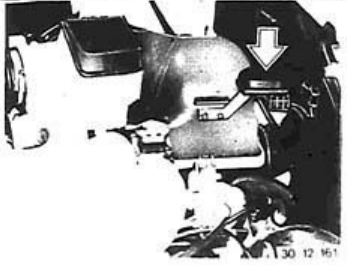
1 Temperature switch for idle speed regulation
2 Coolant temperature sensor for L-Jetronic
3 Temperature transmitter
4 Temperature time switch



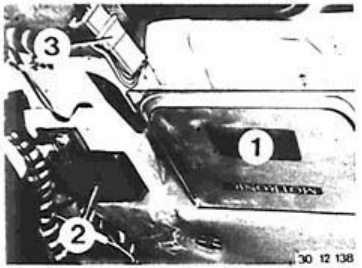
Ground point for engine electrical system



Plug connection for reference mark sensor (B) and speed sensor (D)

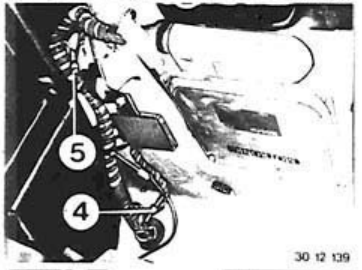


Pressure sensor for partial load enrichment (see Gr. 13 for information)

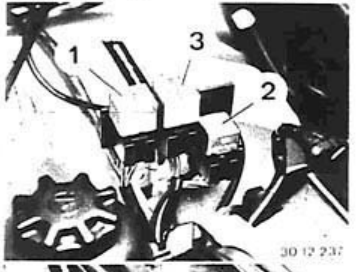


ENGINE ELECTRICAL SYSTEM

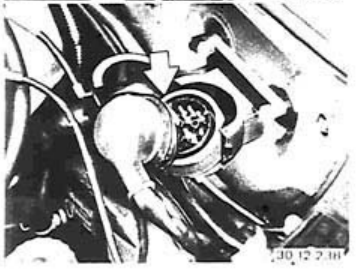
BMW 325 e Cat. Conv. Since 1986 Model:
1 Control unit for DME (see Gr. 13)
2 Control unit for idle speed regulation (see Gr. 13)
3 Plug for car electrical system, fuel pump relay



4 Plug for different transmissions (wire colors: green/yellow – blue/brown)
– disconnected for automatic transmission (leaner mixture)
– connected for manual transmission
5 Plug for air conditioner (wire colors: blue/white)

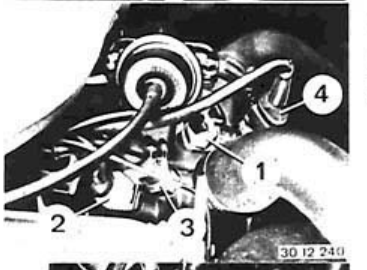


Relay 1 for fuel pump
Relay 2 for DME
Relay 3 for oxygen sensor heating

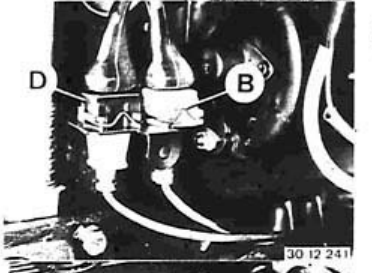


Engine wire harness plug (20 pins)
Installation:
The screw-on cap locks in final position.

Ground point for engine electrical system
Diagnosis plug

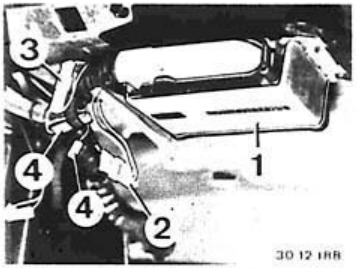


1 Temperature switch 45° C (113° F) for idle speed regulation
2 Coolant temperature sensor for DME
3 Temperature transmitter
4 Temperature time switch



Plug for reference mark sensor B (gray) and speed sensor D

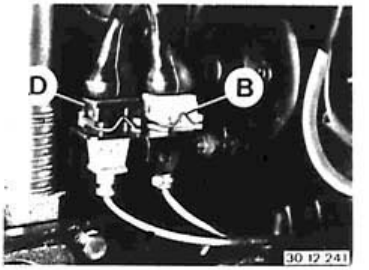
Pressure sensor (see Gr. 13)



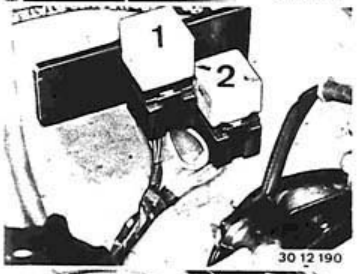
ENGINE ELECTRICAL SYSTEM

BMW 325 i:

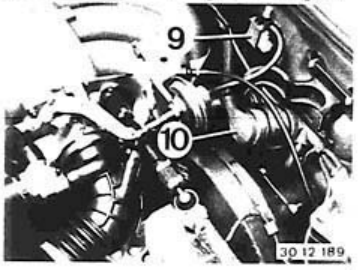
1 Control unit for DME
2 Plug for car electrical system and fuel pump relay (3 pins)
3 Plug for transmission (2 pins)
– disconnected for automatic transmission (leaner mixture)
– connected for manual transmission
4 Plug for injection control (1 pin)



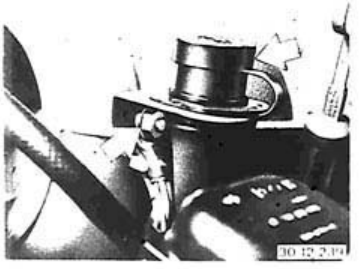
Reference mark sensor (B) gray
Speed sensor (D)



1 Relay for fuel pump
2 Relay for fuel injection

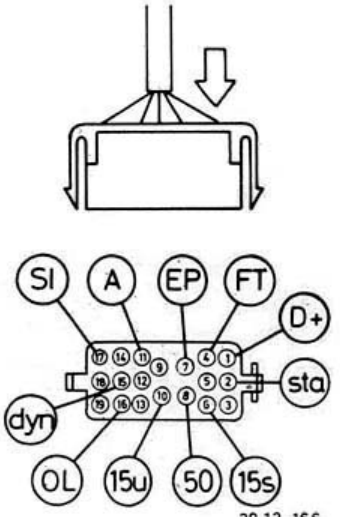


9 Solenoid for throttle valve positioner (only all wheel drive cars)
10 Engine wire harness plug



Ground point for engine electrical system.
Diagnosis plug.

CONNECTION PLAN FOR ENGINE WIRE HARNESS PLUG



Up to 1985 Models

No.	Term.	Description
1	D+	Alternator charge indicator
2	sta	Oil level - static
3	–	–
4	FT	Coolant temperature gage
5	–	–

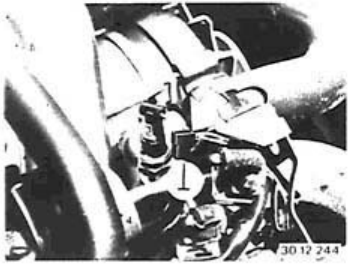
12 11 004 CHECKING AND ADJUSTING IGNITION TIMING
– 4 Cylinder Models –

Caution!
Refer to page 12 - 0 for instructions when working on the engine electrical system.
Testing Conditions:
- Apply the plug-in TDC transmitter.
- Engine at operating temperature
  Oil temperature > 60° C (140° F).
- Distributor/DME control unit number** must agree with specifications on the nominal value microfiche.

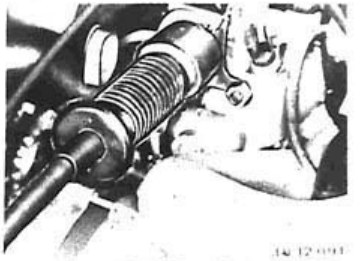
Connect BMW service tester or BMW digital tester to operating instructions.

Models with NOx Control:
The NOx control unit is series connected with ignition control unit as a second control unit.
Operation of the NOx control must be stopped to check the ignition timing.

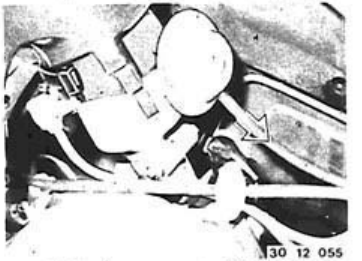


Pull off 4.8 mm (0.189") plug on 17° C (63° F) temperature switch and connect on ground.
Check/adjust ignition timing.
The ignition timing of cars with NOx control will be retarded by approx. 10° at about 1500 rpm.

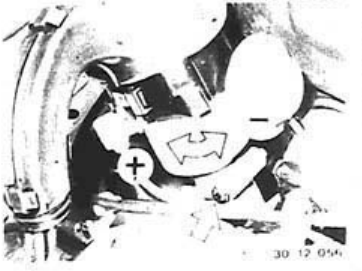
** See Specifications



Checking Dwell Angle:
The dwell angle is given by design and can be checked, but not adjusted.
The ignition control unit is no longer ready for use in case of malfunction.



Checking/Adjusting Ignition Timing*:
Pull off vacuum hose for advance ignition control.



Start and accelerate engine to test speed*.
Check ignition timing*, adjusting if necessary.
Correct by loosening the bolt and turning the distributor accordingly.
+ = ignition timing advanced
– = ignition timing retarded

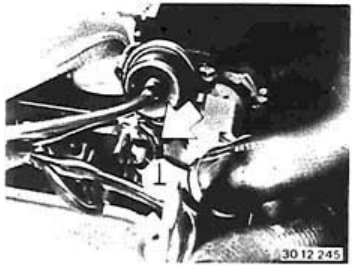
* See Nominal Value Microfiche

12 11 004 CHECKING AND ADJUSTING IGNITION TIMING – 6 Cylinder Models –

Caution!
Refer to page 12 - 0 for instructions when working on the engine electrical system.
Testing Conditions:
- Check for correct installed position of TDC transmitter to the vibration damper.
- Engine at operating temperature = oil temperature > 60° C (140° F).
- Distributor/DME control unit numbers** must agree with specifications on the nominal value microfiche.

Connect BMW service tester or BMW digital tester to operating instructions.

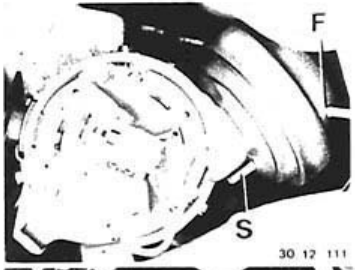
Models with NOx Control:
- The NOx control is integrated in the DME control unit of DME engines with NOx control.
  The ignition timing at idle speed is not influenced.
- The NOx control unit is series connected with the ignition control unit as a second control unit in case of engines with TCI. Operation of the NOx control must be stopped to check the ignition timing.



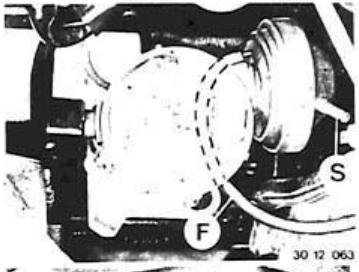
Pull off 4.8 mm (0.189") plug on the 17° C (63° F) temperature switch and connect on ground..
Check/adjust ignition timing.
The ignition timing of cars with NOx control will be retarded by approx. 10° at about 1500 rpm.

** See Specifications

Checking Dwell Angle:
The dwell angle is given by design and can be checked, but not adjusted.
The DME control unit is no longer ready for use in case of malfunction.

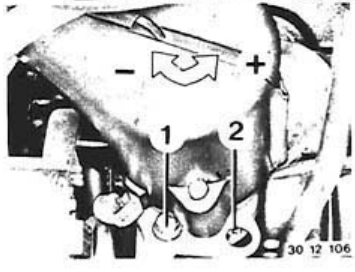


Checking/Adjusting Ignition Timing* – Cars with Distributor Engine:
Pull off vacuum hoses.
F = advance ignition control (black)
S = retard ignition control (black/white)
Cars with Automatic Transmission:
No hose for retard ignition control – connection on vacuum box not used.



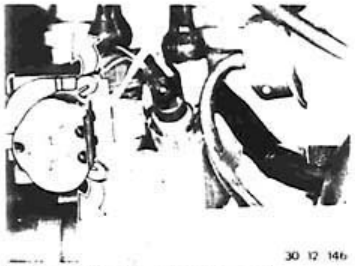
Important!
The ignition control boxes are inversed on distributors with larger diameter vacuum hose connections – see pictures.
F = advance control (black) (4 mm/0.157" dia.)
S = retard control (black/red) (8 mm/0.315" dia.)

DME Engine:
Ignition timing corrections are not possible.



Start and accelerate engine to test speed*.
Check ignition timing*, adjusting if necessary.
Correct by loosening bolt (1) and turning the distributor on splines (2) accordingly.
+ = ignition timing advanced
– = ignition timing retarded

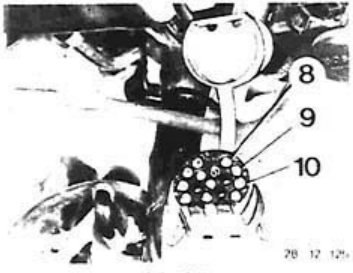
* See Nominal Value Microfiche



12 11 031 REPLACING TDC POSITION SENSOR

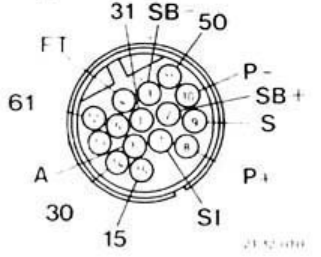
Unlock clips and take diagnosis socket out of holder.

Press female plugs out of chambers (8, 9 and 10) with special tool**.

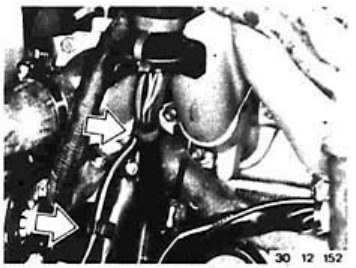


Installation:
Connect new TDC sensor as illustrated.

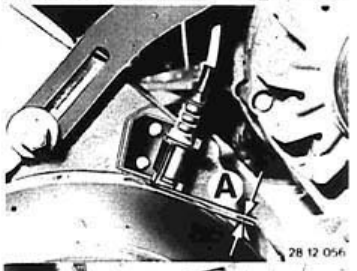
Number	Wire Color
8 (P+)	yellow
9 (S)	shielding
10 (P–)	black



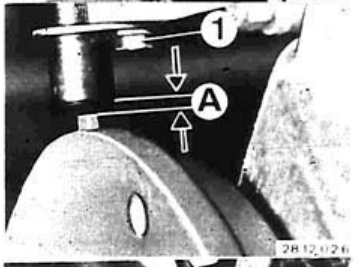
** Source: HWB



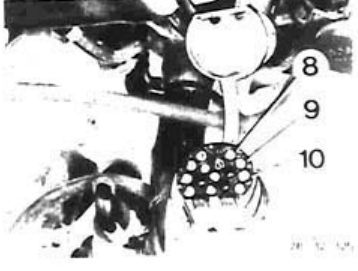
Disconnect wire on wire harness and holder



M 20:
Lift TDC position sensor out of clamp.
Installation:
Make sure sensor fits correctly.
Keep clearance A between sensor and vibration damper to 0.2 ... 2.0 mm (0.008 to 0.079").

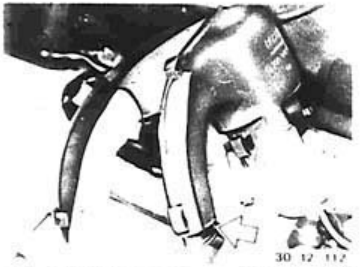


M 30:
Unscrew TDC position sensor on holder (1).
Keep clearance (A) between 0.2 and 2.0 mm (0.008 and 0.079").



Testing:
Measure resistance* on connections 8 and 10
Check insulation between 8 / 9 and 9 / 10.

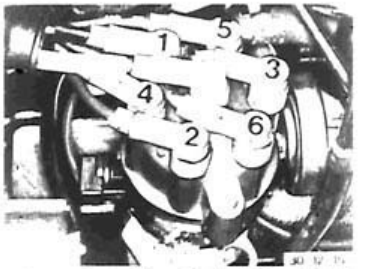
* See Specifications



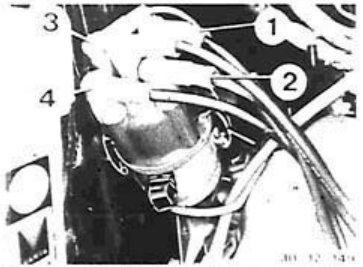
12 11 091 REPLACING DISTRIBUTOR CAP

Caution!
See page 12 - 0 for instructions when working on engine electrical system.

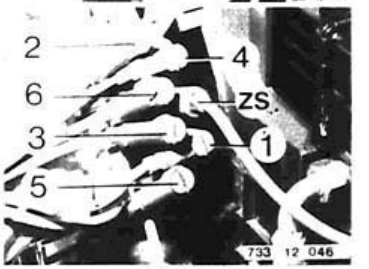
M 10 Engines:
Take off protective cap.
Installation:
Have retaining clips engage correctly.
Attach retaining strap.



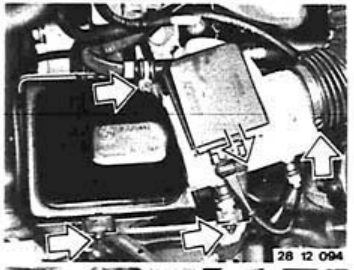
Pull off shielded plugs.
Installation:
Check firing order.



Open retainers and take off distributor cap.
Pull out shielded plugs.
Installation:
Check firing order.

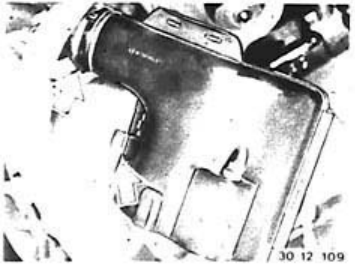


M 20 B 25 / B 27 Engines:
Take off protective cap.
Pull out shielded plugs.
Installation
Check firing order.

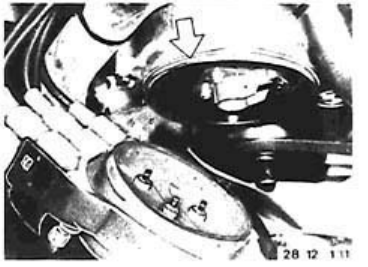


M 20 B 20 / B 23 Engines:
Remove air cleaner with air flow sensor.

Unscrew screws and take off distributor cap.
Caution!
Danger of cutting hands on radiator fins.



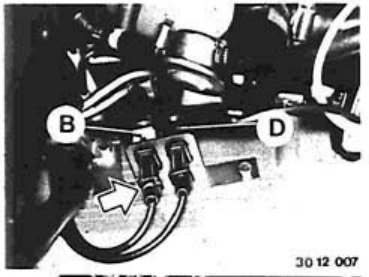
Turn both toggles 90° and take off distributor cap.
Take off protective cap.
Installation:
Mount sealing sleeve with tape.
Install retaining clips.



Installation:
Check seal, replacing if necessary.

12 14 510/ 515 REPLACING SPEED OR REFERENCE MARK SENSOR

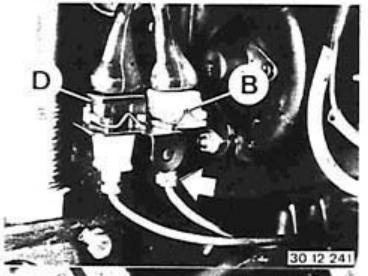
Disconnect plugs.



30 12 007

Before 1986 Models:

Installation:
Connect gray plug of reference mark sensor (B) and plug with tape.



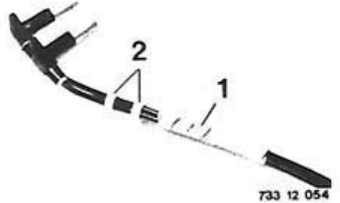
30 12 241

Since 1986 Models:

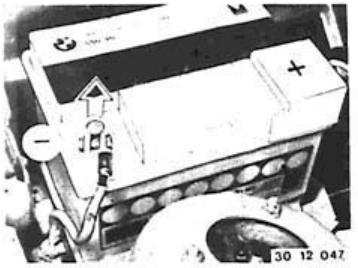
Unscrew sensor on transmission case and pull it out.

30 12 243

Installation:
Transfer protective sleeve with clips.
Lubricate seal with Molykote paste.
Keep grease and dirt off of face of sensor.
Mark new reference mark sensor with tape.

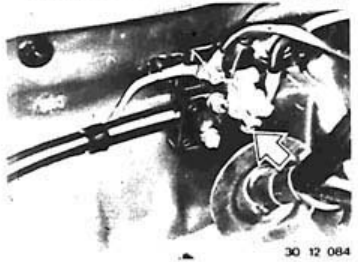


733 12 054

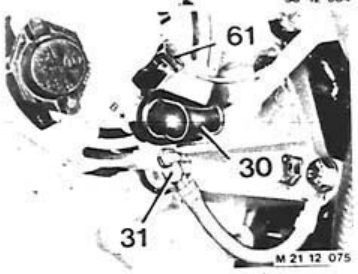


12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR

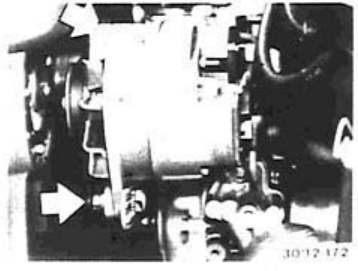
Disconnect battery ground lead.



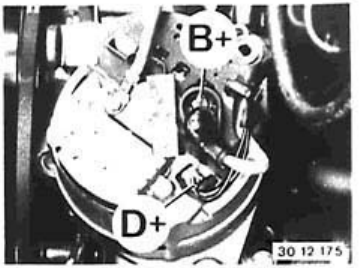
Disconnect battery terminal on connector – only applicable for 325 e/i cars.



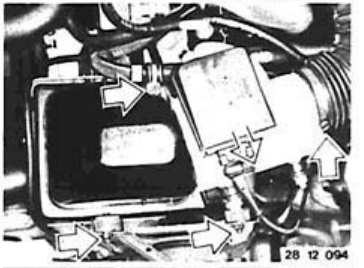
65 A Bosch Alternator:
Disconnect leads on connections B + (term. 30) and D + (term. 61).
Unscrew ground lead (term. 31).



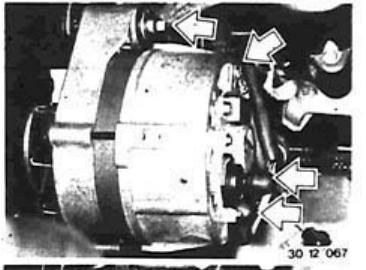
65 A Motorola Alternator:
Unscrew nuts and pull out bolts.
Remove alternator.



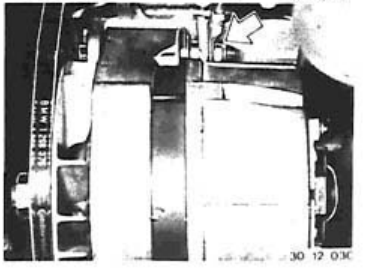
Disconnect connections D + (term. 61) and B + (term. 30).
Installation:
Tighten drive belt see 12 31 299



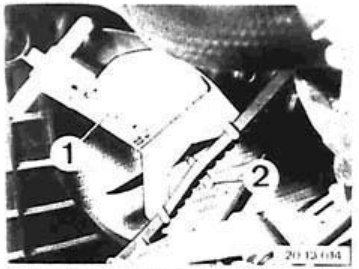
80 A Bosch Alternator:
Remove air cleaner and air flow sensor.
Unscrew holder for engine wire harness



Unscrew nut and remove bolt with tensioning wheel.
Remove leads on connections B + and D +.
Loosen cable clip and disconnect ground lead.

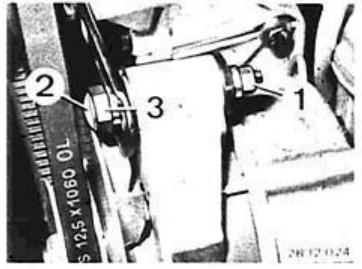


Unscrew nut and pull out bolt.
Remove alternator.
Installation:
Tighten drive belt – see 12 31 299.
Check degasing tank, discharging if necessary – see 12 32 000.

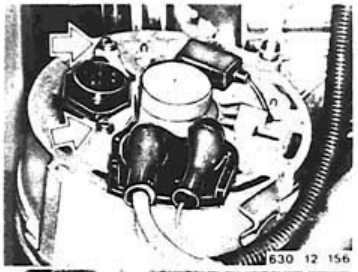


12 31 299 CHECKING / TIGHTENING ALTERNATOR DRIVE BELT

Check drive belt tightness with Special Tool 11 5 020, tightening if necessary.
Pulling hook (2) must be applied in center of teeth.
Gage needle must be located on scale above the green or yellow range.



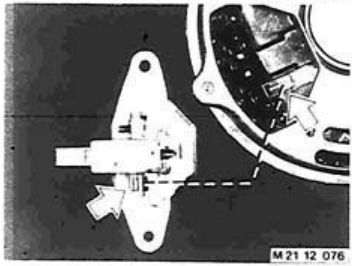
Tightening Drive Belt:
Loosen nut (1) and turn tensioning wheel (3) with a torque of about 7 Nm (5 ft. lbs.).
Tighten nut (1).
Recheck tightness with special tool tester, correcting if necessary.



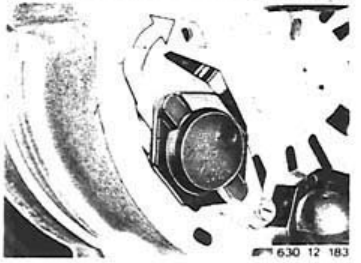
12 32 000 REMOVING AND INSTALLING/ REPLACING VOLTAGE REGULATOR

Bosch Alternator:
Unscrew bolts and take off regulator carefully.

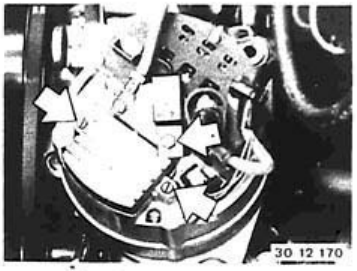
Check slip rings for wear, fine grinding and polishing if necessary.



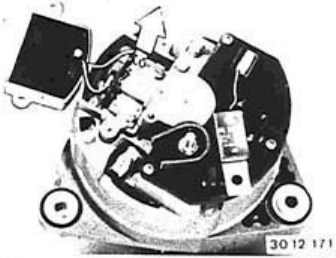
Clean contact surfaces and tension of contact springs, correcting if necessary.



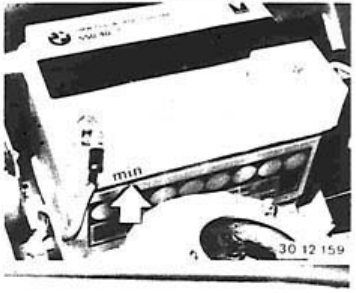
Installation:
First mount regulator with one bolt finger tight, then press regulator to final installed position and finally tighten both bolts.



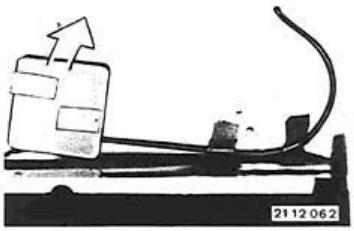
Motorola Alternator:
Remove shielded capacitor.
Unscrew screws.



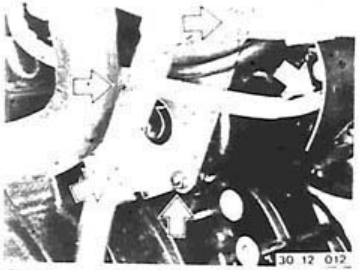
Pull off connecting plug and remove regulator.
Installation:
Wire colors must match colors of the connectors.



Check/correct battery acid level after replacing the voltage regulator.
Check charging current of the alternator with a BMW service tester (Engine Test P 02).



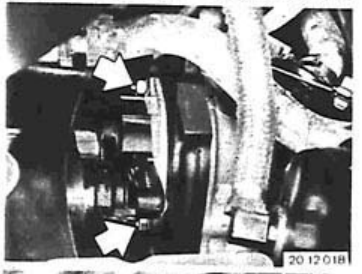
BMW 325 e/i:
Check degasing tank, emptying if necessary.



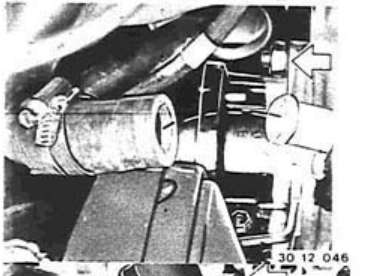
12 41 020 REMOVING AND INSTALLING STARTER

Disconnect battery ground lead.

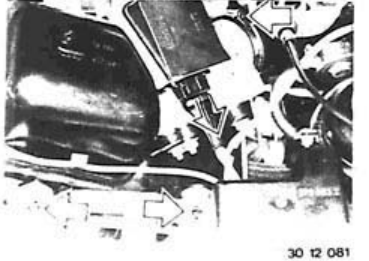
4 Cylinder Models with Carburetor:
Unscrew holder.
Disconnect wires on solenoid switch.
Installation:
Run battery lead through rubber guard.



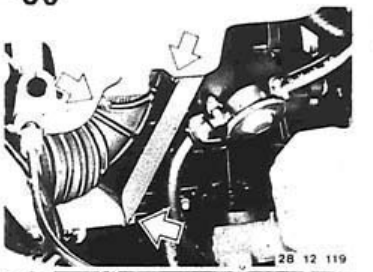
Unscrew nuts and remove starter.



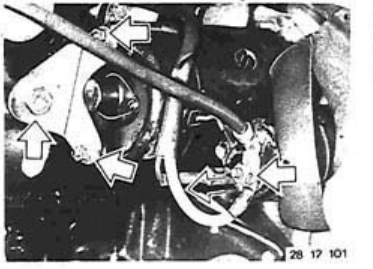
4 Cylinder Models with L-Jetronic:
Drain coolant in engine.
Disconnect hoses for heater.
Unscrew nuts with starter wrench**.
Installation:
Add coolant* and bleed cooling system – see 17 00 039.



Remove air cleaner with air flow sensor.

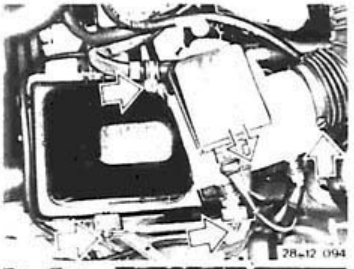


Remove dust cover and support for intake manifold.

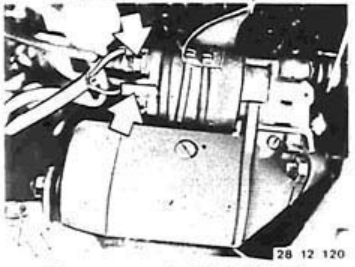


Disconnect wires (term. 30 and 50).
Unscrew support.
Unscrew lower mounting point and take off starter.

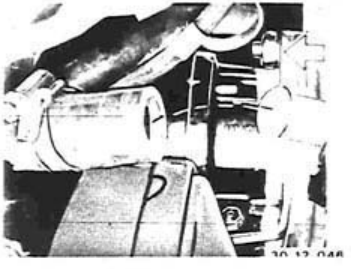
* See Service Information of Gr. 00
** Source: HWB



M 20 B 20 / B 23 Six Cylinder Models:
Disconnect battery ground lead.
Remove air cleaner with air flow sensor.

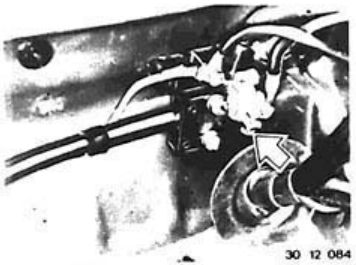


Jobs Performed from Underneath:
Disconnect leads (term. 30 and 50).
Unscrew support and lower mounting point.

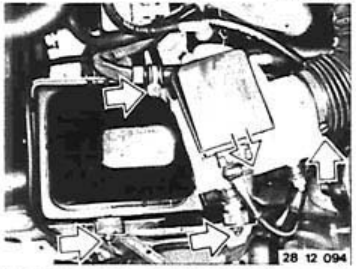


Drain coolant in engine.
Disconnect hoses for heater.
Unscrew nut with starter wrench**.
Remove starter from above.
Installation:
Add coolant* and bleed cooling system – see 17 00 039.

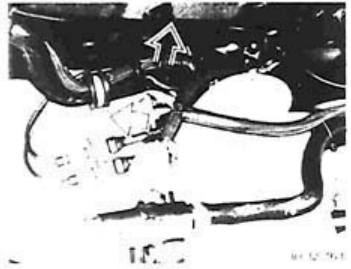
* See Service Information of Gr. 00
** Source: HWB



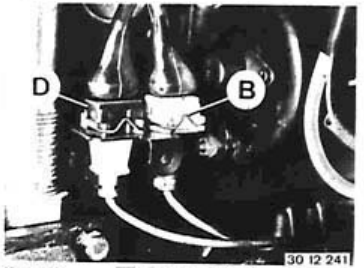
M 20 B 25 / B 27 Six Cylinder Models:
Disconnect positive lead on connector.



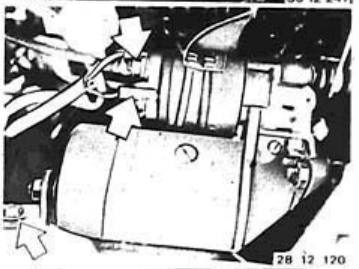
Remove air cleaner with air flow sensor.



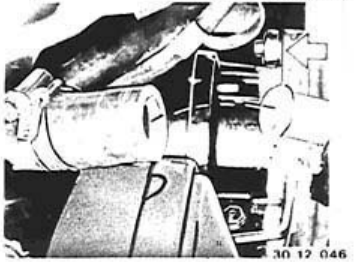
Loosen wire clips and pull up engine wire harness.



Since 1986 Models:
Disconnect plugs for reference mark sensor (B) (gray) and speed sensor (D).

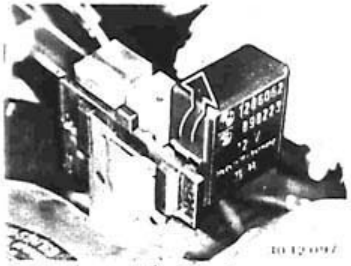


Disconnect leads (term. 30 and 50).
Unscrew support.
Unscrew nut from underneath.
Remove starter.



Drain coolant in engine.
Disconnect hoses for heater.
Unscrew nut with starter wrench**.
Installation:
Add coolant and bleed cooling system – see 17 00 039.

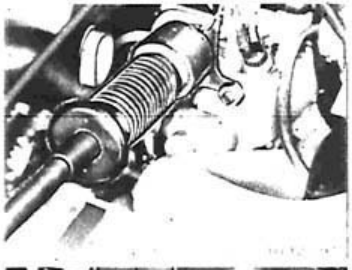
** Source: HWB



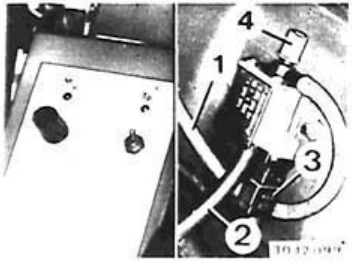
12 63 075 CHECKING IGNITION SWITCH-OVER SYSTEM

BMW 318 i Cat. Conv.:
Take off protective cap.
Unlock and pull up relay.
Pull off plug.

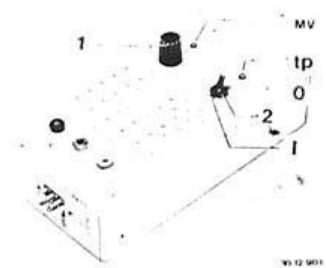
Connect relay (3) and plug (4) on ignition switch-over simulator, Special Tool 12 1 460.
Set switch (1) on simulator to position A.



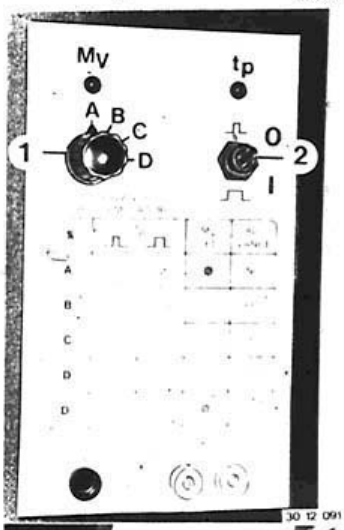
Connect BMW service tester or BMW digital tester.
Perform engine test 06 and ignition timing test.
The ignition timing displayed now will be "RETARDED" approx. 20° on crankshaft by the simulator.



Lamp "MV" on simulator will be on – the solenoid valve is activated.
Hose (1) is charged.
1 To vacuum control on distributor
2 To intake manifold or throttle housing
3 Electric simulator activation

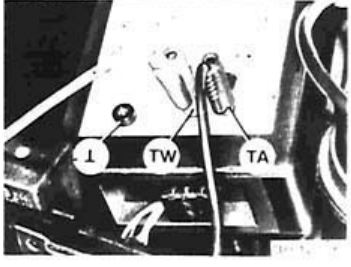


Lamp "tp" (injection signal from L Jetronic control unit) flashes throughout the entire test.
Switch 1 = Test position selector
Switch 2 = Injection signal variator (O/I)



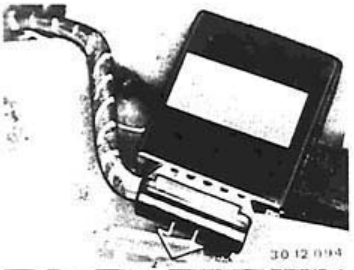
Perform tests A through D in conformance with survey printed on simulator.
Example:
Switch 1 at position D.
Switch 2 at position O.
Lamp MV not on – this means the vacuum control has vacuum.
ADVANCE = Vacuum advance control working
EITHER POSITION = Switch 2 can be in any desired position.

Refer to troubleshooting table for ignition switch-over system, if conditions specified for testing do not occur.

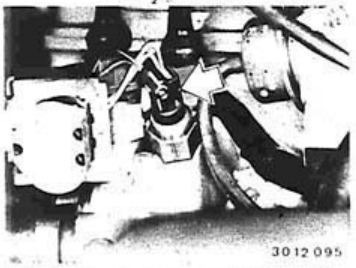


Resistance values* for coolant temperature and intake air temperature sensors can be taken from the plug sockets.
⊥ = Ground
TW = Coolant temperature
TA = Intake air temperature

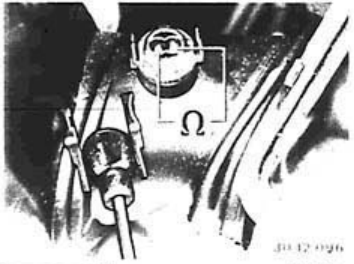
* See Specifications



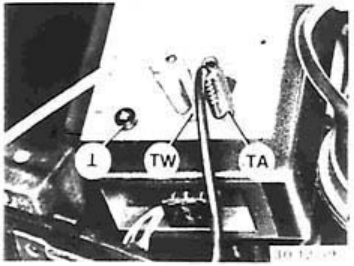
If the coolant temperature switch is tested at a temperature below 45° C (113° F), plug must be pulled off of idle speed control unit (in glove box above L-Jetronic control unit).



Check resistance* of coolant temperature switch.



Check resistance* of intake air temperature sensor.



Temperature sensors remain connected for testing with the simulator.

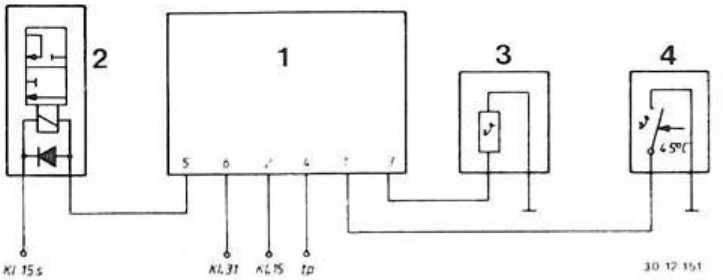
* See Specifications

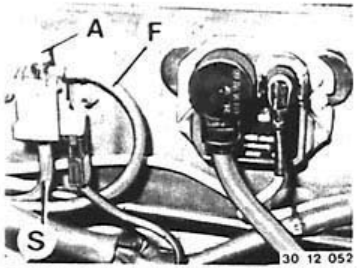
TROUBLESHOOTING IGNITION SWITCH-OVER SYSTEM

Connect ignition switch-over simulator, Special Tool 12 1 460
Run engine at idle speed.

Lamp tp not flashing	– No tp signal from L-Jetronic control unit or no power supply to simulator. L-Jetronic control unit connections or wire harness defective. Engine running erratically or not running.
Lamp MV not on	– No power supply to simulator. Wire harness to simulator defective. Ignition switch-over relay defective.
No advance control	– Ignition switch-over relay defective. Connections or wire harness for solenoid valve defective.
Ignition timing not reached with vacuum activated vacuum control	– Solenoid valve defective. Vacuum hose leaks. Vacuum control defective.

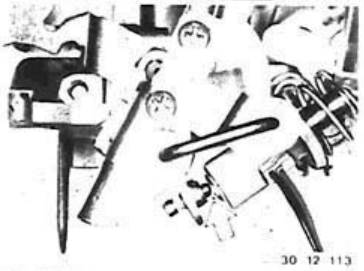
1 Ignition switch-over relay
2 Solenoid valve (red cap)
3 Air temperature sensor
4 Coolant temperature switch



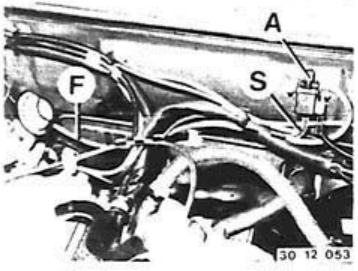


12 63 ... CHECKING SOLENOID VALVE FOR IGNITION SWITCH-OVER

Cars with 2 BE Carburetor:
Connections:
F = To vacuum control
S = To carburetor flange
A = Discharge (red cap)



Checking:
Turn on ignition.
Power is supplied to the solenoid valve with the idle speed switch closed (see figure) and a temperature above 20° C (68° F) (from intake manifold temperature sensor).



Hose F is discharged via cap A at idle speed – no advance control.
Power supply – see wiring diagram and "Troubleshooting 2 BE Carburetor" in Group 13.

See Group 11 for solenoid valves in conjunction with emission reduction.

INSTRUCTIONS FOR WORKING ON IGNITION, DME (DIGITAL MOTOR ELECTRONICS) AND ENGINE ELECTRICAL SYSTEMS

- Always disconnect the battery or unscrew the ground lead on the ground connection point (rear right seat) or interrupt power supply for the ignition coil for any type of work on the electrical system, charging the battery or welding jobs – dangerous high tension voltage! Dangerous high tension voltage in engine and car electrical systems (e.g. on the tachometer).

- The secondary (high tension) side of the ignition system must have a load of at least 4 k-ohms.

- The engine must not be started as long as the distributor cap is removed or the electric lead is disconnected on ignition coil terminal 4.

- Neither shielded capacitors nor test lamps may be connected on terminal 1 of the ignition coil.

- Electric lead of ignition coil terminal 1 must never be connected on ground or B + Therefore the terminal 1 lead may not be used to interlock engine starting when service installing a burglar alarm system.

- Never disconnect the battery or electric leads on the alternator and starter while the engine is running.

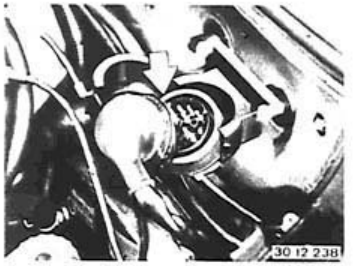
INSTRUCTIONS FOR WORKING ON DIESEL ENGINE ELECTRICAL SYSTEMS

- Always disconnect the battery for any type of work on the electrical system, charging the battery or welding jobs.

- Never disconnect the battery or electric leads on the alternator and starter while the engine is running.

- Only carry out jobs on the electrical system with the ignition turned on after disconnecting the preheating time control unit – in order to prevent destruction of the heater plugs.

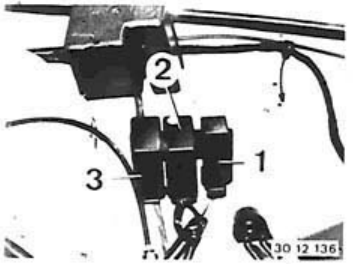
- Only use specified original BMW components.



LAYOUT OF ENGINE ELECTRICAL SYSTEM

BMW 316 i Cat. Conv./M 10:

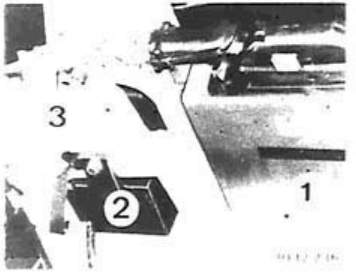
1 Engine wire harness plug



1 Relay for fuel injection, fuel pump and oxygen sensor heating

2 Relay for idle speed stabilization (see Group 13 for information) since 1986 model
Making relay – only with air conditioner switches off coasting shutoff when air conditioner is running.

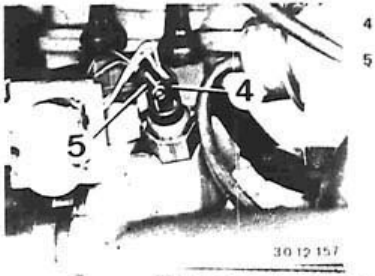
3 Relay for ignition switchover



1 L-Jetronic control unit (see Group 13)

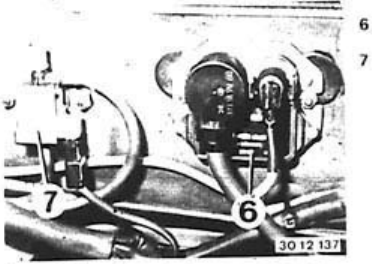
2 Idle speed control unit (see Group 13)

3 Plug for car electrical system fuel pump relay



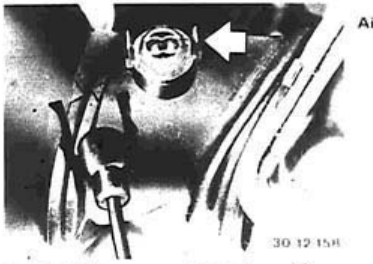
4 Temperature sender

5 Temperature switch for ignition switchover and idle speed control

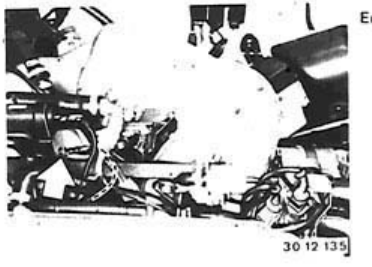


6 Ignition control unit (TCI-S)

7 Solenoid for ignition switchover

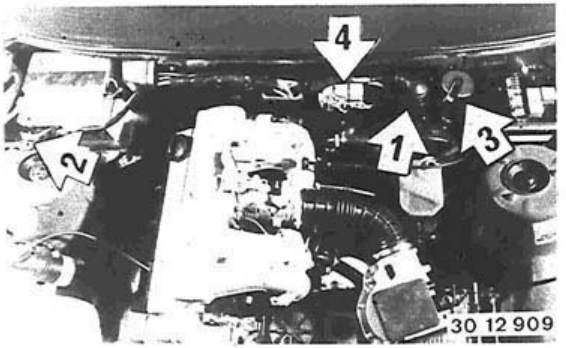


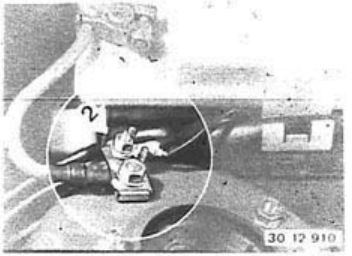
Air temperature sensor for ignition switchover



Engine electrical system ground point

M 40 (M 1.3):



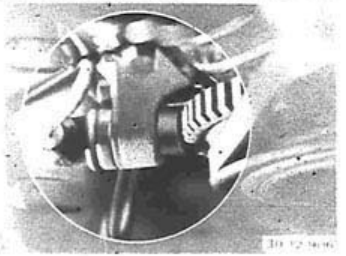


1 Plug

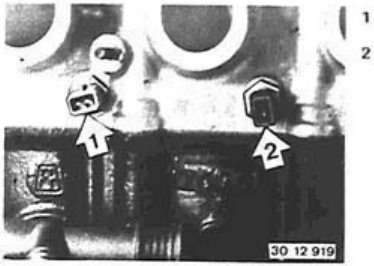
2 Engine electric and electronic ground point

3 Diagnosis socket

4 Relay (DME/electric fuel pump/oxygen sensor)

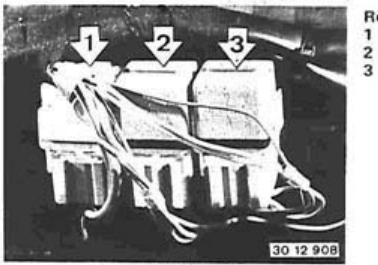


Inductive pulse sender

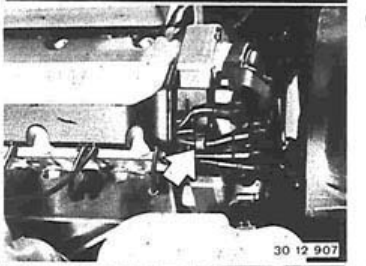


1 Coolant temperature sensor (DME)

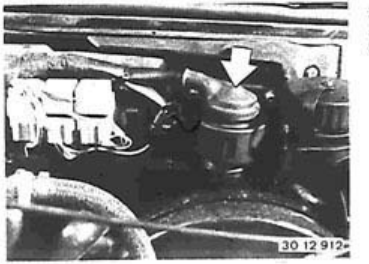
2 Temperature sender



Relay Arrangement:
1 DME
2 Electric fuel pump
3 Oxygen sensor

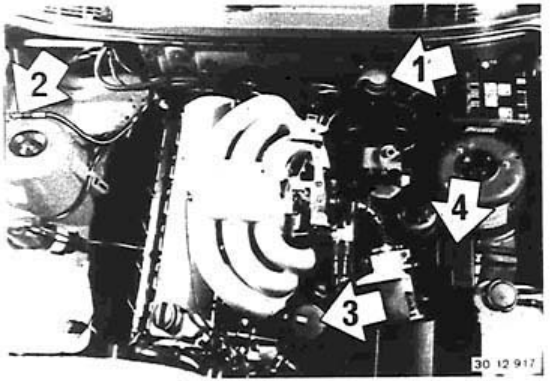


Cylinder identifying sender

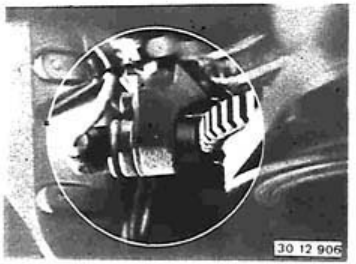


20-pin engine wire harness plug
Installation:
Screwed connector engages in final position.

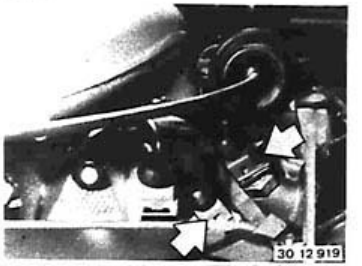
Engine Electrical Equipment Layout
M 20 (M 1.1) 320 i / 325 i



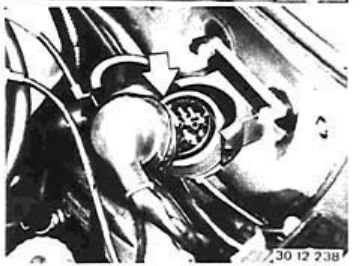
Layout:
1 = Engine wire harness plug
2 = Enine electric/electronic grd. point
3 = Diagnosis socket
4 = Relay connection point
Note:
Touring (Station Wagon) Models:
Battery located at front right.



Inductive pulse sender

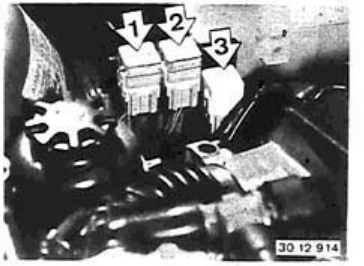


Coolant temperature sensor (DME) (blue)
Temperature gage



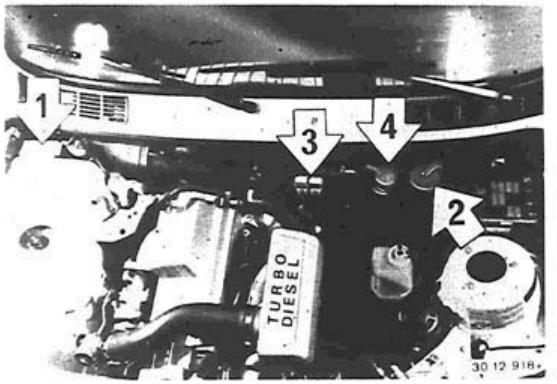
20-pin engine wire harness plug
Installation:
Screwed connection engages in final position.

Cylinder identifying sender



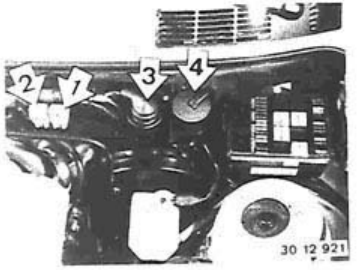
Relay Arrangement:
1 DME
2 Electric fuel pump
3 Oxygen sensor

Location of M 21 Engine Electric Components

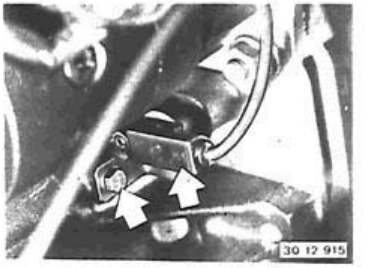


1 Heating time control unit
2 Diagnosis socket
3 Fuel filter heating relay
4 Engine plug

Note:
Battery of "touring" models is located front right.

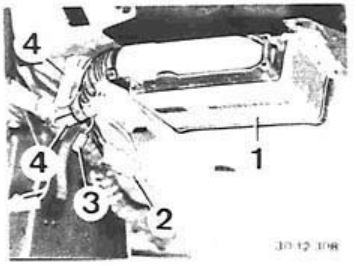


1 Pole mixup protection relay
2 Fuel heating relay
3 Engine plug
4 Diagnosis socket



Speed sender

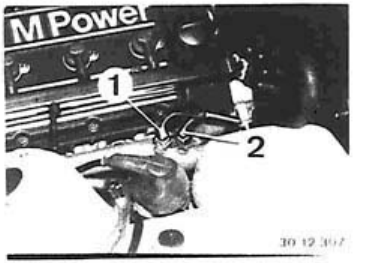
Adjustment – see 12 - 121.



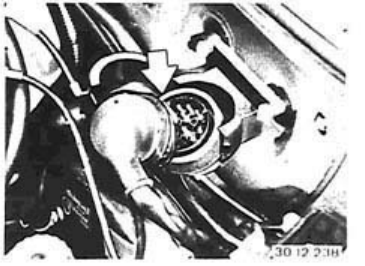
Location of S 14 Engine Electric Components in M3 Models:

Underneath trim panel in glove box.

1 DME control unit (see Group 13)
2 Car wire harness plug conn.
3 Air conditioner plug conn.
4 Fuel version plug conn. (see Group 13)



1 Coolant temperature sensor
2 Temperature gage

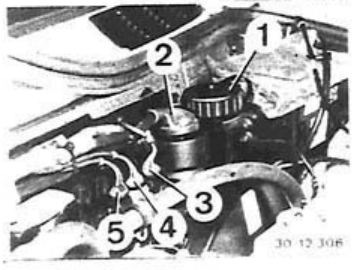


Engine wire harness plug (20 pins)

Installation:
The screwed connection must engage in final position.

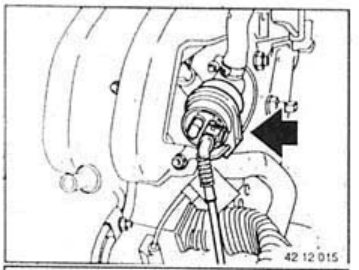
Relays behind trim panel.

1 Fuel pump relay
2 Master relay
3 Tank venting relay



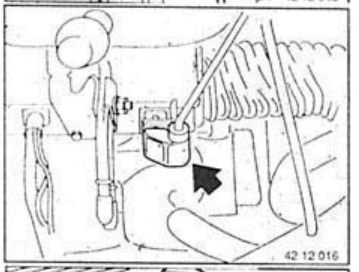
1 Diagnosis socket
2 Engine wire harness plug conn.
3 Position sender plug conn.
4 Reference mark sender plug conn. (gray)
5 Speed sender plug conn.

Location of M 42 Engine Electric Components:



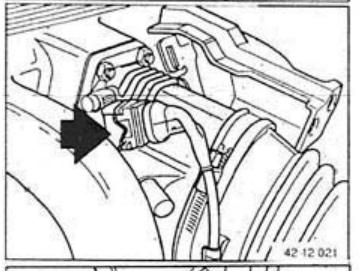
Idle speed control plug

Location:
On rear intake manifold.



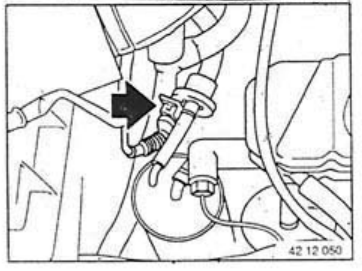
Plug for fuel injectors

Location:
On end of electric lead duct, close to the injection pipes.



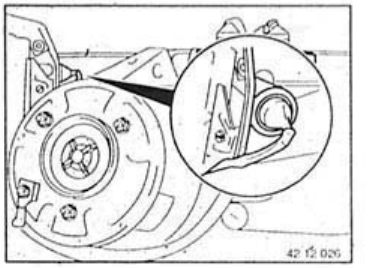
Throttle valve potentiometer plug

Location:
On throttle valve neck.
Nominal values – see Specifications.



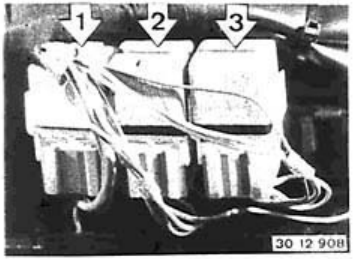
Tank venting valve plug

Location:
Next to air cleaner.



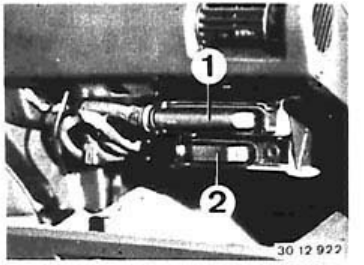
Oxygen sensor plug

Location:
Below battery console.



Location of Relays:

M 40 / M 42
1 Master relay
2 Fuel pump relay
3 Oxygen sensor relay

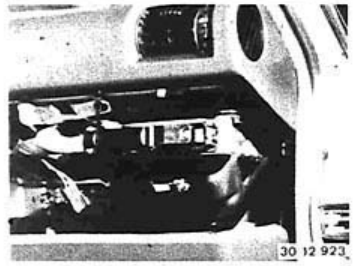


M 21

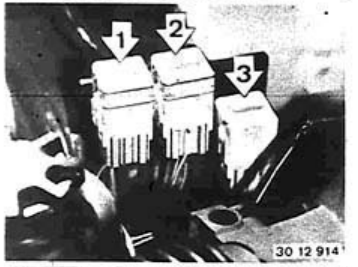
1 = MLG control unit (35 pins)
2 = AS control unit (25 pins)

MLG = Injection rate – combustion air – road speed

AS = Exhaust gas recirculation Beginning of injection



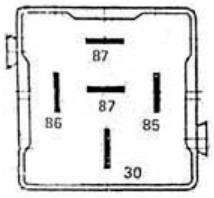
M 40 / M 42
DME control unit (in glove box)



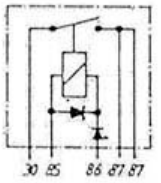
M 20
1 Master relay
2 Fuel pump relay
3 Oxygen sensor relay

M 20
DME control unit (in glove box)

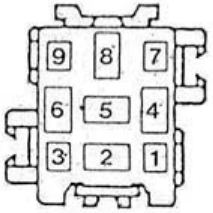
12 – 106/1



32 12 139



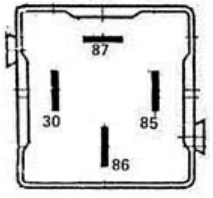
32 12 141



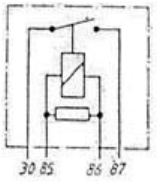
32 12 140

Master Relay: M 40 / M 20 / M 42
(plug conn., circuit diagram, socket)

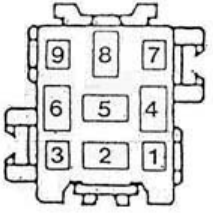
Socket No.	Pin No.	Wire Colors	Wire Size mm²
2	87	red / white	0.75/4
4	85	brown	0.5
5	87	red / blue	4
6	86	red	0.5
8	30	red	4/0.5



32 12 142



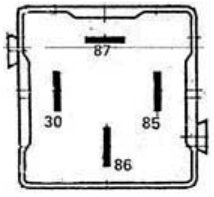
32 12 143



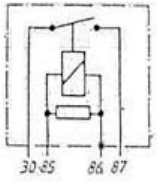
32 12 140

Fuel Pump Relay: M 40 / M 20 / M 42

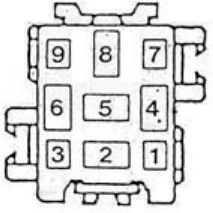
Socket No.	Pin No.	Wire Colors	Wire Size mm²
2	87	green / violet	1.5/1
4	85	brown / green	0.5
6	30	red	1.5
8	86	red / white	0.75



32 12 142



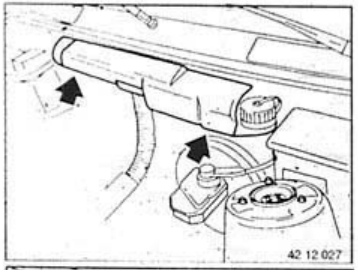
32 12 143



32 12 140

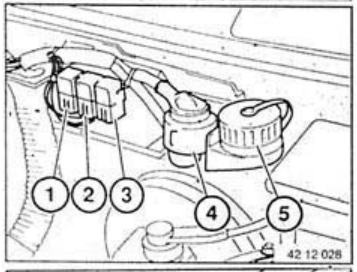
Oxygen Sensor Relay: M 40/M 20/M 42

Socket No.	Pin No.	Wire Colors	Wire Size mm²
2	87	green / blue	0.5
4	85	brown / green	
6	30	green / white	1/0.5
8	86	green / white	0.5

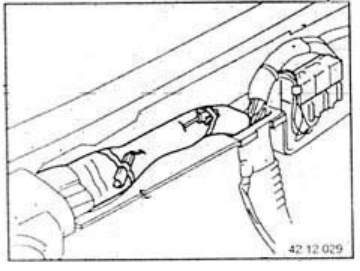


Location of Relays on Engine Compartment Firewall – M 42

Take off cover.



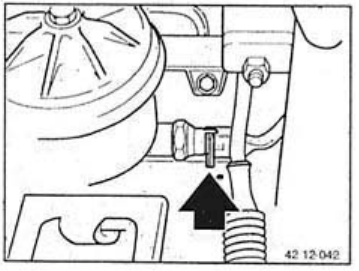
1 Master relay
2 Fuel pump relay
3 Oxygen sensor heating relay
4 Engine plug
5 Diagnosis socket



Plug for catalytic converter provision

Location:
On engine wire harness, on firewall. Black/white lead with single-pin plug receptacle.
Plug connected; catalytic converter not installed, idle speed CO potentiometer is activated.

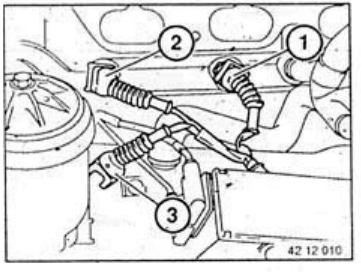
Plug disconnected: catalytic converter installed, idle speed CO potentiometer not activated. CO is regulated via the oxygen sensor.



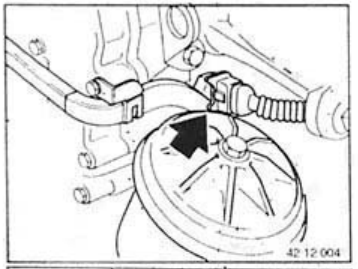
Removing and Installing / Replacing Oil Pressure Switch – M 42

Location:
On oil filter.

Important!
Plug receptacles on wire harness from the oil pressure switch and from the temperature gage sender are identical. Mark one of the plugs with insulating tape when disconnecting both plugs.
Diffference Between Both Plugs:
Lead of the temperature gage sender is guided out of the electric lead duct separately.



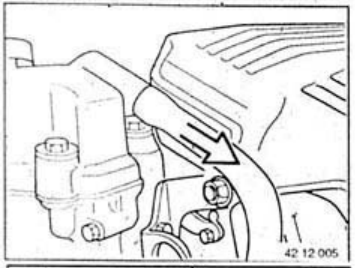
1 Coolant temperature gage sender
2 Coolant temperature sensor - DME
3 Oil pressure switch



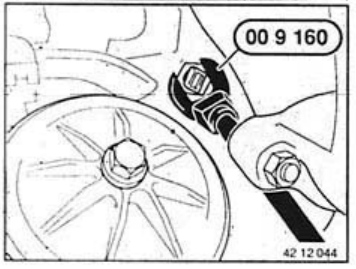
Removing and installing / Replacing Coolant Temperature Sensor for DME – M 42

Coolant temperature sensor

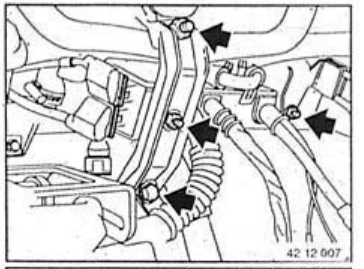
Disconnect plug.



Pull off crankcase venting hose.



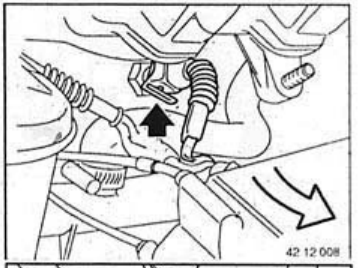
Unscrew with Special Tool 00 9 160.



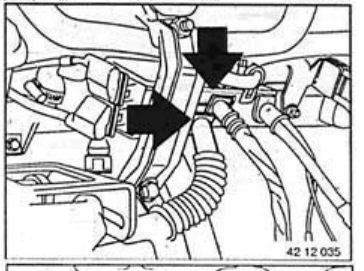
Removing and installing / Replacing Temperature Gage Sender – M 42

Remove complete air cleaner – see Group 13.

Pull off crankcase venting hose.

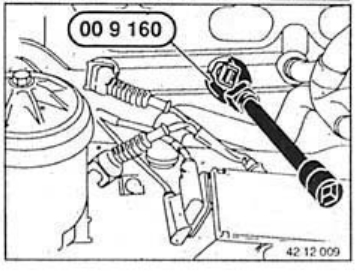


Remove complete intake manifold holder.
Loosen electric lead duct.



Pull electric lead duct forward.
Disconnect plug.

Caution!
Pulling the electric lead duct forward could cause unclipping of rubber grommets for electric lead openings in the electric lead duct, so that penetrating water would lead to malfunction of the engine electrical system. Consequently always check for correct seating of rubber grommets after installation of the electric lead duct.



Unscrew with Special Tool 00 9 160.

Explanations

S	=	Switch
ASC	=	Automatic Stability Control
DWA	=	Burglar Alarm System
EKP	=	Electric fuel pump
KW	=	Crankshaft
LLR	=	Idle speed control
ZWS	=	Double-coil rotary control
LMM	=	Air flow sensor
HLM	=	Hot wire air mass sensor
IIG	=	Inductive pulse sender
MSR	=	Engine Drag Torque Control
EV	=	Fuel injector

(1)° Imax (0.2 A)/Umax (150 V)

(2) Potential-free ground input

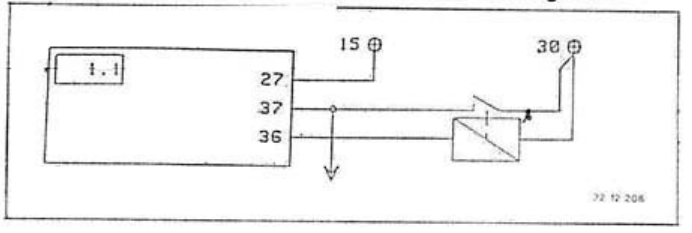
HOLDING CIRCUIT DIAGRAM
(M 1.1, M 1.3)

DME with holding circuit since 12.86 – terminals 27 and 36 used.

Important!
Control units of cars before 12.86 can not be used in cars since 12.86, since the car wire harnesses are different.

The holding circuit is provided so that Motronic can keep the master relay activated for another 3 seconds after switching off ignition lock term. 15 and with the engine stopped.

Motronic with Holding Circuit



Motronic without Holding Circuit

24 Oxygen sensor heating relay

TESTING MEANS

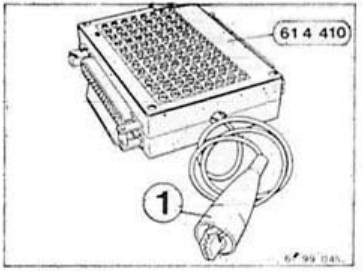
Wiring diagrams are contained in "General Car Electrical System – 3 Series" files.

Only use qualified testing leads, terminals and clips.

88 Pin Test Adapter Set 61 4 410:
Test adapter set consists of 88-pin adapter for troubleshooting on control units with 88-pin connection plates; test lead set with one each black and red test leads.

Multimeter tests can be carried out on periphery and control unit with this test adapter. Control unit must be taken out of holders for testing. Refer to pin connections for testing instructions in detail.

Inside of test box housing is coated with metal to avoid interference. Ground connection (1) must therefore always be connected with vehicle ground.
To keep capacitive and inductive loads as low as possible a printed circuit board is used internally. Consequently overloads (e.g. short circuits) must always be avoided!



DME 1.7 M 42 PIN CONNECTIONS

Connections of 88 Pin Plug Plate on DME Control Unit

If not specified to the contrary in "Testing Information" column, engine running at idle speed

Digital Motor Electronics (DME) M 1.7 / Four Cylinder M 42 Engines

New in Comparison with Old DME Control Units:

- 88-pin plug
- Stationary ignition distribution
- Camshaft sender
- Throttle valve potentiometer
- Air conditioner compressor shutoff

Description of DME 1.7 Operation:

DME permit precise control and regulation of fuel injection and ignition even under variable operating conditions. It works additionally in conjunction with other systems, namely

- burglar alarm,
- instrument cluster and
- on-board computer,

which can influence the entire engine timing depending on requirements.

DME performs the following operations, which will be described in detail later.

- Fuel injection timing
- Ignition timing
- Ignition distribution
- Cold start control
- Adaptive idle speed regulation
- Adaptive oxygen sensor regulation
- Adaptive tank venting
- Accelerating enrichment
- Dynamic coasting shutoff
- Catalytic converter protection
- Anti-knock
- Emergency running
- Family curve switchover with EH transmission
- Relay controls
- Self-diagnosis with fault memory

Components Delivering Input Signals to DME Control Unit:

- Pulse sender (speed/position)
- Pulse sender (cylinder identification) camshaft sender
- Air flow sender
- Oxygen sensor
- Idle speed CO potentiometer (without catalytic converter)
- Throttle valve potentiometer
- Temperature sensor (intake air)
- Temperature sensor (engine)
- Road speed sender
- Burglar alarm
- Air conditioner switch
- Air conditioner compressor
- Battery
- Terminal 15
- Programming voltage (version coding)

Outputs on DME Control Unit Wired via Final Stages to Deliver Signals to Following Components:

- Fuel injectors (cylinders 1 + 3)
- Fuel injectors (cylinders 2 + 4)
- Ignition coil 1
- Ignition coil 2
- Ignition coil 3
- Ignition coil 4
- Idle speed control
- Air flow sensor
- Throttle valve potentiometer
- Tank venting valve
- Master relay (control unit power supply)
- Fuel pump relay
- Oxygen sensor heating relay
- Fault lamp (only USA)
- Economy control (instrument cluster)
- Instrument cluster (TD and ti signals)

IDLE SPEED CONTROL, SPEED LIMIT, COLD START CONTROL

Refer to E 34 diagnosis test plan in chapter 1210 DME M 1.3.

TYPES OF INJECTION

Each group of fuel injectors (2 + 4 or 1 + 3) is activated by a final stage (current amplifier). It is therefore possible to divide the injection cycle into groups of cylinders. This guarantees limited engine operation even when one group fails.

Semi-sequential injection:

There is injection in one group of cylinders (2 + 4 or 1 + 3) only once every 720 crankshaft degrees as from an engine speed of 600 rpm. This timing can function only when the DME control unit receives a signal from the camshaft sender (on camshaft sprocket of exhaust valves). Timing remains in semi-sequential injection if the signal is received later.

Parallel injection:

Parallel injection means simultaneous activation of all fuel injectors for each crankshaft revolution and takes place only when the camshaft sender has not put out any signals since starting the engine.
If a signal is put out later, the system switches over to semi-sequential injection as soon as an engine speed of 2500 rpm is exceeded.

IGNITION

Stationary Ignition Distribution:

Each cylinder has its own ignition coil. In this manner the system of rotating ignition distribution is omitted. DME activates each ignition coil separately.

Double Ignition:

Double ignition means activation of the spark plugs for each crankshaft revolution and takes place only when the camshaft sender does not put out signals. Switching over from normal to double ignition, or vice versa, takes place immediately in contradiction to fuel injection.

ANTI-KNOCK FUNCTION

The ignition timing is retarded depending on intake air and engine temperature, in order to prevent self-ignition of the fuel/air mixture in the combustion chamber (knocking).

CATALYTIC CONVERTER PROTECTION

There is danger of overheating the catalytic converter when the catalytic converter protection is active over a long period of time. For this reason the fuel / air mixture is enriched to reduce the exhaust gas temperature.

THROTTLE VALVE POTENTIOMETER

A throttle valve potentiometer is installed instead of a throttle valve switch with idle and full load contacts. This potentiometer must no longer be adjusted, since DME learns the idle speed ignition timing (idle speed switching point) on its own. DME adds a determined value to the learned value. This value must go from the potentiometer to DME in order to be processed as a full load signal in DME.

AIR CONDITIONER COMPRESSOR SHUTOFF

In order to have the entire engine power for drive while moving off, the air conditioner compressor is switched off for up to 7 seconds at road speeds of < 8 km/h (5 mph) and simultaneous full load state.

TANK VENTING FOR MODELS WITH CATALYTIC CONVERTER

OXYGEN SENSOR CONTROL FOR MODELS WITH CATALYTIC CONVERTER

DRIVE AWAY PREVENTION

SELF-DIAGNOSIS

Refer to E 34 diagnosis test plan in chapter 1210 DME M 1.3 for information about the BMW diagnosing system.

ABBREVIATIONS

AFS	Air flow sensor
AT	Automatic transmission
BA	Burglar alarm
CCS	Crankshaft
CMS	Camshaft
CU	Control unit
DME	Digital motor electronics
EFR	Electric fuel pump
EH	Electronic-hydraulic
ETC	Electronic transmission control
FI	Fuel injector
FL	Full load
IS	Idle speed
ISC	Idle speed control
KD	Kickdown
MF	Microfiche
MR	Master relay
MT	Manual transmission
PL	Partial load
RxD	Diagnosis sensing lead
SV	Solenoid valve
TD	Speed signal once each ignition
ti	Injection time
tL	Load signal
TR	Speed signal once each revolution
TV	Throttle valve
TVE	Tank vent
TxD	Diagnosis data lead
U-Batt	Battery voltage
U-Vers	Power supply

ENGINE ELECTRIC/ELECTRONIC BRIEF TEST LIST
– Without Application of Self-Diagnosis –**

This brief test list refers to important points, which are required for correct function of the engine electric/electronics.

Tests are arranged to support each other and therefore should be carried out in the given order.

Testing Requirements:

- Starting system okay (battery charged, starting motor and ignition lock).
- Good ground connections between engine and body and engine wire harness okay.
- Specified gasoline in tank (octane number, leaded/unleaded, not contaminated).
- Engine in good operating condition (timing, compression, etc.).

Preparations:

Connect universal adapter* on DME control unit and wire harness with 55-pin connecting leads.

730 34 121

* Source of Supply: HWB
** Alternatively with BMW Diagnosis Tester

Testing Connections on Universal Adapter	Test	Corrective Measures
Pin 18 / ground (19) Battery positive supply for control unit	Measure voltage ≈ 12 V	Check battery and lead via relay 2 (master relay) to control unit.
Pin 37 / ground (19) Power supply for control unit	Measure voltage with ignition ON > 10 V	Check / repair relay 2 (master relay) and electronics ground point.
Pins 2, 14, 19, 24 / body ground Ground supply for control unit	Measure resistance against battery negative or ground < 1 ohm	Check / repair connections and leads on ground point.
Pins 47 / 48 Inductive pulse sender	Check resistance of sender and plug connection 540 ohms ± 10 % Check speed signal (one signal for each revolution) with an oscilloscope	Repair leads, replacing pulse sender if necessary.
Pin 3 / ground Fuel pump relay activation	Check speed signal with oscilloscope	If pulse sender (pins 47 / 48) is okay, replace DME control unit.

Testing Connections on Universal Adapter	Test	Corrective Measure
Pin 1 (term. 1) / ground Ignition final stage	Crank engine with starting motor and check signal with an oscilloscope. Other Tests: Power supply for ignition coil Ignition coil Distributor and leads Spark plugs	Replace DME control unit, if tests up to this point are okay.
Pins 17 / 14 Final stage of fuel injectors for cyl. 2-4-6 (M20) Final stage of fuel injectors for cyl. 3-4 (M 40)	Check signal with an oscilloscope. Other Tests: . Plug connections and leads for fuel injectors Fuel injectors	Replace DME control unit, if tests up to this point are okay.
Pins 16 / 14 Final stage of fuel injectors for cyl. 1-3-5 (M 20) Final stage of fuel injectors for cyl. 1-2 (M 40)	Check signal with an oscilloscope. Other Tests: Plug connections and leads for fuel injectors Fuel injectors	

DDE OPERATING CONDITION TABLE FOR TROUBLESHOOTING

Faulty Component or Function	Replacement Value	Function Shutoff	Warning Lamp on Continuously	Influence on Operation
Solenoid for injection begin control or wrong inside pressure*	– –	Exhaust gas recirculation Injection begin control	–	Reduced torque – loud needling noise in lower speed range due to emergency injection begin
Program computer in 35-pin injection volume control unit	–	Injection volume control	–	Engine stops
Program computer in 25-pin injection begin control unit	yes	Exhaust gas recirculation Injection begin control and diagnosis	–	Reduced torque – loud combustion noise in lower speed range due to emergency injection begin
Computer coupling Speed and position sender	yes from injection begin sender	– Exhaust gas recirculation Injection begin control	– X	Reduced full load volume Engine might die while running at idle speed Reduced torque Different response behavior Moving off only possible with acceleration
Speed sender and injection begin sender Road speed sender (in rear final drive)	– 0 km/h (0 miles)	Injection rate and injection begin control Road speed control Hesitation damper	X –	Engine stops Strong hesitation in manual shift cars No idle speed boost while driving (manual shift models)
Drive potentiometer and drive for injection rate In injection pump	–	Injection rate control	X X	Engine stops
Fuel temperature sensor	0° C (+ 32° F)	–	–	Slight reduction in engine power
Air temperature sensor	+ 140° C (+ 284° F)	Exhaust gas recirculation	–	Slight impairment of response behavior (pickup)
Coolant temperature sensor	– 20° C (– 4° F) (+ 50° C/+ 122° F for self-cleaning)	Exhaust gas recirculation Exhaust gas recirculation	– –	Possibly brief starting smoke after hot start Increased starting rate stall speed Brief white smoke possible after cold start and poorer response behavior (pickup) with increase in speed
Charge pressure sensor Pedal value sender	980 mbar yes	Charge pressure control –	– –	Reduced torque Driving with constant engine speed 1200 rpm for manuals 1450 rpm for automatics
Injection begin sender (integrated in cyl. no. 4 fuel injector)		Exhaust gas recirculation Injection begin control	X	Reduced torque

* E.g. due to contaminated fuel (paraffine separation = flaking) or fuel tank driven empty possibly after replacement of fuel filter (briefly until filter is filled again).

TROUBLESHOOTING DME 1.7 M 42

Note
Always conform with safety and accident prevention regulations for all tests and work on the engine electric and electronic system.

Caution!
Dangerous high tension on primary and secondary circuits of ignition.

The battery should not be disconnected whenever possible, since otherwise this would cancel the faults stored in memories of all control units.

Disconnect control units on wire harness only with the ignition turned off.

Test electric leads only with disconnected control unit or component plugs.

Testing Means:

Wiring diagrams can be found in "General Car Electrical System - 3 Series" files.
Only use qualified testing leads, terminals and clips.
Use 88-pin test adapter set 61 4 410.
Multimeter

Presentation of a memory-stored fault on screen.

Location of Fault:
The number of a fault refers to the pin connection on the control unit. A fault could be on a component, concerned electric leads or in the control unit.

Type of Fault:
Shorts, breaks, exceeding of ranges or implausible functions are displayed.

Frequency:
Information whether or not (brief fault) a fault exists at the moment of time. Also display of how often the fault was recognized. If the fault no longer exists, the number of times the engine had been started since the last recognition of the fault is displayed.

Recognition During:
Additional fault information about the operating conditions during recognition of a fault.

List of Faults:

Faults stored in memories can be displayed on the tester by selecting 900 (Fault Memory).

No faults stored in memories.

Function disturbed: engine operation not possible.

Troubleshooting:

Requirements:
- Starting system okay (battery charged, ignition switch and starter okay, etc.).
- Ground connections on battery, engine and body okay.
- Specified gasoline in tank.
- Engine in perfect operating condition (timing, compression, etc.).

a) Check power supply for DME control unit according to wiring diagram.

b) Measure input signals.
   - Speed signal from inductive pulse sender at starting speed (see status call).
   - Air flow sensor signals (see status call).

c) Measure output signals.
   - Activation of fuel pump relay according to wiring diagram.
   - Ignition final stage with help of ENGINE TEST test step 10.
   - Fuel injectors - check to component test.

d) Test fuel pressure.
   Technical data – see component testing chapter.

FAULT 1

900 fault memory: 1 electric fuel pump relay

Explanation:
This fault is stored when a short occurs on relay 1 (electric fuel pump) or in control lead to DME control unit pin 1. This fault is recognized only when at least one additional final stage is faulty.

Troubleshooting: as displayed on screen.

FAULT 3

900 fault memory: 3 fuel injectors cyl. 1 + 3

Explanation:
This fault is stored when shorts or breaks occur on fuel injectors for cyl. 1 + 3 or their power supply leads.

Note: The entire fuel injector group is stopped with a short on one fuel injector or its power supply lead. Two cylinders remain in operation.

Troubleshooting: as displayed on screen.

FAULT 8

900 fault memory: 8 fault lamp

Explanation: Only applicable for US models.
This fault is stored when shorts occur on fault lamp or its power supply lead.

Troubleshooting: as displayed on screen.

FAULT 12

900 fault memory: 12 throttle valve potentiometer

Explanation: This fault is stored when shorts or breaks occur on potentiometer or its power supply leads.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 16

900 fault memory: 16 camshaft sender

Explanation: This fault is stored when faulty signals from camshaft sender occurr at speed of > 2500 rpm.

Troubleshooting: as displayed on screen.

FAULT 29

900 fault memory: 29 idle speed control

Explanation: This fault is stored when a short or break occurs in lead to pin 29.

Troubleshooting: as displayed on screen.

FAULT 32

900 fault memory: 32 fuel injectors - cyl. 2 + 4

Explanation: see Fault 3.

FAULT 36

900 fault memory: 36 tank venting valve

Explanation: This fault is stored when a short or break occurs on tank venting valve or its power supply lead.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 87

900 fault memory: 37 oxygen sensor heating relay

Explanation: Fault is stored when a short or break on relay or power supply lead from DME control unit pin 37 is recognized.

Troubleshooting: as displayed on screen.

FAULT 41

900 fault memory: 41 air flow sensor

Explanation: This fault is stored when shorts or breaks occur on air flow sensor or its leads (power supply or signal lead).
Also recognition when Up/Uv value of LMM is no longer in the normal operating range of 0.02 to 0.95.
DME control unit then works with determined replacement values, load signal tL = 3.5 ms (partial load) and 6.0 ms (full load) and ignition timing = 20 crankshaft degrees before TDC.

Troubleshooting: as displayed on screen.
Test air flow sensor with status call 200. Up/Uv value shows the relation betw. potentiometer voltage (slider) and power supply voltage (5 V) in air flow sensor.
Specifications – see component testing.

FAULT 54

900 fault memory: 54 control unit power supply

Explanation: This fault is stored when power supply exceeds 16 V. A drop below 9 V is recognized 3 minutes after starting at the earliest.

Possible Fault Causes:
- Contact resistance on lead connections
- Incorrect drive belt tightness
- Voltage regulator or alternator faulty

Troubleshooting: as displayed on screen.

FAULT 70

900 fault memory: 70 oxygen sensor

Explanation: This fault is stored when a short or break occurs on oxygen sensor or its leads, or when no oxygen senor is installed (cars prepared for catalytic converter). It requires an engine temperature of > 70° C (158° F) over a period of 3 minutes and a load signal of 3.5 ms for 5 seconds.

Troubleshooting: as displayed on screen.
Test values for oxygen sensor – see component testing.

FAULT 73

900 fault memory: 73 road speed signal

Explanation: This fault is stored by DME when following conditions are fulfilled simultaneously.

Engine speed	> 4500 rpm
Load signal	5.0 ms
Road speed signal	3 to 5 km/h (2 to 3 mph)

Troubleshooting: as displayed on screen.

FAULT 76

900 fault memory: 76 idle speed CO potentiometer

Explanation: Valid only for cars without catalytic converter. This fault is stored when shorts or breaks occur on potentiometer or its leads. Replacement value of 2.77 V is used.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 77

900 fault memory: 77 intake air temperature sensor

Explanation: This fault is stored when shorts or breaks occur on temperature sensor or its leads. Recognition of a break requires 3 minutes time after starting and idle speed for at least 30 seconds. Replacement value of 50° C (122° F) is used after recognition of fault.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 78

900 fault memory: 78 engine temperature sensor

Explanation: This fault is stored when shorts or breaks occur on temperature sensor or its leads.
Intake air temperature is used as a replacement value in case of fault, but only for the first 3 minutes after starting when air temperature is < 20° C (68° F). A replacement value of 80° C (176° F) is ready for use in other conditions.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 85

900 fault memory: 85 air conditioner compressor

Explanation: This fault is stored when control unit receives "compressor in operation" (battery voltage on pin 85) and "A/C switch not operated" (0 V on pin 86) signals simultaneously. In this case either pin 86 has a break or there is a short between battery voltage and pin 85.

Troubleshooting: as displayed on screen.

FAULT 100

900 fault memory: 100 final stage

Explanation: This fault is stored when a loose contact occurs on a final stage output. If another final stage fault (Fault Codes 1, 3, 18, 29, 32, 36 or 37) occurs additionally, it can be assumed that fault 100 is identical with one of these faults.

FAULT 200

900 fault memory: 200 DME control unit

Explanation: This fault is stored when the internal self-test finds a fault in the memory modules (manipulated data).

Possible causes: programming fault or disturbed program run-off in DME control unit. This fault will also be stored when programming of the control unit had been manipulated. In this case the locks on the control unit housing will be damaged.

Correction: Test drive car after cancelling the fault memory. DME control unit must be replaced if the fault occurs again.

FAULT 201

900 fault memory: 201 oxygen sensor control

Explanation: This fault is stored in case of excessive deviation in the fuel/air mixture (excessively rich or lean mixture for longer than 12 seconds). It requires an oxygen sensor ready for operation.

Possible Causes of Fault:
- Wrong fuel pressure
- Faulty or carbonized fuel injectors
- Faulty engine temperature sensor
- Wrong air in intake
- Faulty tank venting system
- Dirty spark plug
- Leak in exhaust system in front of oxygen sensor
- Faulty air flow sensor
- Impaired combustion (ignition or compression not okay)

Troubleshooting: as displayed on screen. Test values – see component testing and technical data microfiche.

COMPONENT TESTING DME 1.7 M 42

Note:
Always conform with safety and accident prevention regulations for all tests and work on the engine electric and electronic system.

Caution!
Dangerous high tension on primary and secondary circuits of ignition.

Important!
The battery should not be disconnected whenever possible, since otherwise this would cancel the faults stored in memories of all control units.
Disconnect control units on wire harness only with the ignition turned off.
Test electric leads only with disconnected control unit or component plugs.

Testing Means:

Wiring diagrams can be found in "General Car Electrical System - 3 Series" files.
Only use qualified testing leads, terminals and clips.
Use 88-pin test adapter set 61 4 410. Multimeter

Test values for component testing are listed in the appendix. Refer to technical data microfiche for other specifications.
Removal and installation are described in the repair manual.

SURVEY OF FAULT CODES AND COMPONENT TESTS

Component / Function	Brief Test Input	Fault Code in Memory
DME control unit	–	200
Ignition coils	–	–
Fuel pump relay (relay 1)	100	1
Throttle valve potentiometer	200	12
Tank venting valve	100, 300	36
Air flow sensor	200	41
Camshaft sender	100	16
Oxygen control	100	201
Fault lamp	–	8
Fuel injectors	300	3/32
Sensor heating relay	300	37
Oxygen sensor	100	70
Road speed signal	200	73
A/C compressor shutoff	–	48
DME master relay (relay 2)	100	–
Power supply	200	54
Air conditioner switch	100	–
A/C compressor	100	85
CO potentiometer	200	76
Idle speed control	–	29
Intake air temperature sensor	200	77
Engine temperature sensor	200	78
Speed/position pulse sender	200	–
Ignition timing tap	100	64
Converter clutch	–	63

DME CONTROL UNIT

Function Test:
Different function blocks such as, for example, ignition, injection, oxygen control, etc. can only be tested when necessary input signals are receivede on the control unit first – see pin connections.

FUEL PUMP RELAY (DME Relay 1)

Function Test:
100 - electric fuel pump relay must switch on while starting or running engine (display: ON). In addition with ignition ON electric fuel pump relay is briefly activated by DME in order to build up required fuel pressure prior to starting. Rise in voltage can be measured at fuse 23.

Possible Causes of Fault:
- Lead to DME control unit pin 1 faulty
- Relay 1 or power supply faulty
- Power supply for DME control unit faulty
- No signals from speed/position pulse sender
- No ground potential put out on DME control unit pin 1 while starting and running engine, although above points are okay = control unit is faulty

IDLE SPEED CONTROL (LLS)

Function Test:
300 - Idle speed control is activated with second cycle – plate on idle speed control must open and close fully.

Resistance Test:
Resistance of coil can be measured direct on the component.
See appendix for specifications.

TANK VENTING VALVE

Electric Function Test:
300 - Valve is activated with second cycle. Cycling can be felt with hand.

Leak Test:
Disconnect hoses on valve, connect vacuum supply from Service Tester on the 8 mm connection (note flow direction arrow). Regulate vacuum to 600 mbar and supply 12 V to valve.
Switch off vacuum pump – pressure drop must not exceed 50 mbar after 20 seconds.
In a state without electric current the valve is closed by a check valve to to intake pipe vacuum of 20 mbar.

Activating Phase Test:
100 - Valve is activated at idle speed (display: OFF) and therefore closed. Gradual opening can be observed as soon as oxygen control is active and the speed increased (display: OPEN). Tank vent valve is closed for about 100 seconds between phases of scavenging.
The valve is still kept closed for 3 to 5 seconds after stopping the engine.

AIR FLOW SENSOR (LMM)

LMM Signal Test:
100 - Up/Uv value (Up = potentiometer voltage, Uv = power supply voltage 5 V) indicates the voltage relation resulting from the sensor plate position in LMM. At idle speed the value should be 0.2 to 0.3; at full load it rises to 0.9. A value of 0.02 is displayed when power supply or control lead has a break.

Power Supply Test:
5 V power is supplied to LMM from DME control unit pin 59 (+) and pin 14 (–) with the ignition ON. See wiring diagram for connections on LMM.

CAMSHAFT SENDER

Function Test:
100 - Full bank injection is switched over to semi-sequential injection and double ignition switched off as soon as the control unit receives camshaft sender signals. If the signal comes later, semi-sequential injection is maintained. Switching over from normal to double ignition, or vice versa, takes place immediately in contradiction to fuel injection.
Further testing with multimeter test 23/24. Connect oscilloscope on component plug and operate engine at idle speed. An alternating voltage curve with positive and negative half-waves should appear on the screen.

Resistance Test:
Resistance can be measured direct on the component plug. See appendix for specifications.

OXYGEN CONTROL

Function Test:
100 - Oxygen sensor at operating temperature is required for calling. Engine must be run at least 30 to 40 seconds before regulation cuts in. Engine operation is necessary (50° C/122° F engine temperature at idle speed, 30° C/86° C at partial load). Oxygen control cuts in later at lower outside temperatures. Regulation can compensate wear-caused deviations in fuel/air mixing to a great extent and consequently hide other faults. If applicable, disconnect the oxygen sensor while troubleshooting the fuel/air mixture. Single-pin plug for CO potentiometer in engine wire harness (on firewall) must not be connected.

OXYGEN SENSOR

Function Test:
200 - Requirement for calling is oxygen sensor at operating temperature. The displayed voltage signal is tapped in steps and fluctuates between 0.02 and 0.85 V. A constant value of 0.45 V is displayed when the oxygen sensor is not working or lead to DME control unit has a break. This value is also displayed when no oxygen sensor is installed.

CO POTENTIOMETER (Without Catalytic Converter)

Function Test:
200 - Single-pin plug for CO potentiometer in engine wire harness (on firewall) must be connected. Measure CO. Turn adjusting screw on air flow sensor to adjust to specified value. Basic setting of potentiometer is 2.77 V. Refer to 12-152 for Specifications.

FAULT LAMP "CHECK ENGINE" (only USA)

Function Test:
Fault lamp receives 12 V power supply from control unit as soon as an exhaust relevant fault is detected. It lights up continuously after ignition is turned ON for controlling.

FUEL INJECTORS

Electric Function Test:
300 - Fuel injectors are activated with a frequency of 10 Hz. Pulse time is 1 ms. To avoid the ejection of fuel, activation time must be as brief as possible. Activation can be felt with a hand. Pulses can be checked with a multimeter on the fuel injector plug.

Resistance Test:
Resistance of a fuel injector must be measured direct on the component. Only a complete fuel injector group (2 injectors) can be measured on DME control unit plug. See appendix for specifications.

SENSOR HEATING RELAY

Function Test:
300 - This activation takes place in second cycles. Relay remains switched on in normal operation for so long, until high speeds or load occur.

Possible Causes of Fault:
- Lead to DME control unit pin 37 faulty
- Relay or power supply faulty

CONTROL MASTER RELAY (DME Relay 2)

Function Test:
100 - Master relay is activated on terminal 85 with ground potential after ignition is turned ON or engine runs (display: ON). Relay switches on and supplies rest of control unit with power.

Possible Causes of Fault:
- Lead to DME control unit pin 54 faulty
- Relay 2 or power supply faulty
- Power supply for DME control unit faulty
- Control unit faulty when ground potential is not put out on control unit pin 54, although above points are okay

CONTROL UNIT POWER SUPPLY

100 - Control unit has the voltage displayed at the moment. It should not be less than 10 V.

INTAKE AIR TEMPERATURE SENSOR (In Air Flow Sensor)

Function Test:
200 - Intake air temperature of engine at operating temperature is 50 to 70° C (122 to 158° F) – ambient air temperature 23 ± 5° C (73 ± 9° F).
A display below – 40° C (– 40° F) indicates a break in the temperature sensor or lead to the DME control unit.

Resistance Test:
Connect universal adapter. Measure resistance on connections 77 and 14. Or direct on air flow sensor pins 4 and 5. See appendix for specifications.

ENGINE TEMPERATURE SENSOR (Coolant)

Function Test:
200 - Displayed engine temperature should correspond with the coolant temperature. A value below – 40° C (– 40° F) indicates a break in the temperature sensor or lead to the DME control unit.

Resistance Test:
Connect universal adapter on engine wire harness. Measure resistance on connections 45 and 19. See appendix for specifications.

SPEED / POSITION PULSE SENDER

Function Test:
200 - Speed signals can be called at starting speed on from running engine. Further testing with multimeter test 23/24. Connect oscilloscope on component plug and crank the engine. An alternating voltage curve with positive and negative half-waves should appear on the screen.

Resistance Test:
Resistance can be measured direct on the component plug. See wiring diagram for connections. See appendix for specifications.

Possible Cause of Fault:
If lead, plug and resistance are okay, check distance of pulse sender to incremental wheel on the vibration damper – 0.15 to 1.5 mm (0.006 to 0.059").
Adjusted distance with adjustable holder: 1.0 ± 0.3 mm (0.039 ± 0.012").

THROTTLE VALVE POTENTIOMETER

Function Test:
200 - Operate throttle valve and observe the voltage value. Voltage values approximately between 0.6 (idle speed) and 4.2 (full load) volts. (4.9 V = break)

Resistance Test:
See appendix for specifications.

Installation:
DME control unit must be disconnected from power supply at least 10 seconds after replacement of throttle valve assembly or throttle valve potentiometer.

IGNITION COIL

See 12-212.

Status Call 100		Nominal State
101	Electric fuel pump relay	While starting or running engine = ON
116	Camshaft sender	After coasting shutoff once = ON
127	Master relay	While starting or running engine = ON
136	Tank venting valve	Idling = OFF until timing begins
137	Oxygen sensor heating	With high speed and load = OFF
163	Converter clutch (only EGS)	Speed dependent in 3rd + 4th gear = ON
164	Ignition timing tap (only cars with manual transmission)	At idle speed = OFF, only for downshifts ON briefly
165	Range P/N (only automatics)	Selector lever in P or N = ON
171	Oxygen control	Engine running = ON, if oxygen sensor has operating temperature
181	Burglar alarm switch	Burglar alarm not activated = OFF
185	Compressor control	Compressor relay switched on = ON
186	Air conditioner switch	Switch (defroster, air circ. or air cond.) operated and air volume control wheel not set to 0 = ON

Status Call 200		Nominal Values
212	Throttle valve potentiometer	0.6 (idle) to 4.2 V (full load), 4.9 V = break
241	LMM Up/Uv relation [1]	0.1 to 0.3, break = 0.02
254	Control unit power supply	> 10 V
270	Oxygen sensor voltage (cat) [1]	0.02 to 0.85 V, with break or faulty oxygen sensor = 0.45 V
273	Road speed	Depending on road speed
276	CO potentiometer (no cat.)	Basic setting = 2.77 V
	CO in % by vol. [1] [3]	0.7 ± 0.5
277	Intake air temperature	Depending on ambient temperature, approx. – 40° C (– 40° F) = break
278	Engine temperature	Depending on engine operation, approx. – 40° C (– 40° F) = break
225	Ign. timing in crankshaft degrees before TDC [1]	11 ± 3
274	Engine speed in rpm [1]	
	Idle speed	850 ± 40
	Shutoff speed	6500 ± 40
217	Inj. signal ti in ms [1] [2]	3.2 to 3.9
290	Load signal tL in ms [1]	1.3 to 1.6

1) Oil temperature 60° C (140° F) or coolant temperature 80° C (176° F), no electric power consuming equipment switched on, at idle speed.

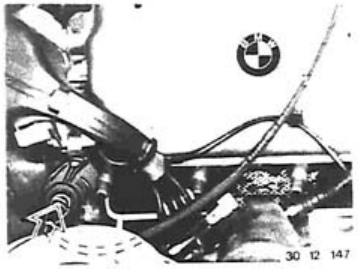
2) Valid with semi-sequential injection.

3) Measured ahead of the catalytic converter – engine test, test step 09.

TECHNICAL DATA – DME 1.7 M 42

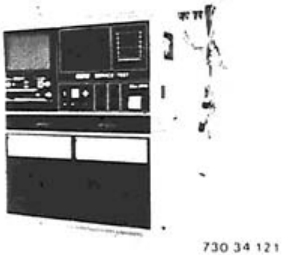
Resistance measured at 23 ± 5° C (73 ± 9° F)

Idle speed control (one coil)	8 ± 2 ohms
Fuel injector	15 to 17 ohms
Fule injector group (2 injectors)	8 ± 0.5 ohms
Speed/position pulse sender	540 ± 60 ohms
Cylinder identifying pulse sender	1.15 to 1.41 k-ohms
Engine temperature sensor	
at 20 ± 3° C (68 ± 5° F) coolant temp.	2.3 to 2.7 k-ohms
at 80 ± 3° C (176 ± 5° F) coolant temp.	0.3 to 0.36 k-ohm
Intake air temperature sensor	
at 20 ± 3° C (68 ± 5° F) air temp.	2.2 to 2.7 k-ohms
at 50 ± 3° C (122 ± 5° F) air temp.	0.76 to 0.91 k-ohm
Tank venting valve	45 ± 20 ohms
Ignition coil	
primary coil	0.4 to 0.8 ohm
secondary coil	not measurable
Throttle valve potentiometer	
idle speed position	4 ± 0.8 k-ohms
full load position	1 ± 0.2 k-ohm



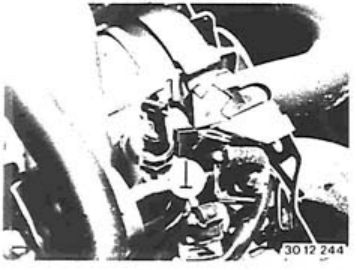
12 11 004 CHECKING AND ADJUSTING IGNITION TIMING – 4 Cylinder / M 10 –

Important!
See page 12 - 0 for instructions for working on engine electrical system.
Testing Conditions:
Pluggable TDC sender installed.
Engine at operating temperature – oil temperature at least 60° C (140° F).
Distributor/DME control unit number** conforms with information on nominal value microfiche.



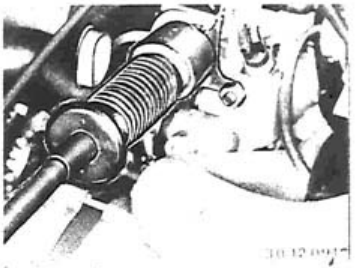
Connect BMW Service Tester or BMW Digital Tester to operating instructions.

Cars with NOx Control:
The NOx control unit is series connected after the ignition control unit as a second control unit. Function of NOx control has to be stopped to check the ignition timing.

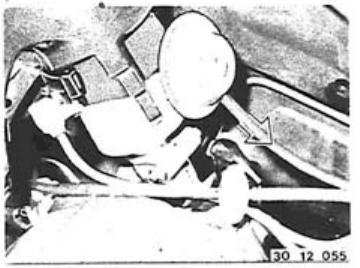


Pull off 4.8 mm (0.189") plug on 17° C (63° F) temperature switch and hold on ground.
Check / adjust ignition timing.
At engine speed of about 1500 rpm NOx control will retard the ignition timing by approx. 10°.

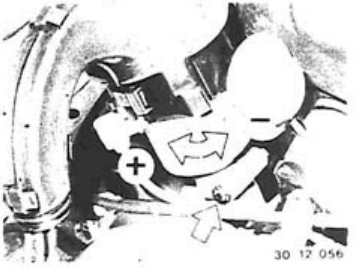
** See Specifications



Checking Dwell Angle:
The dwell angle is given by design and can be checked, but not adjusted.
The ignition control unit is no longer ready for operation in case of malfunction.

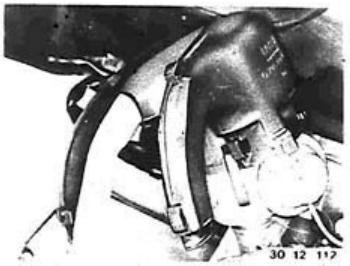


Checking/Adjusting Ignition Timing*:
Pull off vacuum hose for advance control.



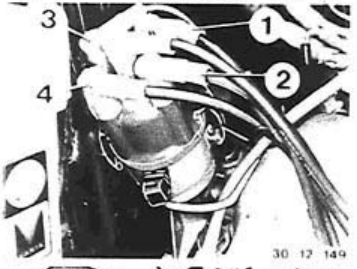
Start and run engine at test speed*.
Check ignition timing,* adjusting if necessary.
Correct by loosening screw and turning the distributor accordingly.
+ = ignition timing advanced
– = ignition timing retarded

* See Nominal Value Microfiche

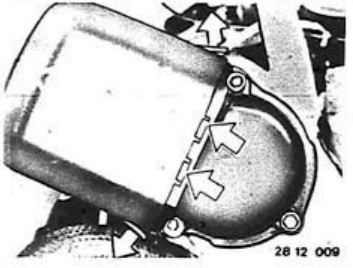


12 11 091 REPLACING DISTRIBUTOR CAP

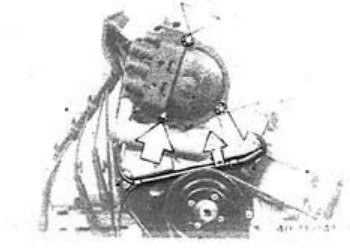
Important!
See page 12 - 0 for instructions for working on engine electrical system.
Engine M 10:
Take off protective cap.
Installation:
Have clips engage correctly.
Install retaining strap.



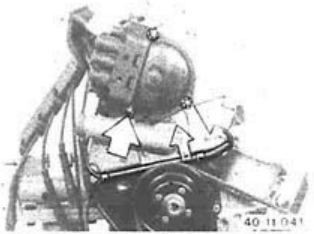
Open clips and take off distributor cap.
Pull out shielded plug.
Installation:
Check firing order.



Engine M 40 / M 20:
Take off cover.
Installation:
Engage cover in holders.
Note:
M 20:
Unscrew water pipe on engine block.



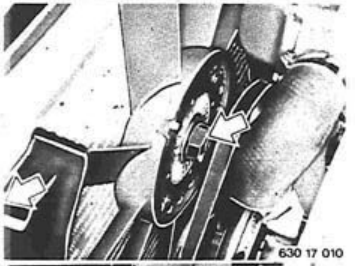
Pull off shielded plug.
Installation:
Numbers on leads and cap (e.g. 5) must be the same.
ZS = Ignition coil
Note:
Firing Order:
M 40: 1, 3, 4, 2
M 20: 1, 5, 3, 6, 2, 4



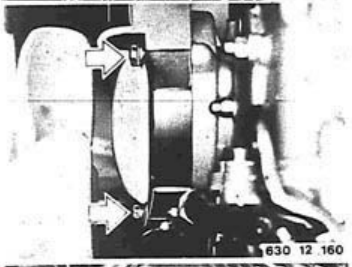
12 11 111 REPLACING DISTRIBUTOR ROTOR

Remove distributor cap – see 12 11 091.

Caution!
Danger of cutting hands on radiator fins.

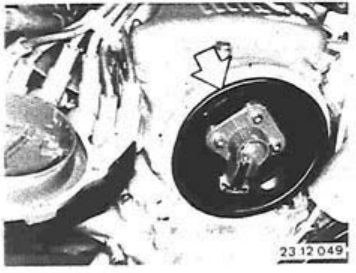


Remove fan – left-hand threads! Use Special Tool 11 5 030 / 040. Unscrew and push up fan cowl.

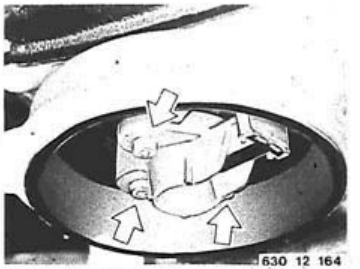


Unscrew screws and take off distributor.

Caution!
Danger of cutting hands on radiator fins.

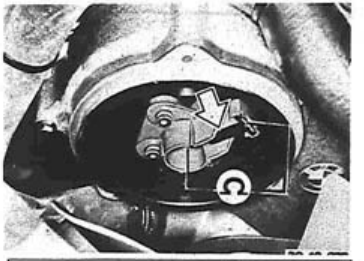


Installation:
Check seal, replacing if necessary.

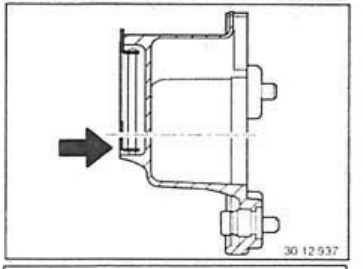


Unscrew screws with 3 mm key.

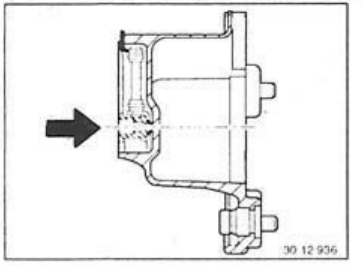
Installation:
Tightening torque*.



Testing:
Measure resistance*.
Check surface and cast compound for cracks and burnt spots.



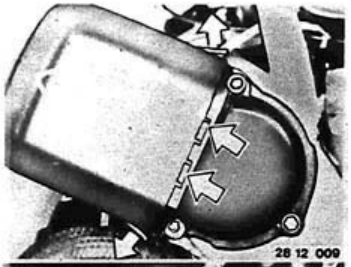
S 14:
Distributor rotor without cavity, with flat contact for terminal 4:
Always make sure that a spring-loaded carbon pin is installed with the distributor cap.



Distributor rotor with cavity:
Only distributor caps with fixed brass pin may be installed.

Caution!
Wrong matching of distributor rotors and distributor caps could lead to damage on distributor cap.

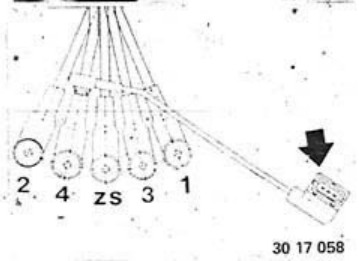
* See Specifications



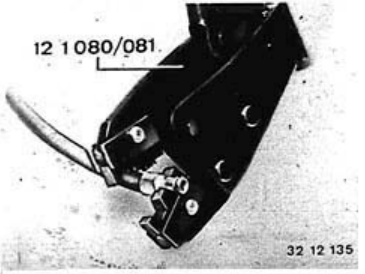
12 12 . . . REPLACING SENDER FOR CYLINDER IDENTIFICATION

Take off cover.
Pull off shielded plug located on ignition lead of cyl. no. 4 for M 40 or cyl. no. 6 for M 20.
Cut off ignition lead.
Cut off sender on ignition lead.

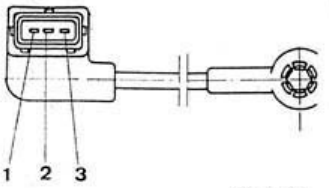
M 20:
Disconnect plug underneath the diagnosis socket.
Take off lead.
Plug on new sender (2).



M 40:
Disconnect plug underneath intake pipe.

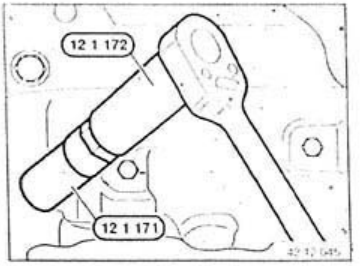


Install shielded plug – see 12 12 072.



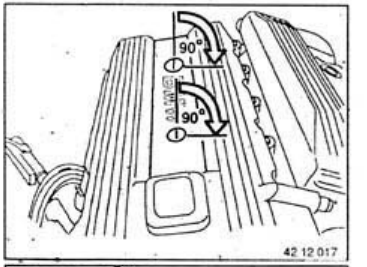
Testing Sender:
Measure resistance of coil between leads (1 and 2)
Nominal value*.

* See Specifications



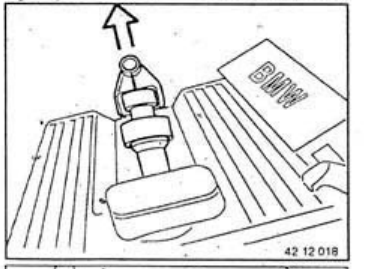
12 12 011 REPLACING SPARK PLUGS M 40

Remove spark plug connectors.
Tighten spark plugs with Special Tools 12 1 171 and 12 1 172.
Check tightening torque* when working without Special Tool 12 1 172.

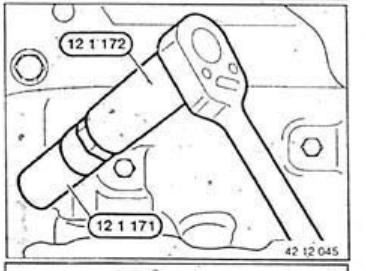


12 12 011 REPLACING SPARK PLUGS M 42

Remove cover on electric lead duct.

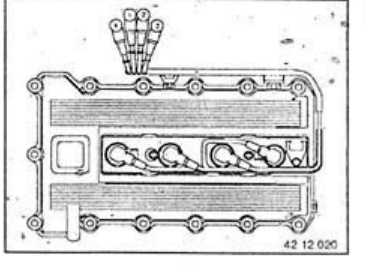


Pull off spark plug connectors.



Unscrew spark plugs with Special Tool 12 1 171.

Installation:
Tighten spark plugs with Special Tools 12 1 172 and 12 1 171.



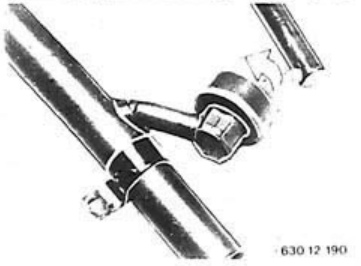
*Routing of Ignition Leads in Cylinder Head Cover

* See Specifications

630 12 189

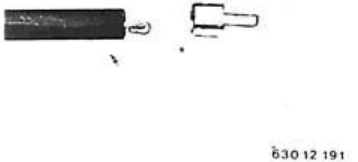
12 12 071 REPLACING ONE SPARK PLUG CONNECTOR

M 3 / M 5 / M 6 Models:
Unscrew ignition lead tube.
Pull out spark plug connectors.
Testing:
Measure shielded resistance*.



630 12 190

Pull off rubber cap toward rear.
Unscrew spark plug connector.
Installation:
Give rubber cap a thin coat of lubricant** to make installation easier.



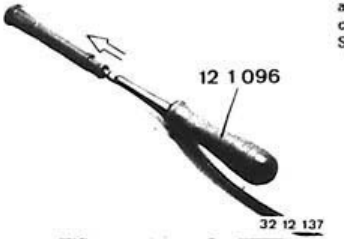
630 12 191

Replacing Connection (Screwed) for Ignition Lead:
Strip the ignition lead insulation by about 12 mm (1/2") with a stripping pliers** after cutting off the connection.
Bend wire at length of about 6 mm (1/4").

12 12 116

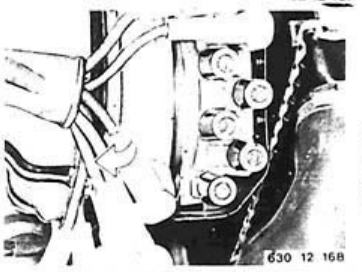
Place connection flush with pliers and press on.

* See Specifications
** Source of Supply: HWB



32 12 137

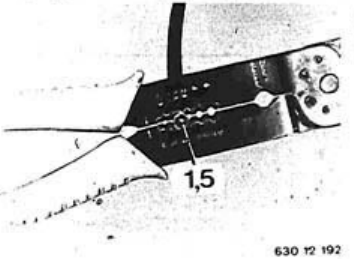
Place ignition lead in Special Tool 12 1 096 and slide into spark plug connector until connection is heard to engage.
Spray with lubricant (12 1 098) if necessary.



630 12 168

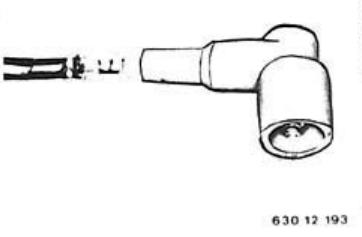
12 12 . . . REPLACING SHIELDED CONNECTOR AND IGNITION LEAD CONTACT
(on Ignition Lead for Ignition Coil or Distributor)

M 3 / M 5 / M 6 Models:
Pull off shielded connector and unscrew on ignition lead.
Testing:
Measure shielded resistance*.



630 12 192

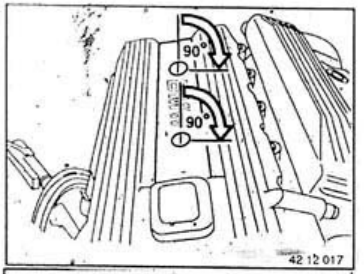
Strip insulation on ignition lead with an insulation stripping pliers** after cutting off the old lead contact.



630 12 193

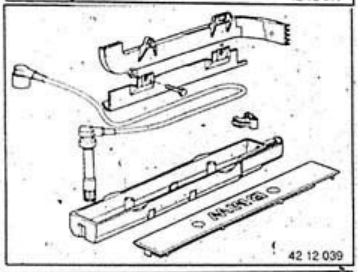
Install new lead contact with pliers for ignition lead contacts**.
Perform tear out test.
Apply a thin coat of lubricant** to make installation easier.
Screw shielded connector on ignition lead.

* See Specifications
** Source of Supply: HWB

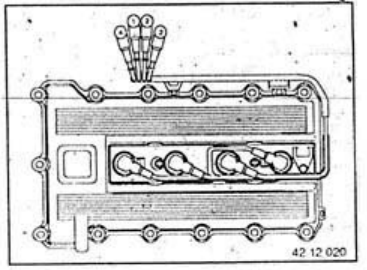


12 12 021 REPLACING ONE IGNITION LEAD – M 42

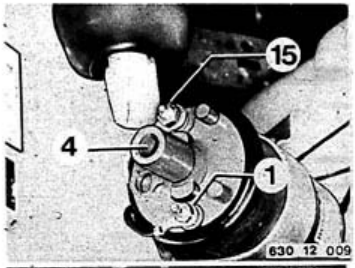
Remove cover on electric lead duct.



Components of Electric Lead Duct

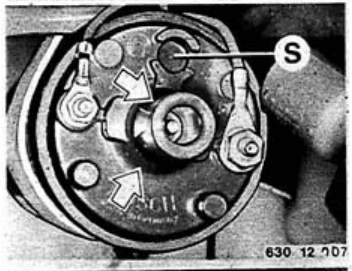


Routing of Electric Leads

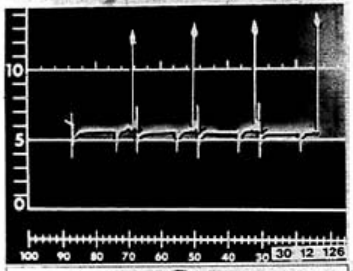


12 13 009 CHECKING IGNITION COIL

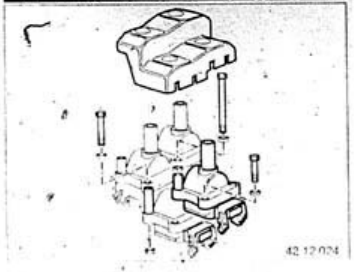
Multimeter Test (M 06):
Measure resistance of primary coil – term. 1/15 = 0.5 ohm ± 10 %
and secondary coil – term. 15/4. = 6 k-ohms ± 10 %.



Inspect connection plate for hairline cracks and traces of burning.
Check plug (S) for tight fit – replace ignition coil if it is pressed out.



Connect BMW SERVICE TESTER on diagnosis socket.
Run engine test step 09.
Observe oscilloscope – ignition voltage = 6 to 14 kV.
Check ignition voltage deviation = < 3 kV.



M 42:
See from page 12-119/2 on.

INSTRUCTIONS FOR WORKING ON DIRECT IGNITION (WITHOUT DISTRIBUTOR) OF M 42 ENGINE

Caution!
Ignition must always be turned off before working on the ignition system. Dangerous high tension occurs when working with the ignition turned on.

Location of Dangerous Tension:
- Ignition coil terminal 4
- Ignition lead
- Spark plug connector
- Spark plug
- Ignition coil term. 1 lead to DME control unit

Ignition must always be turned off before connecting the service or digital tester, primary or secondary adapter and replacing parts of the ignition system.

Testing Instructions:

Firing order: 1 - 3 - 4 - 2

The engine may not be started without a connected secondary circuit, i. e. after disconnection of spark plug connectors on spark plugs and ground connection 4a.

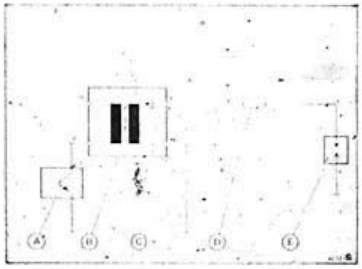
Master relay of DME must be pulled off for the compression test.

Shielded capacitors may not be connected on terminal 1 of the ignition coil.

Terminal 1 of the ignition coil may not be connected with ground or B + (danger of shorting the ignition final stages in the DME control unit).

Multimeter or test lamp may not be connected on terminal 1 while the engine is running.

Caution!
Approx. 350 V tension.



WIRING DIAGRAM FOR STATIONARY IGNITION DISTRIBUTOR OF M 42 ENGINE

A = Control signal for ignition coil from DME

B = Ignition coil

C = Secondary coil ground connection

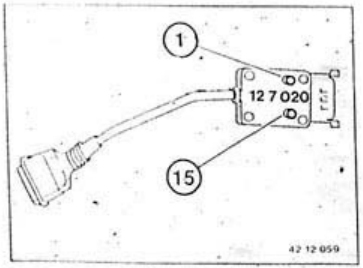
D = Ballast resistor for ignition lead, spark plug connector

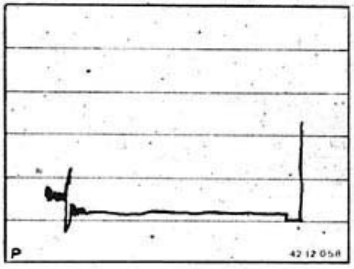
E = Spark Plug

Checking One Ignition Coil of Stationary Ignition Distribution

Check cast compound of primary coil carrier for cracks.
If gray material runs out on edges of the coil carrier, this indicates a faulty ignition final stage in the DME control unit.

Resistance Test:
Primary side: 0.4 to 0.8 ohm nominal value.
The secondary side cannot be tested because of the cascade circuit.





CHECKING PRIMARY SIGNAL FOR DIRECT IGNITION (WITHOUT DISTRIBUTOR)

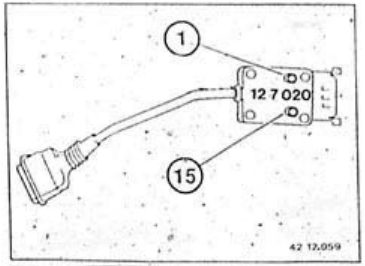
Engine Test Step 05

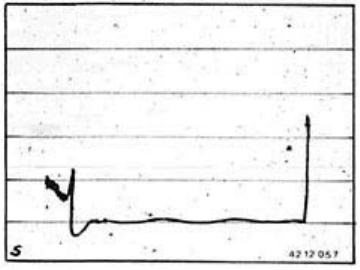
Select four cylinder.
Connect universal adapter lead on tester.
Connect brown clip on vehicle ground. Do not use red inductive clip as only one cylinder is being measured. This is why engine speed display is too low by factor 4.
Connect primary lead adapter 12 7 020 on pertinent ignition coil being tested.

Connect black clip of universal adapter lead on pin 1 of universal adapter.

Produce stationary signal on oscilloscope by pressing button R on the tester.

Note:
Combustion voltage curve on oscilloscope is very erratic as mixture swirl is different on 4-valve engine than on 2-valve engine.





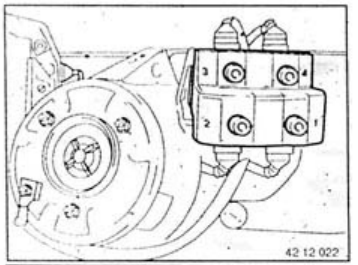
CHECKING SECONDARY SIGNAL FOR DIRECT IGNITION (WITHOUT DISTRIBUTOR)

Engine Test Step 10

Connect capacitive clip (blue) and primary adapter lead 12 7 020 on pertinent ignition lead being measured close to the ignition coil.
Connect black clip of universal adapter lead on pin 1 of primary adapter.

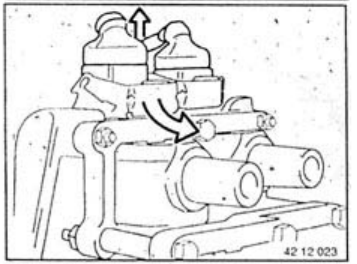
Produce stationary signal on oscilloscope by pressing button R on the tester.

Note:
Display of ignition signals is strongest on ocsilloscope when capacitive clip and black terminal are connected on the same cylinder.
Neighboring ignition leads could cause disturbance on the screen of the oscilloscope.

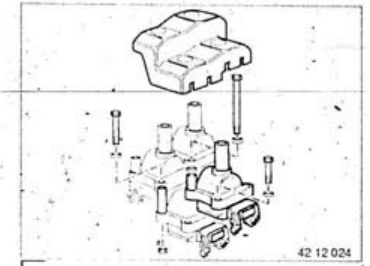


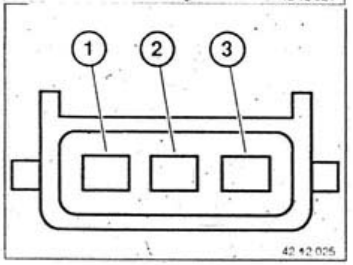
12 13 011 REPLACING ONE IGNITION COIL (Stationary Ignition Lead)

Arrangement of Ignition Coils



Pull off high tension lead.
Take off cap.
Unlock plug.
Pull off plug.





Ignition Coil Plug Pin Connections

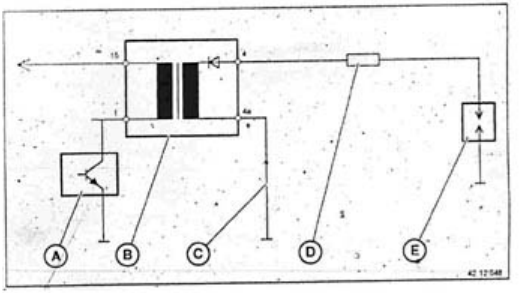
1 = Terminal 15

2 = Terminal 4a

3 = Terminal 1

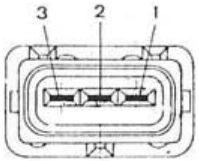
Wiring Diagram of Ignition Coil, Stationary Ignition Distributor

B = Ignition coil



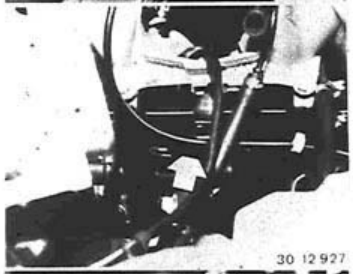
12 14 ... PULSE SENDER

Check pulse sender for tight fit and damage.

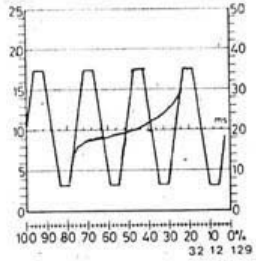


32 12 128

Multimeter Test (M 06):
Disconnect plug.
Measure resistance between 1 and 2 = 520 ohms – ± 5 %.
Perform insulation test = > 100 k-ohms.

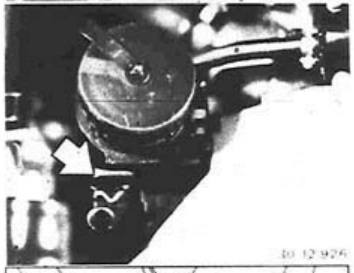


Disconnect plug.
M 40



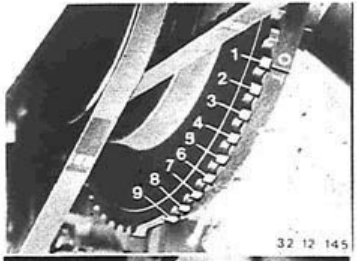
32 12 129

Connect oscilloscope on connections 1 and 2 of pulse sender (M 22/23).
Crank engine with the starter.
Signal shown here should appear on the screen.



Disconnect plug.
M 20

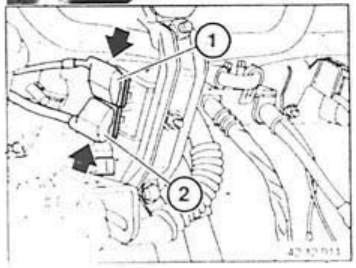
Note:
Pull out protective rail from the side.



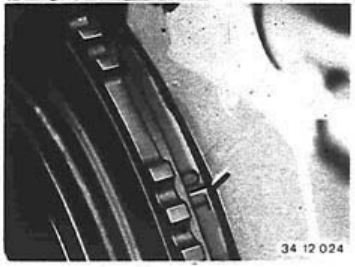
32 12 145

Checking Increment Wheel:
M 30
1. **TDC mark must be in middle of a tooth.**
2. **There must be a gap after 9 teeth counted in engine rotating direction from TDC mark.**

If not, replace vibration damper.

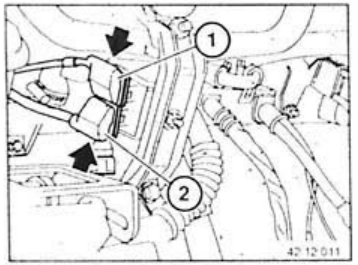


Disconnect plug (2).
M 42



M 20:
1. **TDC mark must be in middle of a tooth gap.**
2. **A large gap must be located after a tooth in engine rotating direction from TDC mark.**

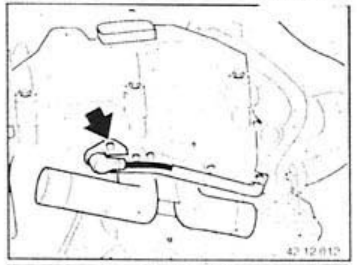
If not, replace vibration damper.



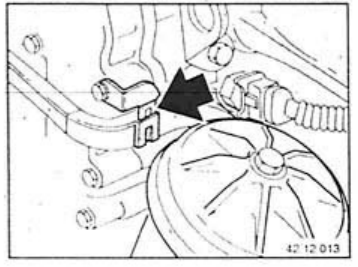
12 14 150 REPLACING CYLINDER IDENTIFYING SENDER (STATIONARY IGNITION DISTRIBUTOR) – M 42

Unplug both plugs on the electric lead duct.

1 Cylinder identifying sender (stationary ignition distributor)
2 Pulse sender for DME



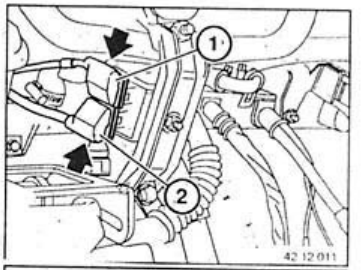
Unscrew screw.



Unclip electric lead guide in holder.

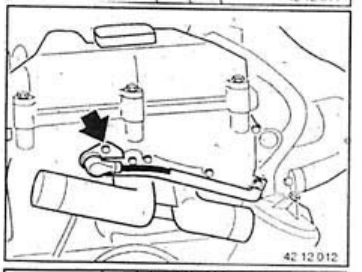
Take electric lead out of holder.

Important!
Check for correct seating of the O-ring when installing the sender.

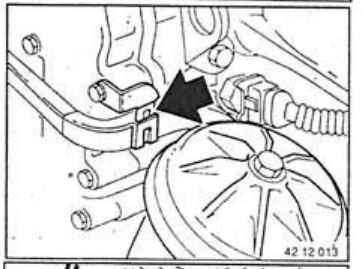


12 14 155 REPLACING PULSE SENDER ON VIBRATION DAMPER – M 42

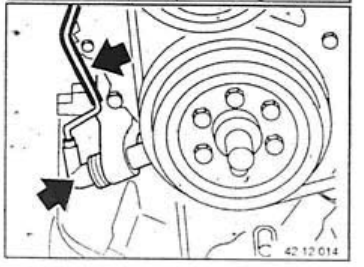
1 Cylinder identifying sender (stationary ignition distributor)
2 Pulse sender for DME



Unscrew screw.



Unclip electric lead guide in holder.

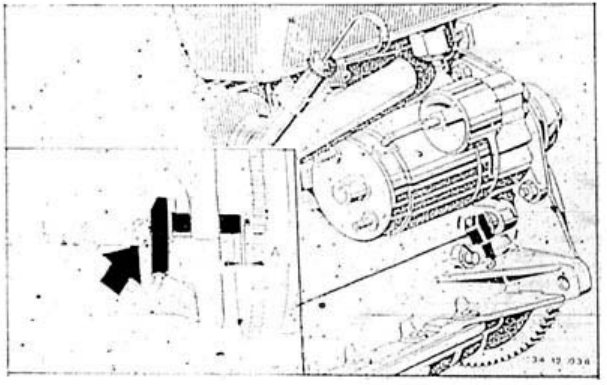


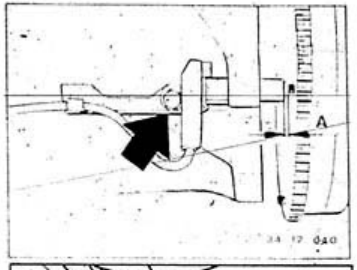
Unscrew screw.
Unclip electric lead on line.

Note:
Clip line in guide rail securey again, so that the line cannot rub on the drive belt.

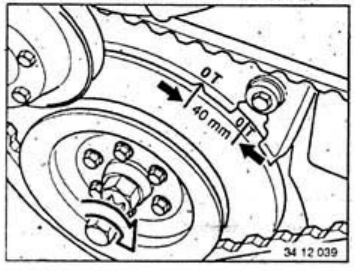
12 14 160 REPLACING AND ADJUSTING SPEED SENDER – M 21

Disconnect plug and line.

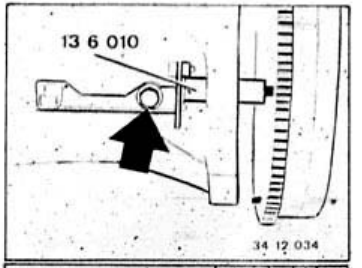




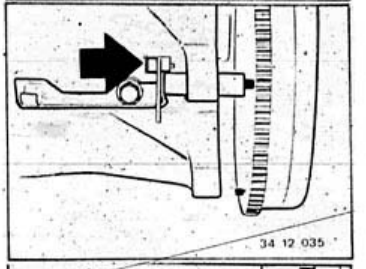
Unscrew holder.



Adjusting:
Turn crankshaft up to 40 mm (1.575") further than the TDC mark.
Check whether the dowel pin of the flywheel can be seen through the take-up bore for the speed sender.

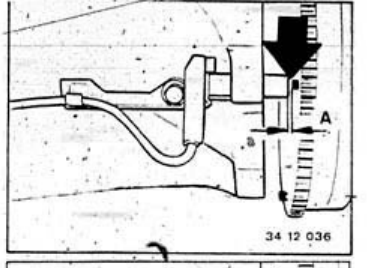


Mount Special Tool 13 6 010 on holder. Mount holder on crankcase and slide forward against the stop. This automatically adjusts distance (A) required between the pin on the flywheel and the speed sender.
(Special Tool 13 6 010 is 1.3 mm (0.051") longer than the speed sender.)
Tighten holder.

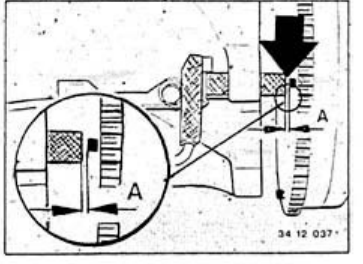


Unscrew Special Tool 13 6 010 on the holder and pull out.

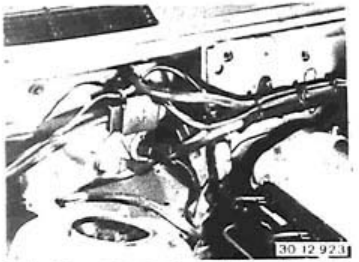
Important!
Holder must no longer be loosened on the engine block. Only loosen and pull out the special tool.



Slide speed sender into holder.
Screw on speed sender.

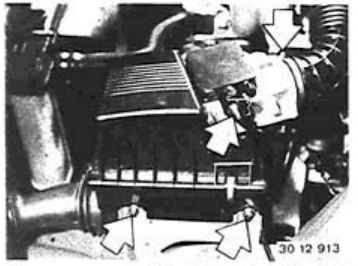


Distance A = clearance between pin on the vibration damper and speed sender.

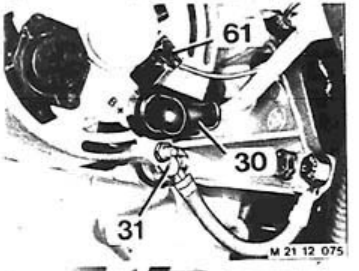


12 31 020 REMOVING AND INSTALLING ALTERNATOR

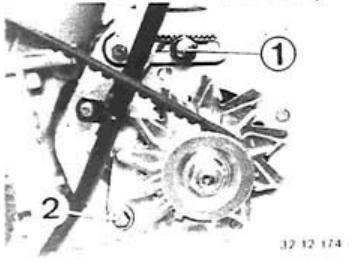
Disconnect battery ground lead (or positive connection point on firewall).



M 40 / M 20 — Removing Air Cleaner and Air Flow Sensor:
Pull off plug.
Loosen hose clamp.
Lift out air cleaner and air flow sensor.



Alternator:
Take off protective cap.
Disconnect electric wires on connections B+ (term. 30) and D+ (term. 61).



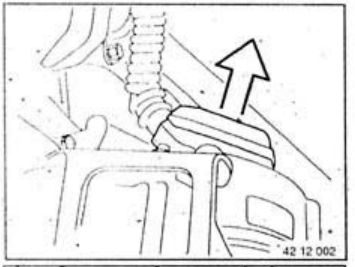
Unscrew upper nut and remove bolt with tensioning wheel.
Unscrew lower nut and remove bolt (wires D+ / B+ removed).

Installation:
Tension drive belt (SR version)* – see 12 31 299.

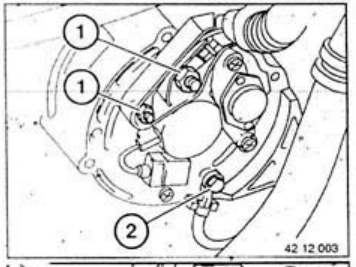
* See Specifications

12 31 020 REMOVING AND INSTALLING OR REPLACING ALTERNATOR – M 42

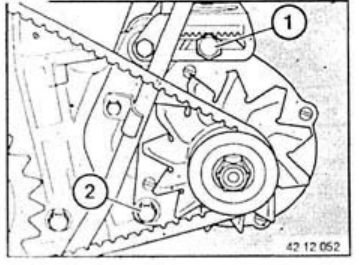
Disconnect battery ground lead.
Remove air cleaner.



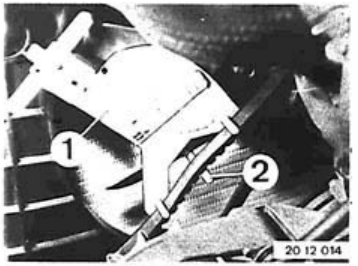
Remove cover on alternator leads.



Disconnect leads (1).
Disconnect ground strap (2).

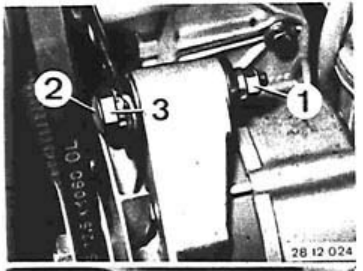


Unscrew mounting bolts.
Take off drive belt.
Tighten drive belt – see 12 31 299.



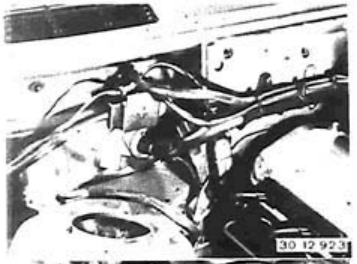
12 31 299 CHECKING/TIGHTENING ALTERNATOR DRIVE BELT

Check tightness of drive belt with Special Tool 11 5 020, tightening if necessary.
Pulling hook (2) must bear in middle of teeth for this purpose. Tester needle must be found on scale above the green or yellow field.



Tightening Drive Belt:
Unscrew nut (1) and turn tensioning wheel (3) with a torque of about 7 Nm (5 ft. lbs.).
Tighten nut (1).
Recheck tightness with the tester, correcting if necessary.

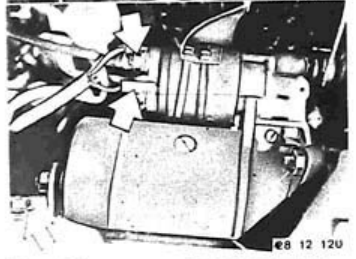
Drive Belt Tightness Tester:
"with new measuring scale" for SR belts.
SR = service reduced.



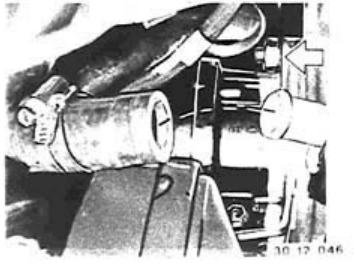
12 41 020 REMOVING AND INSTALLING STARTER

Disconnect battery ground lead (or positive connection on firewall).
Disconnect leads on terminals 30 and 50 of solenoid.

Unscrew nuts.



Unscrew rear mounting bracket.



M 20:
Remove complete air cleaner.
Drain coolant in engine.
Disconnect water hoses on heater.

Installation:
Push starter in to guide pins.
Fill and bleed cooling system – see 17 0 039.

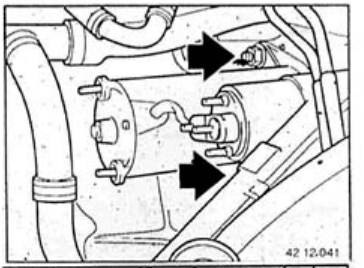
M 21 Diesel:
Unscrew support on intake air manifold.
Disconnect crankcase venting hose.

M 21 Turbocharged Diesel:
Unscrew support on intake air manifold.
Disconnect crankcase venting hose.
Unscrew transmission splash guard.
Drain coolant in engine.
Disconnect water hoses for heater.

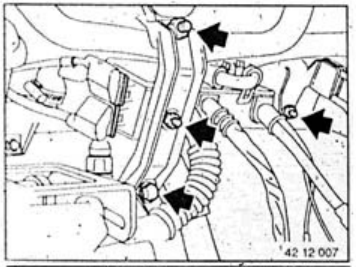
S 14:
Remove complete intake air manifold.
Disconnect coolant return pipe on engine block.

12 41 020 REMOVING AND INSTALLING OR REPLACING STARTER – M 42

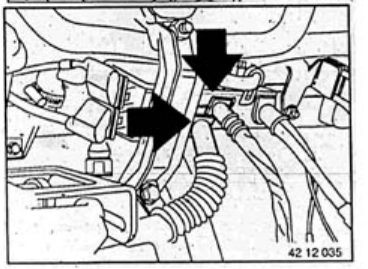
Disconnect battery ground lead.
Remove air cleaner.
Remove intake hose of throttle valve assembly.



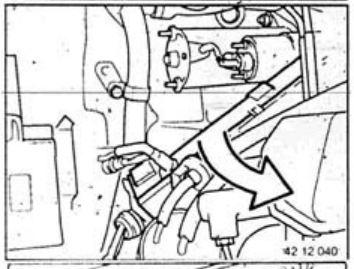
Unscrew bolts.



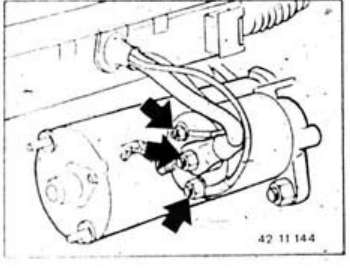
Unscrew support on intake manifold.
Mark plugs on electric lead duct.
Pull plugs off of electric lead duct forward.



Important!
Make sure that the rubber grommets for electric lead openings are clipped in the electric lead duct correctly when installing the electric lead duct. If not, penetrating water could lead to malfunction of the engine electric system.



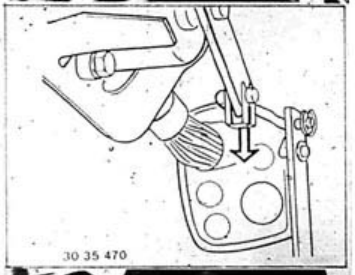
Turn electric lead duct to the side in direction of the spring strut.



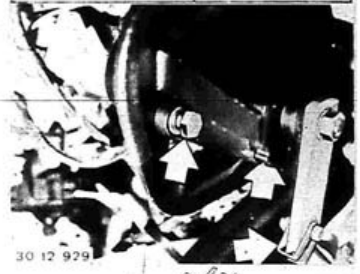
Disconnect leads on starter.

12 72 ... REMOVING AND INSTALLING OR REPLACING PEDAL VALUE SENDER (DDE)

Turn off ignition.
Remove dashboard trim panel at bottom left - see 51 45 . . ..
Disconnect plug.



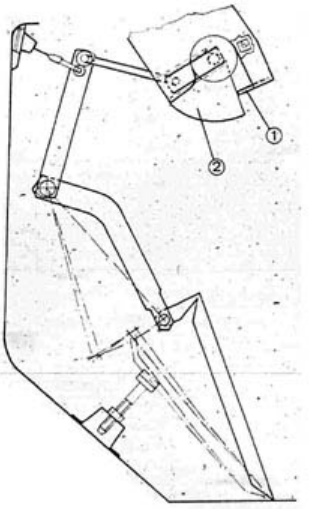
Pull retainer off of pedal value sender linkage.
Installation:
Adjust pedals - see Group 35.



Unscrew both screws.

Installation:
Check whether angle between pedal value sender lever and stop is 83 +/- 1 degrees, correcting if necessary.
Place gage on end of pedal value sender shaft (linkage disconnected).
1 Adapted to pedal value sender shaft end
2 Stop on holder for pedal value sender
3 Lever for pedal value sender
4 Pedal value sender
Gage = Special Tool 12 7 100**

** Source of Supply: HWB



12 72 ... ADJUSTING ACCELERATOR PEDAL WITH ELECTRONIC ENGINE POWER CONTROL

Adjusting Procedures for E 30 td:

1. Idle Speed Position
   Tighten hexagon nut on pedal value sender to specified torque* with an angle of 83 +/- 1 degrees set by the factory between the pedal value sender lever and stop (tighten with support on the pedal value sender lever).

2. Full Load Position
   Manual Transmissions:
   Operate accelerator pedal to the kickdown position in the pedal value sender. Screw knurled head screw against stop on accelerator pedal in this position and lock.

   Automatic Transmissions:
   Operate accelerator pedal to the kickdown position in the pedal value sender. Adjust knurled head screw in this position to have a distance of 6 mm (0.236") between bolt head and accelerator pedal. Position reversing washer on idle stop of holder for transmission reversing. Adjust transmission throttle cable to have 0.25 to 0.5 mm (0.010 to 0.020") distance between the lead seal and adjusting screw. Adjust accelerator pedal throttle cable without tension

1 =Stop
2 =83 degree gage

Important!
Check pedal value sender with a diagnosis tester after adjusting. Connect tester, turn on ignition and move accelerator pedal to idle speed position. Compare actual voltage displayed on tester with specified value, correcting the adjustment if necessary.
Specification:
min. 353 mV
max. 451 mV
Full load max. 3.2 V

* See Specifications.

13 Fuel System

Model 324d / 324td (DDE) .....

WORKING INSTRUCTIONS CONCERNING CLEANLINESS ON FUEL SYSTEMS

- Clean area around point of repair thoroughly – for example, prior to unscrewing pipe connections, switches, etc..
- Place removed components on clean surfaces only and cover with plastic sheet – never use cloths losing lint!
- Cover or plug open pipes/hoses or components immediately – never work with compressed air.
- Only install cleaned components.
  Take new parts out of their packaging only immediately before installation of same.
- Never let diesel fuel get on coolant hoses – rinse off with water immediately, if necessary.

Explanation of Abbreviations:

DDE = Digital Diesel Electronics

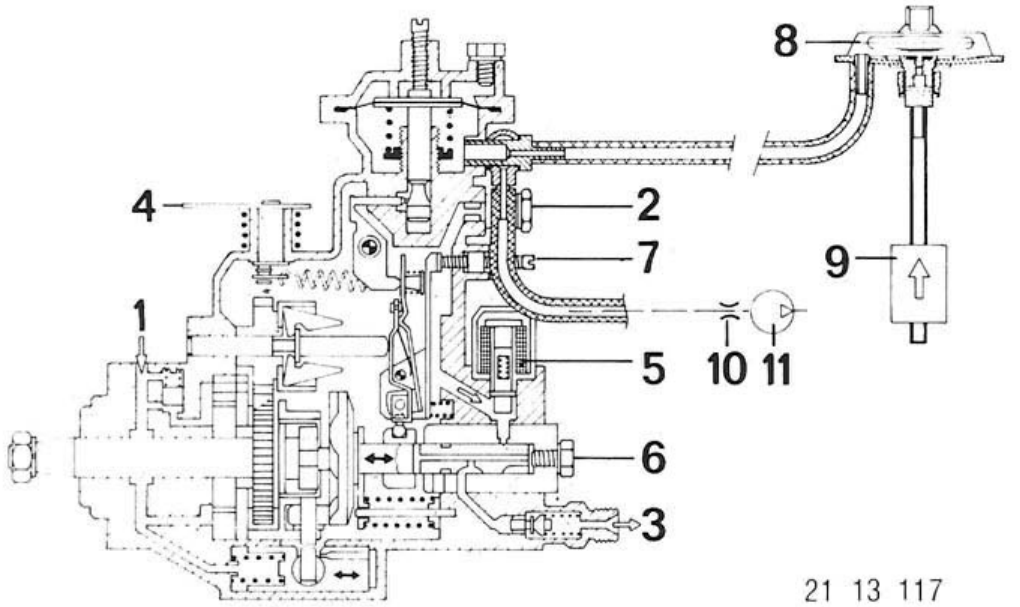
AS = Exhaust gas recirculation, Injection begin control

MLG = Fuel rate, combustion air, road speed

SB = In reference to injection begin

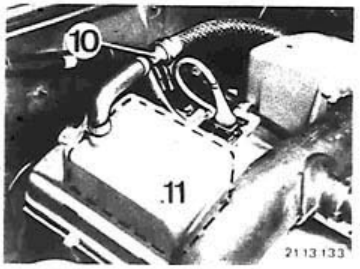
ME = In reference to injection rate

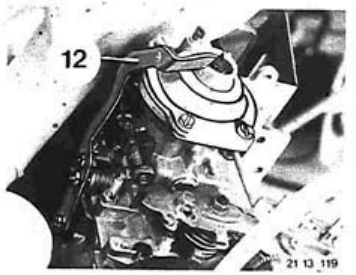
INJECTION PUMP LAYOUT



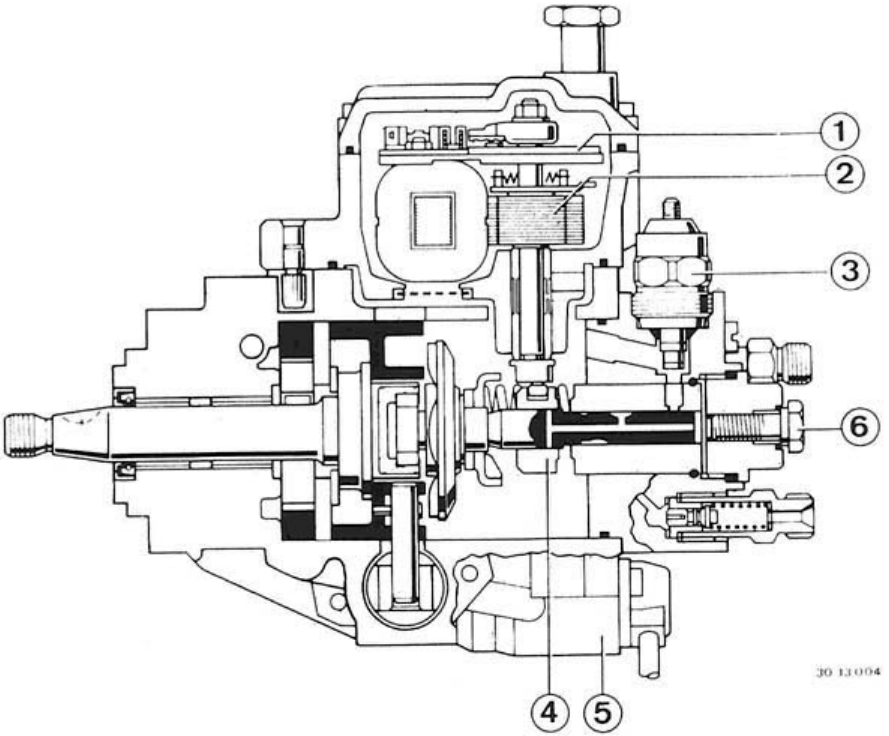
21 13 117

1 Fuel feed
2 Fuel return and leak oil connection
3 Injector connection
4 Speed lever
5 Electric shutoff
6 Plug for high pressure chamber (for static adjustment with dial gage)
7 Bolt for full load injection rate
8 Control unit for absolute pressure
9 Air filter for control unit
10 Orifice in vacuum distributor
11 Vacuum pump
12 Manual stopping lever





LAYOUT DRAWING OF ELECTRONICALLY REGULATED INJECTION PUMP FOR DDE



1 Control valve distance sender
Potentiometer for feedback voltage

2 Drive for injection rate rotating magnet

3 Electric shutoff

4 Control valve

5 Solenoid for injection begin

6 Plug for high pressure chamber
(for static adjustment with dial gage)

TROUBLESHOOTING ENGINE ELECTRIC, FUEL AND INJECTION SYSTEMS

Requirements:
- Starting system in perfect condition (battery voltage, starter, ignition lock, etc.)
- Engine in perfect running condition (timing, compression)
- Specified fuel in tank (without contamination, winterproof)
- Connections plug connections and ground points as on wiring diagram

1. Engine does not start
2. Engine hard to start (coolant temp. 20° C/68° F).
3. Engine surges in idle
4. Warm engine idles erratically
5. Engine misfires while driving
6. Performance unsatisfactory
7. Fuel consumption too high
8. Engine cannot be stopped
9. Engine runs hard, black exhaust smoke in full load
10. Fog-type exhaust smoke
11. Cold engine idles unsatisfactorily
12. Engine speed does not pick up when cold
13. Distributor injection pump too hot
14. Excessive black smoke in full load constant drive
15. Excessive black smoke in acceleration phase

TROUBLESHOOTING DIGITAL DIESEL ELECTRONICS (DDE1)

Requirements:
- Starting system OK (battery voltage, starter, ignition lock, etc.)
- Engine mechanically OK (timing, compression)
- Specified fuel in tank (without contamination, winterproof)
- Connections, plugs, wires and ground points checked to wiring diagram.

1. Engine won't start
2. Engine hard to start (coolant temp. 20°C/68°F)
3. Warm engine idles unevenly
4. Misfiring while driving
5. Performance unsatisfactory
6. Fuel consumption too high
7. Engine cannot be stopped
8. Engine runs hard, black exhaust in full load range
9. Foggy exhaust
10. Cold engine idles unsatisfactorily
11. Engine does not pick up when cold
12. Distributor injection pump runs hot
13. Engine stops on its own
14. Engine runs at high idle speed
15. Engine runs with max. 1200 rpm (or 1400 rpm at A)
16. Strong vehicle shake
17. Engine runs at high speed
18. Warning lamp lights up

Refer to BMW diagnosing system and BMW 5 Test Plan for additional trouble-shooting of DDE1.

TROUBLESHOOTING DIGITAL DIESEL ELECTRONICS (DDE2)

Requirements:
- Starting system OK (battery voltage, starter, ignition lock, etc.)
- Engine mechanically OK (timing, compression)
- Specified fuel in tank (without contamination, winterproof)
- Connections, plugs, wires and ground points checked to wiring diagram.

1. Performance unsatisfactory
2. Fluctuating power output
3. Road speed display missing
4. Vehicle shakes
5. Cruise control driving not possible
6. Fuel consumption display fluctuates
7. Engine runs hard (pingles)
8. Black exhaust
9. Engine shutoff in all operating conditions
10. Misfiring, strong shake
11. Engine won't start
12. Insufficient reaction to accelerator pedal
13. Fluctuating idle speed of cold engine
14. Engine runs at high idle speed
15. Black exhaust at high altitude

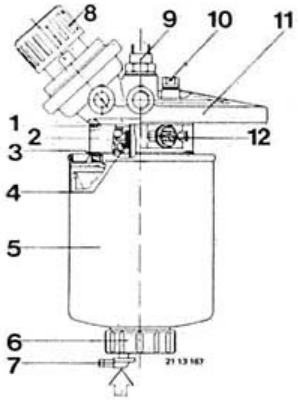
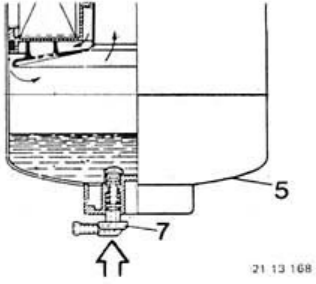
Refer to BMW diagnosing system and BMW 5 Test Plan for additional trouble-shooting of DDE2.



DDE
13 32 000 FUEL FILTER

Note:
Fuel preheating is described in Gr. 12.

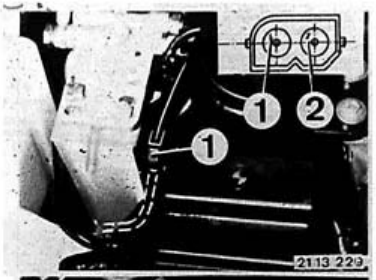
1 Seal
2 Heating element
3 Seal
4 Heating element mounting nut
5 Filter cartridge
6 Cap
7 Drain valve
8 Manual pump
9 5.5° C (42° F) temperature switch
10 Bleeding screw
11 Filter head
12 Heating element electric conn.

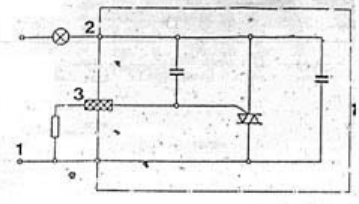


DDE
13 32 050 EMPTYING WATER TRAP IN FUEL FILTER

Unscrew bleeding screw (10).
Press up drain valve and drain until pure diesel fuel runs out.

Unlock cap - turn 90 degrees - of manual pump (8) and pump until fuel runs out at bleeder screw (10).
Tighten bleeding screw (10).
Lock manual pump (8).





13 32 ... CHECKING WATER LEVEL SENSOR

Disconnect plug (1).
Bridge pins 1 and 2 on wire harness with ignition ON.
Indicator lamp with gas station symbol in instrument cluster must light up.

Checking Sensor:
Remove sensor with fuel filter cap.
Connect plug (1).
Submerge sensor in a metal container filled with water, which is connected with vehicle ground.
Ignition ON - indicator lamp in instrument cluster must light up.
Turn off ignition before disconnecting plug.

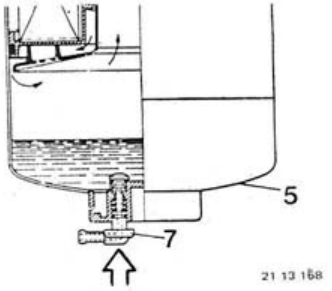
Wiring Diagram for Water Level Warner:

1 Vehicle ground
2 Indicator lamp, 9 to 15 V operating voltage
3 Sensor

Voltage drop at outlet = 1 V.

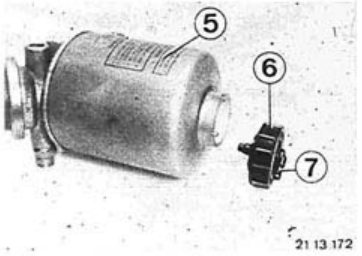
Important!
As from control unit version T 5 or S 1 water level sensor is monitored by diagnosing system (see fault memory).

Note:
Check electric wires to wiring diagram.

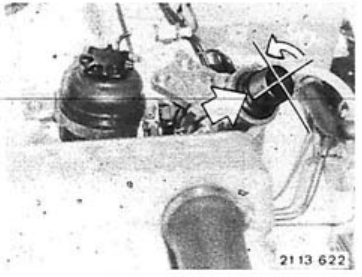


DDE
13 32 051 REPLACING FUEL FILTER

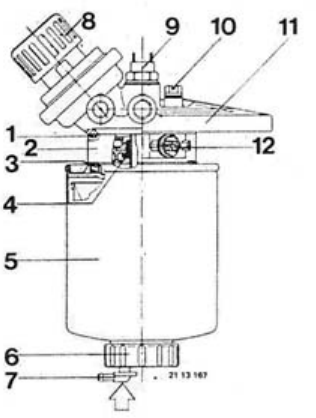
Loosen bleeder screw (10) and drain a small amount of diesel fuel at drain valve (7).
Unscrew filter cartridge (5) – use a standard tool.



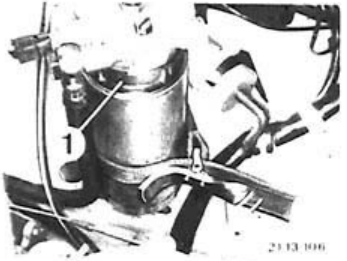
Install cap (6) with drain valve (7) on a new filter.
Installation:
Lubricate seal (3) lightly with oil.
Screw on filter by hand until gasket bears – tighten one half turn afterwards by hand.



Unlock cap of manual pump (8) by turning 90° and pump so long, until diesel fuel runs out of bleeder screw (10).
Tighten bleeder screw (10).
Lock manual pump (8).



1 Seal
2 Heating element
3 Seal
4 Heating element nut
5 Filter cartridge
6 Cap
7 Drain valve
8 Manual pump
9 Temperature switch 5.5° C (42° F)
10 Bleeder screw
11 Filter head
12 Heating element electric conn.



13 32 051 REMOVING AND INSTALLING OR REPLACING FUEL FILTER CARTRIDGE

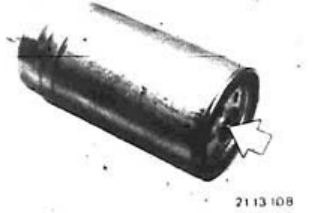
Unscrew filter cartridge with a standard tool – counterholding on the turning heating unit (1) if necessary.

Installation:

Insert a new seal when reusing the filter cartridge.

Replacing:

Unscrew cap (2) and install on new filter cartridge.



Fill new filter cartridge with pure fuel and screw on filter head against stop.

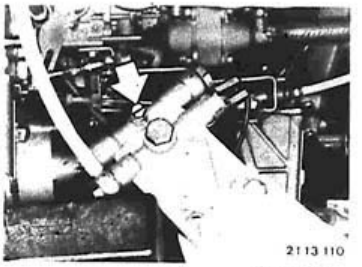
Then tighten by hand with one half turn.

Start and run engine at idle speed.

Bleeding takes place automatically.

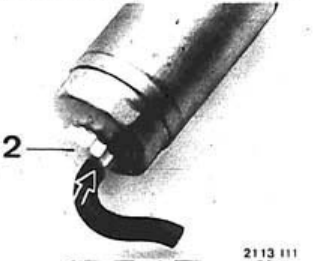
Check filter for leaks, tightening more if necessary.

Feed line must be filled with fuel not having air bubbles.

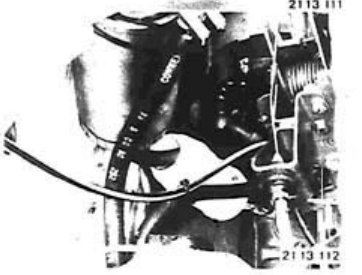


13 32 . . . DRAINING WATER IN FUEL FILTER

Unscrew bleeder screw.



Connect 8 mm (0.315") dia. shaped hose on drain adapter.

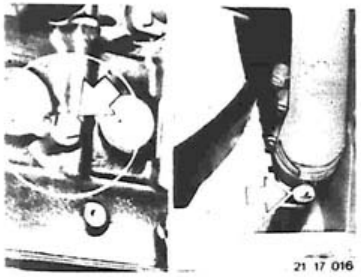


Hold a 0.2 liter (0.4 pint) container underneath shaped hose and loosen cap (2) about one turn.

Drain system until pure diesel fuel runs out.

Then tighten the cap and bleeder screw.

Start engine and run it at idle speed until the feed line is filled with fuel not having air bubbles.

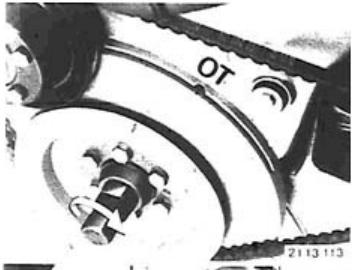


21 17 016

13 51 000 REMOVING AND INSTALLING INJECTION PUMP

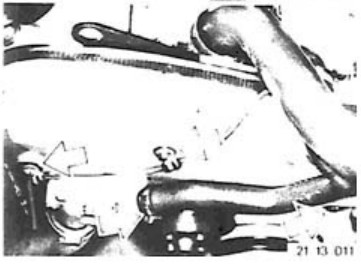
Remove engine splash guard – see 51 47 . . ..
Unscrew drain plugs on engine and radiator.
Drain coolant.
Unscrew and swing away expansion tank.
Installation:
Pour in coolant* and bleed cooling system – see 17 00 039.

Remove intake manifold – see 11 61 . . ..



21 13 113

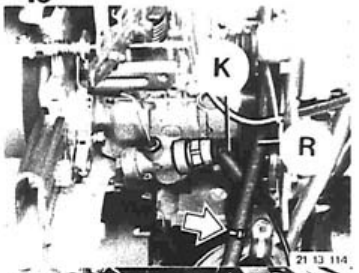
Turn crankshaft to TDC mark (ignition in cylinder no. 1).



21 13 011

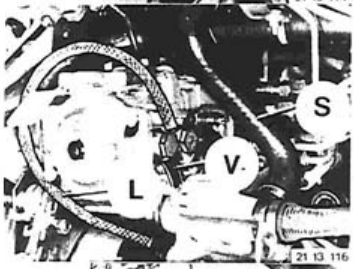
Disconnect water hose.
Loosen drive belt on alternator and unscrew toothed belt cover.

* See Operating Material Folder



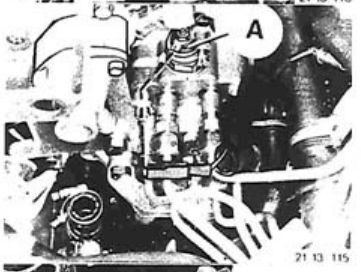
21 13 114

Unscrew connection and mounting of return line (R).
Pull off rubber cap and plug on cold start valve (K).



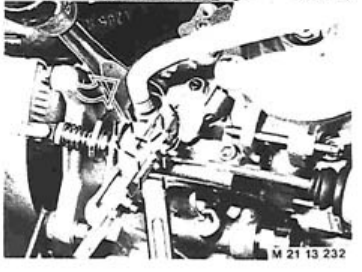
21 13 116

Disconnect hoses for vacuum (V), leak oil (L) and cold starting aid (S).



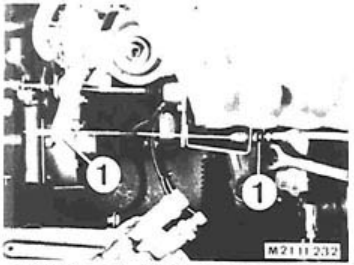
21 13 115

Pull off rubber cap and plug on electric shutoff (A).

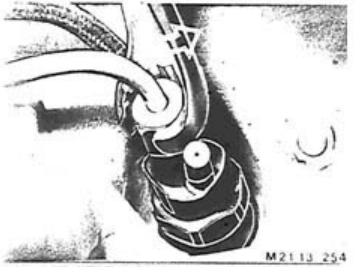


M 21 13 232

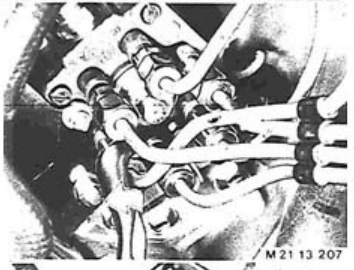
Counterhold on adapter and unscrew fuel feed line with Special Tool 13 5 020.
Plug opening with a protective cap.



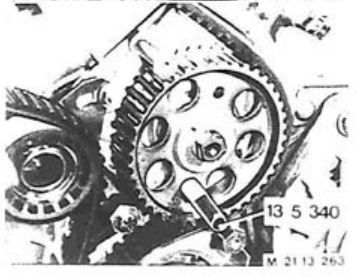
Disconnect cables and take them out of the holders.



Unscrew all coupling nuts on fuel injectors.
Plug openings of fuel injectors with protective caps.
Caution!
Reposition special tool in good time to avoid bending the injection lines.

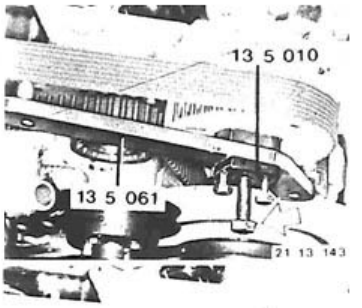


Unscrew coupling nuts on injection pump and take off lines.
Plug openings with protective caps.
Installation:
Tighten the lines beginning with connection 4.
Tightening torque*.

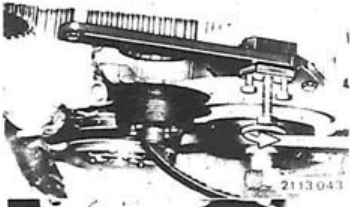


Unscrew nut on toothed belt sprocket.
Hold sprocket with Special Tool 13 5 340.

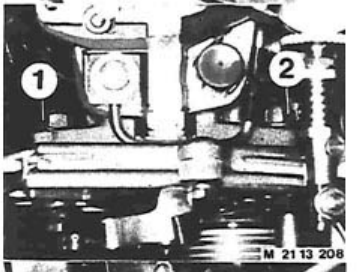
* See Specifications



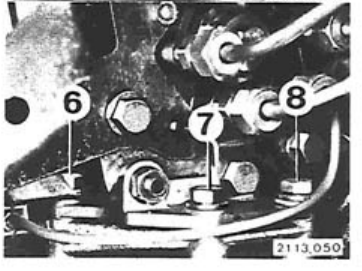
Bolt Special Tools 13 5 061 and 13 5 010 on toothed belt sprocket.
Loosen bolt (see arrow) completely.



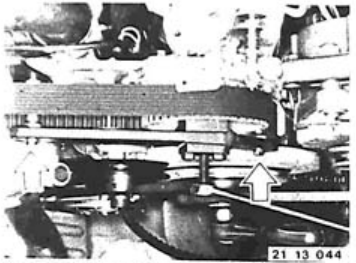
Turn crankshaft slightly until special tool can be bolted.
Use M 6 x 20 bolts.



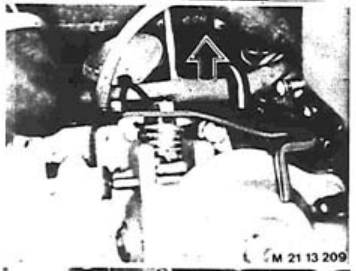
Unscrew nuts (1 and 2).



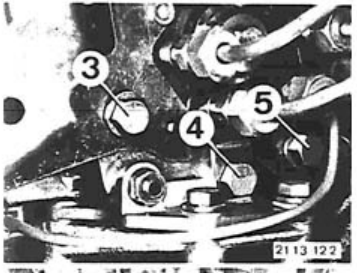
Unscrew bolts (6 ... 8).



Press out injection pump toward rear with Special Tool 13 5 010.

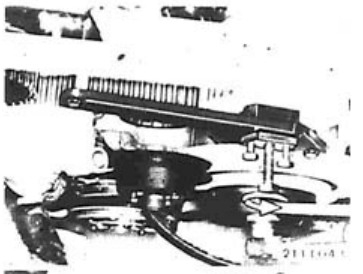


Pull wire harness out of holder.
Take off injection pump.

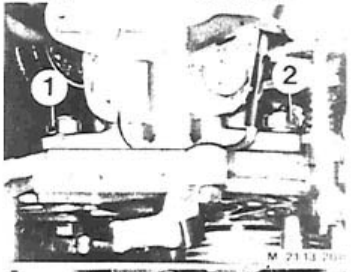


Unscrew nuts (3 ... 5) prior to installation.

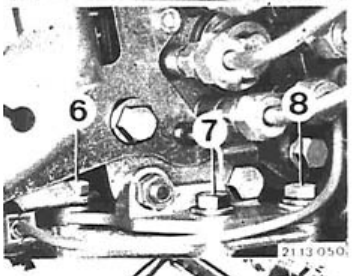
Move injection pump shaft to installed position with Special Tool 13 5 062 – lever faces up.



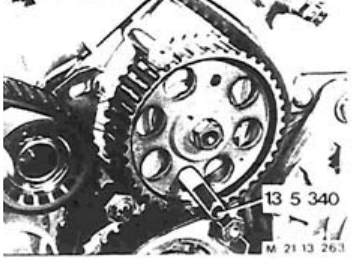
Loosen bolt on puller completely.
Install injection pump – make sure woodruff key does not fall out.



Tighten nuts (1 and 2) loosely.

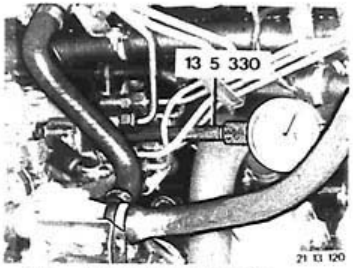


Tighten bolts (6 ... 8).
Remove Special Tool 13 5 010 / 061.

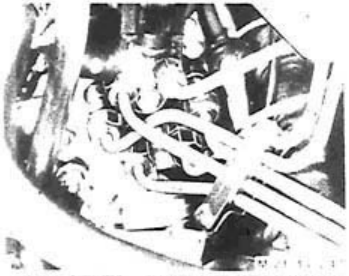


Tighten toothed belt sprocket nut.
Tightening torque*.

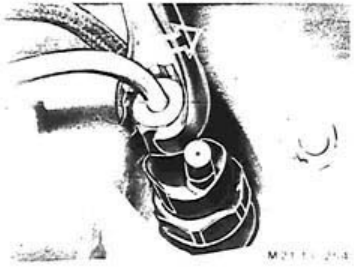
* See Specifications



Adjust injection pump statically – see 13 51 005.



Connect fuel feed line and bleed injection pump – see 13 51 320.

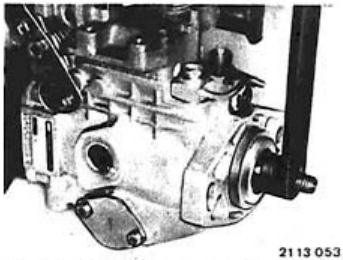


Assemble and then bleed fuel lines – see 13 51 320.
Check idle speed*, correcting if necessary – see 13 00 050.

* See Specifications

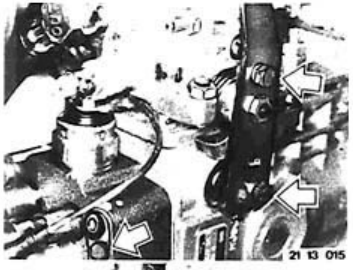
13 51 001 REPLACING INJECTION PUMP

Remove injection pump – see 13 51 000.
Cut open end of bleeding cap on new injection pump.



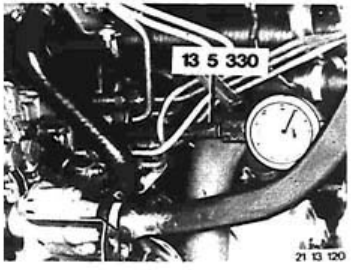
21 13 053

Move injection pump shaft to installed position with Special Tool 13 5 062 lever faces up.



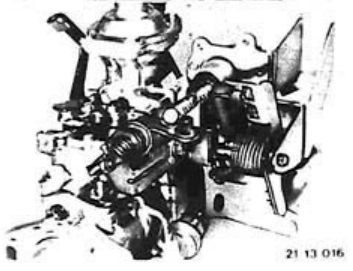
21 13 015

Transfer stopping lever and holder for wire harness.



21 13 120

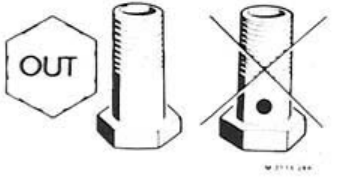
Install and adjust injection pump statically see 13 51 005.
Bleed fuel system – see 13 51 320.
Check idle speed, correcting if necessary see 13 00 050.

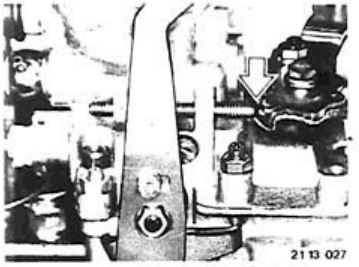


21 13 016

Transfer holder for cable or lever for cars with automatic transmission.

Connect return hose.
Hollow union bolt OUT is matched with an injection pump – don't mix them up.

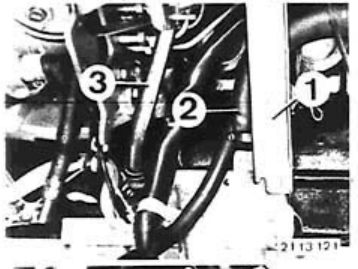




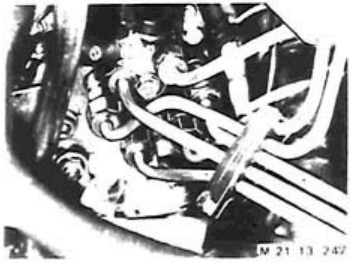
13 51 005 CHECKING/CORRECTING STATIC ADJUSTMENT OF INJECTION

Requirements:
Coolant temperature > 20° C (68° F) or speed lever resting on idle stop.

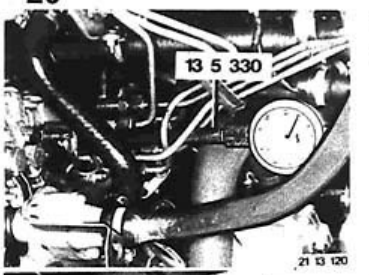
Disconnect battery lead on connector.
Disconnect speed sensor wire plug.



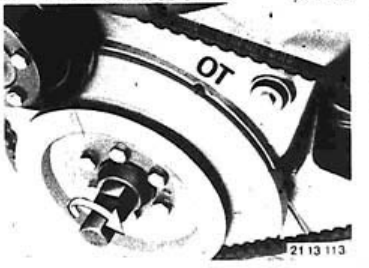
Checking:
Unscrew support (1) for intake manifold and bleeding hose (2).



Unscrew plug.

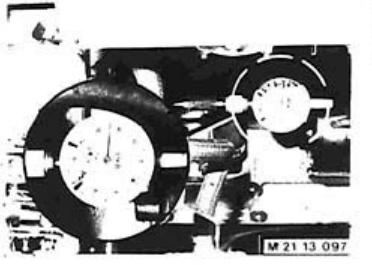


Screw in Special Tool 13 5 330.
Insert dial gage and apply test point with preload. *



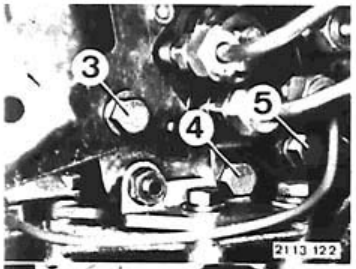
Turn crankshaft clockwise until needle of dial gage stops moving.
Turn scale to zero.
Turn crankshaft further in direction of TDC mark (ignition of cylinder no. 1) until applied Special Tool 11 2 300 engages.

Note:
Do not turn crankshaft counterclockwise – wrong test results.

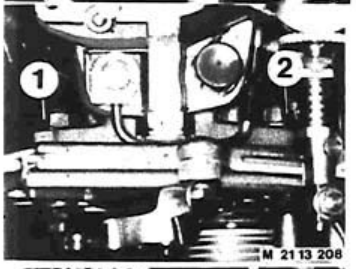


Read value from dial gage.
If test value* is not reached, loosen injection pump and correct static adjustment.

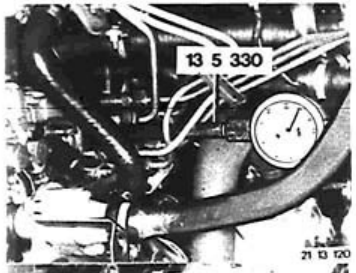
* See Specifications



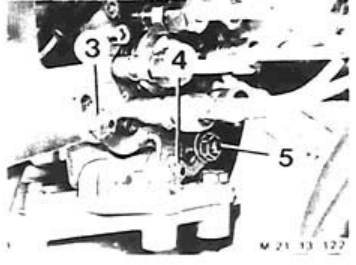
Correcting:
A new adjustment will be necessary, if the test value* can no longer be reached.
To loosen the injection pump, remove the dial gage and holder.
Unscrew bolts (3 ... 5).



Loosen nuts (1 and 2) only one half turn to avoid tension from the toothed belt.

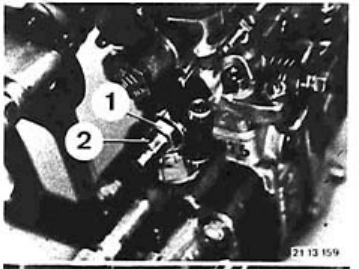


Apply dial gage with holder.
Move injection pump to correct position.
Swinging the injection pump toward the engine = earlier ignition timing point.



Tighten bolts in order of 1 through 5 after finishing adjustments.
Recheck adjustment.

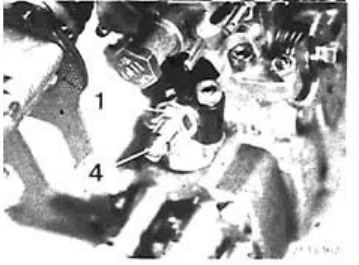
* See Specifications



– Full throttle volume correction –
with full throttle smoke above 2500 rpm:
– Check compression – see 11 00 039.
– Adjust valve clearance – see 11 34 004.
– Check static adjustment of injection pump.
Unscrew lock nut (1) and turn back up to lockplate (2).
Lockplate (2) limits the adjustment in direction of "more volume".

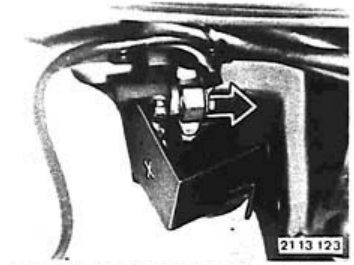
The factory adjustment is marked with a notch and serves as an initial basis – remark the initial position if necessary.

Adjusting screw (3) must be "tightened" 3 and 1/2 turns with Special Tool 13 5 100.
Reference Values:
Screw tightened = "less volume".
Screw loosened = "more volume".
3 and 1/2 turns of the adjusting screw will change the volume by approx. 1.0 mm^3.



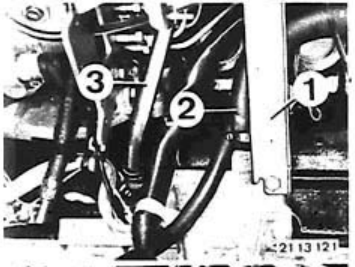
Tighten lock nut (1).
Caution!
Danger of breaking the plastic housing – counterhold on volume screw (4) if necessary!
Make visual inspection after test drive – take back full throttle volume by another 1 mm^3 if necessary.
Lock nut (1) with identification paint**.

** Source: HWB, No. 81 22 9 407 404

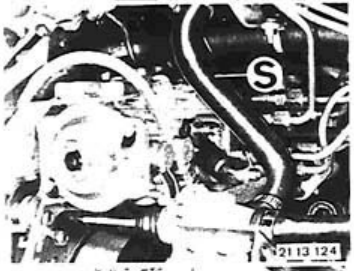


13 51 301 REPLACING ELECTRIC FUEL SHUTOFF

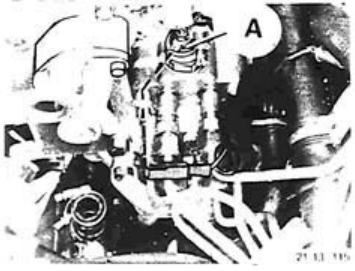
Disconnect battery lead on connecter and remove on starter.



Unscrew support for intake manifold (1), bleeding hose (2) and oil pipe (3).

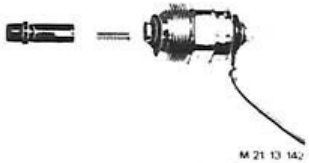


Pinch hoses tight with clamps.
Detach hose (S).



Pull off rubber cap and plug.
Disconnect lug and unscrew shutoff (A).

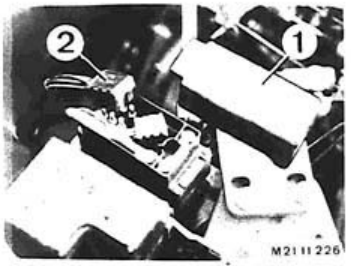
Watch out for spring and piston while removing – they could fall out.
Installation:
Tightening torque*.



13 51 510 REPLACING ELECTRIC VALVE ON COLD START BOOSTER

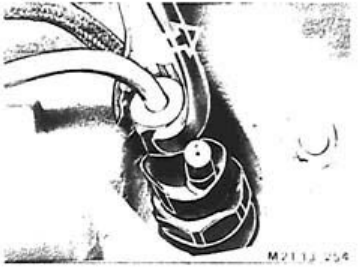
Take off rubber cap and pull off plug.
Unscrew valve – watch out for spring which could fall out.
Installation:
Tightening torque*.

* See Specifications

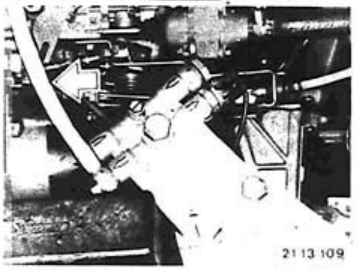


13 51 320 BLEEDING FUEL SYSTEM

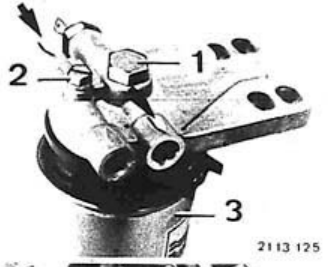
Pull off plug (2) on heating time control unit when bleeding the system for protection of the glow plugs.



Bleeding Injection Lines:
Unscrew all coupling nuts on fuel injectors with Special Tool 13 5 020.
Crank engine with the starter until fuel runs out, checking pressure valves if necessary.
Tighten nuts afterwards.
Tightening torque*.



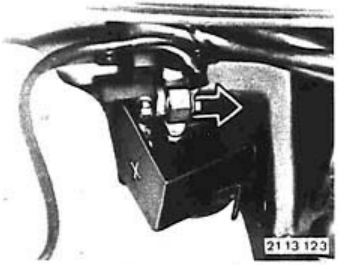
The fuel feed line and fuel filter are bled during the starting phase.



However, this requires that filter cartridge (3) is filled with fuel.
If necessary, unscrew bolt (1) and pour in fuel.
Bolts (1 and 2) must be tightened for bleeding.

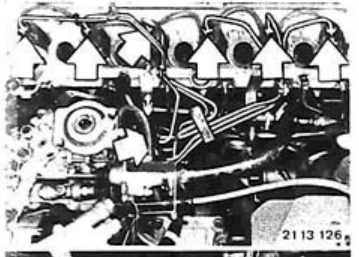
Bleeding Injection Pump:
Loosen plug on high pressure section two turns.
Start engine until fuel runs out, checking electric fuel shutoff if necessary.

* See Specifications

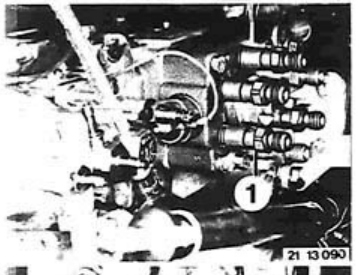


13 51 290 REPLACING PRESSURE VALVES

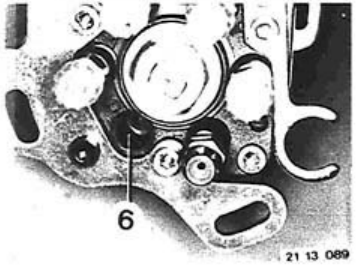
Disconnect battery lead on connector.



Unscrew intake manifold – see 11 61 . . ..
Unscrew all injection lines with Special Tool 13 5 020 and take off complete package.
Plug openings with protective caps.

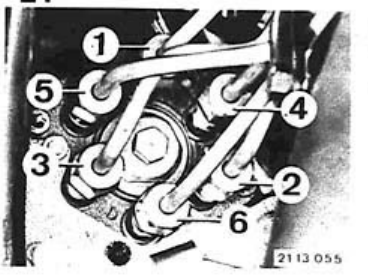


Unscrew pressure valves.
Caution!
Loose parts could fall out.



Lift out washer (6) with a scribe or similar tool.
Installation:
Use new insulators (6).
Tightening torque*.

* See Specifications

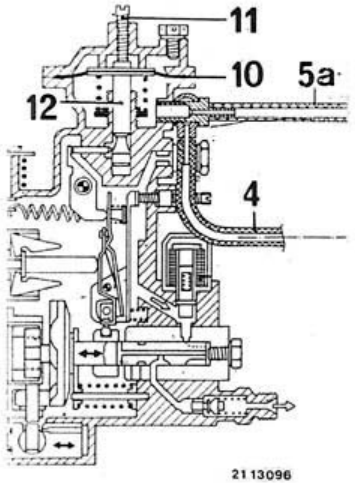


Tighten injection lines in order of 4, 2, 6 and so on.
Tightening torque*.
Tighten lines on fuel injectors only after bleeding.

Arrangement of Parts:
1 Pressure valve holder
2 Pressure valve
3 Pressure valve body
4 Spring
5 Washer
6 Insulator

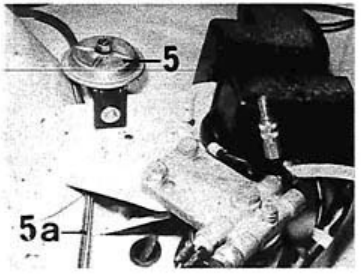
* See Specifications

13 51 . . . CHECKING ATMOSPHERIC PRESSURE DEPENDENT REGULATION



2113096

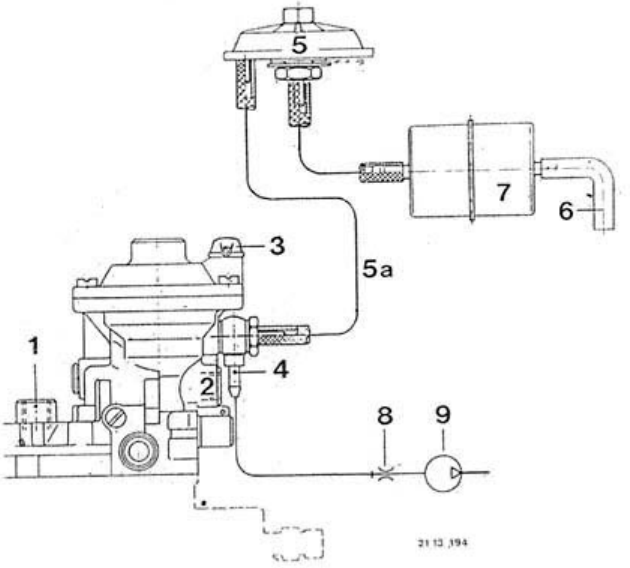
1) Leak Test on Diaphragm:
Plug hose (5a).
Connect vacuum pump on connection (4) and produce 300 to 350 mbar vacuum.
Pulling off the hose on connection (4) will cause pressure pin (12) to move up suddenly against adjusting screw (11).
This is indicated by a loud click.
If diaphragm (10) leaks, the regulation will not work and the injection pump has to be replaced.



2) Function of Control Unit:
Control unit (5) holds the pressure underneath diaphragm (10) at a constant value* continuously.
Example:

Absolute air pressure	980 mbar
Pressure measured in line 5a	– 270 mbar
Constant absolute pressure underneath diaphragm	710 mbar

The vacuum measured in line (5a) will always depend on the absolute air pressure.
Constant Pressure* Not Reached:
Check lines for leaks.
Check flow in filter.
Replace control unit, if necessary.



2113194

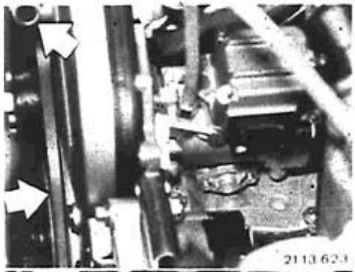
1 Fuel feed
2 Fuel return
3 Venting (cap must be unscrewed)
4 Vacuum supply (> 300 mbar)
5 Control unit
6 Elbow hose (must face down)
7 Filter (check direction of flow)
8 Orifice
9 Vacuum pump

* See Specifications

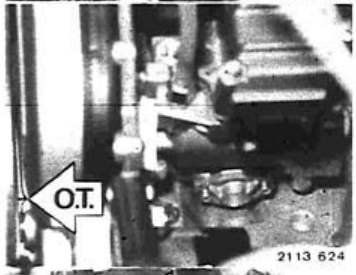
DDE

13 51 000 REMOVING AND INSTALLING INJECTION PUMP

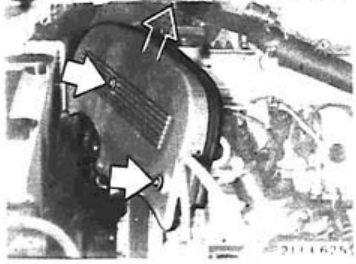
Removing:
Disconnect battery ground lead.
Important!
This will cancel memories of all systems – read memories first.
Unscrew front splash guard.
Unscrew drain plug on radiator.
Drain coolant.
Installation:
Pour in coolant* and bleed cooling system – see 17 00 039.



Disconnect water hoses.
Loosen and take off drive belt on alternator.
Installation:
Tighten drive belt.

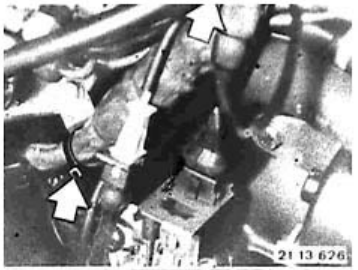


Turn crankshaft to TDC mark (ignition position in cylinder no. 1).

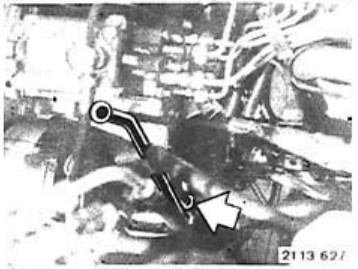


Unscrew toothed drive belt cover.

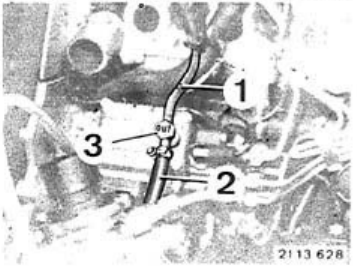
* See Operating Fluid Specifications



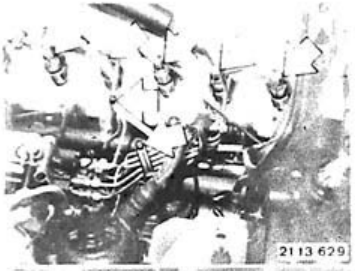
Loosen electric lead holders.



Unscrew holder for oil pipe.

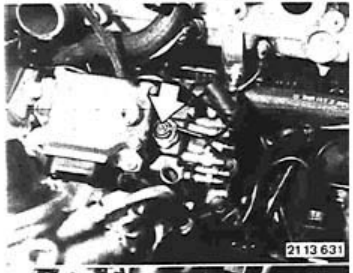


Pull off leak oil hose (1).
Unscrew return pipe (2).
Hollow union bolt (3) is matched with the injection pump.

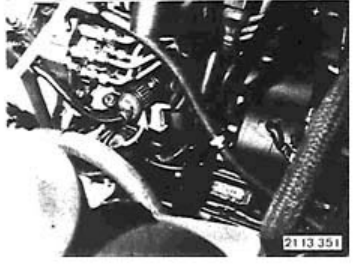


Unscrew spacing holders of injection pipes.
Unscrew all coupling nuts on injection nozzles.
Plug openings in injection nozzles with caps.
Important!
Reposition tool in time to avoid bending the injection pipes.

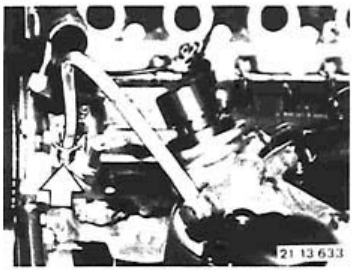
Unscrew coupling nuts on injection pump and pull back pipes.
Plug openings with caps.



Unscrew connection for fuel shutoff.

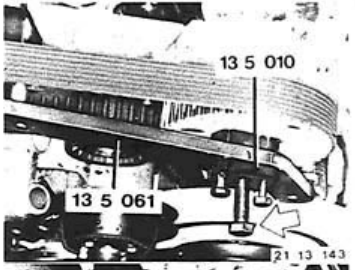


Disconnect wire harness.

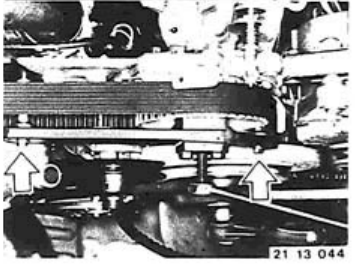


Counterhold on adapter and unscrew pipe with Special Tool 13 5 020.
Plug opening with a cap.

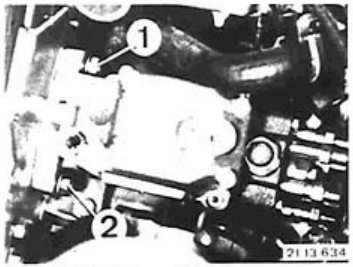
Unscrew nut on toothed belt sprocket.
Hold in position with Special Tool 13 5 340.



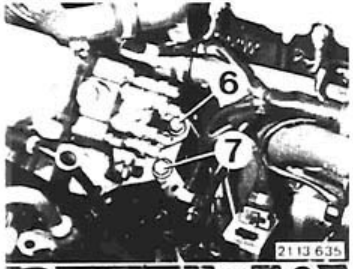
Bolt Special Tools 13 5 061 and 13 5 010 on toothed belt sprocket.
Screw back bolt (see arrow) completely.



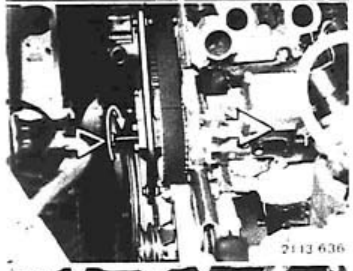
Turn crankshaft further, until special tool can be bolted.
Use M 6 x 20 mm screws.



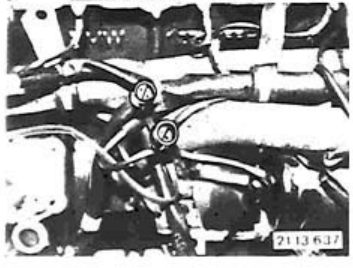
Unscrew nuts (1 and 2).



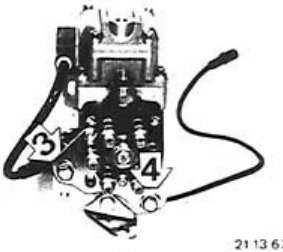
Unscrew bolts (6 and 7).



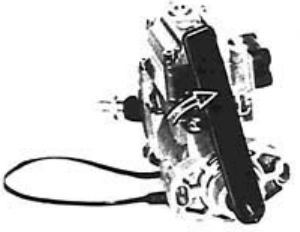
Disengage injection pump toward rear with help of a puller.
Then unscrew bolt completely.



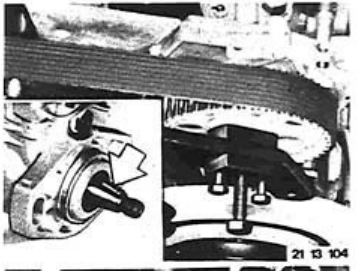
Pull electric lead plug out of holder.
Take off injection pump.
Disconnect plug for solenoid lead.



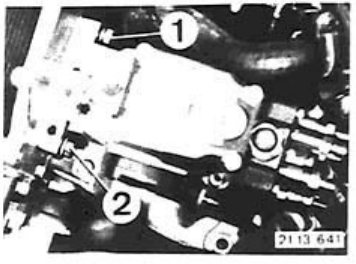
Installing:
Transfer parts – see 13 51 001.
Unscrew nuts (3 and 4) prior to installation.



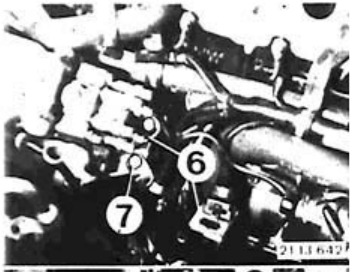
Bring injection pump shaft into installed position with Special Tool 13 5 062.
Rotary lever must be perpendicular in front of felt cam.



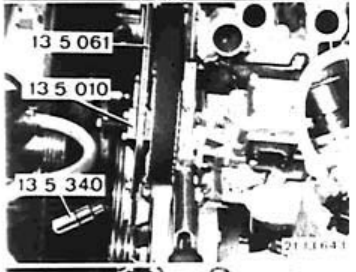
Mount injection pump, being careful that the woodruff key does not fall out.



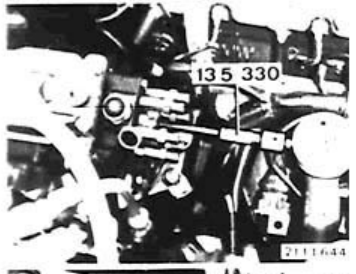
Screw on nuts (1 and 2), but do not tighten to final torque.



Tighten holder (6) and bolt (7).



Remove Special Tools 13 5 010 and 13 5 061.
Mount the drive belt sprocket, using Special Tool 13 5 340 to counterhold.
Tightening torque*.

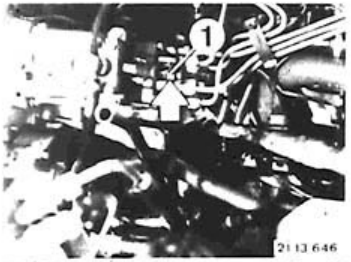


Adjust injection pump statically – see 13 51 005.

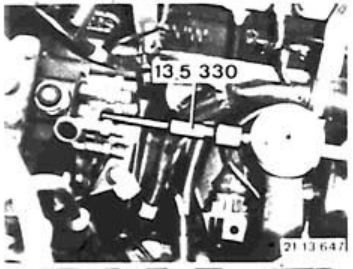
Mount injection pipes, beginning with the tightening at connection (4).
After assembling, bleed fuel system – see 13 51 320 and check idle speed – see 13 00 050 in Construction Group Repair Manual.
Pipes for cylinders 1, 5, 3, 6, 2, 4 to firing order.

* See Specifications

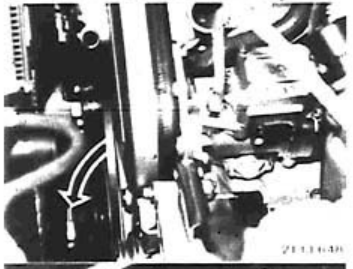
DDE
13 51 005 ADJUSTING INJECTION PUMP STATICALLY



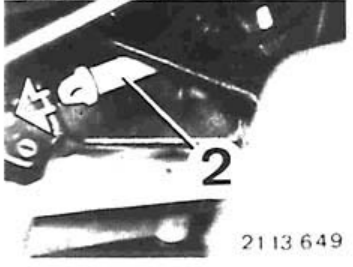
Coolant temperature at least 20° C (68° F).
Unscrew plug (1).
Installation:
Tightening torque*.



Screw in Special Tool 13 5 330.
Mount dial gage with preload.

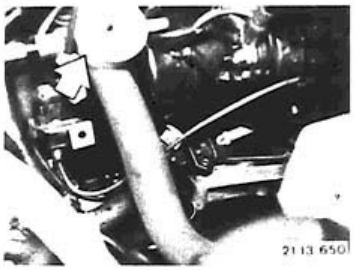


Turn crankshaft clockwise in direction of TDC for cylinder no. 1 (begin about 60 to 90° earlier) until the needle remains at the lowest point for some time.
Set scale of dial gage to zero.

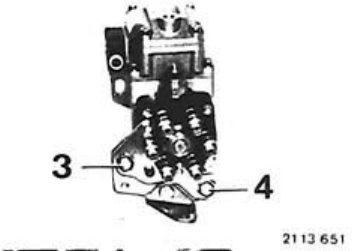


Pull out plug (2).
Turn crankshaft clockwise until Special Tool 11 2 300 engages in bore in flywheel at TDC.
Important!
Don't turn in direction opposite the engine's turning direction – wrong test results.

* See Specifications

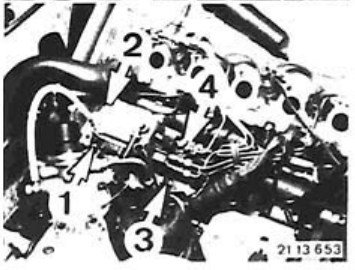


Read amount of distributor piston stroke on dial gage.
Test value: 1.05 ± 0.02 mm (0.0413 ±0.0008").



Adjusting:
Unscrew bolts (3 and 4).

Loosen nuts (1 and 2), but not too much to avoid tension from the toothed drive belt.

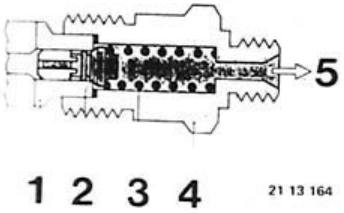


Turn injection pump until dial gage shows the correct value*.
Tighten nuts in order of 1 through 4.
Tightening torque*.
Recheck adjustment.

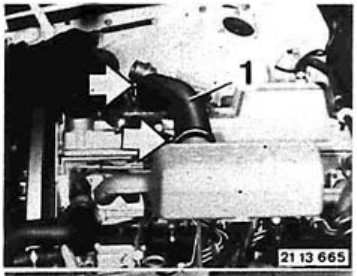
* See Specifications

DDE
13 51 290 REPLACING PRESSURE VALVES

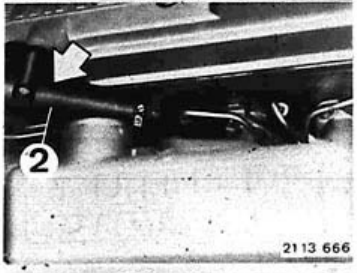
The pressure valve closes the injection pipe to the pump.
It has the task of removing injection pressure from the injection pipe after finishing a delivery phase by removing a defined volume.



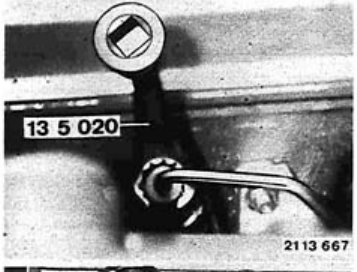
1 Valve carrier
2 Valve piston – valve seat
3 Valve spring
4 Pressure valve holder
5 Injection pipe holder



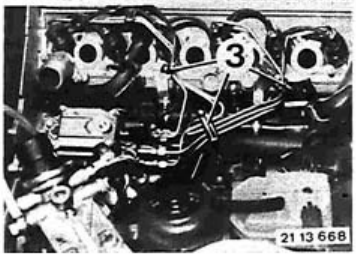
Disconnect battery ground lead.
Important!
This will cancel the memories of all systems, read them first if applicable.
Disconnect hose (1).



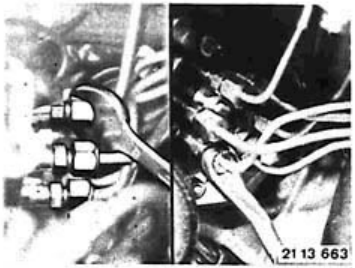
Unscrew oil trap (2).



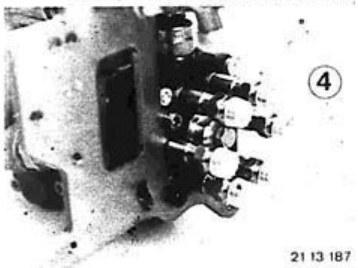
Unscrew injection pipes on injection nozzles with Special Tool 13 50 020.
Install protective caps.
Installation:
Tightening torque: 20 to 25 Nm (14.5 to 18 ft. lbs.).



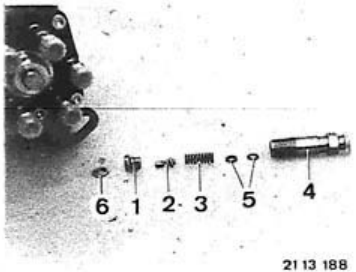
Unscrew spacing holder (3).



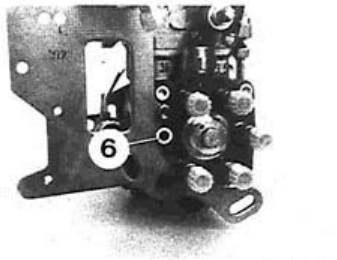
Unscrew injection pipes on injection pump.
Install caps.
Installation:
Tightening torque: 20 to 25 Nm (14.5 to 18 ft. lbs.).



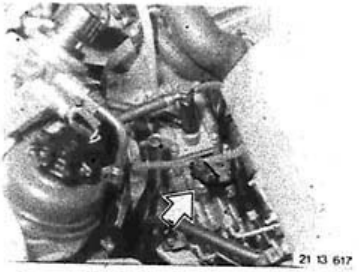
Unscrew pressure valve holder (4).
Caution!
Take off pressure valve holder – parts could fall out.
Parts are matched and must not be mixed up!
Installation:
Tightening torque: 40 ± 2 Nm (29 ± 1 ft. lbs.).



1 Valve carrier
2 Valve piston
3 Valve spring
4 Pressure valve holder
5 Shim(s)
6 Seal

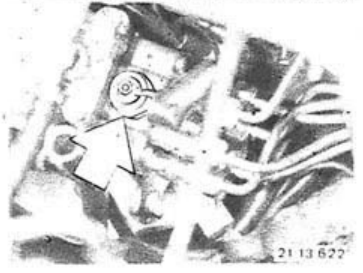


Installation:
Replace seal (6).
Bleed injection system - see 13 51 320.



13 51 300 CHECKING ELECTRIC FUEL SHUTOFF

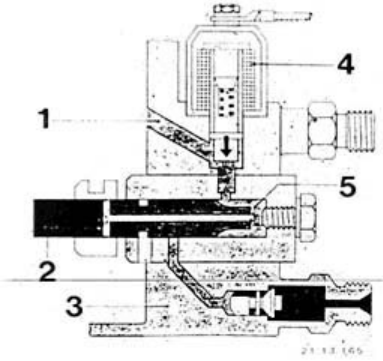
The shutoff receives voltage from the control unit as from ignition key position DRIVE on. A loud click will be heard to indicate this when switching on.



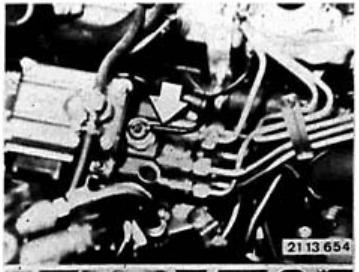
If no click is heard, check power supply to the control unit.
See self-diagnosis for other tests.

13 51 301 REPLACING ELECTRIC FUEL SHUTOFF

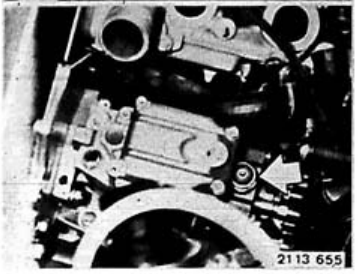
The supply of diesel fuel is interrupted to stop a diesel engine. The shutoff receives electric power from ignition key position DRIVE on.



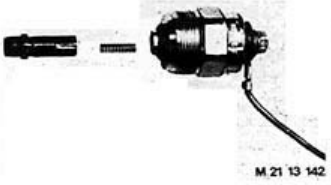
1 Feed bore
2 Distributor piston
3 Distributor head
4 Pulling magnet
5 High pressure chamber



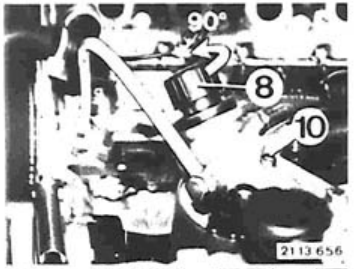
Installation:
Disconnect electric lead on fuel shutoff.



Unscrew fuel shutoff with a 24 mm open-end wrench.
Caution:
Be careful that piston and spring do not fall out!

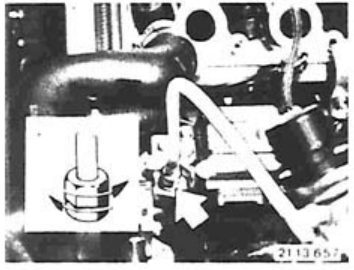


The force of the spring runs the piston out in a state without current -- fuel feed is stopped.
Installation:
Check O-ring for correct seating.
Tightening torque: 20 ± 5 Nm (14.5 ± 3.5 ft. lbs.).

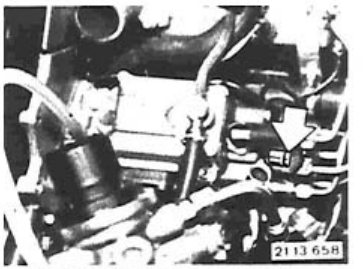


DDE
13 51 320 BLEEDING FUEL SYSTEM

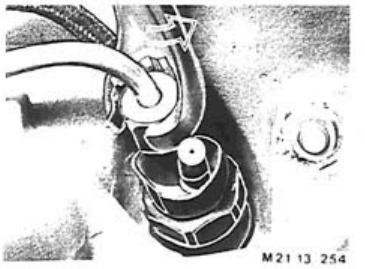
Always begin bleeding procedures on the fuel filter.
Loosen bleeder screw (10).
Unlock cap of manual pump (8) by turning 90° and pump so long, until fuel runs out of the bleeder screw (10).
Lock manual pump (8).



Unscrew coupling nut with Special Tool 13 5 020 while counterholding on adapter, if there is air in the pipe in front of the injection pump.
Operate manual pump on fuel filter until air bubbles escape.



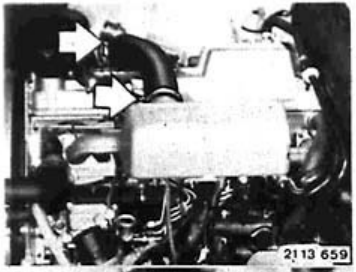
Bleeding Injection Pump:
Unscrew plug two turns.
Crank engine with starter until fuel runs out.
Then tighten plug again.
Tightening torque: 14 + 6 Nm (10 + 4 ft. lbs.).



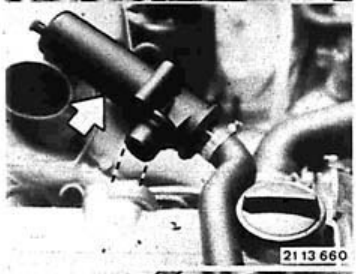
Bleeding Injection Pipes:
Unscrew all coupling nuts on fuel nozzles with Special Tool 13 5 020.
Crank engine with starter until fuel runs out of the pipes.
Tighten nuts again.
Tightening torque: 20 + 5 Nm (14.5 + 3.5 ft. lbs.).

DDE

13 53 320 REMOVING AND INSTALLING COMBINATION FUEL INJECTION NOZZLE

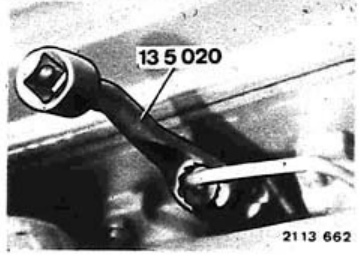


Loosen hose clamps and take off intake air hose.

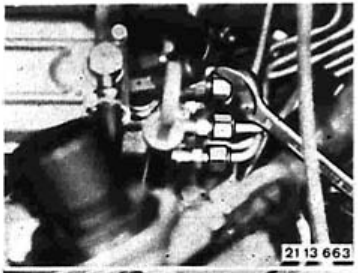


Unscrew oil trap.

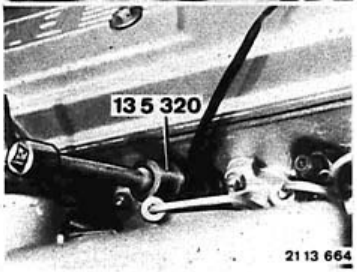
Loosen and remove pipe spacing holder.
Pull off leak oil hoses with a pliers.



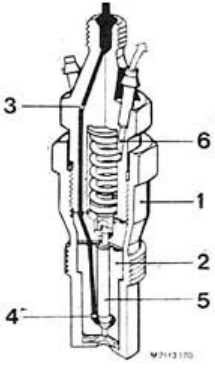
Unscrew coupling nuts with Special Tool 13 5 020.
Note;
Reposition special tool in good time to avoid bending pipes.
Plug openings with caps.



Unscrew coupling nuts on injection pump.
Installation:
Tightening torque*.



Unscrew combination fuel injection nozzle with Special Tool 13 5 320.
Installation:
Bleed injection pipes - see 13 51 320.
See Group 13 in Construction Group Repair Manual for additional information.



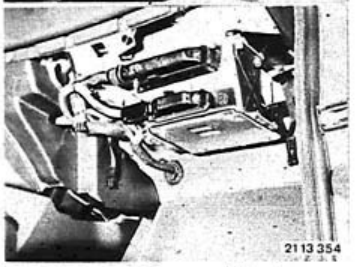
Components of Combination Fuel Injection Nozzle:
1 Nozzle holder
2 Nozzle body
3 Feed bore
4 Pressure chamber
5 Nozzle needle
6 Leak oil pipe

Important!
Never disassemble the fuel injection nozzle with needle movement sensor (electric lead) on cylinder no. 4.

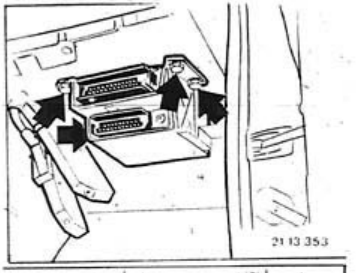
* See Specifications

DDE
13 61 000 REMOVING AND INSTALLING CONTROL UNITS

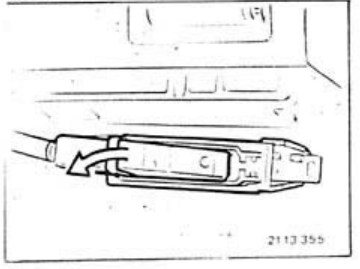
Read fault memories – see BMW diagnosing system.



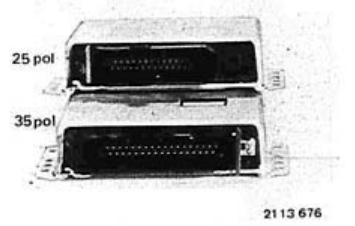
Remove cover in glove box.

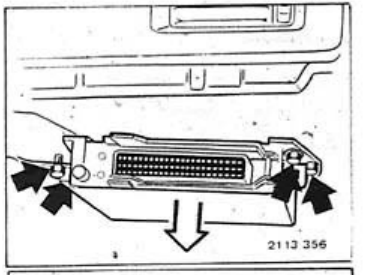


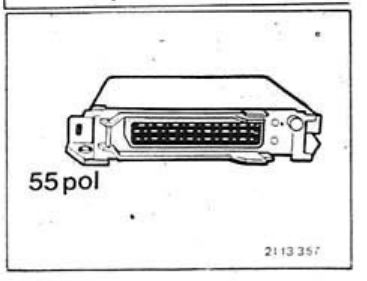
Unscrew screws and remove control units.



Important!
Turn off ignition before disconnection or connection of the multiple-pin plug.







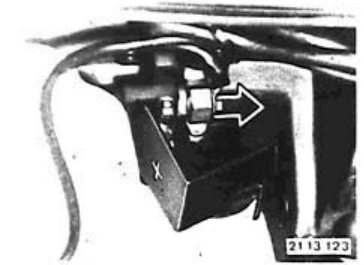
Note:
SB Control Unit
(25 Pin Connection)
Responsible For:
- **Injection begin regulation**
- **Self-diagnosis output**
- **Exhaust gas recirculation**

ME Control Unit
(35 Pin Connection)
Responsible For:
- **Starting injection rate**
- **Injection rate regulation while driving**
- **Smoke limit**
- **Fuel mass correction**
- **Idle speed control**
- **Road speed control**
- **Automatic transmission activation**
- **Charge pressure control**
- **Hesitation suppression**

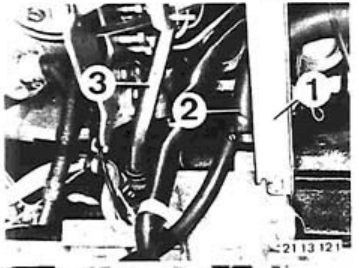
DDE II with One Control Unit (55 Pin Connection with Two Computers)
Computer I:
- **Injection begin regulation**
- **Self-diagnosis output**
- **Exhaust gas recirculation**

Computer II:
- **Injection rate regulation with starting injection rate control and full load injection rate limit**
- **Speed control**
- **Smooth running control and hesitation suppression**
- **Smoke limit and overheating guard**
- **Road speed control**

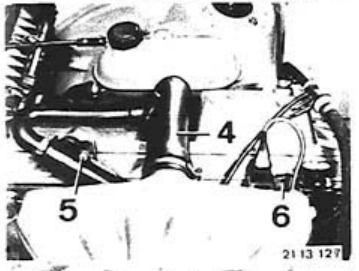
13 53 320 REMOVING AND INSTALLING OR REPLACING COMBINATION FUEL INJECTION NOZZLES



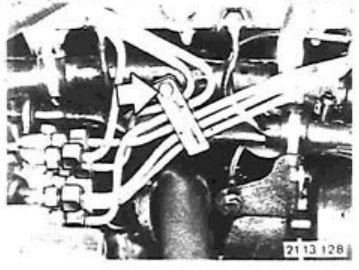
Disconnect battery lead on connector.



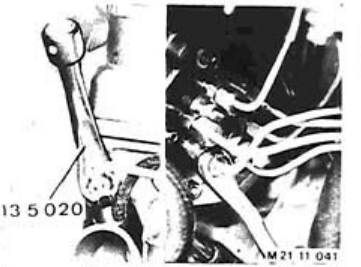
Unscrew following parts:
support for intake manifold (1), vent hose (2), oil test pipe (3), B + wire on starter.



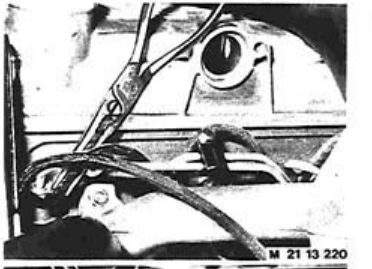
Intake hose (4), oil trap (5), holder for plug (6).



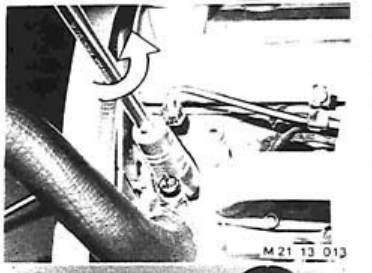
Holder for injection lines.



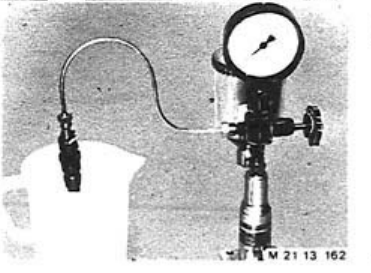
Unscrew coupling nuts in fuel injectors with Special Tool 13 5 020 – only loosen on injection pump.
Plug openings with protective caps.



Pull off all leak oil hoses.

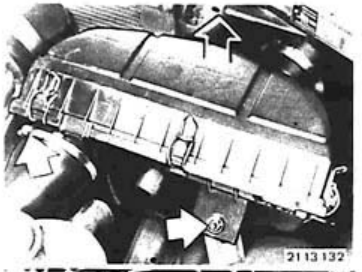


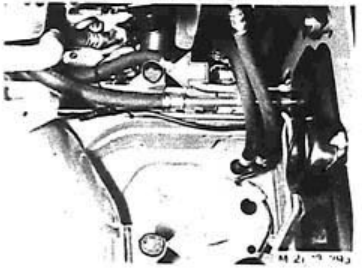
Unscrew combination fuel injection nozzle with Special Tool 13 5 320.
Installation:
Coat threads with copper paste prior to installation.
Check tightening torque* for coupling nuts and combination fuel injection nozzles.
Assemble and then bleed injection lines – see 13 51 320.



Perform test to evaluate injection nozzles – see Construction Group Repair Manual.

* See Specifications

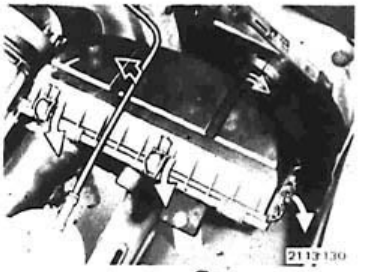




13 71 000 REMOVING AND INSTALLING AIR CLEANER

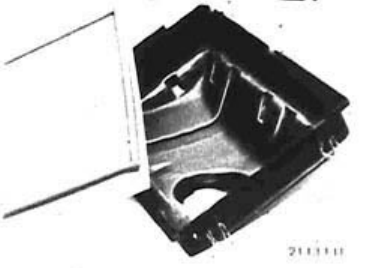
Detach hose and unscrew nut.
Lift out air cleaner.

Installation:
Place air cleaner housing on rubber mounts precisely.



13 72 001 REPLACING AIR FILTER CARTRIDGE

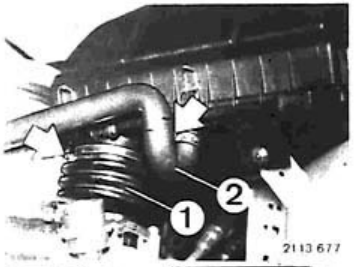
Turn intake funnel 90° and push forward
Open fasteners and lift out cover with filter



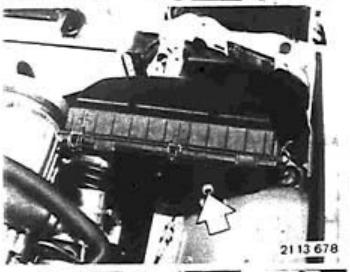
Remove filter cartridge.
Install new filter – check installed position

DDE

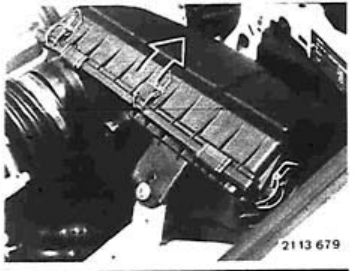
13 71 000 REMOVING AND INSTALLING AIR CLEANER



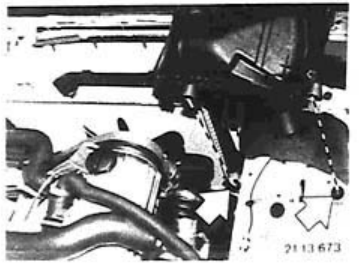
Loosen hose clamps.
Pull off hoses (1 and 2).



Unscrew nut.



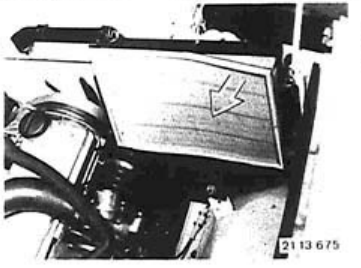
Tilt and pull out filter housing.



Installation:
Guide in intake neck.
Mount housing on rubber mounts.

13 72 001 REPLACING AIR FILTER CARTRIDGE

Open fasteners and pull up filter cartridge.



Insert filter cartridge.
Guide in intake neck.
Close cover and lock fasteners.

TROUBLESHOOTING DDE WITH BMW DIAGNOSING SYSTEM

Insert diskette, connect BMW Service Tester on diagnosis plug – see operating instructions of BMW DIAGNOSING SYSTEM.

Ignition ON:
Select 01 DDE, if necessary perform brief test (brief test only displays, whether there are faults in the system).
Identification of control units appears on the screen after the control unit has taken on the data transmission.

– SB control unit	
SOFTWARE	* *** ***
– VERSION	***
CODE	* *** *** ***
SOFTWARE	* *** *** ***
MANUFACTURING CODE	***
– ME control unit	
BMW SOFTWARE	* *** ***
– VERSION	***
BOSCH CODE	* *** *** ***
SOFTWARE	* *** *** ***
MANUFACTURING CODE	***

Important!
Not applicable for DDE 2 (since plant shutdown 1988 – one control unit in 324 d).

Note:
When replacing control units, also send in a print of the identification (test code).

Call fault memory by selecting 900, troubleshoot according to screen text.

Status calls can be used for additional help in troubleshooting.

STATUS CALLS 100 FOR ME CONTROL UNIT		REMARKS
111	Brake test switch	Brake pedal pressed = ON
112	Idle switch in pedal value sender	Accelerator pedal pressed more than 9° = ON
116	AC switch	Switch pressed = ON, if air volume control wheel is not at 0
127	Clutch switch	Clutch pedal pressed = OFF

STATUS CALLS 100 FOR SB CONTROL UNIT		REMARKS
151	Switch position rate tap	Position 4 = basic position
152	Switch position idle tap	Position 3 = basic position

STATUS CALLS 200 FOR ME CONTROL UNIT		REMARKS
206	Drive potentiometer	2700...2900 mV at engine idle speed and operating temp., 5000 mV = interruption
209	Speed signal	Depending on wheel speed
213	Pedal value sender	353...451 mV in idle position, 3150...3300 mV in full load position and manual transmission, 3700...3800 mV with automatic transmission
222	AG feedback (only with FGR*)	Break or not installed = 5000 mV
223	Engine temperature	Depends on engine operation – 40°C (104°F) = break
224	Fuel temperature	Depends on injection pump temperature – 40°C (104°F) = break
226	FGR* control panel	5 V = break or not installed = 5 V Control lever in off position = 3.4 ... 3.6 V Front = 0.8 ... 0.9 V Rear = 2.6 ... 2.7 V Up = 1.6 ... 1.9 V Down = 4.1 ... 4.3 V
231	Speed (engine)	Variable
232	Power supply for control unit	at least 12.5 V in idle
234	Charging pressure sensor	Engine stopped = atmospheric pressure Break = 100 mbar

STATUS CALLS 200 FOR SB CONTROL UNIT		REMARKS
203	Injection begin sender	2.2 ... 2.5 V at idle, 5 V = break
204	Air temperature	Depends on ambient temperature – 40° C (104° F = break
205	Power supply for control unit	at least 12.5 V in idle
220	Injection begin actual value	Approx. SB nominal value (2° crankshaft)
230	Injection begin nominal value	3.2 ± 0.5° crankshaft before TDC in idle, engine at operating temperature

Note:
A fault will be reported in the system in the brief test, if cruise control is not installed in car.

See E 34 Car Electric/Electronic Test Plan for additional information.

Electric Shutoff

Function Test:
The electric shutoff is located in the high pressure section of the injection pump and is supplied with voltage (10 V) with the ignition turned on. Fuel feed is stopped, as long as there is no power supply.

D 300 – the electric shutoff can also be switched off and on with the SERVICE TESTER

Electric shutoff resistance in ohms	5 ... 10

* Cruise control

TROUBLESHOOTING DDE II WITH BMW DIAGNOSING SYSTEM

Insert diskette and connect BMW Service Tester in the diagnosis socket – see operating instructions of BMW Diagnosing System.

Ignition ON:
Select 01 DDE, if applicable perform the brief test (brief test only displays, whether or not there are faults in the system).
Identification of control units appears on the screen after the control unit has received the data transmission.

– Control Unit Identification

Software	* *** ***
Version	***
Code	* *** *** ***
Software	* *** *** ***
Manufacturing code	***

Note:
Also send in print of identification (test code) when exchanging control units.

Call fault memory by selecting 900, troubleshoot as displayed on screen.

Status calls can be used as further support of troubleshooting.

Status Call 100 from Control Unit	Remarks
131 Stop light test switch	With operated brake pedal = ON
125 Idle speed switch in pedal value sender	With accelerator pedal operated > 9° = ON
144 Air conditioner switch	With operated switch = ON, if air volume control wheel is not at 0
127 Clutch switch	With operated clutch pedal = OFF
127 P / N switch	In position P / N = ON
151 Volume balance switch pos.	Position 4 = basic position
152 Idle balance switch pos.	Position 3 = basic position

Status Call 200 from Control Unit	Remarks
221 Drive potentiometer	2700 ... 2900 mV at idle speed, engine at operating temperature, 5000 mV = break
229 Road speed signal	Depends on wheel speed
237 Pedal value sender	353 ... 451 mV in idle position, 3150 ... 3300 mV in full load position and manual transmission or 3700 ... 3800 mV in full load position and automatic transmission
222 AG feedback (only with FGR*)	– Break or not installed = 5000 mV
253 Engine (coolant) temperature	Depends on engine operation - 40° C (- 40° F) = break
235 Fuel temperature	Depends on injection pump temp. - 40° C (- 40° F) = break
220 FGR* control panel	5 V = break or not installed Control lever in neutral = 3.4 ... 3.6 V Forward = 0.8 ... 0.9 V Back = 2.6 ... 2.7 V Up = 1.6 ... 1.9 V Down = 4.1 ... 4.3 V
247 Engine speed	Variable
215 Power supply for control unit	> 12.5 at idle speed
260 Atmospheric pressure sensor	Actual atmospheric pressure Break = < 100 mbar
205 Injection begin sender	2.2 ... 2.5 V at idle speed, 5 V = break
252 Air temperature	Depends on ambient temperature - 40° C (- 40° F) = break
256 Injection begin actual value	Approx. SB nom. value (< 2° crksh.)
257 Injection begin nominal value	3.2 ± 0.5° crksh. before TDC at idle speed, engine at operating temp.

Note:
Brief test will report a fault in the system, if cruise control is not installed.

Other information – see car electric/electronic test plan E 34.

Electric Shutoff

Function Test:
The electric shutoff is located in the high pressure section of the injection pump and receives > 10 V power supply with the ignition turned on. Fuel delivery is stopped as long as power is not supplied.

D 300 – the electric shutoff can also be switched off and on from the BMW Service Tester.

Electric shutoff resistance	5 ... 10 ohms

* FGR = Cruise control

COMPONENT TEST

Component	Resistance In Ohms	Testing Temperature In ° C (° F)	Control Unit Pins
Speed sender	840 ... 960 1 ... 1.3 k-ohms	15 ... 30 (59 ... 86) 40 ... 60 (104 ... 140)	13 / 47
Fuel temperature sensor	660 ... 960	15 ... 30 (59 ... 86)	13 / 35

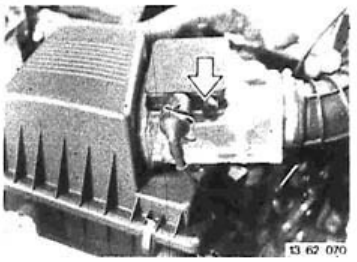
13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL - Car with Catalytic Conv.

M 40
Engines with Single Sensor Motronic
M 1.3

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60 deg. C (140 deg. F).
Engine and ignition in perfect working condition.
Connect BMW SERVICE TESTER to operating instructions.
Routine checking is not necessary.
Put in number of cylinders (4) for idle speed engine test step no. 5.

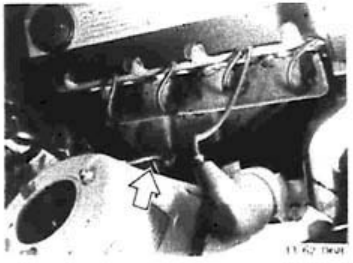


Important!
The position of the air flow sensor adjusting screw must not be changed, since this setting is the basis for oxygen sensor and idle speed control.

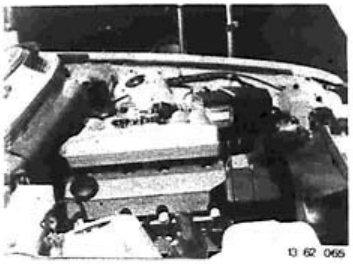
Checking Oxygen Sensor Function (11 78 010):
Unscrew bolt (1).
Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold.
Switch off the exhaust extraction system for the time of testing.
Disconnect oxygen sensor plug.
Pinch the vacuum hose (not while engine is running) and start the engine - CO level rises.
Connect oxygen sensor -CO level should return to the specified value.
Remove clamp on vacuum hose.

1) Engine Idle Speed
Check engine idle speed**.
See BMW diagnosing system, if specified value is not reached.
Check intake system for leaks.
Note:
There is no adjusting screw for idle speed correction.
The idle speed control valve must be heard and felt distinctly while turning on the ignition.

2) CO Level
Disconnect oxygen sensor plug (not in cars with provisions for cat. conv.).
Unscrew bolts. Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold. Check idle speed CO level**.
Switch off exhaust extraction system for time of testing.
<u>CO Level Too High:</u>
Check fuel injectors, fuel pressure and coolant temperature sensor.
<u>CO Level Too Low:</u>
Check hoses and connections for idle speed control or locate leaks,



** See Specifications of Gr. 11 and 13



13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL
- Car with Provisions for Catalytic Converter -

M 40
Engines with Single Sensor Motronic M 1.3

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60 deg. C (140 deg. F).
Engine and ignition in perfect working condition.
Connect BMW SERVICE TESTER to operating instructions.
Put in number of cylinders (4) for idle speed engine test step no. 5.
Routine checking is not necessary.

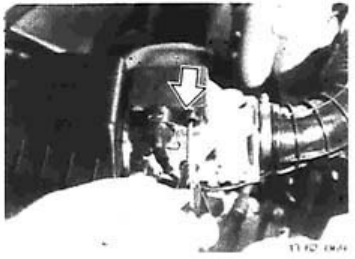
1) Engine Idle Speed
Check engine idle speed**.
See BMW diagnosing system if specified value is not reached.
Check intake system for leaks.
Note:
There is no adjusting screw for idle speed correction.
The idle speed control valve must be heard and felt distinctly while turning on the ignition.

2) CO Level
Unscrew bolts.
Connect Special Tool 13 0 100 in tailpipe or on exhaust manifold.
Check idle speed CO level**.
Switch off exhaust extraction system for the time of testing.
If specified value is not reached, the CO level** of cyl. 1 and 2 or cyl. 3 and 4 can be measured separately for troubleshooting.

** See Specifications of Gr. 11 and 13

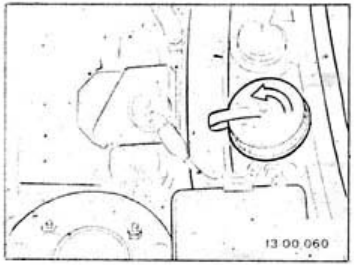
If the specified value is not reached and before correcting the CO level, make sure that there are no faults in the engine, ignition or fuel injection.
Excessive CO Level:
Check
- fuel injectors,
- fuel pressure and
- coolant temperature sensor.

Insufficient CO Level:
- Check hoses and connections for idle speed control or locate leaks.
- Also refer to BMW diagnosing system.



Remove cap with Special Tool 13 1 011.
Adjust the CO level** with a screwdriver applied on the adjusting screw of the air flow sensor.

** See Specifications of Gr. 11 and 13



13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL

M 42
Engines with M 1.7 Motronic

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine and ignition in perfect working condition.
BMW Service Tester connected to operating instructions.
Routine checking is not necessary.
Put in number of cylinders (4) for idle speed engine test step no. 5.

1) Engine Idle Speed

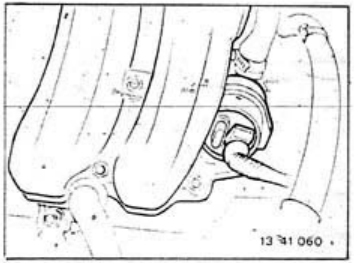
Check engine idle speed.**
See BMW diagnosing system when nominal value is not reached.
Check intake system for leaks.

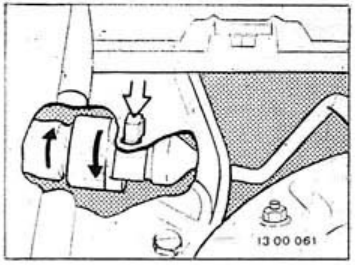
Note:
There is no idle speed adjusting screw. Idle speed control valve must be heard and felt while turning on the ignition.

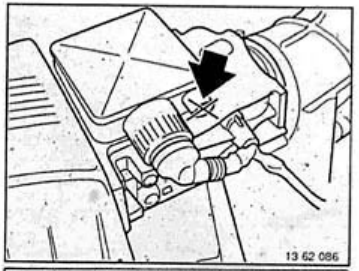
2) CO Level

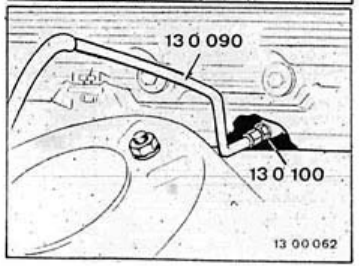
Disconnect oxygen sensor plug (not with catalytic converter provisions). Unscrew screws. Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold and check the idle speed CO level. Switch off exhaust extraction system for time of testing.**
<u>CO Level Too High:</u>
Check fuel injectors, fuel pressure and coolant temperature sensor.
<u>CO Level Too Low:</u>
Check hoses and connections for idle speed regulation and locate points of leakage.

**** See Specifications of Gr. 11 and 13**





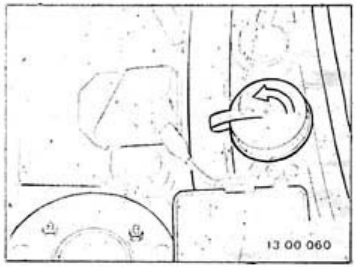




Important!
Corrections cannot be made on the air adjusting screw.

Oxygen Sensor Function Test (11 78 010):

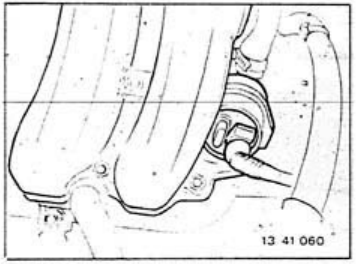
Unscrew screw (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction system for the time of testing.
Disconnect oxygen sensor plug.
Pinch vacuum hose leading to the fuel pressure regulator with a clamp (not while engine is running) and start the engine – CO level rises.
Connect oxygen sensor – CO level must go back to the nominal value.
Remove hose clamp.



13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL
– Cars with Provisions for Catalytic Converter –

M 42
Engines with M 1.7 Motronic

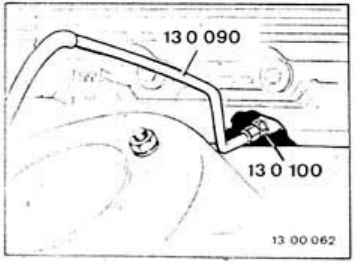
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine and ignition in perfect working condition.
BMW Service Tester connected to operating instructions.
Put in number of cylinders (4) for idle speed engine test step no. 5.
Routine checking is necessary.



1) Engine Idle Speed

Check engine idle speed.**
See BMW diagnosing system when the nominal value is not reached.
Check intake system for leaks.

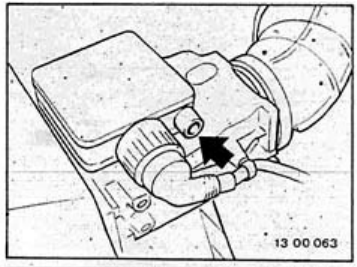
Note:
There is no idle speed adjusting screw. Idle speed control valve must be heard and felt while turning on the ignition.

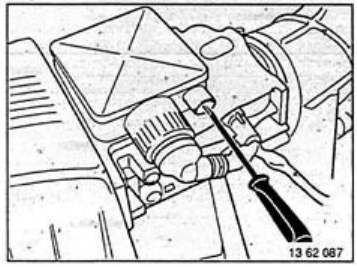


2) CO Level

Unscrew screws. Connect Special Tool 13 0 100 in tailpipe or exhaust manifold.
Check idle speed CO level.**
Switch off exhaust extraction system for the time of testing.
If the nominal value is not reached, the CO level of cyl. 1 through 4 can be measured separately for troubleshooting.**

**** See Specifications of Gr. 11 and 13**





Make sure that there are no faults in the engine, ignition or fuel injection before corrections are made on the CO level adjustment, when the nominal value is not reached.
CO Level Too High:
Check
fuel injectors,
fuel pressure and
coolant temperature sensor.
CO Level Too Low:
Check hoses and connections for idle speed regulation and locate points of leakage.
Also refer to the BMW diagnosing system.

Remove cap with Special Tool 13 1 011. Adjust CO level with a screwdriver applied on the adjusting screw on the air flow sensor.**

**** See Specifications of Gr. 11 and 13**

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL – Cars with Catalytic Converter or Provisions for Catalytic Converter –

M 20
Engines with M 1.1 Motronic (identified by inductive sender on vibration damper with 58 teeth and one gap)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Valve clearance as specified.
Engine and ignition in perfect working condition.
BMW Service Tester connected to operating instructions.
Routine checking is not necessary.

13 41 017

1) Engine Idle Speed

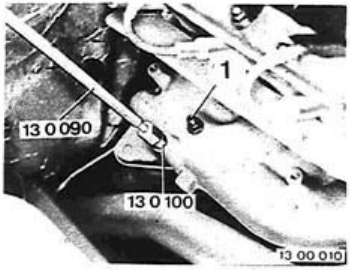
Check engine idle speed.**
See BMW diagnosing system when the nominal value is not reached.
Check intake system for leaks.

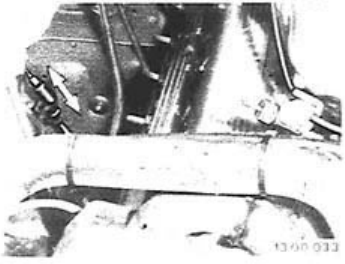
Note:
There is no idle speed adjusting screw.

2) CO Level

Disconnect oxygen sensor plug (not in cars with catalytic converter provisions). Unscrew screws. Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold. Check idle speed CO level. Switch off exhaust extraction system for the time of testing.**
<u>CO Level Too High:</u>
Check fuel injectors, fuel pressure and coolant temperature sensor.
<u>CO Level Too Low:</u>
Check hoses and connections for idle speed regulation or locate points of leakage.

** See Specifications of Gr. 11 and 13





Important!
Corrections cannot be made on the air adjusting screw.

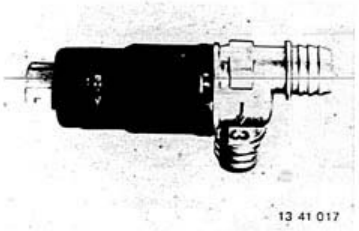
Oxygen Sensor Function Test (11 78 010):

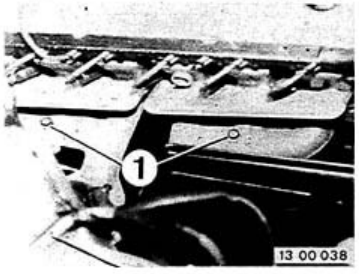
Unscrew screw (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction system for the time of testing.
Disconnect oxygen sensor plug.
Pinch vacuum hose leading to the fuel pressure regulator with a clamp (not while engine is running) and start the engine – CO level rises.
Connect oxygen sensor – CO level should return to the nominal value.
Remove hose clamp.

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL – Cars with Catalytic Converter or Provisions for Catalytic Converter –

M 20
Engines with M 1.1 Motronic (identified by inductive sender on vibration damper with 58 teeth and one gap)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Valve clearance to specifications.
Engine and ignition in perfect working condition.
BMW Service Tester connected to operating instructions.
Routine checking is not necessary.





1) Engine Idle Speed

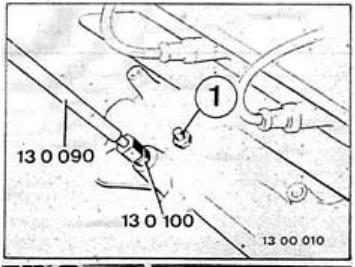
Check engine idle speed.**
See BMW diagnosing system when the nominal value is not reached.
Check intake system for leaks.

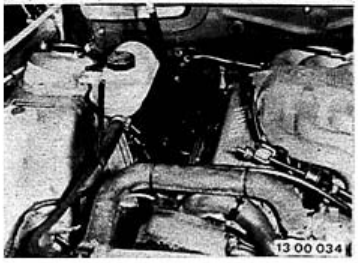
Note:
There is no idle speed adjusting screw.

2) CO Level

Disconnect oxygen sensor plug (not in cars with catalytic converter provisions). Unscrew screws. Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold. Check idle speed CO level. Switch off exhaust extraction system for the time of testing.**
CO Level Too High:
Check fuel injectors, fuel pressure and coolant temperature sensor.
CO Level Too Low:
Check hoses and connections for idle speed regulation and locate points of leakage.

**** See Specifications of Gr. 11 and 13**





Important!
Corrections cannot be made on the air adjusting screw.

Oxygen Sensor Function Test (11 78 010):

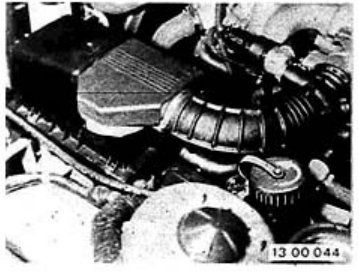
Unscrew screw (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction system for the time of testing.
Disconnect oxygen sensor plug.
Pinch vacuum hose leading to the fuel pressure regulator with a clamp (not while engine is running) and start the engine – CO level rises.
Connect oxygen sensor – CO level should go back to the nominal level.
Remove hose clamp.

13 00 040

13 00 ... ENGINE RUNNING AND CO LEVEL
– Only Cars with Provisions for Catalytic Converter –

M 20
M 1.1 Motronic Since 9.87 and M 1.3 Motronic

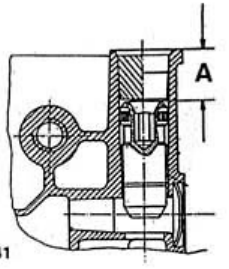
If it had been absolutely necessary to correct the CO level/engine running adjustment on the air flow sensor adjusting screw (1) or if this screw had been maladjusted, the basic adjustment must be checked / restored when converting the car to a catalytic converter or working on the fuel/air mixture system.



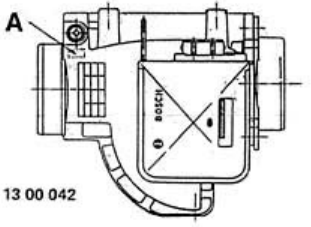
13 00 044

1) Corrections may never be made, if there is a fault in the fuel/air mixture system:

Read self-diagnosing system.
Check intake and fuel systems for leaks.
Check fuel injectors, temperature sensor and fuel pressure – also refer to 13 00 060.



13 00 041



13 00 042

13 00 ... CHECKING BASIC ADJUSTMENT OF AIR FLOW SENSOR ADJUSTING SCREW
– Only Cars with Provisions for Catalytic Converter –
(Anti-tamper Lock in Cars with Catalytic Converter)

M 20
M 1.1 Motronic Since 9.87 and M 1.3 Motronic

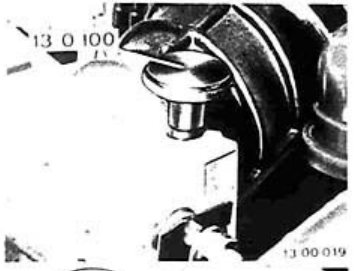
Measure distance "A" to the adjusting screw with a depth gage and compare with the value stamped in the air flow sensor, adjusting if necessary.

13 00 054 ADJUSTING ENGINE IDLE SPEED

M 20
2.0 Liter Engines
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance to specifications.
Air filter cartridge in perfect condition.
All electric equipment switched off.
BMW Service Tester connected to operating instructions.
Exhaust extraction system switched off for the time of testing.

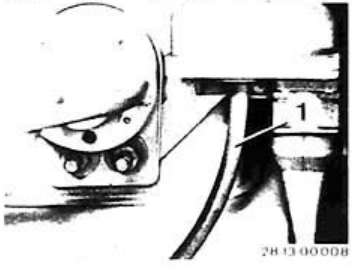
1) Engine Idle Speed

Adjust idle speed* on the air control screw in the bypass bore.



2) CO Level

Make sure that there are no faults in the engine, ignition or fuel injection (see troubleshooting) before correcting the CO level adjustment.
Remove cap with Special Tool 13 1 011.
Adjust the CO level* with Special Tool 13 1 100 applied on the air control screw in the air flow sensor.



Checking Partial Load Enrichment (Before 1984 Annual Plant Shutdown):

Pull off and plug vacuum hose (1).
CO level must rise noticably (approx. 2.5 % by volume).

* See Specifications of Gr. 11

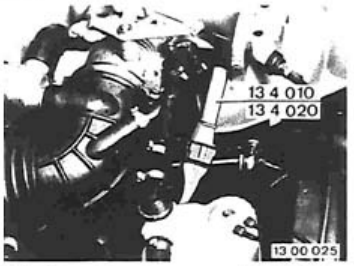
13 00 054 ADJUSTING ENGINE IDLE SPEED / CO LEVEL

M 20
2.5 Liter Engines
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine, ignition and fuel injection in perfect working condition.
Valve clearance to specifications.
All electric equipment switched off.
Air filter cartridge in perfect condition.
BMW Service Tester connected to operating instructions.

1) Engine Idle Speed

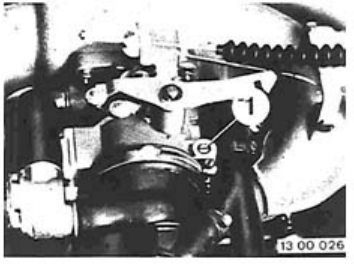
Check engine idle speed*,
Check idle speed control valve when the nominal value is not reached.
Check / correct basic adjustment.
Check intake system for leaks.

Note:
There is no idle speed adjusting screw.

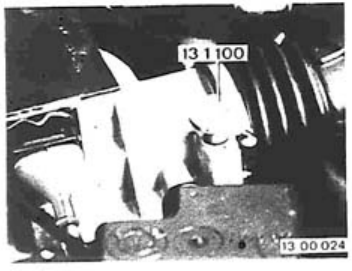


Basic Adjustment for Idle Speed Regulation:

Run engine at idle speed.
Pull off plug on throttle valve switch.
Insert Special Tool 13 4 010 or 13 4 020 in the electric lead plug.
The idle speed control valve is now fixed in the basic adjustment position.



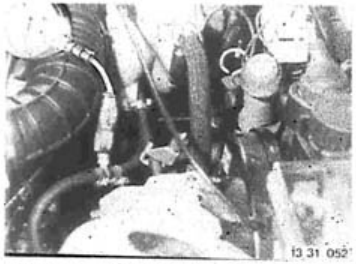
Remove anti-tamper lock.
Adjust engine speed to 760 ± 20 rpm on screw (1).
Install a new anti-tamper lock.



2) CO Level

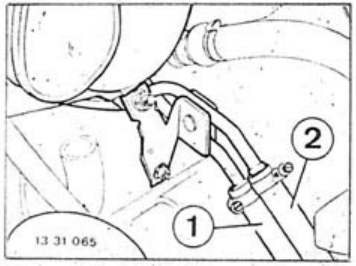
Remove anti-tamper lock with Special Tool 13 1 011.
Adjust the CO level* by applying Special Tool 13 1 100 on the air control screw in the air flow sensor.
Install a new anti-tamper lock.

* See Specifications of Gr. 11 and 13

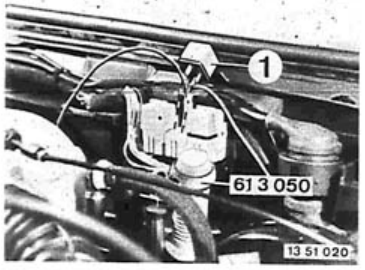


13 31 029 CHECKING FUEL DELIVERY PRESSURE

M 40 / M 42
Install pressure tester 13 3 060 with connecting hose and adapter 13 3 064 in the fuel feed line – in front of the fuel pressure regulator.
Plug fuel return line with Special Tool 13 3 010.

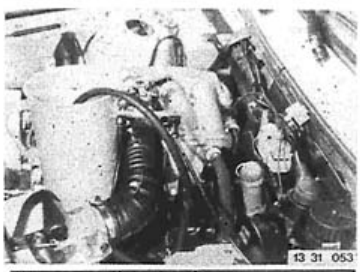


M 42
(1) Feed line
(2) Return line



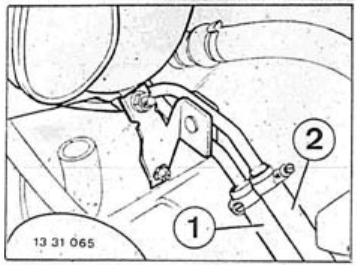
Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

* See Specifications of Gr. 16

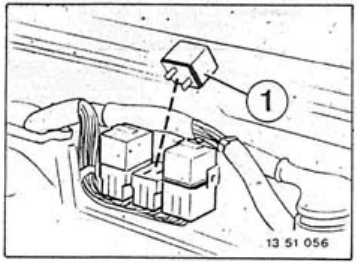


13 31 ... CHECKING FUEL DELIVERY RATE

M 40 / M 42
Unscrew fuel return line, attach an extension hose and hold end of hose in measuring cup 13 3 020.



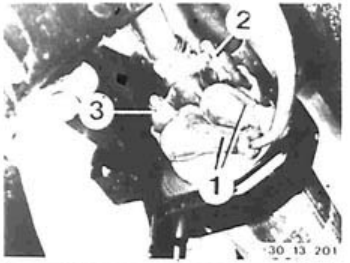
M 42
(1) Feed line
(2) Return line



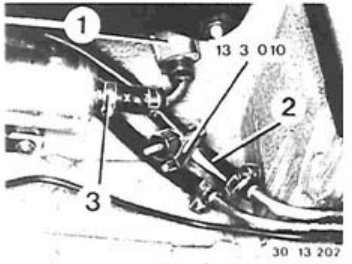
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.

* See Specifications of Gr. 16

13 31 030 REMOVING AND INSTALLING FUEL PUMP

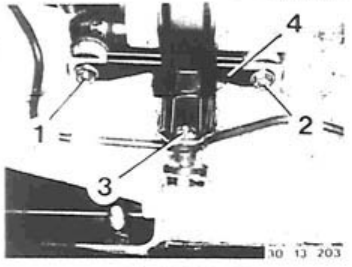


Push back caps (1).
Unscrew nuts (2 and 3) and take off leads.



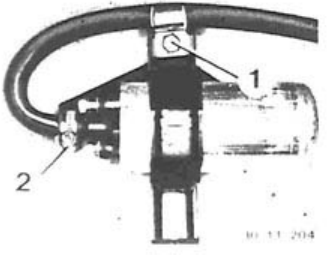
Clamp suction hose (1) and pressure hose (2) with Special Tool 13 3 010.
Loosen hose clamps (3) and pull off hoses.

Note:
Never use squeeze-hose clamps on the pressure hose.

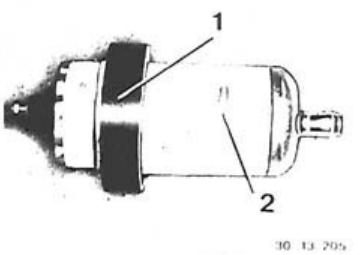


Unscrew nuts (1 ... 3) and take off holder (4).
Remove fuel pump with holder.

Installation:
Check rubber mounts, replacing if necessary.

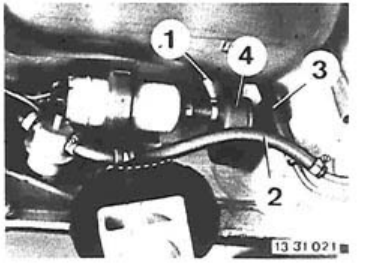


Unscrew bolt (1).
Loosen hose clamp (2) and pull off fuel hose.
Take fuel pump off of holder.



Pull off rubber ring (1).

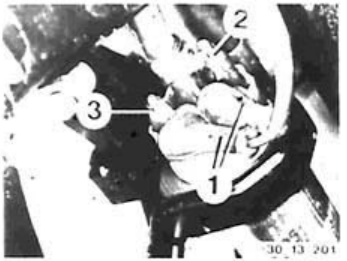
Installation:
Check code number (2)*.



Arrangement of Fuel Pump with Damper Chamber:
1 Suction hose
2 Pressure hose
3 Return hose
4 Damper chamber

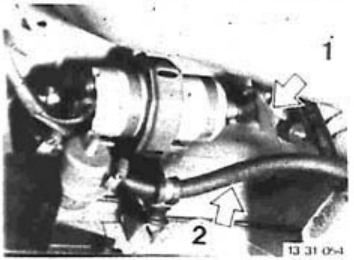
Intank fuel pump since 9/87 – see Group 16.

* See Specifications



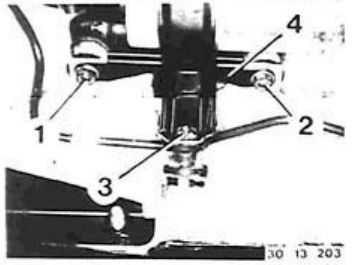
13 31 030 REMOVING AND INSTALLING FUEL PUMP

M 40
Push back caps (1).
Unscrew nuts (2 and 3) and take off leads.



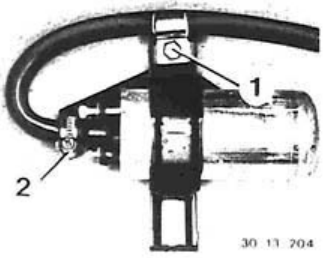
Clamp suction hose (1) and pressure hose (2) with Special Tool 13 3 010.
Loosen hose clamps (3) and pull off hoses.

Note:
Never use squeeze-hose clamps on the pressure hose.

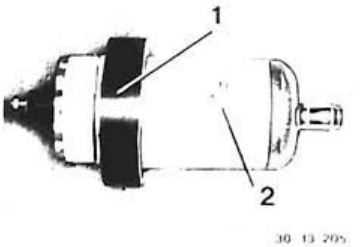


Unscrew nuts (1 ... 3) and take off holder (4).
Remove fuel pump with holder.

Installation:
Check rubber mounts, replacing if necessary.

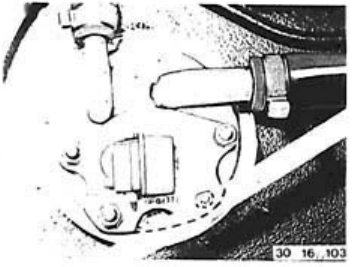


Unscrew bolt (1).
Loosen hose clamp (2) and pull off fuel hose.
Take fuel pump off of holder.



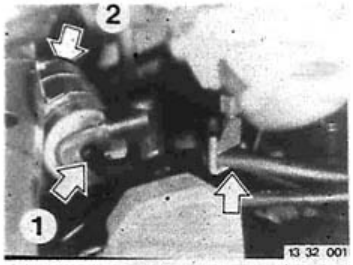
Pull off rubber ring (1).

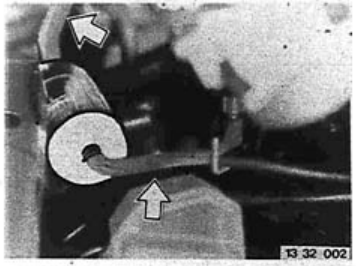
Installation:
Check code number (2)*.

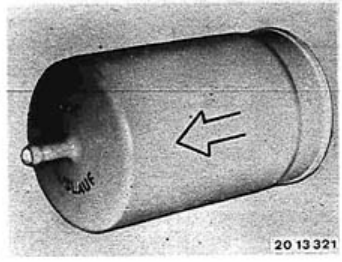


Intank fuel pump since 3/88 or 9/88 and M 42 – see Group 16.

* See Specifications





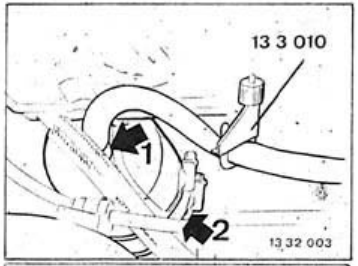


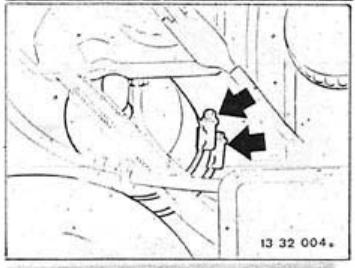
13 32 051 REMOVING AND INSTALLING FUEL FILTER

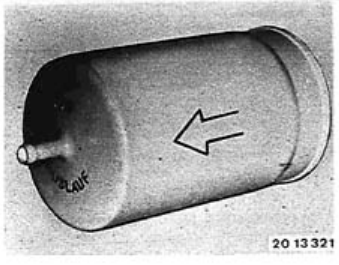
E 30 / M 40 / M 20
Clamp fuel feed hose in front of and behind the filter with Special Tools 13 3 010.
Unscrew bolts.
Loosen hose clamps (1 and 2):

Pull off fuel hoses.
Remove filter.

Installation:
Check direction of flow (arrow).







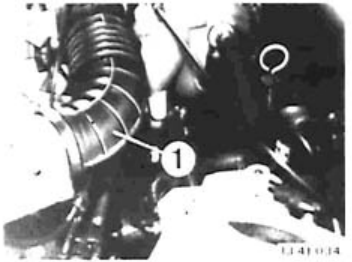
13 32 051 REMOVING AND INSTALLING FUEL FILTER

E 30 / M 42
Clamp fuel feed hose in front of and behind the filter with Special Tools 13 3 010.
Unscrew bolts.
Loosen hose clamps (1 and 2).

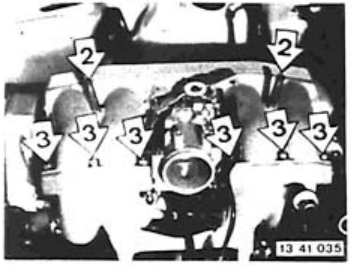
Pull off fuel hoses.
Remove filter.

Installation:
Check direction of flow (arrow).

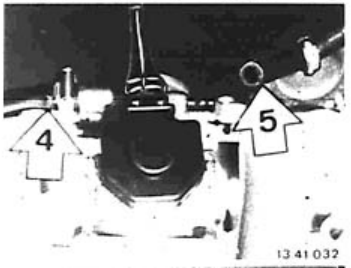
13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE



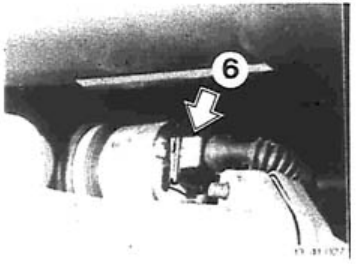
M 40
Disconnect hose (1).



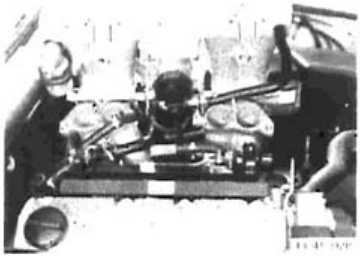
Unscrew bolts (2).
Unscrew nuts (3).



Disconnect hoses (4 and 5).

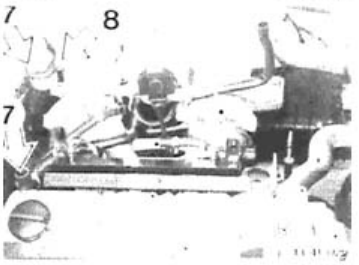


Pull off plug (6).

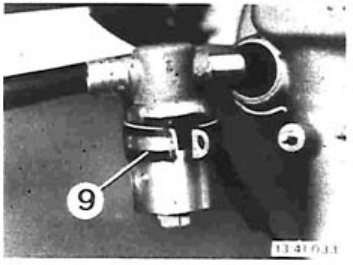


Pull out and tilt up upper section of the intake manifold.

Installation
Replace gasket.



Disconnect hose (7).
Unscrew bolt (8).

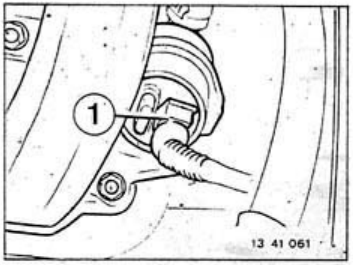


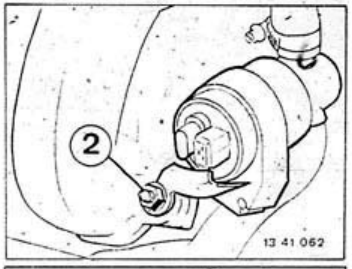
Remove idle speed control valve.

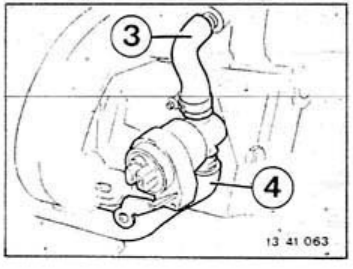
Installation:
Check code number (9).
Check idle speed*.

Testing:
Idle speed control valve must be heard (clicking) and felt while turning on the ignition.
Check electric connections – see BMW self-diagnosis.

* See Specifications of Gr. 11 and 13







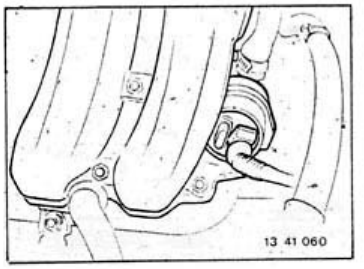
13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE

M 42
Pull off plug (1).

Unscrew nuts (2).

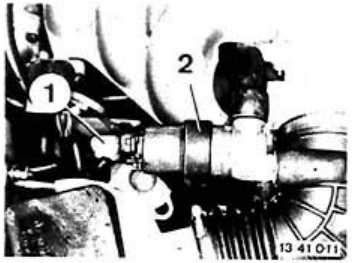
Pull out idle speed control valve, while disconnecting hoses (3 and 4).

Installation:
Check code number.
Check idle speed*.



Testing:
Idle speed control valve must be heard (clicking) and felt while turning on the ignition.
Check electric connections – see BMW self-diagnosis.

* See Specifications of Gr. 11 and 13

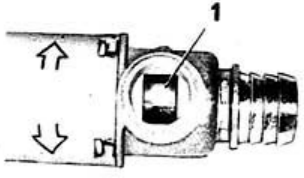


13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE

M 20 B 20
M 20 B 25
Pull off plug (1).
Disconnect strap (2).
Pull idle speed control valve off of hoses and remove.

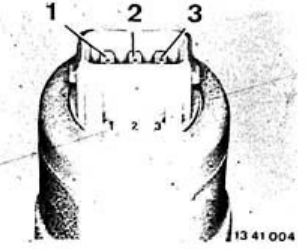
Installation:
Check code number (1)*.
Check idle speed*.

Note:
Operation of the idle speed control valve can be felt by grabbing hold of the valve with a hand (timed power supply).



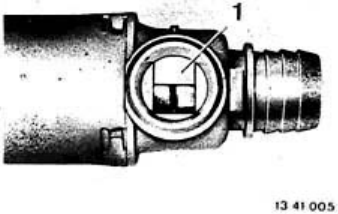
Mechanical Test:

It should be possible to move the rotary piston (1) in the idle speed control valve by turning the idle speed control valve suddenly.



Electric Test:

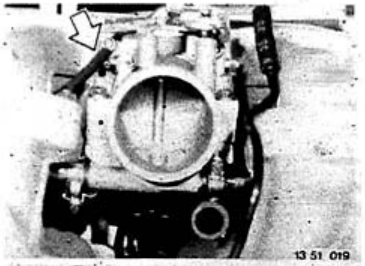
Measure resistance between terminals (1 and 3);
specification= approx. 40 ohms.
Measure resistance between terminals (2 and 1) or (2 and 3);
specification = approx. 20 ohms each.



Dynamic Test:

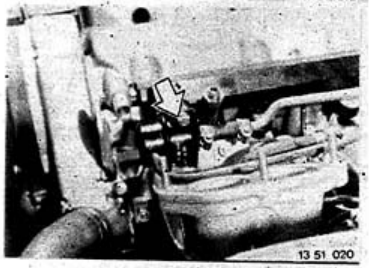
Remove idle speed control valve (plug remains connected).
Open or close rotary piston (1) completely.
Turn on ignition.
Rotary piston must move to and remain in a position equal to about 50 % of the cross section opening.

* See Specifications of Gr. 11 and 13

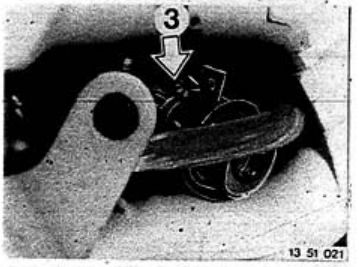


13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

M 40
Pull off vacuum hose (1).

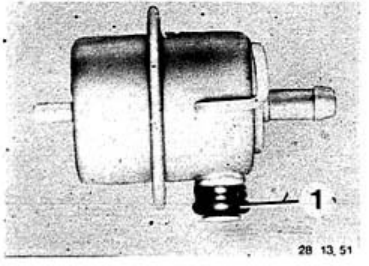


Unscrew bolts (2).
Pull out and turn fuel pressure regulator.

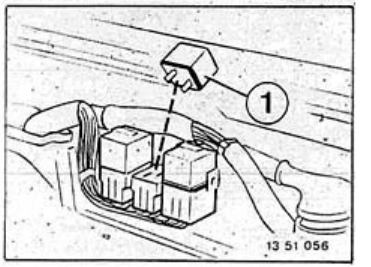


Disconnect fuel hose (3).
Take off fuel pressure regulator.

Installation:
Lubricate seal with clean engine oil which does not contain silicone.
Replace seal (1).
Check code number and manufacturing date.

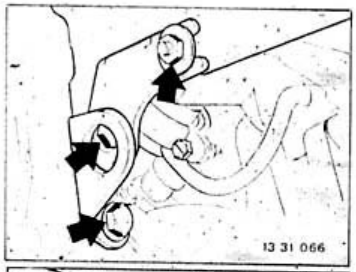


Checking:
Install pressure tester 13 3 060 with connecting hose and adapter 13 3 064 in the fuel feed line – in front of the fuel pressure regulator.



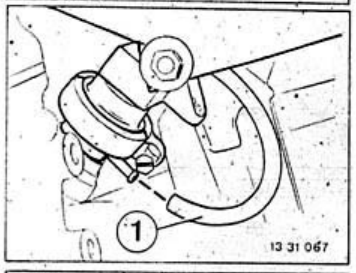
Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Read fuel injection pressure*.

* See Specifications or Nominal Value Microfiche

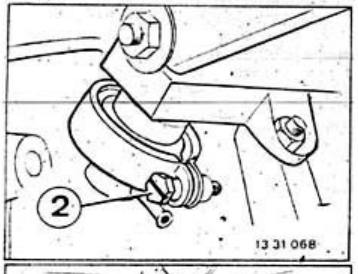


13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

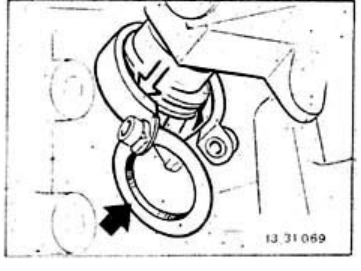
M 42
Unscrew front brace.



Pull off vacuum hose (1).



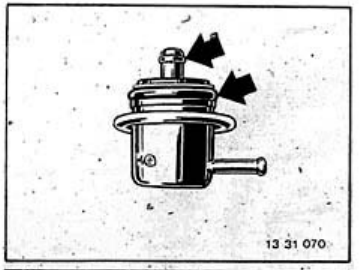
Unscrew and remove bolt (2).



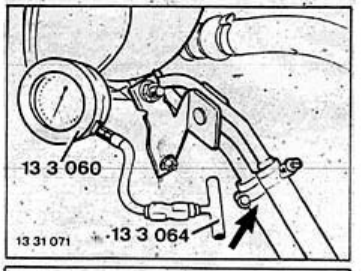
Press off fuel pressure regulator.

Caution!
Seals fit tight, fuel runs out and ring (3) will fall down.

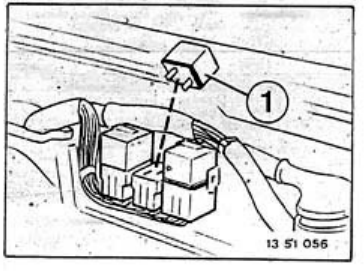
Installation:
Lubricate seals with clean engine oil which does not contain silicone.



Installation:
Replace seal.
Check code number and manufacturing date.

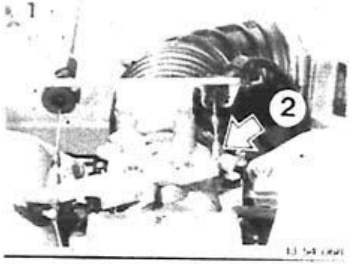


Testing:
Install pressure tester 13 3 060 with connecting hose and adapter 13 3 064 in the fuel feed line – in front of the fuel pressure regulator.



Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Read fuel injection pressure*:

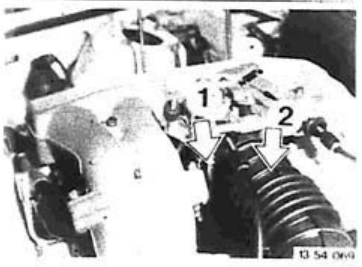
* See Specifications



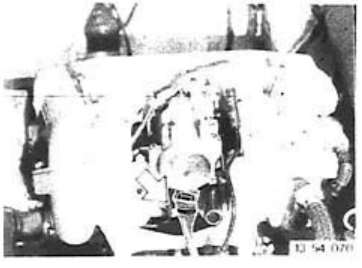
13 54 030 REMOVING AND INSTALLING THROTTLE VALVE ASSY.

M 40
Pull off plastic cap.
Disconnect cables (1 and 2).
1 = to cruise control motor
2 = to accelerator pedal

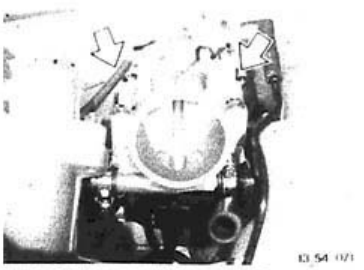
Installation:
Adjust cables – see Groups 35 and 65.



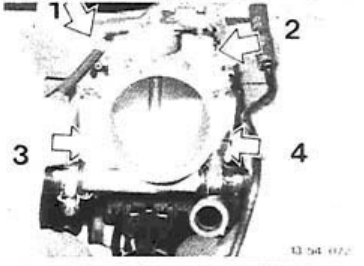
Loosen hose clamp (1) and remove hose (2).



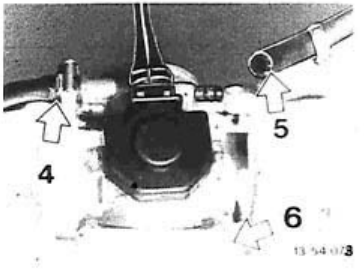
Pull plug (3) off of the throttle valve switch.



Pull off vacuum hoses.

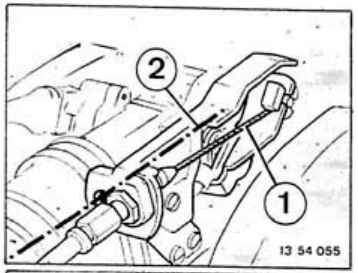


Unscrew bolts (1 ... 4).
Take off throttle valve assembly.



Installation:
Replace gasket (6).

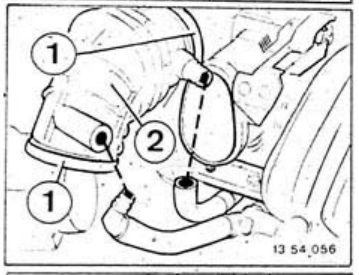
Disconnect hoses (4 and 5).



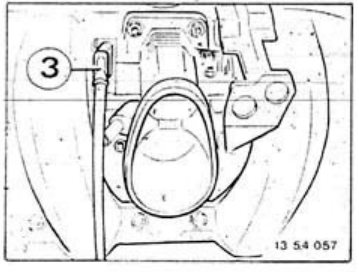
13 54 030 REMOVING AND INSTALLING THROTTLE VALVE ASSY.

M 42
Disconnect cable (1) and, if applicable, cable (2).
1 = to accelerator pedal
2 = to cruise control motor

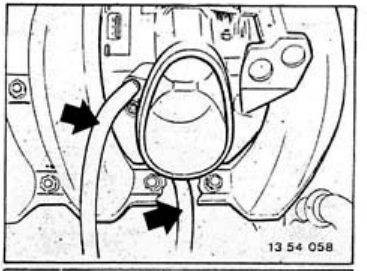
Installation:
Adjust cables – see Groups 35 and 36.



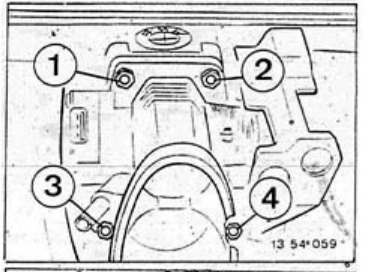
Loosen hose clamp (1) and remove hose (2).



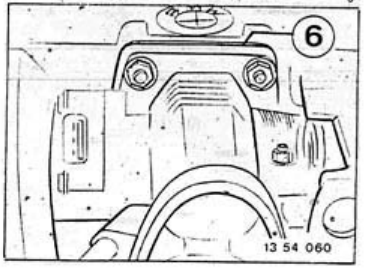
Pull plug (3) off of the throttle valve switch.



Pull off vacuum hoses.



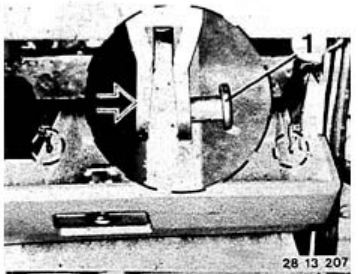
Unscrew bolts (1 ... 4).
Take off throttle valve assembly.



Installation:
Replace gasket (6).

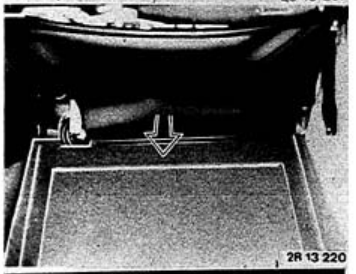
Disconnect hoses (4 and 5).

Important!
Throttle valve adjustments are not possible. The throttle valve assembly must be replaced in case of improper handling.

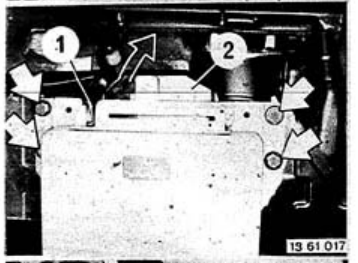


13 61 000 REMOVING AND INSTALLING CONTROL UNIT

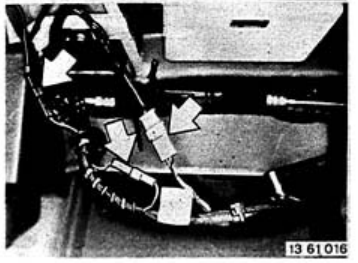
Open glove box.
Pull off pins (1) of both retaining straps.



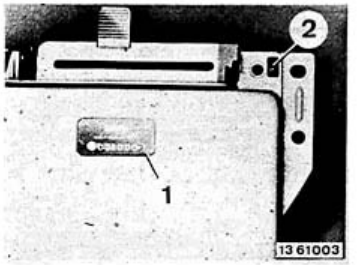
Loosen trim panel.

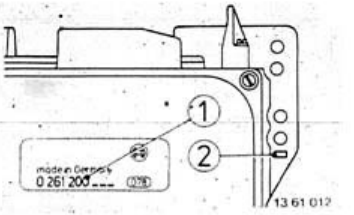


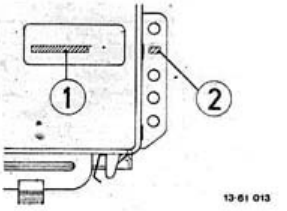
Push back retainer (1) and pull off plug (2).
Unscrew four mounting screws and take out control unit.



See wiring diagram for plug connections.

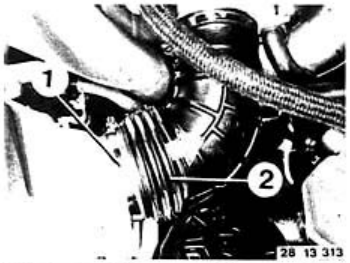






Installation:
Check code number (1)* and manufacturing date (2)*.
Check / adjust engine idle speed* and idle speed CO level*.

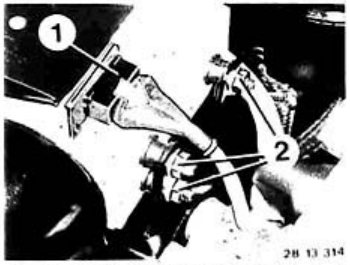
* See Specifications of Gr. 11 and 13



13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR

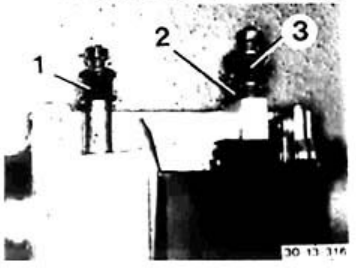
M 10

Loosen hose clamp (1) and pull air hose off of the air flow sensor.

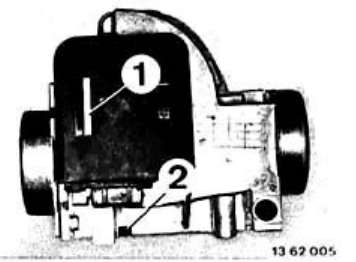


Pull off plug (1).
Loosen nuts (2) and take off air flow sensor.

Installation:
Check seal (1), replacing if necessary.

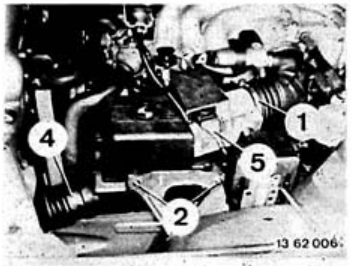


Unscrew dampers (1 ... 3) on air flow sensor.
Check dampers, replacing if necessary.



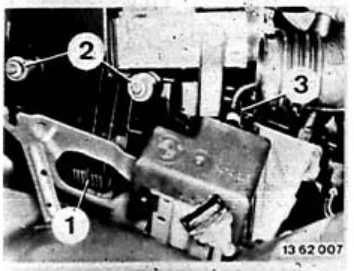
Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and idle speed CO level*.
Check air flow sensor*.

* See Specifications and Nominal Value Microfiche



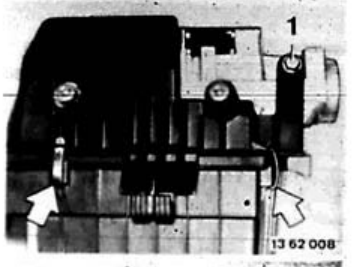
13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR

M 20
Loosen hose clamp (1).
Loosen nuts (2).
Pull off hose (4).
Pull off plug (5).

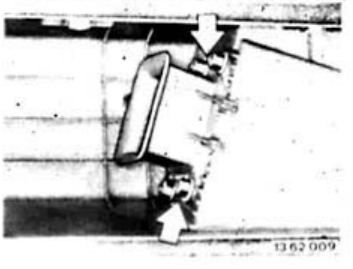


Cut off strap (3).
Take off complete air cleaner.

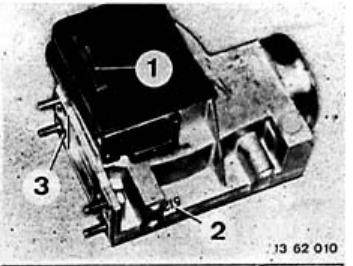
Installation:
Check rubber mount (1) and dampers (2), and make sure of correct seating.



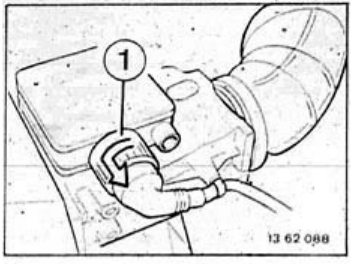
Open four fasteners.
Unscrew screw (1).
Separate housing sections.



Unscrew nuts.



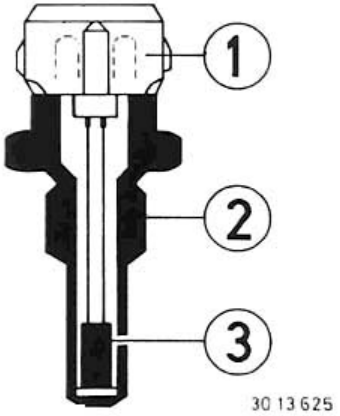
Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and idle speed CO level*.
Check gasket (3).
Check air flow sensor*.



M 40 / M 42
Remove plug (1) with a screwdriver.

Remaining procedures same as M 20.

* See Specifications of Gr. 11 and 13



30 13 625

13 62 531 REMOVING AND INSTALLING/ CHECKING COOLANT TEMPERATURE SENSOR

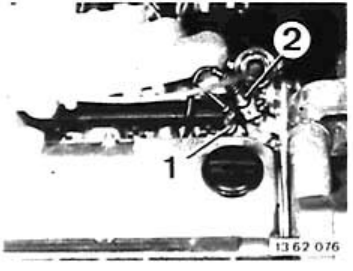
The temperature sensor measures the engine temperature and sends this information to the control unit as a resistance value.
The resistance value drops with rising temperature (NTC).
1 = Plug connection
2 = Housing
3 = NTC resistor

Removing and installing:

Pull off plug (1).
Unscrew temperature sensor.

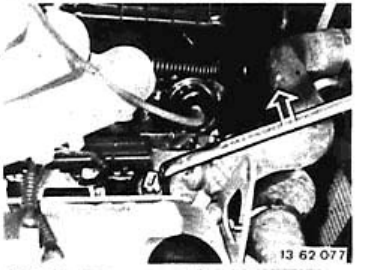
Installation:
Tightening torque .

28 13 031



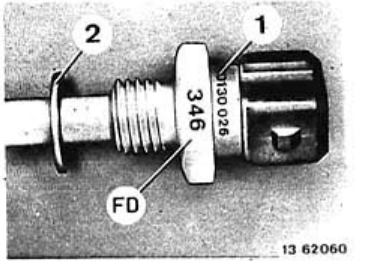
13 62 076

M 20
Pull off plugs (1 and 2).
Lift fuel injector plug plate slightly.



13 62 077

Unscrew temperature gage sender (2).
Unscrew temperature sensor (1).



13 62060

Installation:
Check code number (1) .
Replace seal (2).
FD = Manufacturing date
Fill and bleed cooling system – see Group 17.

Testing:

Connect Jetronic test leads 61 1 440.
Check nominal value with ohmmeter.
To check the entire temperature range, remove and place the temperature sensor in a water bath heated to testing temperature and measure resistance with an ohmmeter.

13 62062

Engines with self-diagnosis – see . BMW diagnosing system (engine temperature).

* See Specifications

* See Specifications

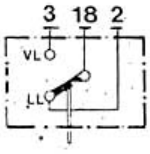
13 63 544 CHECKING AND ADJUSTING THROTTLE VALVE SWITCH

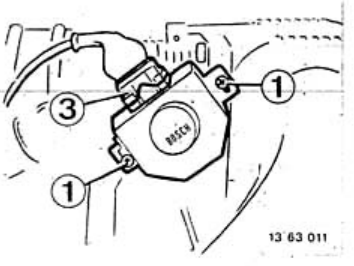
Checking Throttle Valve Switch:
Approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
Approximately 0 ohm between connections 3 and 18 with the throttle valve wide open.

LL = Idle
VL = Full load

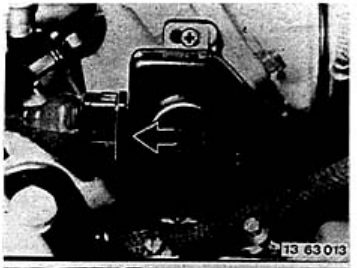
Wiring diagram shows the throttle valve in idle position.

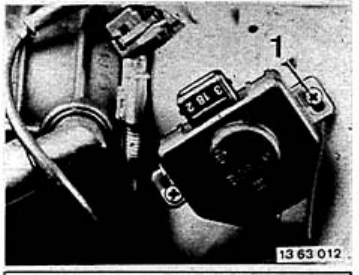
Schaltbild

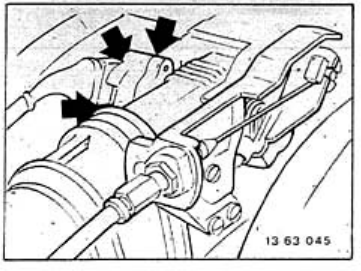




Adjusting:
Remove throttle valve assembly – see 13 54 030.
There should be approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
Adjust by loosening screws (1) and turning the throttle valve switch.
Open throttle valve after adjusting – resistance should rise immediately to ohms.
Resistance should drop back to approximately 0 ohm after releasing the throttle valve.







13 63 551 REMOVING AND INSTALLING THROTTLE VALVE SWITCH

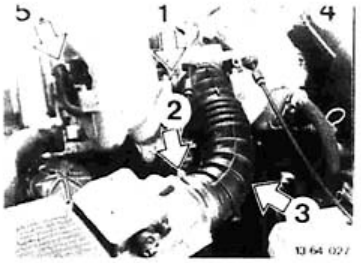
Pull off multiple-pin plug (3).

Remove throttle valve assembly – see 13 54 030.
Unscrew screws (1).
Take off throttle valve switch (2).

Installation:
Check code number (1) .
Adjust throttle valve switch – see 13 63 544.

M 42

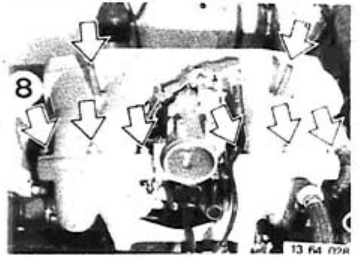
Important!
The throttle valve assembly has to be removed to replace the M 42 throttle valve switch.
The switch does not have to be adjusted (automatic adjustment).



13 64 027

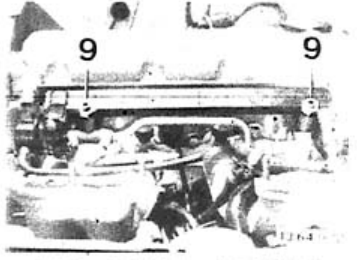
13 64 150 REMOVING AND INSTALLING OR REPLACING ALL FUEL INJECTORS

M 40
Pull off plastic cap.
Loosen hose clamps (1 and 2).
Pull off hose (3).
Disconnect hoses (4 and 5).

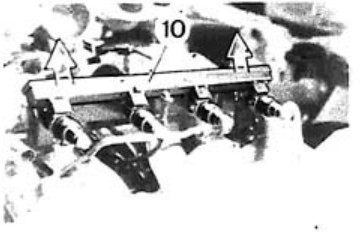


13 64 028

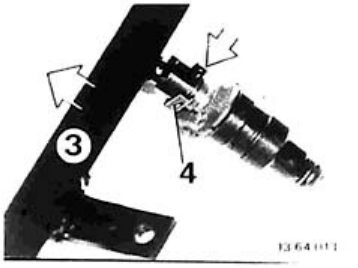
Unscrew bolts.
Unscrew nuts (8).



Pull out and tilt up upper section of the intake manifold.
Unscrew bolts (9).

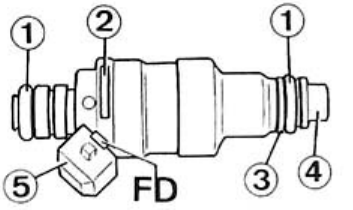


Push up injection pipe (10) until fuel injectors have cleared the guide in the intake manifold.



13 64 011

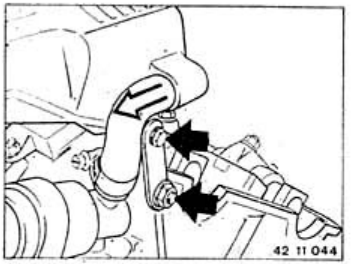
Lift out retainer (2) and pull off fuel injector.



13 64 026

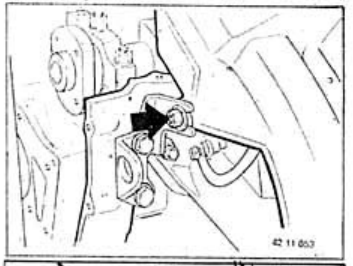
Installation:
Check O-ring (1), replacing if necessary.
Check code number (2)*.
FD = Manufacturing date
Check position of plastic washer (3).
Check color* of plug receptacle (5) or injection nozzle guard (4).
Only coat O-rings with vaseline or SAE 90 gear lube for installation.

* See Specifications

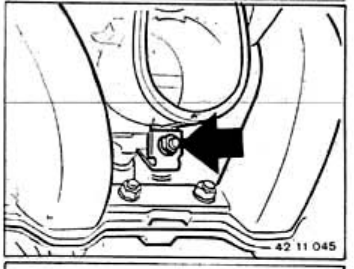


13 64 150 REMOVING AND INSTALLING OR REPLACING ALL FUEL INJECTORS

M 42
Remove upper section of collector.
Unscrew rear brace.
Pull off hose.

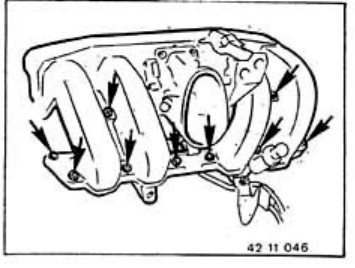


Loosen front brace.

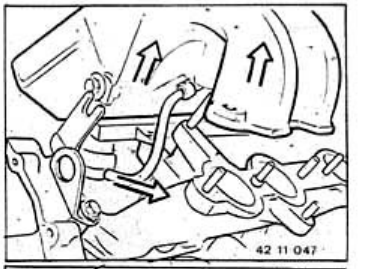


Unscrew holder for preheater.

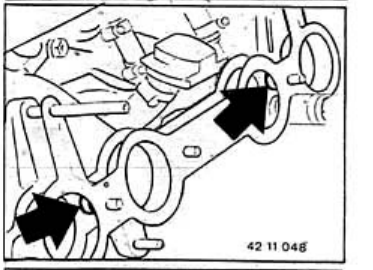
Installation:
If applicable, bend holder for the pre-heater until the bearing surface of the preheater bears on the throttle valve assembly.



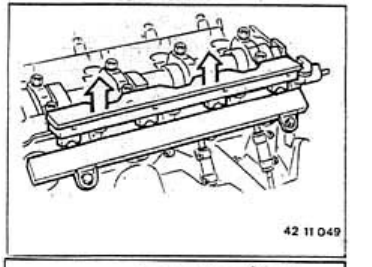
Unscrew screws.



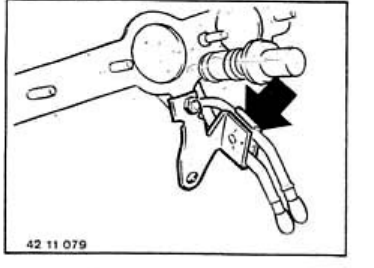
Lift off upper section of the intake manifold.
Pull hose off of the fuel pressure regulator at the same time.



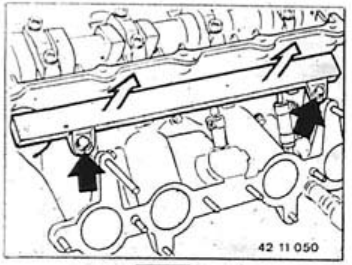
Installation:
Replace gasket.
Check dowel sleeves.



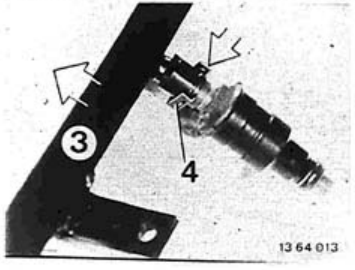
Pull plug plate off of the fuel injectors.



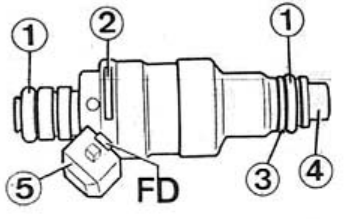
Unscrew clamp.



Unscrew screws.
Pull off injection pipe complete with fuel injectors.



Lift out retainer (2) and pull off fuel injector.



Installation:
Check O-ring (1), replacing if necessary.
Check code number (2)*.
FD = Manufacturing date.
Check position of plastic washer (3).
Check color* of plug receptacle (5) or injection nozzle guard (4).

Important!
Only coat O-rings with vaseline or SAE 90 gear lube for installation.

* See Specifications

TROUBLESHOOTING DME WITH BMW DIAGNOSING SYSTEM (M 40 Engine)

Insert diskette and connect BMW Service Tester in diagnosing socket – see operating instructions of BMW diagnosing system.

Ignition ON:
Select 01 DME, if applicable run off the brief test (brief test only displays, whether or not there are faults in the system).
Identification of control units appears on the screen after the control unit has taken on the data transmission.

01 DME
Control Unit identification

Version E 30, Engine Code M 40 B 16 / M 40 B 18
with or without oxygen sensor
HG type of fuel
CODE check – see Specifications of Parts Microfiche
ECE/D country version

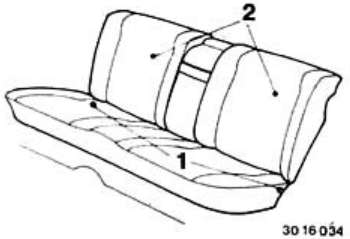
30 16 003

16 11 030 REMOVING AND INSTALLING FUEL TANK

Draw out fuel with a scavenging pump**.

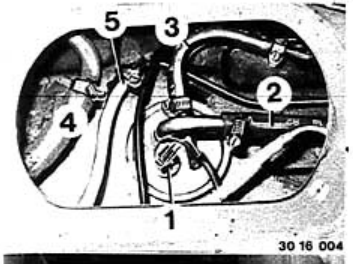
Caution!
Conform with safety precautions and legislation of a pertinent country.



30 16 034

Pull up seat cushion (1) and remove insulation sheet.

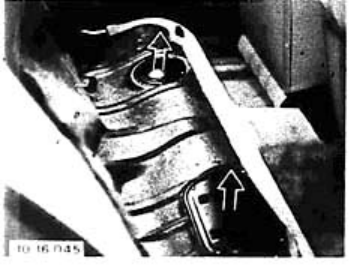
Touring – see 52 20 000.



30 16 004

Unscrew cover.
Pull off plug (1).
Loosen and pull off hoses (2 ... 5).

Installation:
Use new hose clamps.

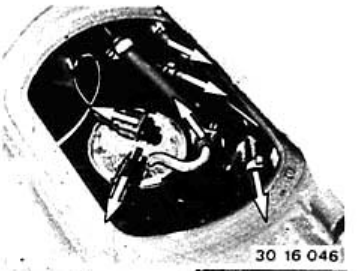


30 16 045

320 I / 325 I Since 1988 Models:

Unscrew both covers.

** Source of Supply: HWB



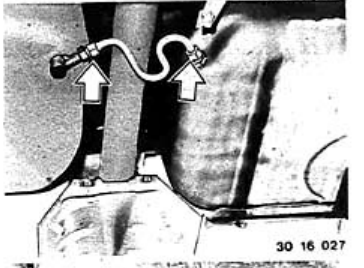
30 16 046

Pull off plugs on fuel level sender and fuel pump.
Disconnect fuel hoses.

30 16 047

Remove fuel level sender or fuel level sending unit.
Draw out remaining fuel through opening for the fuel level sender.

Important!
Draw out fuel through both openings in cars with two fuel level senders.

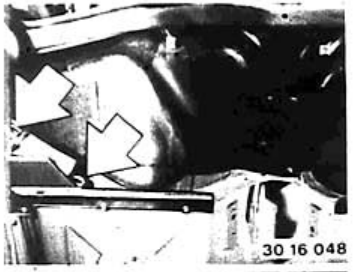


30 16 027

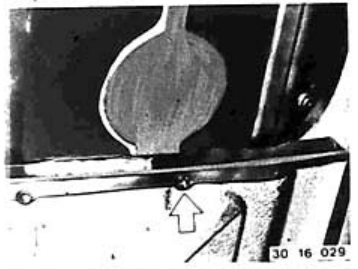
Remove muffler assembly – see 18 12 000.
Unscrew heat shield and connecting pipe.

30 16 023

Remove propeller shaft – see 26 11 000.
Loosen hose clamp and pull off hose.



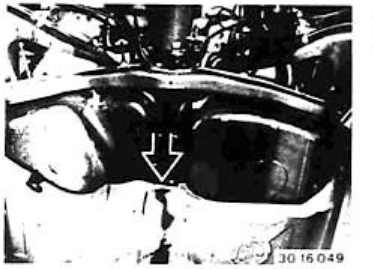
BMW 320i / 325i Since 1988 Models:
Pull off fuel pipes.
Unscrew fuel filter, if applicable.



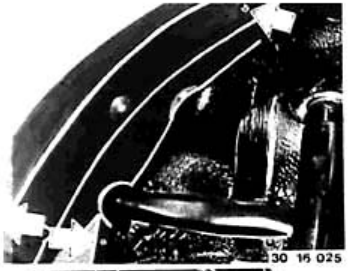
Remove stone guards left and right.

Support tank, if necessary.
Unscrew bolts and nuts.

Take off fuel tank on the right-hand side first.
Loosen and pull off hose (8).
Remove strips of adhesive tape.

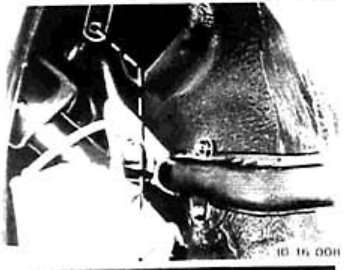


BMW 320i / 325i Since 1988 Models:
Tilt and lift out fuel tank.

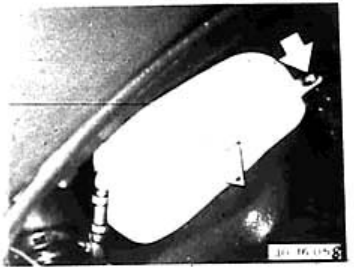


16 11 120 REPLACING EXPANSION TANK FOR TANK VENTING SYSTEM

Remove rear wheel – see 36 10 300.
Unscrew wheel house trim panel.
If applicable, draw off gasoline with a scavenging pump**.

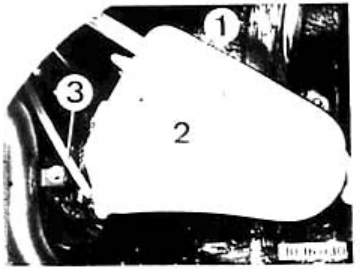


Unscrew expansion tank.
Loosen and pull off hoses.
Installation:
Place pin in guide precisely.
Use new hose clamps.



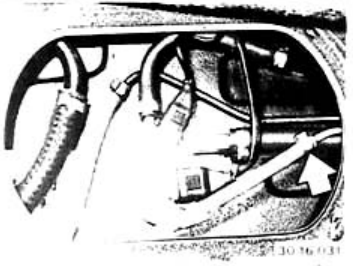
BMW 320i / 325i Since 1988 Models:
Unscrew bolt.
Remove expansion tank.

** Source of Supply: HWB

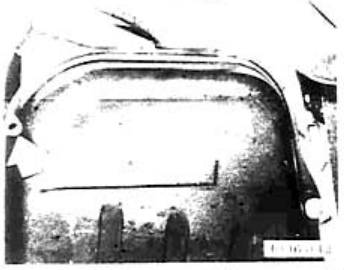


16 11 ... CHECKING VENTING SYSTEM FOR FUEL TANK

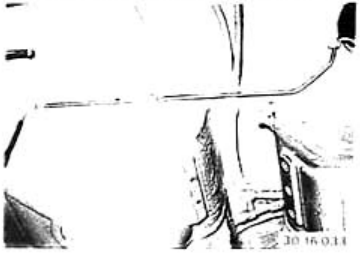
Check connections on expansion tank for tight fit and leaks.
1 Pipe to outdoors
2 Pipe to filler neck
3 Pipe to fuel tank



Check connection for venting pipe.



Checking routing and flow of vent hose.



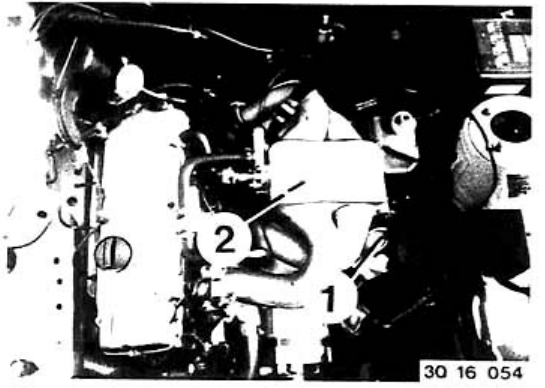
Cars with Catalytic Converter:
Route vent hose in direction of engine in side member area and check flow.

Cars with Catalytic Converter:
If applicable, remove and install / check tank venting valve.

BMW 316i / 318i (M 10)

1 = Carbon canister

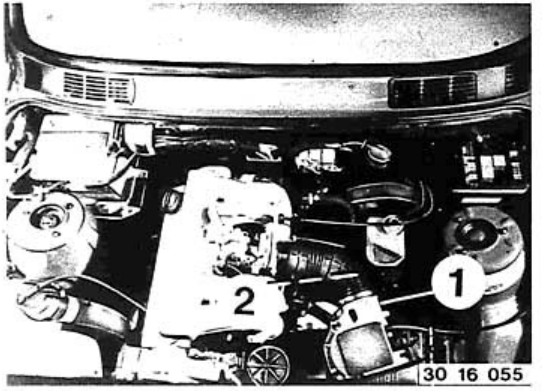
2 = Check valve



BMW 318i / M 40

1 = Carbon canister

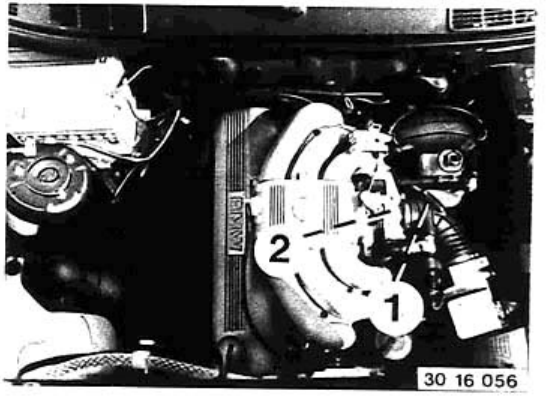
2 = Tank venting valve



BMW 320i / 325e / 325i (M 20)

1 = Carbon canister

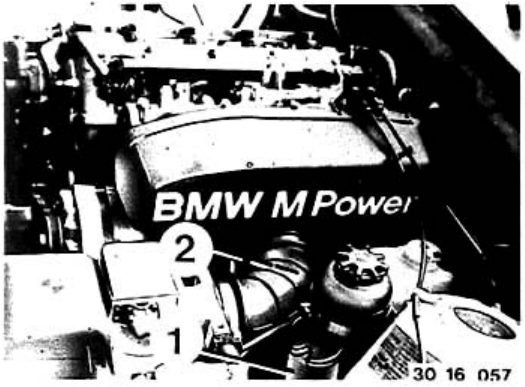
2 = Tank venting valve



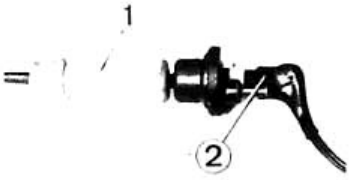
M 3 (S 14)

1 = Carbon canister

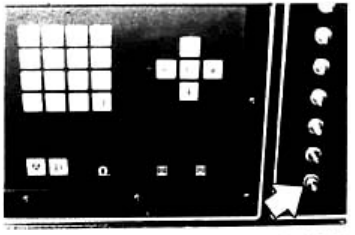
2 = Tank venting valve



Lift out plug for all previously mentioned models.
Pull off hoses.
Lift out tank venting valve.

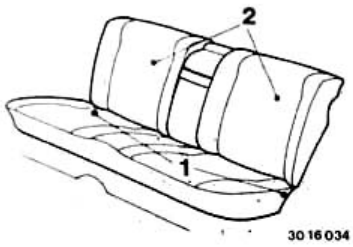


Connect vacuum hose (1) on 0.8 mm (0.031") diameter neck.
Supply 12 V voltage to tank venting valve (2) (lead 61 1 440).



Select multimeter function 21 on BMW Service Tester.
Adjust vacuum to 600 ± 100 mbar.
Then switch off.

Pressure should not drop by more than 50 mbar during the test time of about 20 seconds.
Replace tank venting valve, if pressure drops by more than 50 mbar.



30 16 034

16 12 000 REMOVING AND INSTALLING OR REPLACING FUEL LEVEL SENDER . (Models without Fuel Transfer Pump)

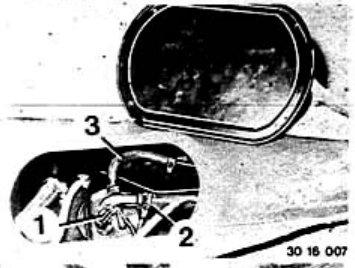
Pull up seat cushion (1) and remove insulation sheet.

Touring – see Group 52.

30 16 113

If the fuel tank is full, draw off or unscrew drain plug and drain approx. 10 liters (2.5 gallons) of fuel.

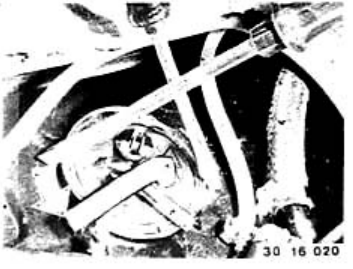
Important!
Conform with safety precautions and legislation of a pertinent country.



30 16 007

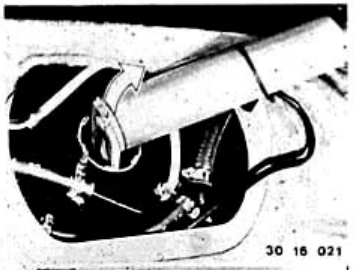
Unscrew cover.
Pull off plug (1).
Loosen and pull off hoses (2 and 3).
Model 316:
Only hose (3).

Installation:
Use new hose clamps.



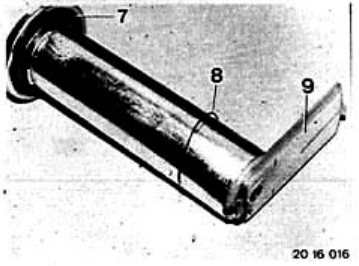
30 16 020

Turn fuel level sender counterclockwise.



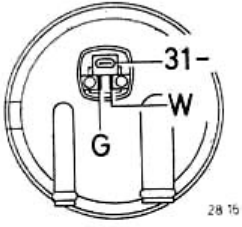
30 16 021

Pull up and take out fuel level sender carefully.



20 16 016

Installation:
Replace seal (7).
Check filter screen (9) for dirt, cleaning if necessary.
Remove retainer (8) before installing a new fuel level sender.



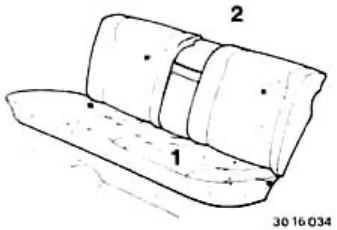
28 16 130

Testing:
Measure resistance* on connections G and 31 (ground) in "EMPTY" and "FULL" float positions.
The resistance curve should not have any interruptions.
Connection W should have ground in "EMPTY" float position.

G = Sender resistor
W = Warning lamp

** Source of Supply: HWB

* See Specifications



30 16 034

16 12 002 REMOVING AND INSTALLING FUEL INTAKE (Models with Fuel Transfer Pump)

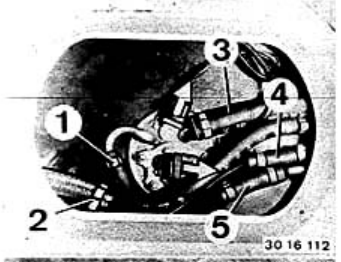
Pull up seat cushion (1) and remove insulation sheet.

Touring – see Group 52.

30 16 003

If the fuel tank is full, draw off or unscrew drain plug and drain approx. 10 liters (2.5 gallons) of fuel.

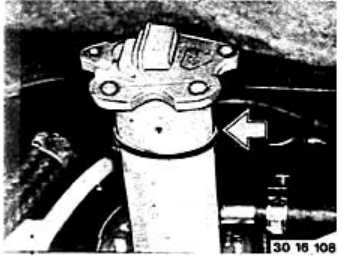
Caution!
Conform with safety precautions and legislation of a pertinent country.



30 16 112

Unscrew cover.
Pull off plug.
Loosen and pull off hoses (1 and 3).

Installation:
Use new hose clamps.

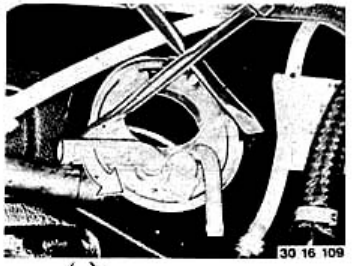


30 16 108

Loosen and pull out fuel level sender slowly.

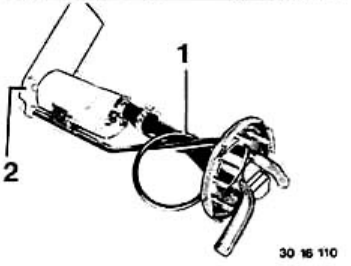
Installation:
Replace seal.
Remove retainer for transportation when installing a new fuel level sender.

** Source of Supply: HWB



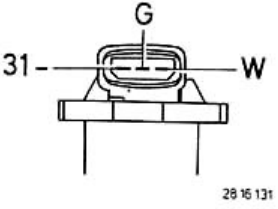
30 16 109

Turn fuel intake counterclockwsie and pull out carefully.



30 16 110

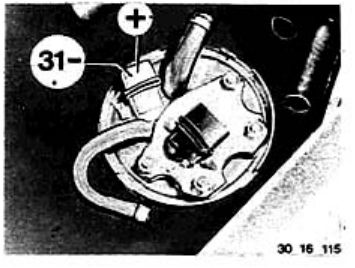
Installation:
Replace seal (1).
Check filter screen (2) for dirt, cleaning if necessary.



28 16 131

Testing:
Measure resistance on connections G and 31 (ground) in "EMPTY" and "FULL" float positions.
The resistance curve should not have interruptions.
Connection W should have ground in "EMPTY" float position.

G = Sender resistor
W = Warning lamp

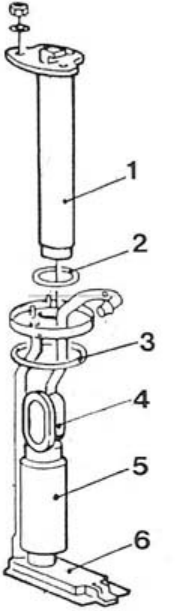


30 16 115

Testing Fuel Transfer Pump:
Measure power consumption of pump.
If applicable, check the delivery pressure .

* See Specifications

16 12 . . . REMOVING AND DISASSEMBLING FUEL LEVEL SENDER AND INTANK PUMP (Models 320 i / 325 i)



30 16 042

Fuel Level Sender and Intank Pump Survey

1 Fuel level sender

2 Gasket

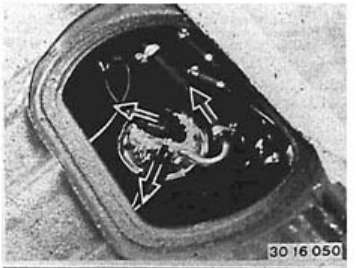
3 Pressure damper

4 Fuel pump

5 Fuel filter screen

Check fuel pump pressure and delivery rate – see Group 13.

Check fuel level sender – see pages 16 - 8 and 16 - 9.

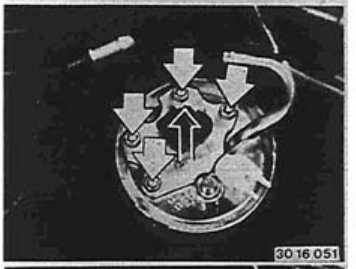


30 16 050

If the fuel tank is full, draw off some of the fuel with a scavenging pump**.

Caution:
Conform with safety precautions and legislation of a pertinent country.

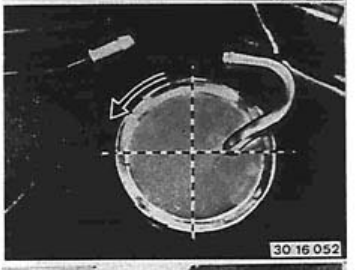
Lift out rear seat cushion – also refer to Group 52.
Loosen insulation sheet partially.
Unscrew cover.
Pull off plug.
Loosen and pull off fuel hose.



30 16 051

Unscrew screws and pull out fuel level sender slowly.

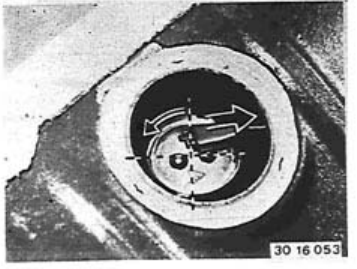
Installation:
Replace gasket.
Remove retainer for transportation when installing a new fuel level sender.



30 16 052

Turn fuel intake counterclockwise and pull out carefully.

Installation:
Replace gasket.



30 16 053

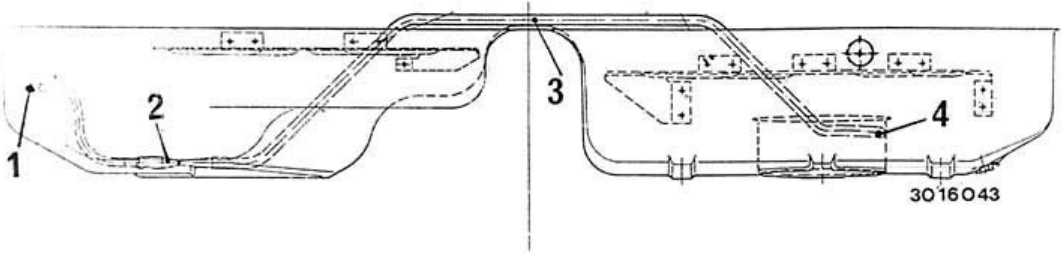
Left Tank Side:
Unscrew cover.
Pull off plug.
Turn fuel level sender counterclockwise and pull out carefully.

Testing:
Measure resistance* between both pins in "EMPTY" and "FULL" float positions.

** Source of Supply: HWB

16 12 . . . FUEL RETURN PIPE
– 320i / 325i Since 1988 Models –

Fuel Tank Survey
(only the bottom tank plate is shown in the side view for better view)



1 = Return pipe in tank (left tank chamber)

2 = Ejector

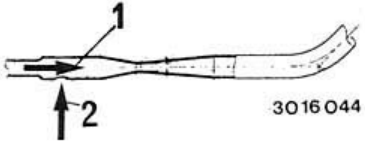
3 = Overflow pipe (right tank chamber)

4 = Splash shell

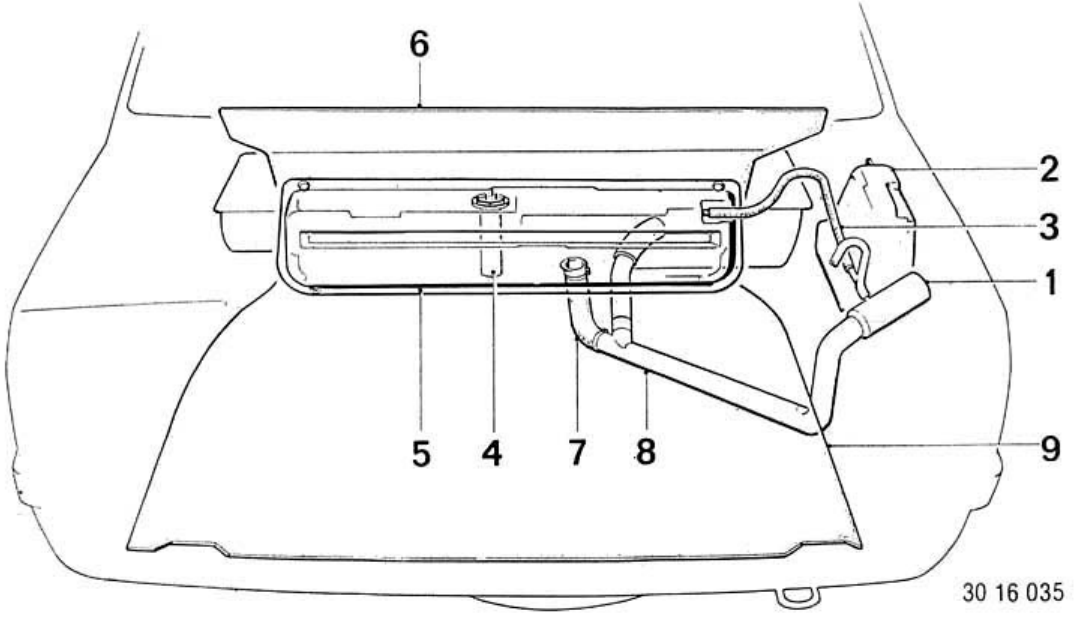
Overflow between the left and right tank chambers functions to the ejector principle.

1 = Fuel return from engine

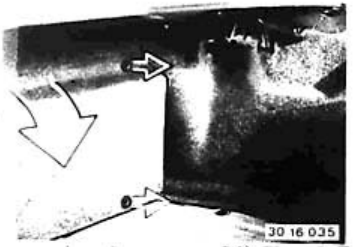
2 = Inlet for fuel from left tank chamber



LAYOUT DRAWING OF ADDITIONAL FUEL TANK

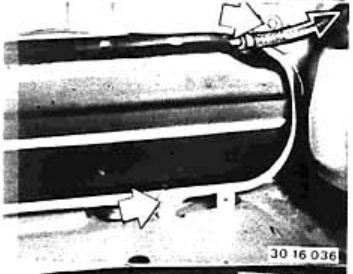


1 Filler neck
2 Expansion tank
3 Bleeder hose
4 Fuel level sender
5 Additional tank
6 Trunk separating wall
7 Molded filling hose
8 Filler pipe
9 Trunk floor plate

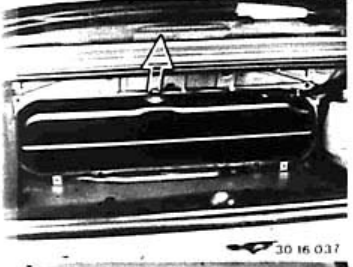


16 11 035 REMOVING AND INSTALLING ADDITIONAL FUEL TANK

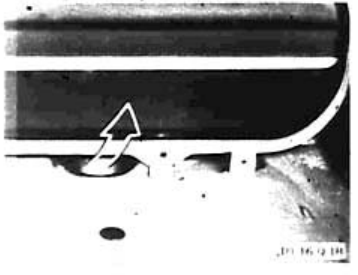
Lift out expansion rivets and take off trim panel.



Unscrew bolts on left and right sides.
Unscrew bleeder hose.

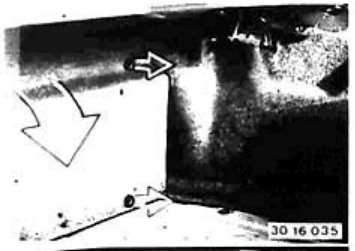


Pull off plug.

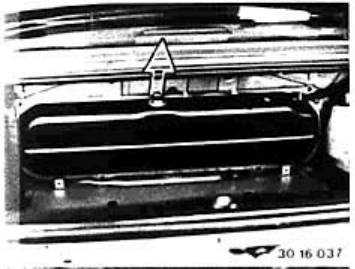


Lift tank.
Lift out sleeve.
Unscrew bolt.
Remove additional tank.

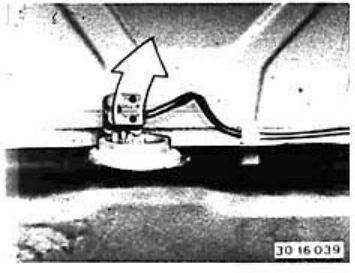
16 14 002 REMOVING AND INSTALLING FUEL LEVEL SENDER FOR ADDITIONAL FUEL TANK



Lift out expansion rivets and take off trim panel.



Pull off plug.



Unscrew and lift out fuel level sender.
Installation:
Use a new seal.
Remove retainer prior to installation of a new fuel level sender.

Testing:
Measure resistance* on connections G and 31 (ground) with float positioned at "EMPTY" and "FULL".
Resistance curve must not have breaks.
Connection W must have ground with float positioned at "EMPTY"
This sender is series connected with the master sender.

* See Specifications

Cooling Circuit - M 40

1 Cap with pressure relief and vacuum valves

2 From engine

3 Bleeding hose

4 To Thermostat

5 Control hose

6 To water pump

7 Level marks

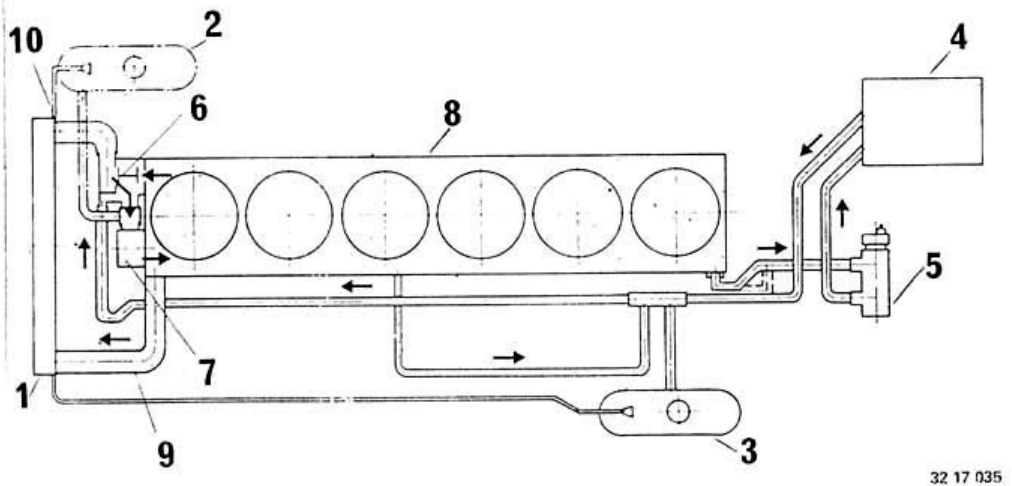
The bypass principle is applied in order to have good air exclusion in the cooling circuit.
Use of a cross-flow radiator permits integration of the bypass expansion tank on the side of the radiator. The tank is designed two-piece in order to have sufficient tank volume. This version permits use of transparent plastic in the area of level marks.

The bleeding hose mouths below the minimum level mark. In this manner air excluded from the bypass tank is prevented from flowing back into the full flow circuit when unscrewing the tank cap.

The pressure relief valve in the tank cap is activated via a control hose by radiator feed pressure.

The cooling system is protected against excessive operating pressure by registering the radiator feed pressure. Pressure protection takes place at approximately the amount of the radiator operating pressure during the after-heating phase. This improves the operating safety of the cooling system and the boiling-over safety while after-heating.

COOLANT CIRCUIT OF SIX CYLINDER M 21 ENGINE



32 17 035

1 Radiator
2 Expansion tank
3 Expansion tank

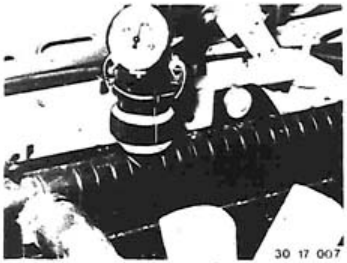
5 Heater valve
6 Thermostat
7 Water pump
8 Engine block
9 Return
10 Feed

BMW 324 d
BMW 324 td

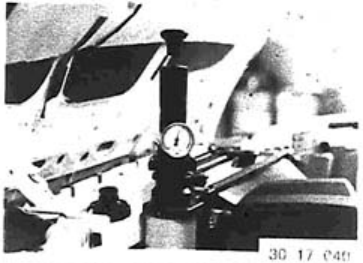
The 324 d coolant circuit differs from that of a turbocharged diesel engine only in the fact, that the branch pipe to the expansion tank goes direct from the thermostat s elbow hose (instead of from the heater s return pipe).



30 17 007

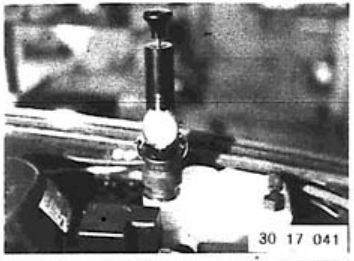
17 00 009 CHECKING COOLING SYSTEM FOR LEAKS

4 Cylinder M 10:
Check on radiator with tester 17 0 002 and adapter 17 0 003.



30 17 040

4 Cylinder M 40:
Check on integrated expansion tank of radiator with tester 17 0 002 and adapter 17 0 005.



30 17 041

6 Cylinder M 20 (Gasoline) and M 21 (Diesel):
Check on expansion tank with tester 17 0 002 and adapter 17 0 005.

30 17 042

S 14 (M 3):
Check on expansion tank with tester 17 0 002.
Note:
If no significant pressure drop (max. 0.1 bar or 1.4 psi) is displayed after 2 mintues, the cooling system does not leak*.

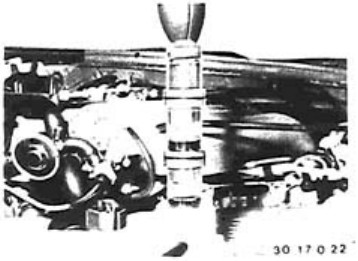
* See Specifications

32 17 025

Checking Cooling System Cap:
Check opening pressure* (pressure relief valve) with tester 17 0 002 in conjunction with adapter 17 0 006 and connecting hose 17 7 010.

32 17 003

Checking Vacuum Valve:
Screw cap on tester 17 0 006 and build up vacuum slowly (with Special Tool 61 6 030). Vacuum valve opens with vacuum of about 0,1 bar (13 psi).*
Check gasket.
Lift vacuum valve slightly and check for correct seating, replacing cap if necessary.



30 17 0 22

17 00 010 CHECKING FOR LEAKS BETWEEN COOLING SYSTEM AND COMBUSTION CHAMBER

Fill "cylinder head tester"** and perform test.
Note:
Conform with operating instructions supplied with tester.

* See Specifications
** Source of Supply: HWB

17 00 039 BLEEDING COOLING SYSTEM

4 / 6 Cylinder Models:

Level of Integrated Expansion Tank - M 40

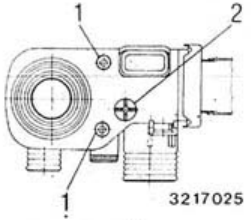
This condition is reached relatively easy by keeping to the following procedures when refilling the system (in a workshop).

Filling the System with Simultaneous Bleeding:
a) on radiator
b) on thermostat housing
(heater open, ignition on, engine not running)

The system is filled until the expansion tank is completely filled with coolant and coolant without air bubbles runs out of both bleeding points.

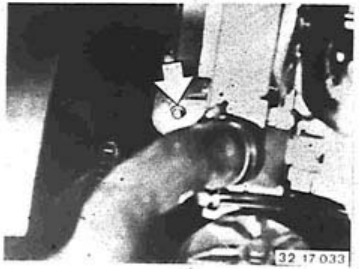
Tighten bleeder screws.

Air still trapped in the system will escape when operating the engine afterwards and cause the coolant level to drop approximately to the specified mark in the expansion tank (engine speed at least 2500 rpm). Slight excessive filling (for example up to the 9th rib from the top) is acceptable.



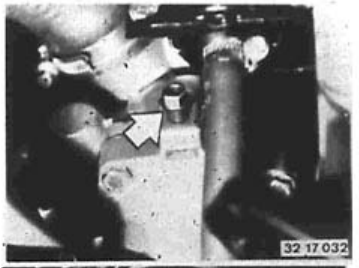
Unscrew M 40 bleeder screw and wait until coolant "without air bubbles" runs out.
Keep adding coolant in expansion tank while bleeding.
Only use specified coolant*.

2 = Bleeder screw on expansion tank

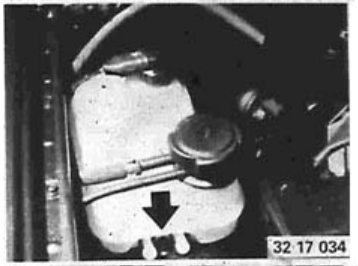


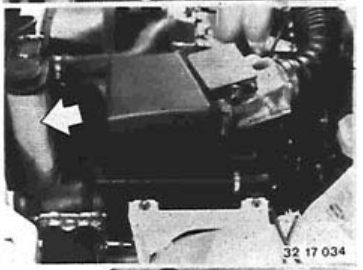
Unscrew M 40 bleeder screw.

* See Service Information of Gr. 00

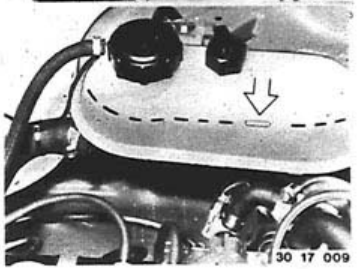


Unscrew M 20/M 21 bleeder screw.



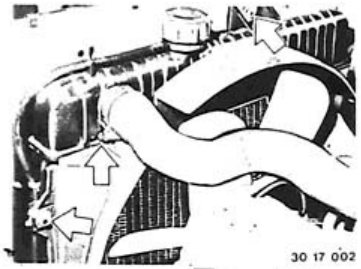


M 40
Mark on tank shows level at about 20 degrees C (68 degrees F).



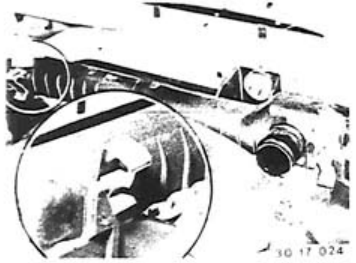
M 20 (Until 1988 Models)
Keep adding coolant in expansion tank while bleeding.
Mark shows level at 20 degrees C (68 degrees F).
Only use specified coolant* and **.

* See Service Information of Gr. 00
** Source of Supply: HWB

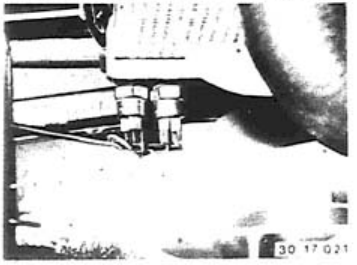


30 17 002

30 17 003



30 17 024



30 17 021

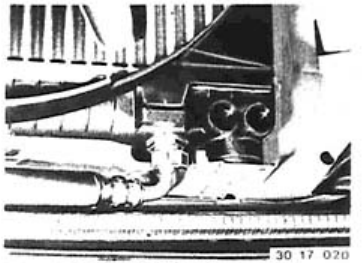
17 11 000 REMOVING AND INSTALLING RADIATOR

4 Cylinder Models:
Unscrew cooling system cap.
Unscrew fan cowl.
Disconnect coolant hoses and drain coolant.
Unscrew mounting bolt and take out radiator from above.
Caution!
Be careful not to cut hands on sharp radiator fins.

Installation:
Fill with specified coolant**.

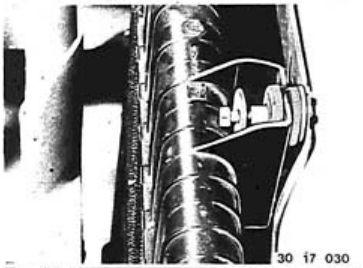
6 Cylinder Models:
Take off retainers.
Lift out fan cowl.
Disconnect coolant hoses and drain coolant.

Cars with Air Conditioner:
Pull off plugs on temperature switches.



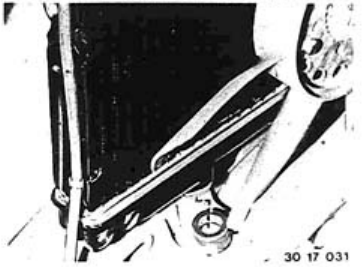
30 17 020

Cars with Automatic Transmission:
Unscrew oil cooler pipes and plug openings with caps.
Installation:
Tightening torque*.
Check ATF level, correcting if necessary.



30 17 030

Unscrew bolt and lift out radiator.
Caution!
Be careful not to cut hands on sharp radiator fins.
Installation:
Install washers and sleeve as shown in picture.
Tightening torque*.

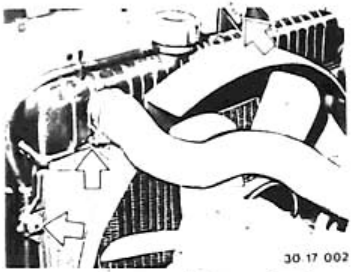


30 17 031

Installation:
Mount radiator on rubber mounts precisely.
Fill and bleed cooling system – see 17 00 039.

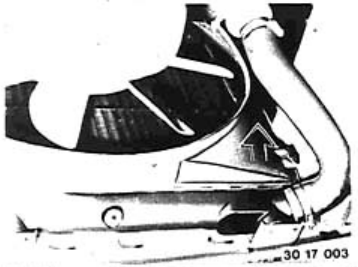
** See Service Information of Gr. 00

* See Specifications



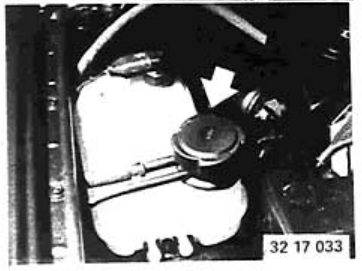
17 11 000 REMOVING AND INSTALLING RADIATOR (1988 Models)

4 Cylinder M 10:
Unscrew radiator cap.
Unscrew fan cowl.
Disconnect coolant hoses and drain coolant (catching in clean container if applicable).
Unscrew mounting bolts and take out radiator from above.



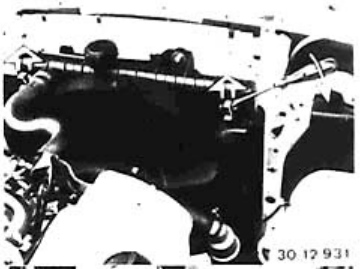
Installation:
Fill with specified coolant* + **.
Caution!
Be careful not to cut hands on sharp radiator fins.

4 Cylinder M 40:
Unscrew cap on integrated expansion tank of radiator.
Note:
Drain plug at bottom left**.

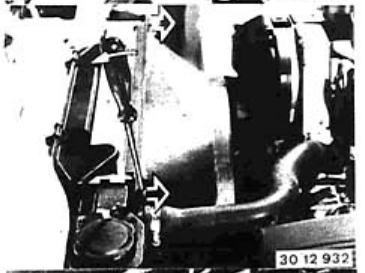


6 Cylinder M 20 / M 21:
Unscrew cap on expansion tank.
Note:
Drain plug at bottom left**.

* See Service Information of Gr. 00
** See Specifications



M 10:
Press fan cowl retainers forward with a slotted screwdriver and pry out upward.
Push fan cowl back.
Also refer to M 21.

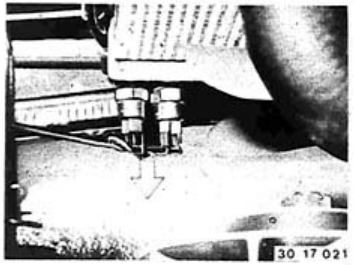


Press out fan cowl plugs toward rear.
M 20:
Unscrew splash guard if necessary see 51 47 . . ..
Drain coolant, catching if necessary.
Coolant*.
Drain plug tightening torque**.
Also refer to M 40.

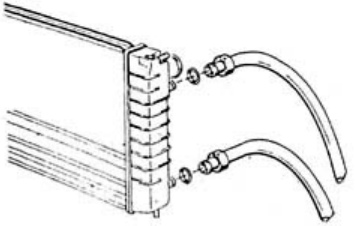
Disconnect coolant hoses.
Detach bleeder hose.
Installation:
Mount coolant hoses**.

Unscrew upper radiator mounting bolts and lift out radiator.
Installation:
Mount radiator on rubber mounts precisely.
Mount coolant hoses**.
Fill with specified coolant* and bleed – see 17 00 039.

* See Service Information of Gr. 00
** See Specifications



Cars with Air Conditioner:
Pull off plugs on temperature switches.

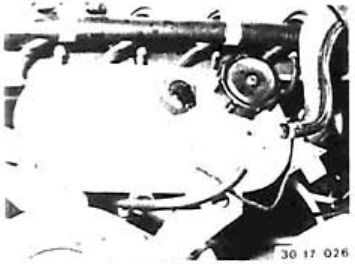


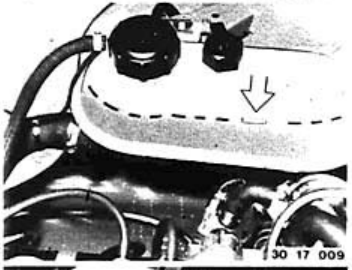
Cars with Automatic Transmission:
Unscrew oil cooler pipes and plug openings with caps.
Installation:
Check ATF level, correcting if necessary.
Tightening torque*.

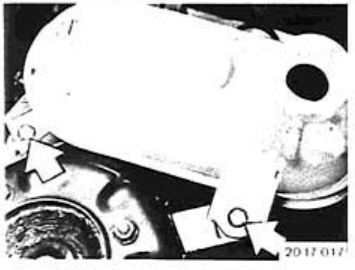
Installation:
Fill and bleed cooling system – see 17 00 039.

M 40 / M 20:
Unscrew oil cooler pipes and plug openings with caps.
Installation:
Check ATF level, correcting if necessary.
Tightening torque*.

* See Specifications







17 11 100 REPLACING EXPANSION TANK (Before 1988 Models)

Caution!
Unscrew cap only when engine is cold. Drain, catch and dispose coolant.

Pull off plug and disconnect hoses. If applicable, pull off plug for level switch.

Installation:
Use new hose clamps if necessary.

Installation:
Pour in specified coolant* and bleed cooling system – see 17 00 039.
Mark on tank shows full level at approx. 20° C (68° F).

Unscrew screws and take out expansion tank.

Installation:
Tightening torque*.

* See Service Information of Gr. 00
** See Specifications

17 11 509 FLUSHING RADIATOR – Radiator Removed –

If oil has penetrated into the coolant circuit, the radiator and expansion tank will have to be flushed and cleaned with Solvethane**.

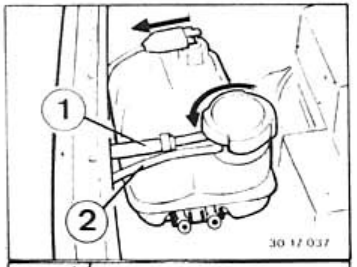
Procedures:

1. Also remove expansion tank in addition to the radiator for M 20/M 21.
2. Pour in about 2 liters (4 pints) of Solvethane.
3. Shake radiator and tank thoroughly and drain after oil has been dissolved.
4. Install cleaned radiator and expansion tank, and connect on coolant circuit.
5. Fill entire cooling system with hot water and flush thoroughly by replacing hot water several times to guarantee removal of solvethane residue.
6. Check drained coolant for traces of oil and, if necessary, repeat step 5. Pour in coolant* and bleed cooling system after finishing the cleaning procedures – see 17 00 039.

Caution!
Solvethane attacks rubber seals, hoses, etc. and consequently must not be permitted to enter or remain in the cooling system.
Always conform with safety precautions for working with Solvethane (printed on cans).

Also refer to Service Information of Group 11.

* See Service Information of Gr. 00
** Source of Supply: HWB

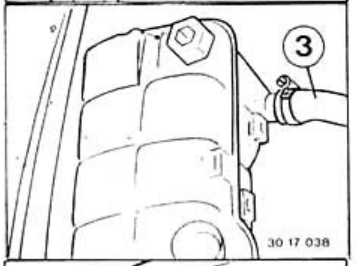


17 11 100 REMOVING AND INSTALLING EXPANSION TANK (Since 1988 Models)

Caution!
Unscrew cap only when engine is cold.
Drain, catch and dispose coolant.

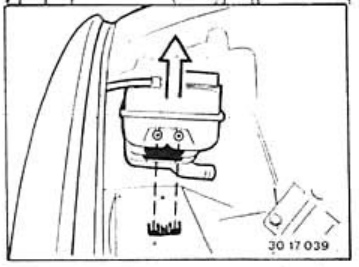
Pull off plug on level switch.
Disconnect hoses (1 and 2).

Installation:
Use new hose clamps.



Disconnect expansion hose (3).

Installation:
Use new hose clamps.
Pour in specified coolant** and bleed cooling system – 17 00 039.

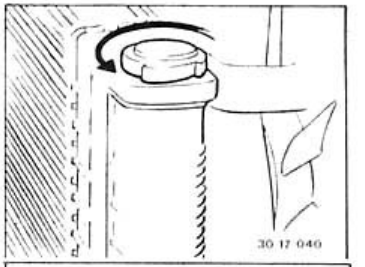


Unclip plastic clips and pull expansion tank out of clamps.

Mark on tank shows coolant level at approx. 20° C (68° F).

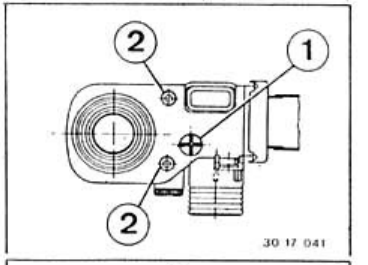
Installation:
Pour in specified coolant** and bleed – see 17 00 039.

* See Specifications
** See Operating Fluids

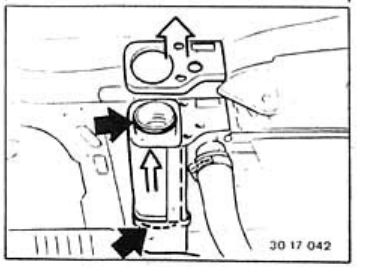


M 40

Caution!
Unscrew cap only when engine is cold.
Drain, catch and dispose coolant.



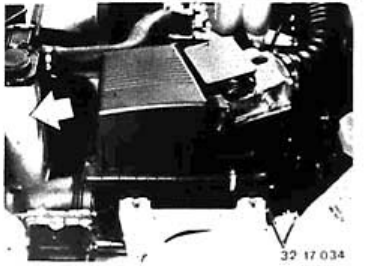
Unscrew bleeder screw (1).
Unscrew mounting screws (2).
Take off upper section.



Pull out expansion tank from above.

Installation:
Replace seals.

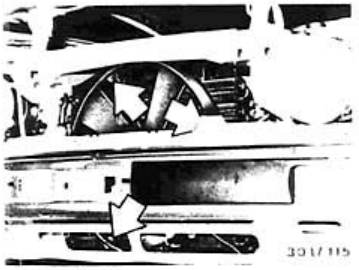
Pour in specified coolant** and bleed – see 17 00 039.



Mark on tank shows coolant level at approx. 20° C (68° F).

Installation:
Pour in specified coolant** and bleed – see 17 00 039.

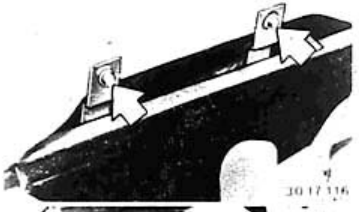
** See Operating Fluids



17 40 000 REMOVING AND INSTALLING ADDITIONAL FAN ASSY.

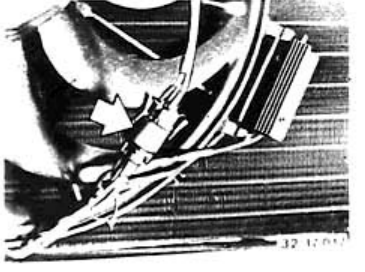
Remove radiator – see 17 11 000.
Remove all radiator grill sections – see 51 13 070.
Unscrew nuts on additional fan.

Unscrew condenser.



Take off trim panel.

Disconnect plug.
Pull back condenser and lift out additional fan from above.
Testing:
Power consumption and speed – see Specifications of Group 17.



18 Exhaust System

4 Cylinders M20, M40

18 00 020 Exhaust assembly – remove and install 18- 1
18 12 031 Final muffler – replace 18- 2
041 Primary muffler – replace 18- 2
18 21 011 Pivot sleeves in exhaust carrier – replace 18- 3
18 32 005 Catalytic converter – remove and install / replace 18- 4

4 Cylinders M42

Exhaust system layout 18-00/42.0

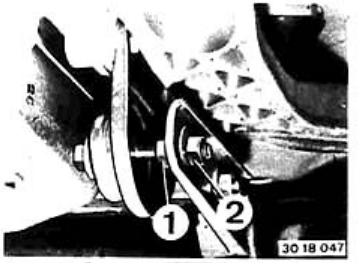
18 00 020 REMOVING AND INSTALLING EXHAUST ASSEMBLY

4 Cylinder M 10 / M 40:
Version with Catalytic Converter:
Disconnect oxygen sensor plug (1).
Pull out plug downward through the protective tube.
Caution!
Oxygen sensor must not be damaged.
Remove oxygen sensor of there is danger of damaging it.
Refer to 11 78 012.

Unscrew exhaust pipe on manifold.
Installation:
Check gasket, replacing if necessary
Replace self-locking nuts.
Coat threads with copper paste CRC**.
Tightening torque*.

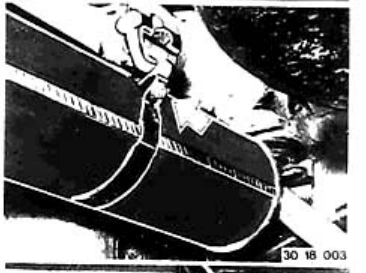
Loosen holder for exhaust.
Installation:
Torque* holder only after finishing installation of assembly (danger of tension).

* See Specifications
** Source of Supply: HWB

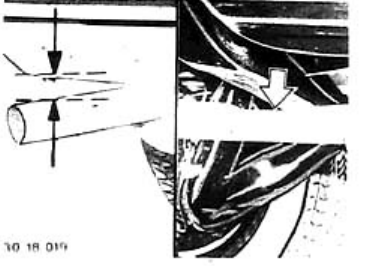


Cars with Automatic Transmission:
Unscrew nut (2).
Installation:
Mount the exhaust carrier without tension by adjusting nut (1).

Disconnect suspension on rear axle carrier – if necessary.
Installation:
Move holder to adjust only after finishing installation of the exhaust assembly and then tighten to correct torque*.



Loosen holder for final muffler.
Installation:
Torque* holder in such a manner, that rubber ring is preloaded.
Preload: 6 mm (0.236").
See exhaust suspension layout drawing.



Take off exhaust assembly.
Installation:
Check spacing to body and rear axle carrier, correcting if necessary.

* See Specifications

18 12 031 REPLACING FINAL MUFFLER

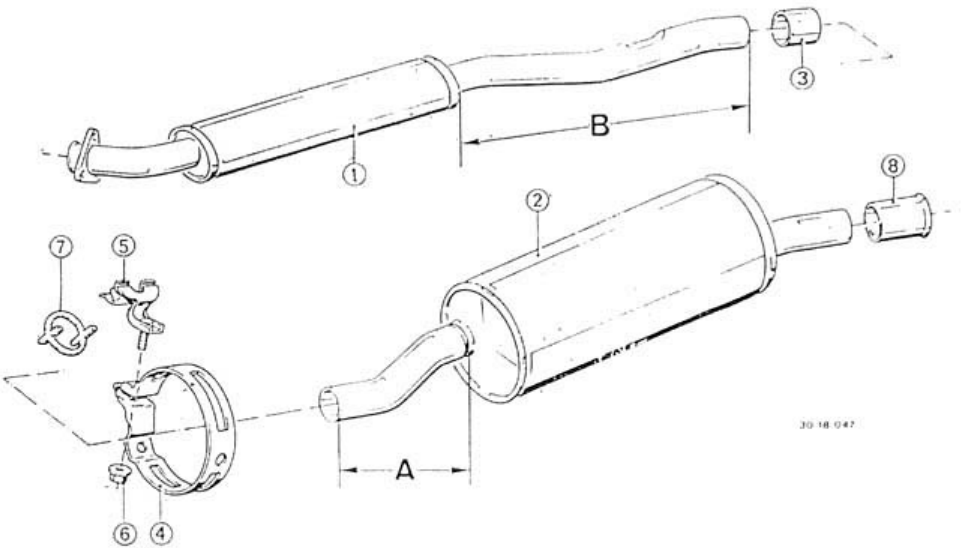
4 Cylinder M 10:
Determine cutting distance (A) on new final muffler (2).
Transfer and mark determined distance to installed final muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Remove final muffler – see 18 00 020.
Slide on welding sleeve (3).
Adjust new final muffler to correct installed position and connect with welding sleeve (3).
Important!
Make sure of sufficient spacing to body.
Tack weld welding sleeve (3).
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.

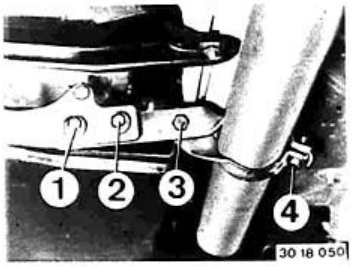
18 12 041 REPLACING PRIMARY MUFFLER

4 Cylinder M 10:
Determine cutting distance (B) on new primary muffler (1).
Transfer and mark determined distance to installed primary muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Unscrew primary muffler on flange and remove.
Adjust new primary muffler to correct installed position and connect with welding sleeve (3).
Important!
Make sure of sufficient spacing to body.
Tack weld welding sleeve.
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.
Since 1988 models the part being replaced must be disconnected on the flanges.

Muffler Assembly:

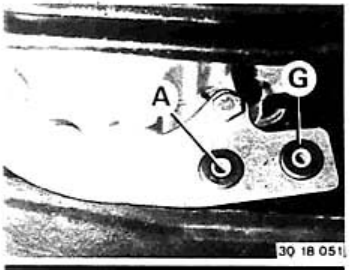
1 Primary muffler
2 Final muffler
3 Welding sleeve
4 Clamp
5 Holder
6 Nut
7 Rubber ring
8 Tailpipe extension



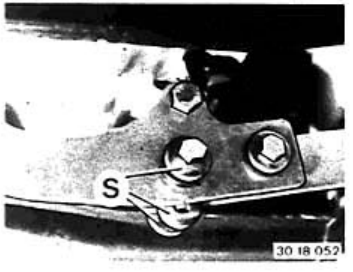


18 21 011 REPLACING PIVOT SLEEVES IN EXHAUST CARRIER

4 Cylinder M 10, M 40:
Unscrew and remove bolts (1 and 2).
Loosen (3 and 4).
Installation:
Tighten bolts and nuts in order of 1 through 4.

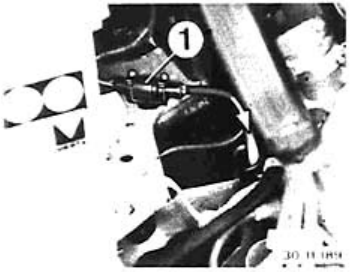


Push in spacers (A) and press out pivot sleeves (G).
Installation:
Coat pivot sleeves with a lubricant for installation of the spacers.



Install washers (S) as shown.
Tightening torque*.

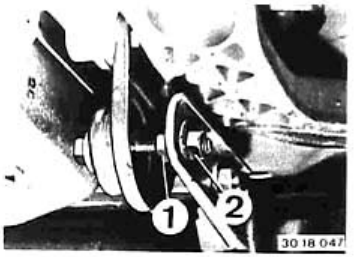
* See Specifications



18 32 005 REMOVING AND INSTALLING OR REPLACING CATALYTIC CONVERTER

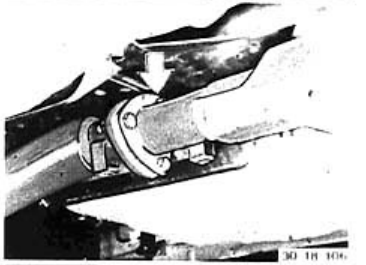
Four Cylinder M 10, M 40:
Disconnect oxygen sensor plug (1).
Pull out plug downwards through protective pipe.

Important!
Oxygen sensor must not be damaged. If danger of damaging oxygen sensor, it must be removed – see 11 78 012.



Cars with Automatic Transmission:
Unscrew nut (2).

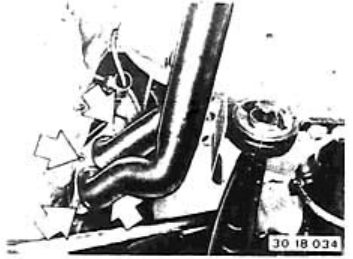
Installation:
Mount exhaust carrier without tension by adjusting nut (1).



Disconnect catalytic converter from final muffler.

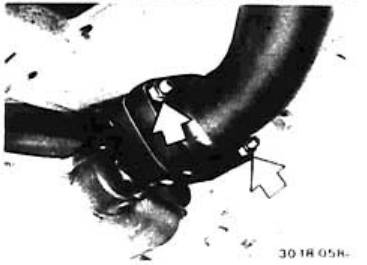
Installation:
Replace gasket and self-locking nuts. Tightening torque*.

Scrapping Information
Used catalytic converters will be accepted and must be returned as warranty parts*.**



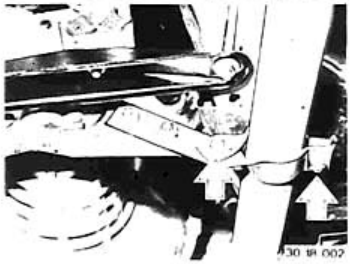
Unscrew exhaust pipe on manifold.

Installation:
Check gasket, replacing if necessary.
Replace self-locking nuts.
Coat threads with copper paste CRC.**



Two Hole Flange Version:

Note:
Turn flange to have maximum ground clearance.



Unscrew exhaust suspension holder.

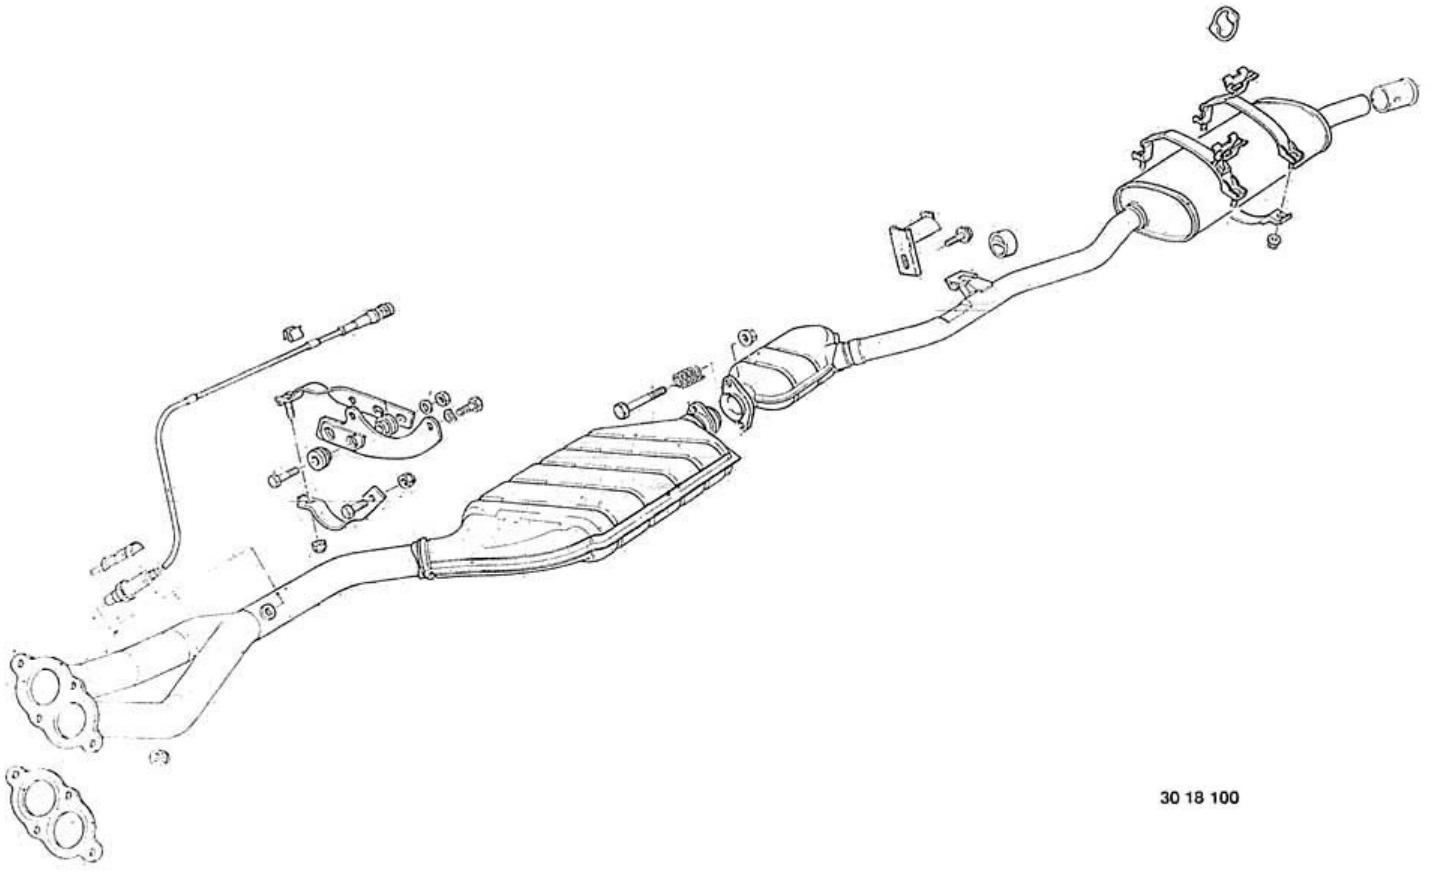
Installation:
Tighten holder to specified torque* only after complete installation.

* See Specifications
** Source of Supply: HWB

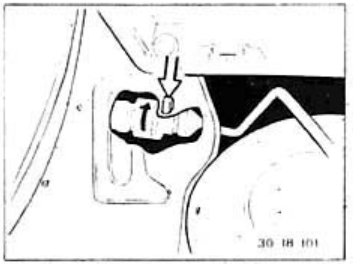
* See Specifications
*** See Service Information

18-00/42.0

EXHAUST ASSEMBLY DRAWING



30 18 100

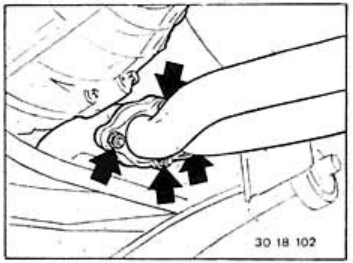


18 00 020 REMOVING AND INSTALLING EXHAUST ASSEMBLY

Model 318 is / M 42:

Disconnect plug for oxygen sensor.
Unclip electric lead in holder.

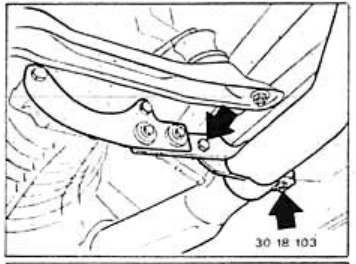
Location:
Underneath battery console.



Unscrew exhaust pipes on manifold.

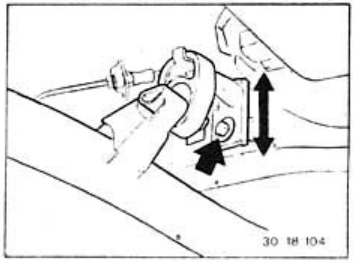
Installation:
Check gasket, replacing if necessary.
Replace self-locking nuts.
Coat threads with copper paste CRC.**

Tightening Procedures:
Step 1 = 30 to 35 Nm (22 to 25 ft. lbs.)
Step 2 = 50 to 55 Nm (36 to 40 ft. lbs.)



Unscrew exhaust pipe on transmission holder.

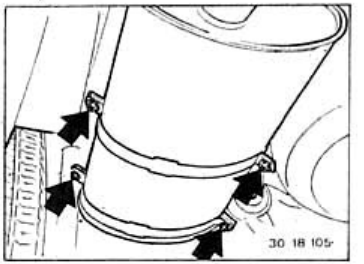
Installation:
Bolt holder only after finishing installation of the complete assembly without tension.
Tightening torque*.



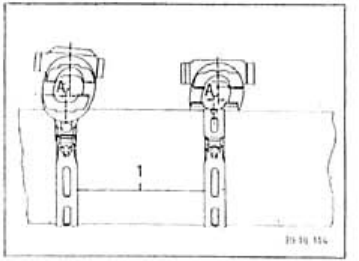
Unscrew holder on rear axle carrier.

Installation:
Align and bolt holder only after finishing installation of the complete exhaust assembly.
Tightening torque*.

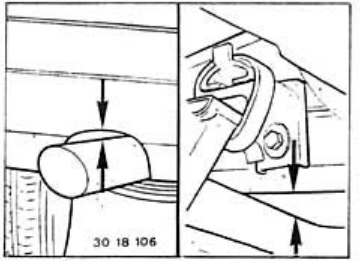
* See Specifications
** Source of Supply: HWB



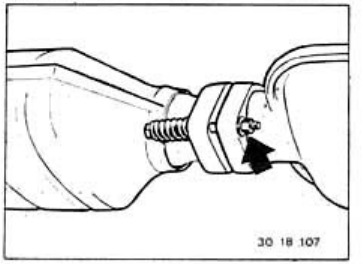
Unscrew holder for final muffler.
Remove exhaust assembly.



Installation:
Slide holder forward until rubber rings are preloaded by 6 mm (0.236").

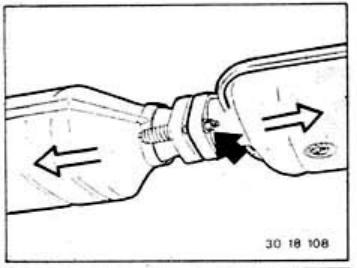


Installation:
Check for sufficient spacing to the body and rear axle carrier – approx. 20 mm (0.787") each.



Installation:
Loosen and then tighten connection between catalytic converter and middle muffler without tension.

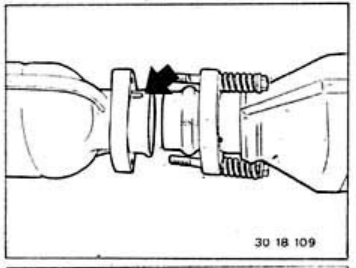
Tightening Procedures:
Press springs (2) flat by tightening nuts (1) uniformly with a torque of 11 to 14 Nm (8 to 10 ft. lbs.). Loosen nuts (1) afterwards by one and one half turns. Flanges must be parallel to each other and springs must not be pressed flat.



18 12 ... DISASSEMBLING EXHAUST ASSEMBLY

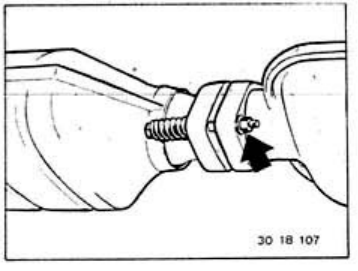
Model 318 is / M 42:

Unscrew flanged connection.
Disconnect exhaust assembly.



Arrangement of Connection:

Important!
Pipe is fitted with a holding tab.
Flange can be pushed on only in one position.



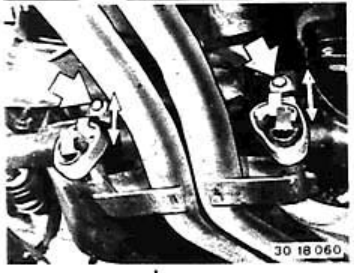
Installation:
Lubricate connection lightly with copper paste CRC.**
Press springs (2) flat by tightening nuts (1) uniformly with a torque of 11 to 14 Nm (8 to 10 ft. lbs.).
Loosen nuts (1) by one and one half turns afterwards.
Flanges must be parallel to each other and springs must not be pressed flat.

Position of Flanges as Seen Looking Forward

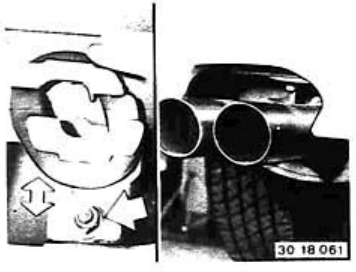
** Source of Supply: HWB

18 00 020 REMOVING AND INSTALLING EXHAUST ASSEMBLY

Engine S 14, M 3:
Unscrew exhaust assembly on flange.
Installation:
Check gasket, replacing if necessary.
Coat threads with copper paste CRC**.
Tightening torque*.



Unscrew holders on rear axle carrier.
Installation:
Adjust and tighten holders only after installation of the complete exhaust assembly.
Tightening torque*.



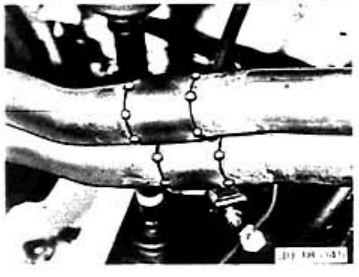
Unscrew holder for final muffler.
Installation:
Adjust spacing to body by moving holder.
Tightening torque*.

* See Specifications
** Source of Supply: HWB

18 12 031 REPLACING FINAL MUFFLER

Engine S 14, M 3:
Remove exhaust assembly – see 18 00 020.
Cut off clamping sleeves at clamping points.
Position clamping sleeves in one direction.

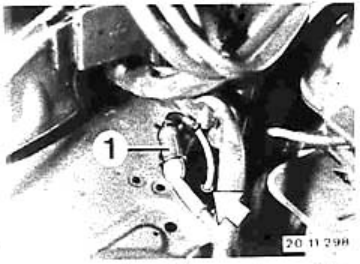
Slide on new sleeves.
Adjust exhaust assembly to correct installed position.
Center sleeves.



Tack weld sleeves with several spot welds.
Remove primary and final mufflers.
Weld sleeves all around.

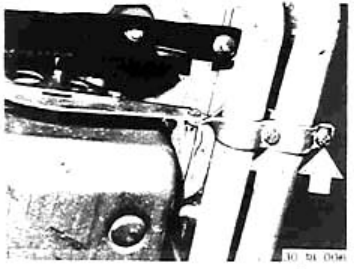
18 00 020 REMOVING AND INSTALLING EXHAUST ASSEMBLY

6 Cylinder M 20:
Cars with Catalytic Converter:
Disconnect oxygen sensor plug (1).
Lift out wire harness.
Installation:
Seal plug connection with Three Bond Silicone 1207** to avoid problems with the contacts of the plug.
Floor plate assembly plug installation.



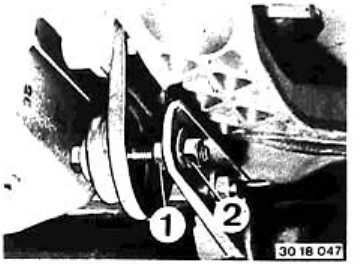
Disconnect oxygen sensor plug (1).
Lift out wire harness.
Right wheel house plug installation.
Important!
Be careful not to damage the oxygen sensor. If there is the possibility of damaging it, remove the oxygen sensor – see 11 78 012.

Unscrew exhaust pipes on exhaust manifold.
Installation:
Check gaskets, replacing if necessary.
Replace self-locking nuts.
Coat threads with copper paste CRC**.
Tightening torque*.

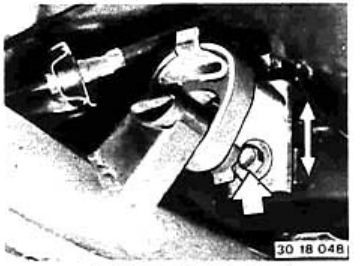


Unscrew exhaust assembly holders.
Installation:
Avoid tension by tightening holders only after installation of complete exhaust assembly.
Tightening torque*.

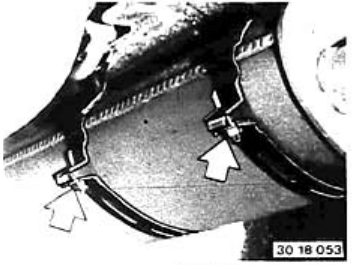
* See Specifications
** Source of Supply: HWB



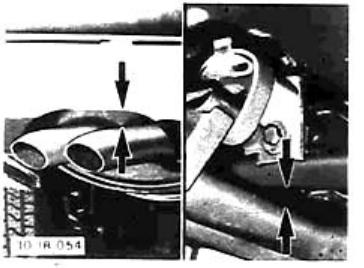
Cars with Automatic Transmission:
Unscrew nut (2).
Installation:
Mount exhaust carrier without tension by adjusting nut (1).



Unscrew holder on rear axle carrier, if necessary
Installation:
Adjust and tighten holder only after installation of complete exhaust assembly.
Tightening torque*.



Unscrew holders for final muffler.
Installation:
Tighten holders that rubber ring is pre-loaded.
Preload = 6 mm (0.236").
Tightening torque*.
(See exhaust suspension layout drawing.)



Take off exhaust assembly.
Installation:
Check installed position.
Make sure of sufficient spacing to body and rear axle carrier.

* See Specifications

18 12 031 REPLACING FINAL MUFFLER

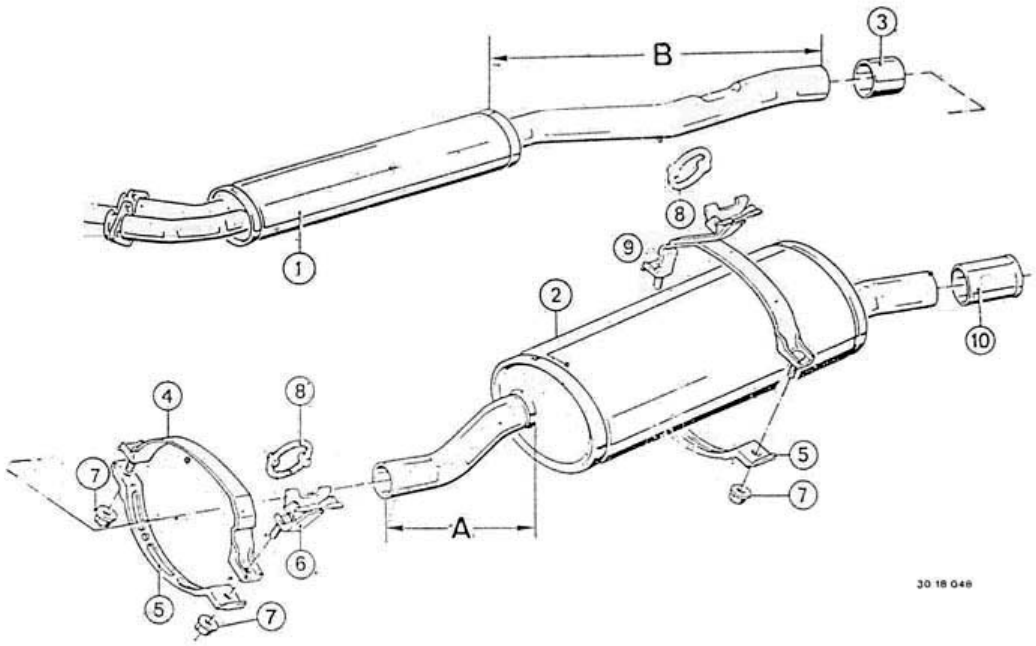
6 Cylinder M 20:
Determine cutting distance (A) on new final muffler (2).
Transfer and mark determined distance to installed final muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Remove final muffler – see 18 00 020.
Slide on welding sleeve (3).
Adjust new final muffler to correct installed position and connect with welding sleeve (3).
Note:
Check for sufficient spacing to body.
Tack weld welding sleeve (3).
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.

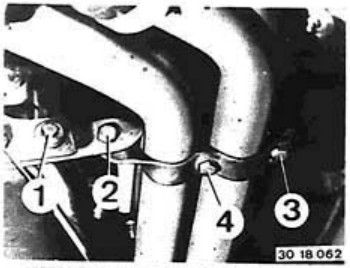
18 12 041 REPLACING PRIMARY MUFFLER

6 Cylinder M 20:
Determine cutting distance (B) on new primary muffler (1).
Transfer and mark determined distance to installed primary muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Unscrew primary muffler on flange and remove.
Adjust new primary muffler to correct installed position and connect with welding sleeve (3).
Note:
Check for sufficient spacing to body.
Tack-weld welding sleeve (3).
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.
Since 1988 models a part being replaced must be disconnected on the flanges.

Muffler Assembly:

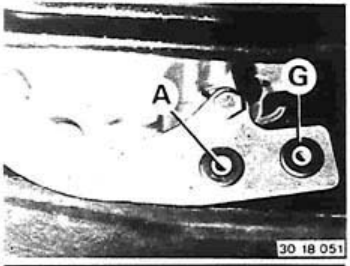
1 Primary muffler
2 Final muffler
3 Welding sleeve
4 Clamp
5 Clamp
6 Holder
7 Nut
8 Rubber ring
9 Clamp
10 Tailpipe extension



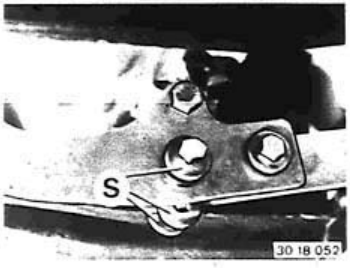


18 21 011 REPLACING PIVOT SLEEVES ON EXHAUST CARRIER

6 Cylinder M 20:
Unscrew bolts (1).
Loosen (2 ...4).
Installation:
Tighten bolts and nuts in order of 1 through 4.



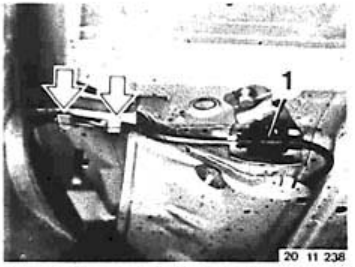
Push in spacers (A) and press out pivot sleeves (G).
Installation:
Coat pivot sleeves with a lubricant for installation of the spacers.



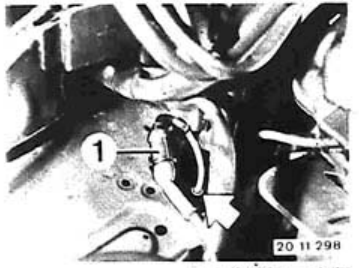
Install washers (S) as shown.
Tightening torque*.

* See Specifications

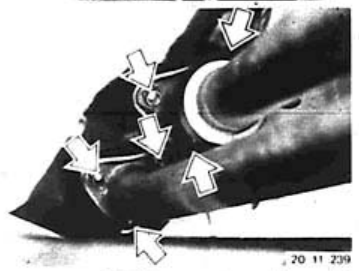
18 32 005 REMOVING AND INSTALLING OR REPLACING CATALYTIC CONVERTER



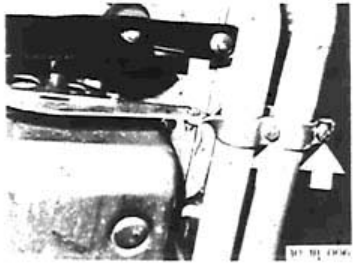
6 Cylinder M 20:
Disconnect oxygen sensor plug (1).
Lift out wire harness.
Installation:
To avoid plug contact problems, seal off plug connection with Three Bond Silicone 1207**.
Floor Assembly Plug Installation



Disconnect oxygen sensor plug (1).
Lift out wire harness.
Right Wheel House Plug Installation

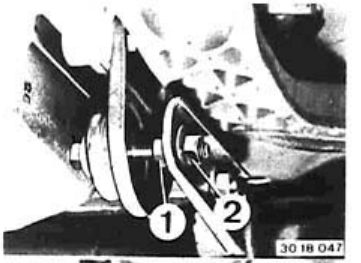


Unscrew exhaust pipes on manifold.
Installation:
Check gaskets, replacing if necessary.
Replace self-locking nuts.
Coat threads with copper paste CRC**
Tightening torque*.

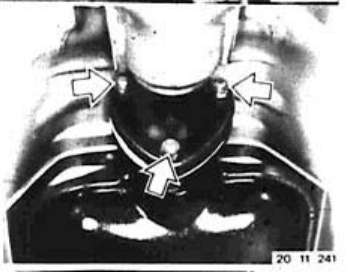


Remove exhaust holder.
Installation:
Mount holder only after finishing installation of catalytic converter (danger of tension)
Tightening torque*

* See Specifications
**Source of Supply: HWB



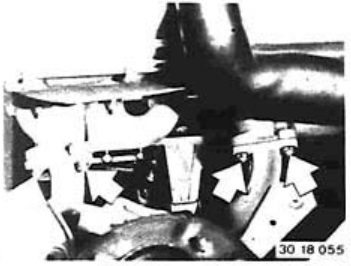
Cars with Automatic Transmission:
Unscrew nut (2).
Installation:
Mount the exhaust carrier without tension by adjusting nut (1).
Tightening torque*.



Unscrew catalytic converter on final muffler.
Installation:
Check seals, replacing if necessary.
Replace self-locking nuts.
Tightening torque*.
Three Hole Flange Version

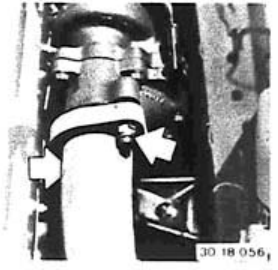
Two Hole Flange Version

* See Specifications

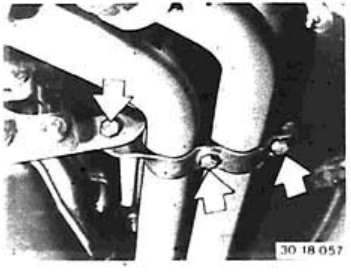


18 00 020 REMOVING AND INSTALLING EXHAUST ASSEMBLY

6 Cylinder M 21:
BMW 324 d:
Remove splash guard.
Unscrew exhaust pipes on manifold.

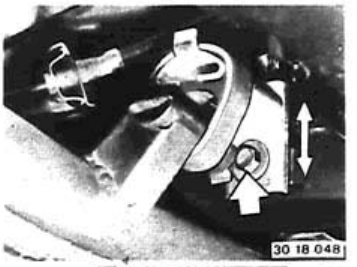


BMW 324 td:
Unscrew exhaust pipe on turbocharger.
Installation:
Check gaskets, replacing if necessary.
Replace nuts.
Coat threads with copper paste CRC**
Tightening torque*.

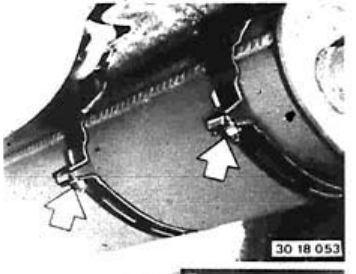


Unscrew holders for exhaust assembly.
Installation:
Avoid tension by tightening holders only after installation of complete exhaust assembly.
Tightening torque*.

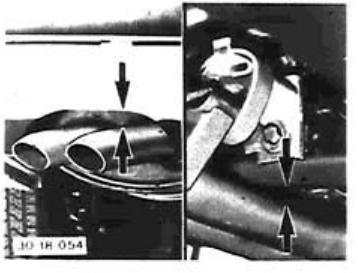
* See Specifications
** Source of Supply: HWB



Loosen holders on rear axle carrier if necessary
Installation:
Adjust and tighten holders only after installation of complete exhaust assembly.
Tightening torque*.



All:
Loosen holders for final muffler.
Installation:
Tighten holders that rubber rings are pre-loaded
Preload = 6 mm (0.236").
Tightening torque*
(See exhaust suspension layout drawing.)



Take off exhaust assembly.
Installation:
Check installed position.
Make sure of sufficient spacing to body and rear axle carrier.

* See Specifications

18 12 031 REPLACING FINAL MUFFLER

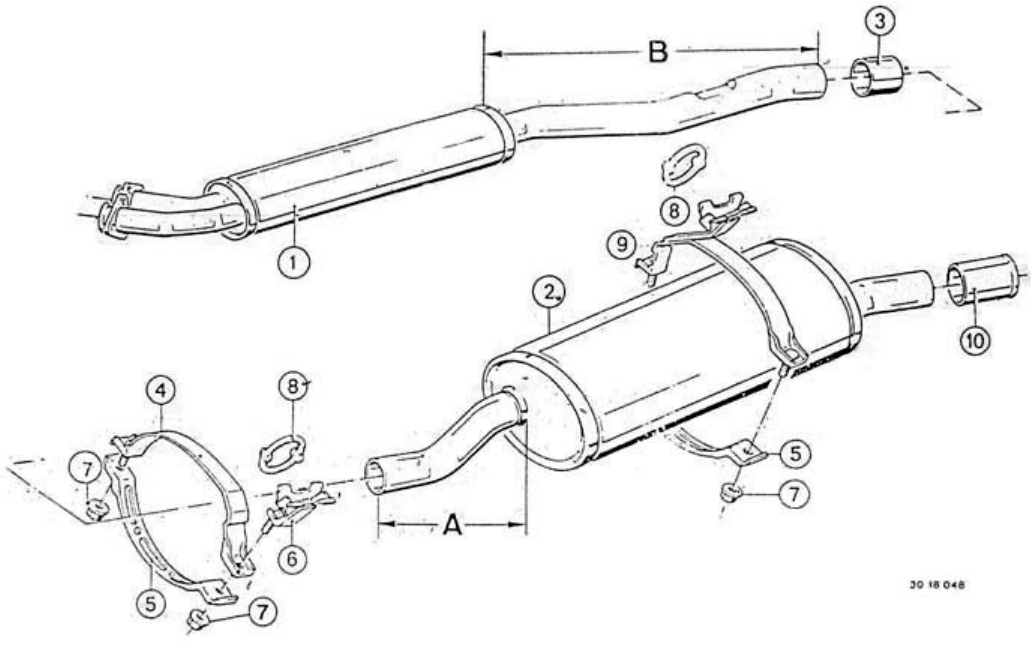
6 Cylinder M 21:
Determine cutting distance (A) on new final muffler (2).
Transfer and mark determined distance to installed final muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Remove final muffler – see 18 00 020.
Slide on welding sleeve (3).
Adjust new final muffler to correct installed position and connect with welding sleeve (3).
Note:
Check for sufficient spacing to body.
Tack weld welding sleeve (3).
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.

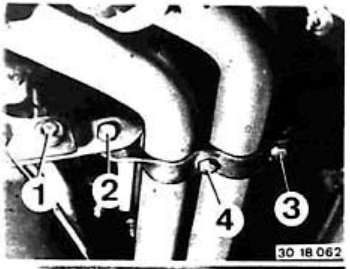
18 12 041 REPLACING PRIMARY MUFFLER

6 Cylinder M 21:
Determine cutting distance (B) on new primary muffler (1).
Transfer and mark determined distance to installed primary muffler.
Cut off exhaust pipe with Special Tool 00 2 200 and deburr edges.
Unscrew primary muffler on flange and remove.
Adjust new primary muffler to correct installed position and connect with welding sleeve (3).
Note:
Check for sufficient spacing to body.
Tack weld welding sleeve (3).
Remove muffler assembly (primary and final mufflers).
Weld welding sleeve (3) all around.

Muffler Assembly:

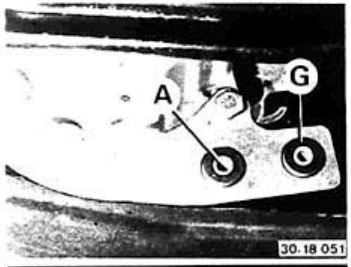
1 Primary muffler
2 Final muffler
3 Welding sleeve
4 Clamp
5 Clamp
6 Holder
7 Nut
8 Rubber ring
9 Clamp
10 Tailpipe extension



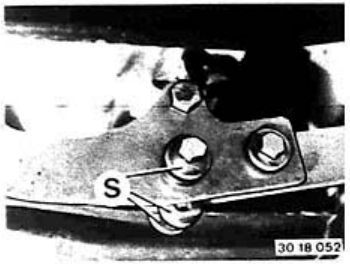


18 21 011 REPLACING PIVOT SLEEVES ON EXHAUST CARRIER

Unscrew bolts (1).
Loosen (2 ... 4).
Installation:
Tighten bolts and nuts in order of 1 through 4.



Push in spacers (A) and press out pivot sleeves (G).
Installation:
Coat pivot sleeves with a lubricant for installation of the spacers.

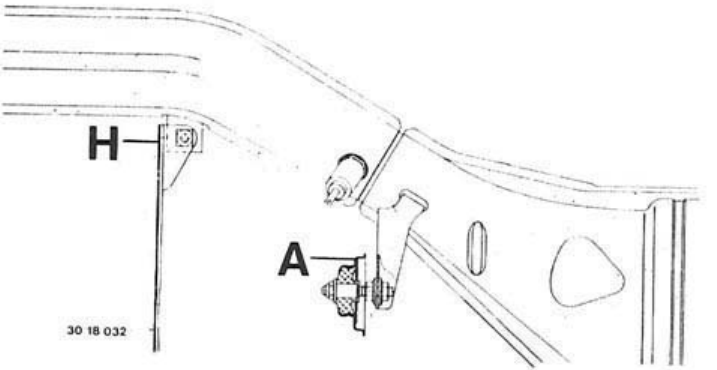


Install washers (S) as shown.
Tightening torque*.

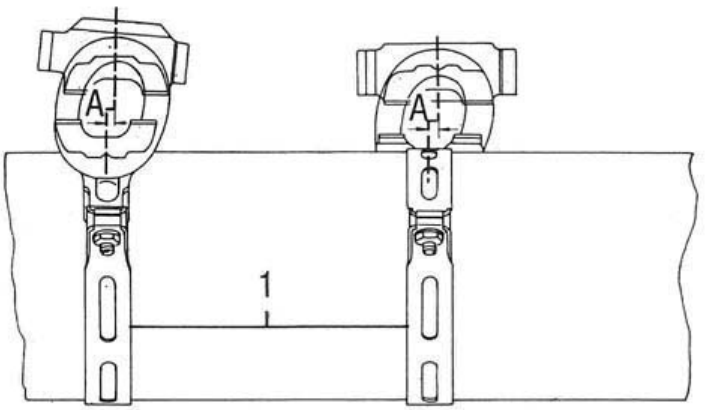
* See Specifications

EXHAUST SUSPENSION LAYOUT DRAWINGS

Installation:
Tighten the exhaust carrier (H or A) only after the exhaust assembly is in correct installed position (danger of tension).
H = Version with manual transmission
A = Version with automatic transmission

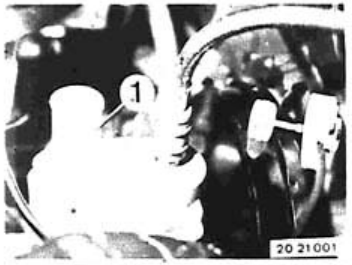


Tighten clamps (1) for the final muffler in such a manner, that rubber suspension parts are pre-loaded.
Preload A = 6 mm (0.236").



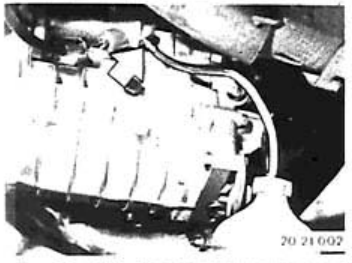
21 Clutch

21 00 006	Clutch – bleed	21- 1
21 11 000	Clutch housing – remove and install	21- 1
21 21 000	Clutch disc – remove and install	21- 2
565	Drive plate – check for lateral runout	21- 4
21 51 000	Clutch release – remove and install / replace	21- 4
21 52 000	Clutch master cylinder – remove and install	21- 5
010	Clutch slave cylinder – remove and install	21- 5
502	Clutch master cylinder – overhaul	21- 6
512	Clutch slave cylinder – overhaul	21- 6
	Troubleshooting clutch	21- 7

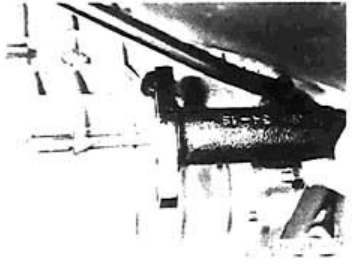


21 00 006 BLEEDING CLUTCH

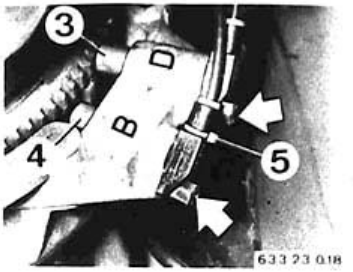
Unscrew cap on brake fluid tank.
Remove float container (1).
Connect bleeder.



Open bleeder screw on clutch slave cylinder until escaping fluid is without air bubbles.
Operate clutch pedal several times during this procedure.

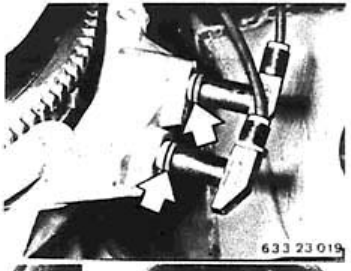


If there is still air in system after repeating the bleeding procedures several times, detach slave cylinder on transmission.
Press push rod against stop in slave cylinder and release slowly.
This will push back any residual air into the tank and guarantee maximum release travel.
Never operate clutch pedal as long as the slave cylinder is removed.

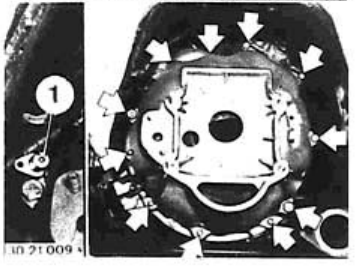


21 11 000 REMOVING AND INSTALLING CLUTCH HOUSING

Remove transmission – see 23 00 022
Remove DME senders.
Important! – Installation:
Check installed position.
Plugs must not be mixed up.
Install speed sensor (3) in bore (D) and reference mark sensor (4) with ring (5) in bore (B).
Engine cannot be started, if plugs are mixed up.

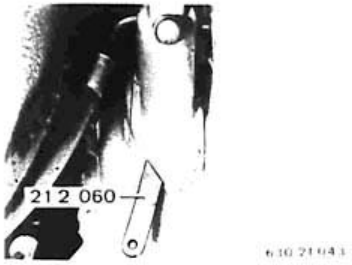


Installation:
Check O-rings.
Install sensors with Molykote Longterm 2.
Important!
Face surface of DME senders must be free of grease and dirt.

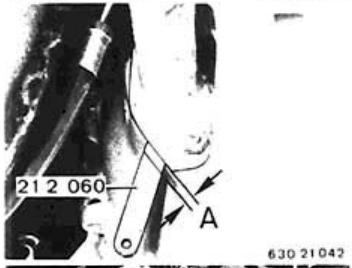


Remove position sender (1).
Unscrew clutch housing.
Use a Torx wrench** to unscrew Torx bolts.
Important! – Installation:
Torx bolts must be installed with washers to avoid an increase in breaking-loose torque.
Tightening torque*.

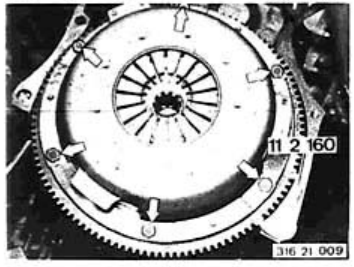
* See Specifications
** Source of Supply: HWB



630 21 041



630 21 042



316 21 009

21 21 000 REMOVING AND INSTALLING CLUTCH DISC

Caution!
Liners contain asbestos - conform with safety precautions (see Group 00).

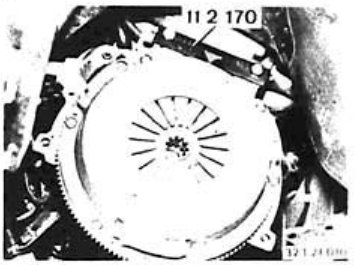
Checking Installed Clutch for Wear:

Clutch liners are okay, if Special Tool 21 2 060 can be pushed into opening of slave cylinder against the stop.

Drive plate is worn and must be replaced when there is a gap of 5 mm (0.197") between Special Tool 21 2 060 and the slave cylinder.

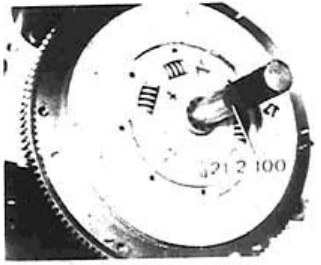
Remove transmission - see 23 00 020 / 022.
Check deviation* at tips of diaphragm springs.
Engine M 10:
Hold flywheel with Special Tool 11 2 160.
Loosen mounting bolts separately 1 to 1 and 1/2 turns until clutch is relaxed.
Take off mounting bolts, clutch disc and drive plate.
Clean clutch parts.
Liners contain asbestos - conform with safety precautions (see general information in Group 00).
Important!
Don't throw or drop clutch disc - improper handling could bend off the three tangential leaf springs, which hold the clutch disc in turning direction. Diaphragm springs would then still introduce lift, but because of the weak leaf springs the pressure ring would not lift sufficiently and the drive plate would not clear.

* See Specifications



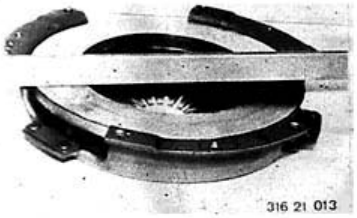
Engines M 20, M 21, M 40:
Hold flywheel with Special Tool 11 2 170.

Check drive plate for wear (A)* and cracks, and torsion damper for tight fit of spring elements.
Important! - Installation:
Check transmission end mark on the drive plate.
Note:
The drive plate of the version with a double-mass flywheel is designed rigid without dampers. Torsion dampers are integrated in the flywheel.

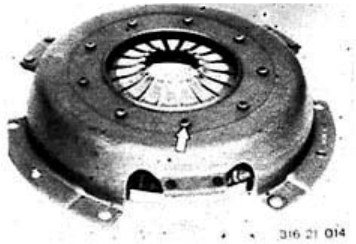


Installation:
Check whether the grooved ball bearing in the crankshaft moves easily, replacing if necessary.
Check flywheel for scoring.
Center drive plate in the flywheel with Special Tool 21 2 100.

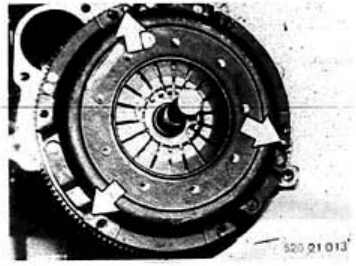
* See Specifications



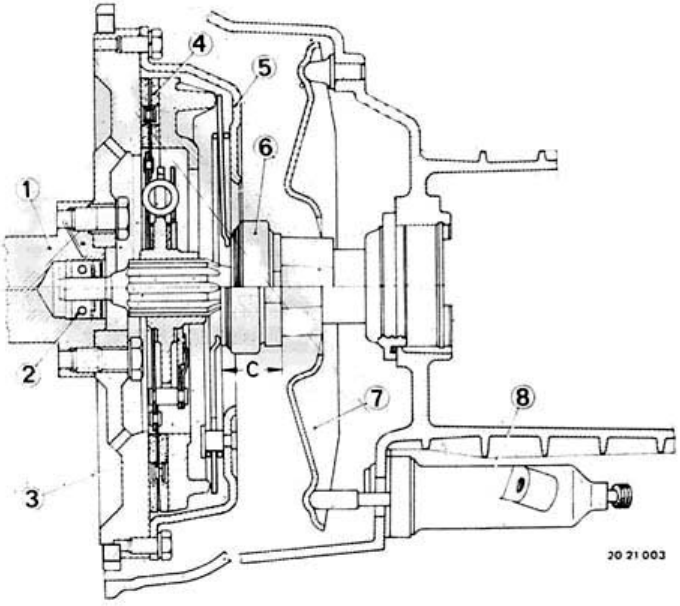
Visually inspect clutch for cracks, wear and burnt spots.
Pressure contact surface must be level.



Visually inspect clutch rivets for wear and tight fit.
Replace a clutch with loose or worn rivets.
Important!
Remove all corrosion inhibitor when installing a new clutch disc.
Note:
The clutch for the version with a double mass flywheel is lower in height.



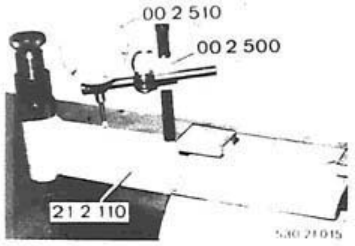
Place clutch disc over dowel pins.
Tighten mounting bolts separately and uniformly to specified torque*.
Give transmission input shaft a light coat of Microlube GL 261** in area of splines and guide pins.



Clutch Assembly:
1 Crankshaft
2 Grooved ball bearing
3 Flywheel
4 Drive plate*
5 Thrust plate*
6 Release*
7 Release lever
8 Clutch slave cylinder

* See Specifications
** Source of Supply: HWB

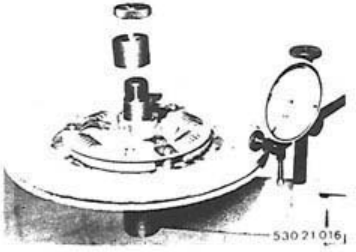
* See Specifications



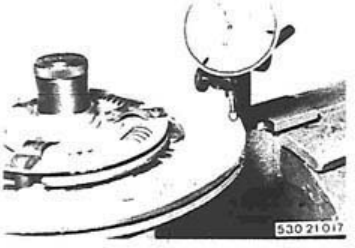
21 21 565 CHECKING DRIVE PLATE FOR LATERAL RUNOUT

– Drive Plate Removed –

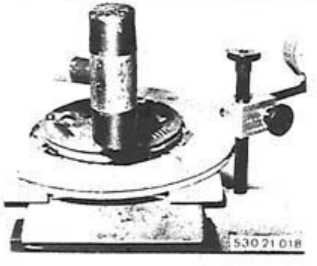
Clamp Special Tool 21 2 110 in a vise.
Mount Special Tools 00 2 510 and 00 2 500.



Clamp drive plate on tester and clean liner with emery cloth.

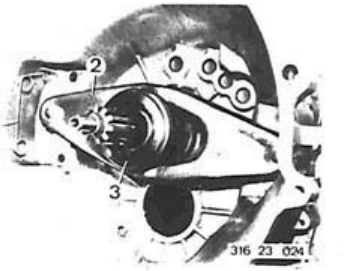


Apply dial gage about 3 mm (0.118") from outer edge.
Turn drive plate and read lateral runout*.



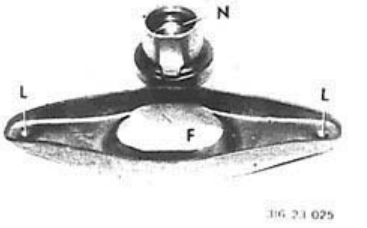
Straighten drive plate by applying knocks from a plastic hammer on take-up points of tester.
Repeat testing procedures.

* See Specifications



21 51 000 REMOVING AND INSTALLING/ REPLACING CLUTCH RELEASE

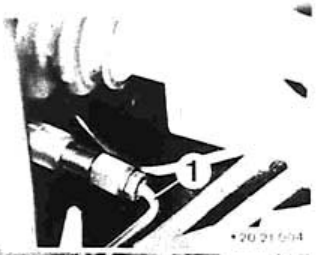
Remove transmission 23 00 020.
Remove spring (1) and release lever (2) with release (3).



Installation:
Pack lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) with Molykote Longterm 2.
Non-conformance could cause bearing to seize on guide sleeve.

Check specified height B* and C* of release.

* See Specifications

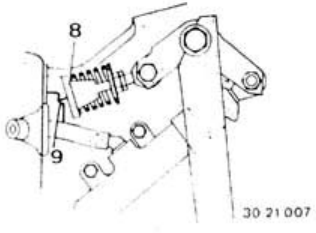


21 52 000 REMOVING AND INSTALLING CLUTCH MASTER CYLINDER

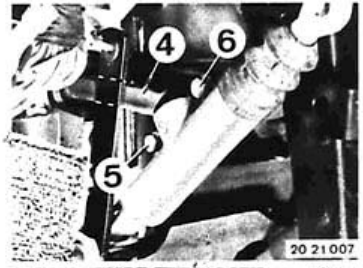
Disconnect line (1) to slave cylinder.

Unscrew cap on fluid tank.
Remove float container (2).
Draw off brake fluid in tank to drop level to connection for filling line.

Detach instrument panel trim at bottom left – see 51 45 180.
Detach piston rod (3) on clutch pedal.
Installation:
Adjust clutch pedal with eccentric bolt (7) – see Group 35.



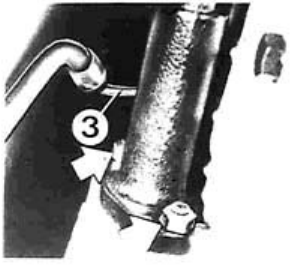
Important! – Installation:
Version with Over-Center Helper Spring:
Engage over-center helper spring (8) in guide tab (9) on pedal base prior to installation of piston rod (3).



Pull out filling line (4).
Unscrew bolts (5 and 6).
Remove master cylinder.
Installation:
Bleed clutch – see 21 00 006.

21 52 010 REMOVING AND INSTALLING CLUTCH SLAVE CYLINDER

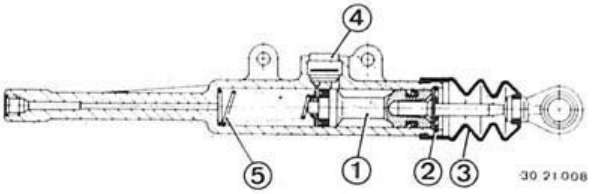
Unscrew cap on fluid tank.
Remove float container (2).
Draw off brake fluid in tank to drop level to connection for filling line.



Detach slave cylinder on transmission.
Remove slave cylinder.
Disconnect line (3).
Note:
Install a 22.2 mm dia. slave cylinder (instead of 20.64 mm dia.) in cars with a double mass flywheel to prevent touching of the release lever when the clutch pedal is floored (also refer to Service Information of Group 21).
Installation:
Bleeder screw faces down.
Install front push rod with Molykote Longterm 2.
Bleed clutch 21 00 006.

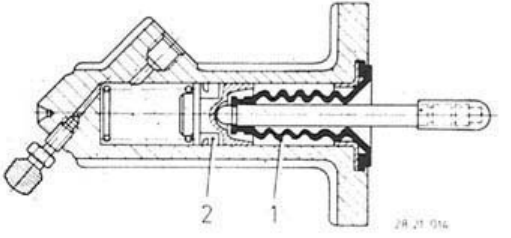
21 52 502 OVERHAULING CLUTCH MASTER CYLINDER
– Removed –

Clean master cylinder and internal parts in alcohol.
Replace entire master cylinder, if cylinder bore has scoring or corrosion.
Install repair kit.
Note:
Only use the repair kit from the manufacturers of the master cylinder.
1 Piston assembly
2 Circlip
3 Cap
4 Plug
5 Spring
Give cylinder bore and grooved rings a light coat of ATE brake cylinder paste*.



21 52 512 OVERHAULING CLUTCH SLAVE CYLINDER
– Removed –

Clean slave cylinder and internal parts in alcohol.
Replace entire slave cylinder, if cylinder bore has scoring or corrosion.
Install repair kit.
Note:
Only use the repair kit from the manufacturers of the slave cylinder.
1 Cap
2 Grooved cup
Retaining ring
Toothed ring
Coat cylinder bore and grooved cup lightly with ATE brake cylinder paste*.



* Source: HWB

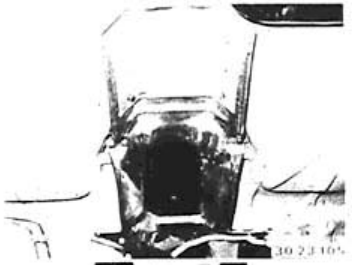
TROUBLESHOOTING CLUTCH

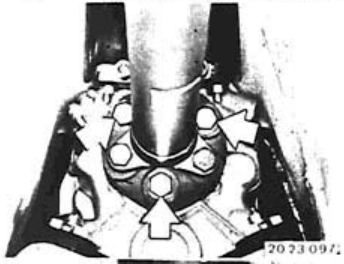
Condition	Cause	Correction
Clutch slips	a) Contact pressure of clutch insufficient	a) Replace clutch 21 21 000
	b) Liner wear* excessive	b) Replace drive plate 21 21 000
	c) Liner covered with oil – transmission or crankshaft seal defective	c) Replace defective seal and drive plate
	d) Clutch overheated	d) Replace clutch 21 21 000
	e) Clutch not an original BMW part	e) Install original BMW parts
Clutch grabs	a) Liners* not as specified	a) Replace drive plate 21 21 000
	b) Liners splattered with oil	b) Replace drive plate 21 21 000
	c) Release pressure one-sided	c) Check release lever
	d) Pressure plate pressing crooked	d) Replace pressure plate 21 21 000
	e) Crankshaft not aligned with transmission input shaft	e) Check centering surfaces of engine and transmission
	f) Engine and transmission suspension defective	f) Replace engine and transmission suspension
	g) Drive plate not an original BMW part	g) Install original BMW part
Clutch will not release	a) Drive plate wrenched excessively or liners broken	a) Replace drive plate 21 21 000
	b) Drive plate lateral runout* excessive	b) Straighten or replace drive plate 21 21 565
	c) Liner rusted on flywheel	c) Clean flywheel, roughen liner with emery cloth
	d) Drive plate seized on transmission input shaft	d) Service drive plate on transmission input shaft and replace damaged parts, if necessary
	e) Pilot bearing for transmission input shaft in crankshaft defective	e) Replace pilot bearing in crankshaft 11 21 571
	f) Air in clutch hydraulic system	f) Bleed clutch 21 00 006
	g) Tangential leaf springs of clutch bent off	g) Replace clutch 21 21 000
Clutch noise	a) Unbalance of clutch and drive plate excessive	a) Replace clutch and drive plate 21 21 000
	b) Torsion damper excessive	b) Replace drive plate 21 21 000
	c) Clutch release defective	c) Replace clutch release 21 51 001
	d) Pilot bearing for transmission input shaft in crankshaft defective	d) Replace pilot bearing in crankshaft 11 21 571
	e) Clutch rivets loose	e) Replace clutch 21 21 000

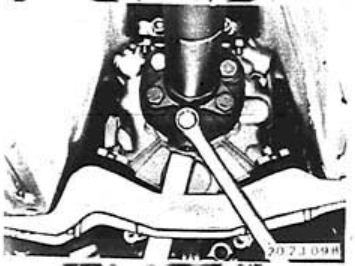
* See Specifications

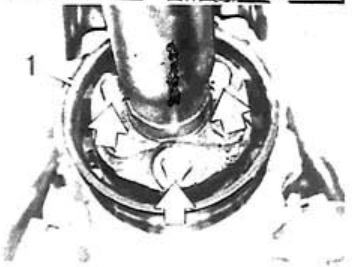
23 Manual Transmission

23 00 020	Transmission – remove and install	23- 1
022	Transmission – remove and install	23- 1
032	Transmission – exchange	23- 3
23 12 . . .	Radial oil seal for output flange – replace	23- 4
. . .	Radial oil seal for selector shaft – replace	23- 5
23 13 010	Vibration damper – remove and install / replace	23- 6
23 71 503	Rubber mounts for transmission suspension	see group 27
	Troubleshooting manual transmission	23- 7









23 00 020/ REMOVING AND INSTALLING 022 TRANSMISSION

Remove exhaust assembly – see 18 00 020.

Model 324 td:
Remove primary and final mufflers.

Cars with Four Wheel Drive:
Remove transfer box – see 27 10 010.

Unscrew heat shield.

Unscrew joint disc on transmission.

Installation:
Always use new stop nuts.

Installation:
Tighten nuts with a standard 17 or 19 mm wrench socket and torque wrench.
Tightening torque*.

Important!
Only tighten nuts on the flange end, whenever possible by design, to avoid tension in the joint disc.

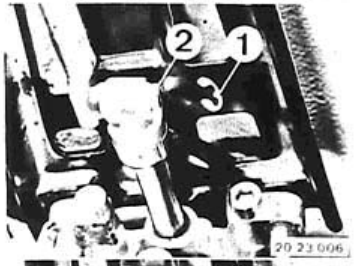
Version with Integrated Vibration Damper (1):

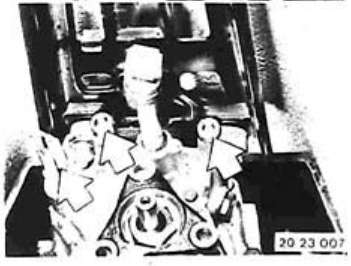
Vibration damper (1) is mounted on the output flange with the pressed-in bolts.
Unscrew nuts on joint disc.

Installation:
Tightening torque*.

Note:
Joint disc can be pulled off only after lowering the transmission.

* See Specifications





Loosen screwed-on ring (1) several turns.

Installation:
Tighten screwed-on ring (1) with Special Tool 26 1 040 after finishing installation.
Tightening torque*.

Unscrew center mount.

Installation:
Preload center mount forward by distance (A) = 4 to 6 mm (0.157 to 0.236").

Bend propeller shaft down and pull off of centering pin.

Important!
Prevent propeller shaft from falling into joints by suspending it from car on a piece of wire.

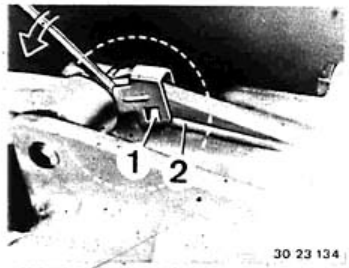
Lift out retainer (1) and take off washer (2).
Pull out shift rod.

Pull off leads on reverse gear switch.
Unscrew shift console on transmission.

Important!
Self-locking bolts – will be difficult to unscrew.

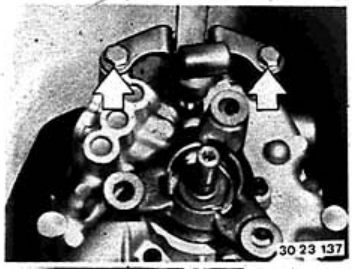
Installation:
Use new bolts.
Make sure that brackets are horizontal to the shift console while tightening (shift lever noise).

* See Specifications

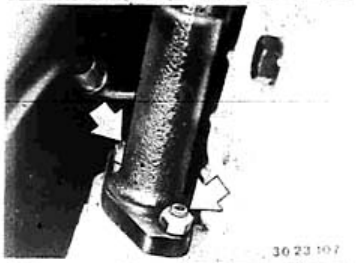


Version with Shift Arm:
Lift spring (1) out of tab (2) on the case with a screwdriver and swing up. Pull out bearing pin.

Installation:
Lubricate bearing pin lightly with Molykote Longterm 2.

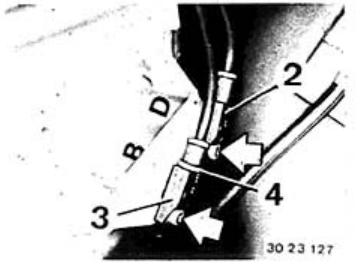


Model M 3:
Unscrew clamp for shift arm on transmission.



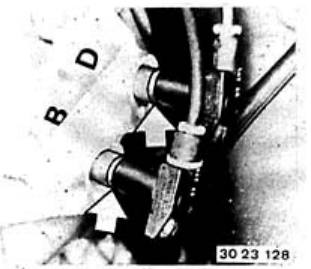
Unscrew clutch slave cylinder on transmission.
Pipe remains connected.

Installation:
Bleeder screw faces down.



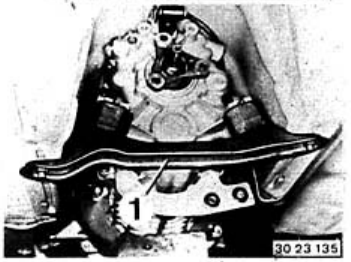
Version with DME:
Unscrew heat shield.
Unscrew bolts.
Pull out speed sender (2) and reference mark sender (3).

Important! – Installation:
Check installed position.
Don't mix up plugs.
Install speed sender (2) without ring in bore D and reference mark sender (3) with ring (4) in bore B.
Engine cannot be started if mixed up.



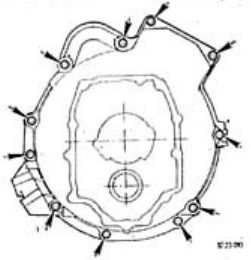
Installation:
Check O-rings.
Install senders with Molykote Longterm 2.

Important!
Face end of DME senders must be without grease and dirt.



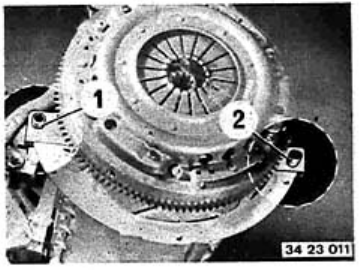
Support transmission.
Remove cross member (1).
Lower transmission to front axle carrier.

Installation:
Center transmission (see Group 26).
Tightening torque*.



Unscrew transmission on engine.
Unscrew Torx bolts with a Torx socket.**
Remove transmission toward rear.

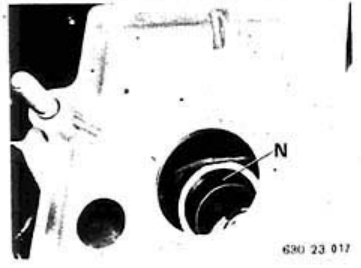
Important! – Installation:
Washers must be used with the Torx bolt version to avoid increasing the breaking-loose torque.
Tightening torque*.



Important!
Check that dowel sleeves (1 and 2) are not missing before installation of the transmission.
As applicable, transfer dowel sleeves from the transmission or use new dowel sleeves.
Coat splines and guide pins lightly with Microlube GL 261.**
Check oil level.

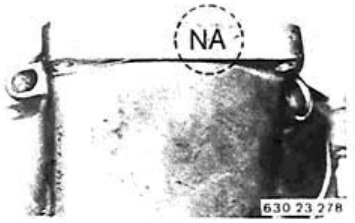
* See Specifications
** Source of Supply: HWB

Transmission 265 Sport:
Unscrew transmission on clutch housing and remove toward rear.
Use special ring wrench** to unscrew and tighten nut at top left.



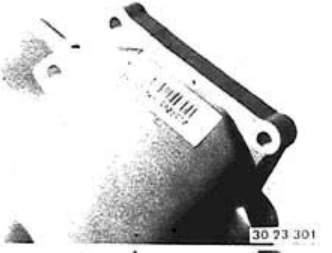
Installation:
Move the release lever to installed position with the clutch slave cylinder.
Align clutch release bearing.
Pack lubricating groove (N) with Molykote Longterm 2.
Non-conformance could cause the bearing to seize on the guide sleeve.
Engage a gear before mounting the transmission.
Guide the transmission's guide sleeve into the release bearing carefully.
Turn the output flange for so long, until the input shaft slides into the drive plate.
Remove clutch slave cylinder again.
Tighten transmission bolts to correct torque*.
Check oil level.

* See Specifications
** Source of Supply: HWB

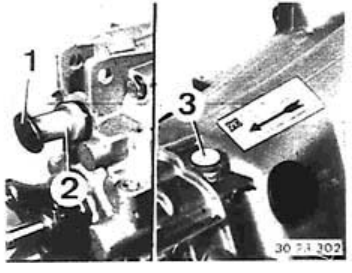


23 00 032 INSTALLING EXCHANGE TRANSMISSION

Remove transmission – see 23 00 020/ 022.
Transmission identification:
BMW code* die-stamped in front case section.



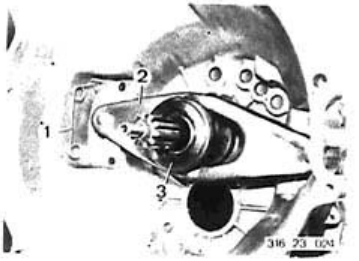
BMW code* label pasted on front case section.



Transmission ZF S 5 - 16:

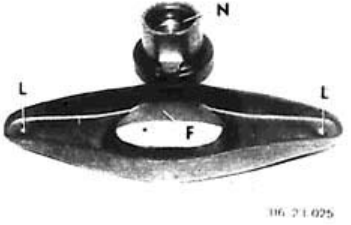
Important!
Mount vent (1) prior to installation of the transmission (red label).
Pull vent (1) and protective sleeve (2) off of the shift shaft.
Lift out cap (3) and install vent (1).

Note:
Only applicable when vent is not mounted.

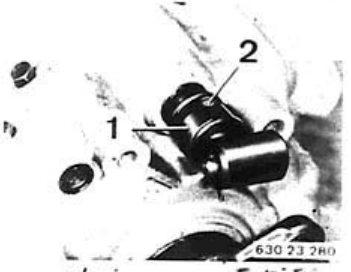


Transfer spring (1) and release lever (2) with release bearing (3).

Note:
Coat transmission input shaft lightly in area of splines and guide pins with Microlube GL 261**.

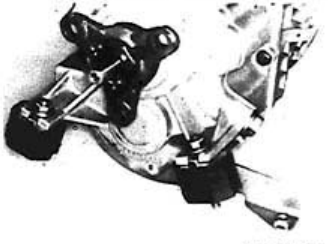


Installation:
Fill lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) lightly with Molykote Longterm 2.
Non-conformance could cause the bearing to seize on the guide sleeve.



Transfer shift rod joint.
Push back locking sleeve (1).
Drive out cylindrical pin (2).

Note:
Check installed position of shift rod joint – offset end of shift rod joint installed to face right-hand side as seen looking forward.

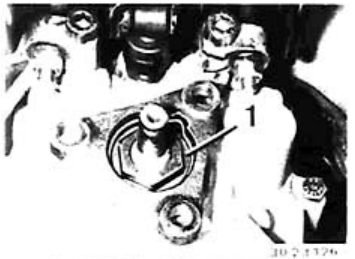


Transfer rubber mounts, exhaust carrier and backup light switch.

Important!
Transmissions are supplied filled with oil since 1.86, so that it is only necessary to check the oil level after installation of the transmission.

* See Parts Catalog

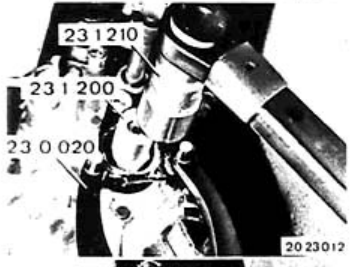
** Source of Supply: HWB



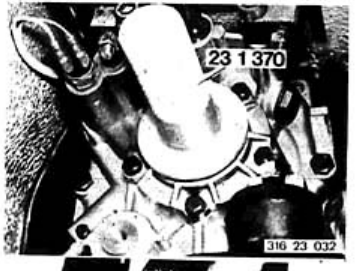
23 12 . . . REPLACING RADIAL OIL SEAL FOR OUTPUT FLANGE

Unscrew propeller shaft at front end and center mount – see 23 00 020/022.
Lift out lockplate (1).
Installation:
Replace lockplate.

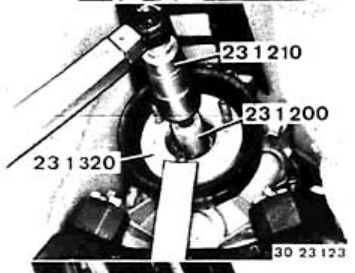
Pull out radial oil seal with Special Tool 00 5 010.



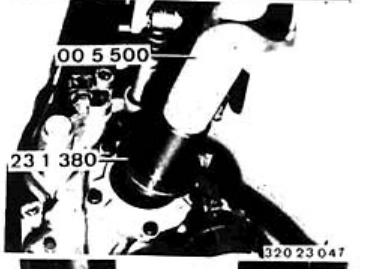
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Install collar nut with bolt cement**.
Tightening torque*.



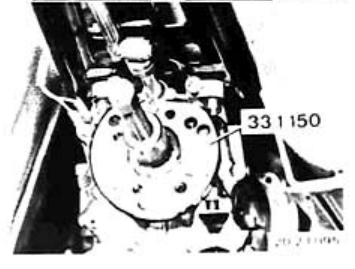
Lubricate sealing lip of radial oil seal with oil.
242 Four Speed Transmission:
Drive in radial oil seal with Special Tool 23 1 370.



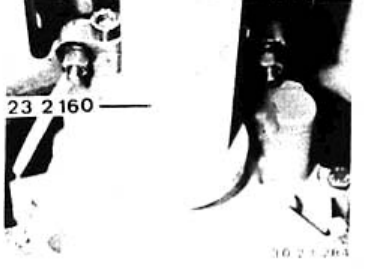
Version with Integrated Vibration Damper:
Hold output flange with Special Tool 23 1 320.



240 / 260 Overdrive Transmissions:
Drive in radial oil seal with Special Tools 23 1 380 and 00 5 500.

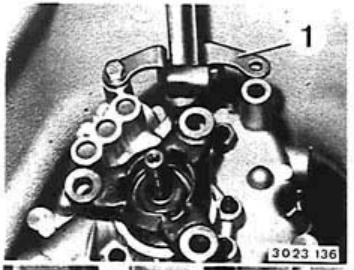


Pull off output flange with Special Tool 33 1 150.



ZF–S 5/16 Transmission:
Drive in radial oil seal with Special Tool 23 2 160.

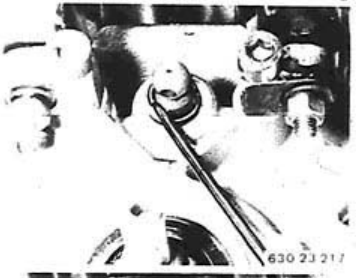
* See Specifications
** Source: HWB



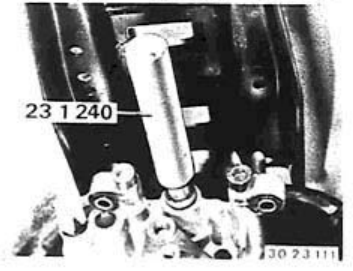
23 12 . . . REPLACING RADIAL OIL SEAL FOR SELECTOR SHAFT

Unscrew propeller shaft – see 23 00 020/022.
Remove drive flange – see 23 12 . . ..
BMW M 3:
Loosen holder (1) on transmission partially before being able to drive out the cylindrical pin for the shift rod joint.

Engage 3rd gear.
Push back locking sleeve (1) and drive out cylindrical pin (2).

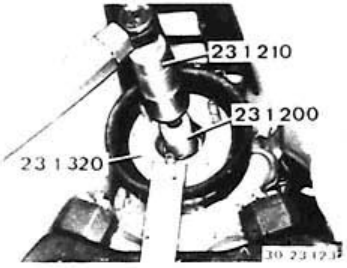


Lift out radial oil seal.



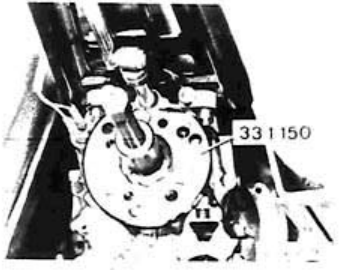
Lubricate sealing lip of radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

See 23 12 ... in Construction Group Repair Manual for procedures to replace the radial oil seal for the input shaft.



23 13 010 REMOVING AND INSTALLING OR REPLACING VIBRATION DAMPER

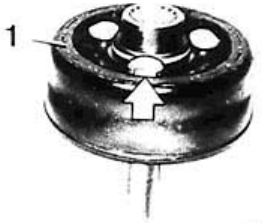
Unscrew front end of propeller shaft and center mount – see 23 00 020 / 022.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 1 320.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Install collar nut with bolt cement**.
Tightening torque*.



Pull off output flange with Special Tool 33 1 150.

Vibration damper (1) is mounted on the output flange with three staybolts.
Press staybolts out of the output flange.
Insert suitable pieces of round steel stock on both sides.

To avoid damage on threads, screw on the nuts.
Press out staybolts.
Take off vibration damper.



Place bore of output flange on a suitable piece of pipe.
Mount vibration damper (1) with staybolts.
Press in staybolts.
Important!
Staybolts must be pressed in with the flat end facing the vibration damper.

* See Specifications
** Source: HWB

TROUBLESHOOTING MANUAL TRANSMISSION

Condition	Cause	Correction
Oil on clutch bell housing	a) O-ring in guide flange leaks b) Radial oil seal for input shaft leaks c) Gasket on end cover (crankcase leaks) d) Radial oil seal for crankshaft leaks	a) Replace O-ring 23 11 . . . b) Replace radial oil seal 23 12 . . . c) Replace gasket 11 14 611 d) Replace radial oil seal 11 14 611
Oil on output flange	a) Radial oil seal for output shaft leaks b) Radial oil seal for selector shaft leaks	a) Replace radial oil seal 23 12 . . . b) Replace radial oil seal 23 12 . . .
Transmission leaks between front and rear sections	a) Gasket defective	a) Replace gasket 23 11 . . .
Oil on vent	a) Oil level too high b) Wrong oil grade (excessive foaming)	a) Correct oil level b) Replace oil
Gear does not stay in – jumps out	a) Sliding sleeve worn, guide rail defective, springs broken b) Sliding sleeves for 1st/2nd and 3rd/4th gears mixed up c) Shift console loose d) Selector forks worn e) Output flange loose	a) Replace damaged parts 23 23 . . . b) Install sliding sleeves correctly 23 23 . . . c) Tighten shift console 23 00 . . . d) Replace selector forks 23 31 . . . e) Tighten output flange

Condition	Cause	Correction
Shifts hard to make (sticking, scratching)	a) Clutch release insufficient 1. Pedal travel insufficient 2. Drive plate worn 3. Liner seized on flywheel 4. Drive plate seized on transmission input shaft 5. Pilot bearing for transmission input shaft in crankshaft defective 6. Air in clutch hydraulic system b) Thick, viscous transmission oil c) Bushes for selector rod arrest damaged d) Excessive play in shift lever mount e) Selector forks worn f) Sliding sleeve worn	a) 1. Check pedal travel and adjust, if necessary. Remove excessively thick floor mats. Floor clutch pedal when changing gear 35 31 000. 2. Replace drive plate 21 21 000 3. Clean flywheel. Replace drive plate 21 21 000. 4. Service or replace drive plate 21 21 000 5. Replace pilot bearing in crankshaft 11 21 571 6. Bleed clutch 21 00 006 b) Use 10 W 50 engine oil for cold climates or cold transm. c) Replace bushes d) Check shift lever mount (shift console) and replace worn ball shell plates, if applicable 25 11 041 e) Replace selector forks 23 31 . . . f) Replace sliding sleeve 23 23 . . .
Transmission grabs when shifting	a) Clutch release insufficient (see a) above) b) Synchromesh rings or sliding sleeves worn c) Reverse gear: shift break of 3 seconds not made	a) See a) above b) Check synchronization, replace damaged parts 23 23 . . . c) Make shift break
Transmission loud	a) Oil level too low b) Transmission shaft bearings defective c) Gears damaged d) Needle bearing of output or input shaft defective e) Pilot bearing for transmission input shaft in crankshaft defective	a) Correct oil level b) Replace all bearings 23 21 . . . c) Replace gear wheel pair or set 23 21 . . . d) Replace needle bearing 23 21 . . . e) Replace pilot bearing in crankshaft 11 21 571

24 Automatic Transmission

4 HP – 22 H/EH

24 00 006	Selector lever, accelerator linkage and throttle cable – adjust	24- 101
011	Hydraulic pressure values – check	24- 105
022	Transmission – remove and install	24- 106
042	Transmission – exchange	24- 109

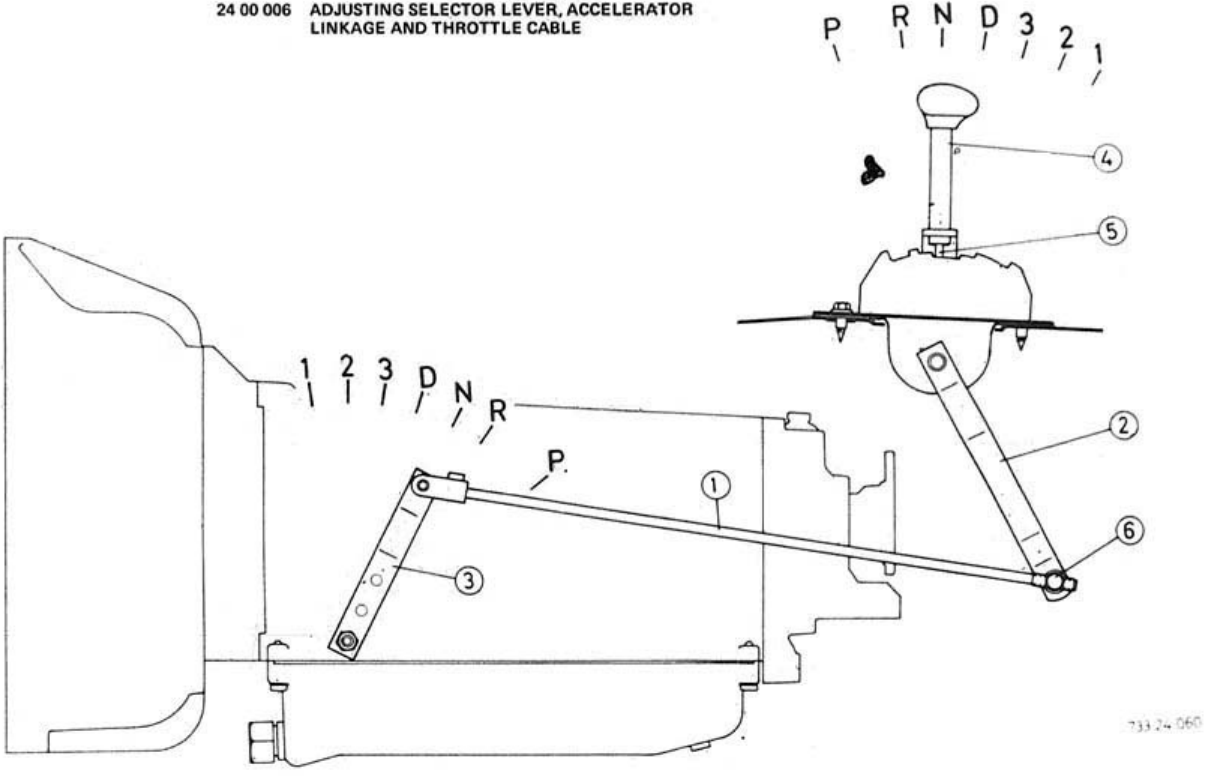
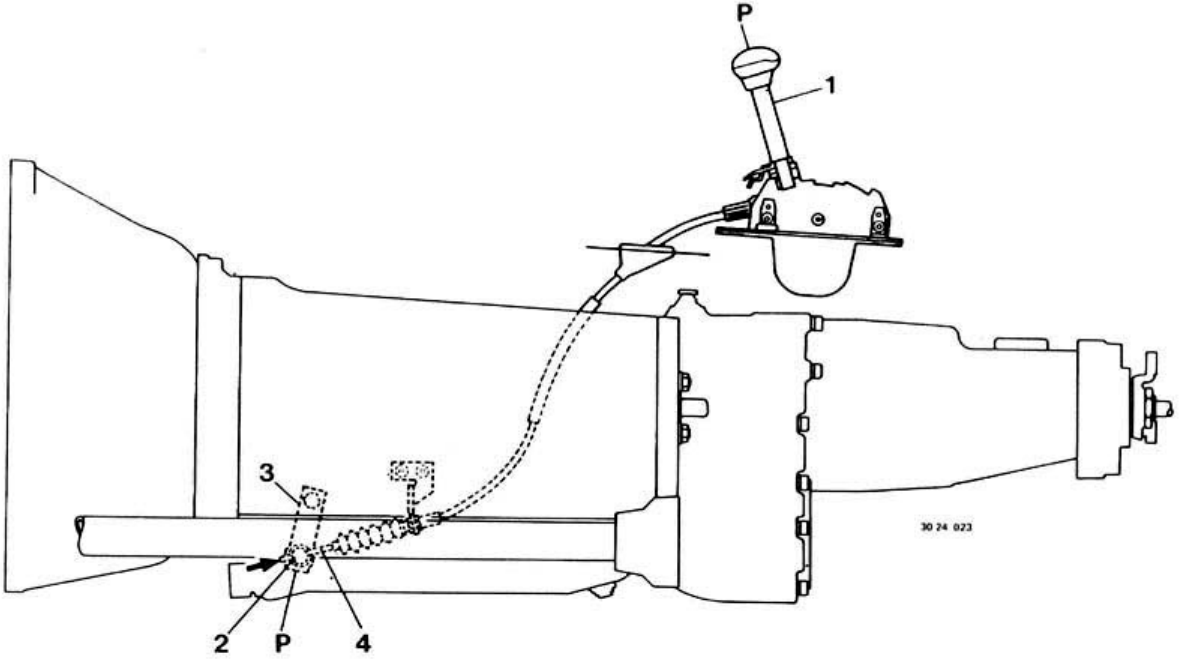
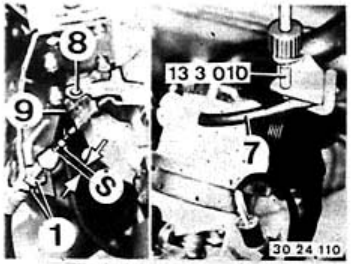
24 00 006 ADJUSTING SELECTOR LEVER, ACCELERATOR LINKAGE AND THROTTLE CABLE

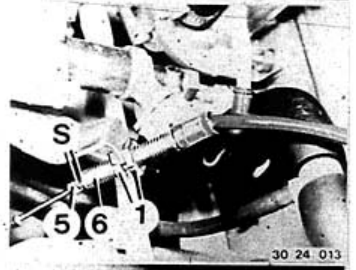


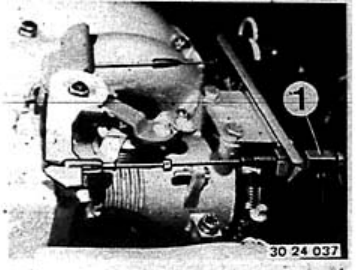
A) Adjusting Selector Lever:
Version with Linkage:
Check tightness of console before making adjustments.
Disconnect selector rod (1) on selector lever lower section (2).
Engage selector lever (3) on transmission in position N.
Press selector lever (4) against stop (5) on shift gate.
Keep changing length of selector rod (1) until pin (6) is aligned with bore in selector lever lower section (2).
Now shorten length of selector rod by 1 turn with pin (6).
Connect and secure selector rod.

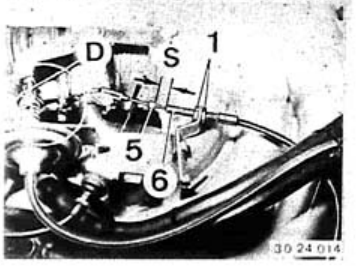


Version with Cable:
Move selector lever (1) to "P".
Loosen nut (2).
Press lever (3) forward (park position).
Press cable rod (4) opposite forward direction.
Clamp cable rod (4) tight with nut (2).
Tightening torque: 10 to 12 Nm (7 to 8.5 ft. lbs.).









B) Adjusting Throttle Cable:
Requirement: full throttle adjustment correct.

Model 316:
Version with 2 BE carburetor.
Start engine.
Clamp venting hose (7) for throttle valve control with Special Tool 13 3 010.
Stop engine.
Throttle valve lever (8) must bear on stop (9).
Adjust play (S) in this position to 0.50 ± 0.25 mm (0.020 ± 0.010") with nuts (1).
Remove Special Tool 13 3 010.

Models 316, 318 I, M 10:
Adjust play (S) in neutral position to 0.50 ± 0.25 mm (0.020 ± 0.010") with nuts (1).

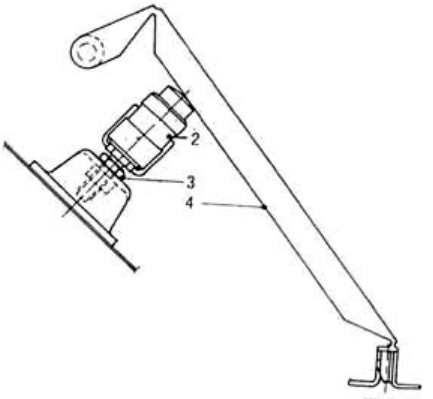
Models 316 I, 318 I, M 40:
Check for correct installed position of throttle cable and tight fit of adjusting screw on holder before adjusting.

Note:
Throttle cable of version with an overhauling element on the throttle valve assembly is adjusted in full throttle position.

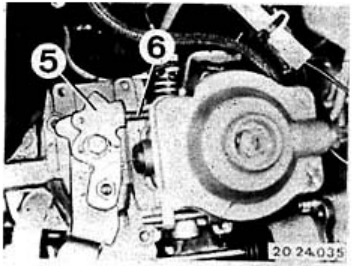
Move throttle valve to full throttle position with an attached throttle cable. Overhauling element must not respond. Adjust the throttle cable full throttle position or kickdown pressure point without play by turning adjusting screw (1).

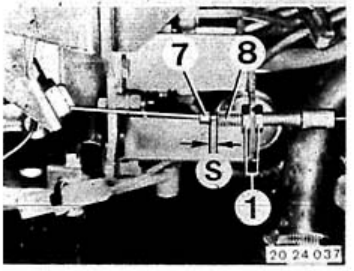
Models 320 I ... 325 I:
Adjust play (S) in neutral position to 0.50 ± 0.25 mm (0.020 ± 0.010") with nuts (1).

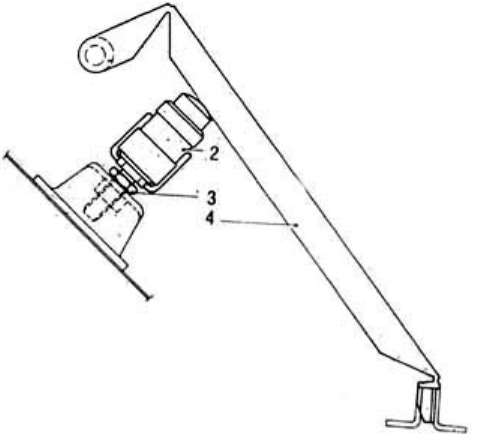
Important!
Version with Throttle Valve Lifter: Throttle valve lift (D) must be pulled to adjust the throttle cable.



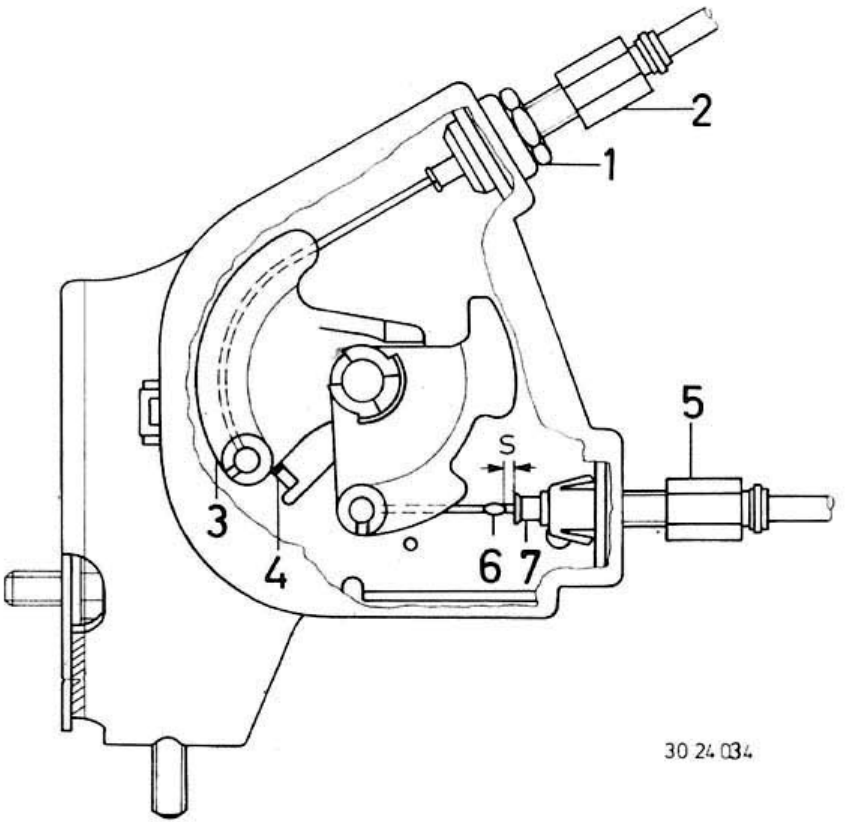
Check kickdown stop (2).
Loosen nut (3) and screw in kickdown stop (2).
Operate accelerator pedal (4) up to the transmission pressure point.
Unscrew kickdown stop in this position until the accelerator pedal bears.
Operate accelerator pedal (4) to kickdown (final position).
Distance (S) from lead seal (5) to end of sleeve (6) must now be at least 44 mm (1.732").



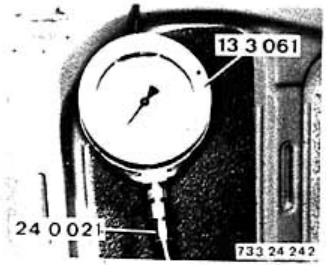




c) Adjusting Throttle Cable (Type 324 d):
Requirement: engine performance adjustment correct.
If applicable, adjust engine performance – see 13 00 050.
Temperature dependent idle speed booster activated.
This means: operating lever (5) must rest on idle stop (6).
Adjust play (S) to 0.50 ±0.25 mm (0.020 ±0.010") with nuts (1).
Check kickdown stop (2).
Loosen nut (3) and screw in kickdown stop (2); press down accelerator pedal (4) to transmission pressure point.
Unscrew kickdown stop in this position until it touches the accelerator pedal.
Press down accelerator pedal (4) to kickdown (final position).
Distance (S) from lead seal (7) to adjusting screw (8) must now be at least 44 mm (1.732").

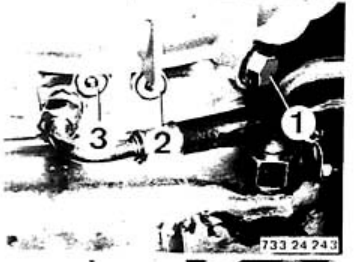


d) Adjusting Throttle Cable
BMW 324 td Since 1988 Models:
Version with Pedal Value Sender:
This requires correct idle speed adjustment.
If necessary, adjust idle speed position – see 12 72 . . ..
Counterhold on nut (1).
Turn adjusting screw (2) until reversing lever (3) bears on stop (4).
Cable must not sag through.
Turn adjusting screw (5) to adjust play (S) between lead seal (6) and sleeve (7) to 0.50 0.25 mm (0.020 ± 0.010").
Check full throttle stop see 12 72 . . ..
Operate accelerator pedal to final position (kickdown).
Distance from lead seal (6) to sleeve (7) must now be at least 44 mm (1.732").



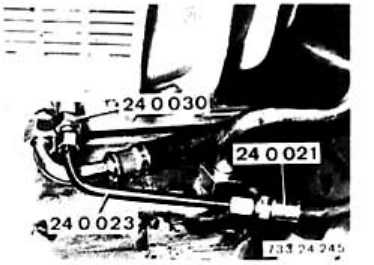
24 00 111 CHECKING HYDRAULIC PRESSURE VALUES

Connect Special Tools 24 0 021 and 13 3 061.



Remove pertinent plugs for testing.
1 Pump pressure
2 Clutch A
3 Converter pressure

A) Pump Pressure:
Mount Special Tool 24 0 070 with seal on transmission.
Connect Special Tools 24 0 023 and 24 0 021.

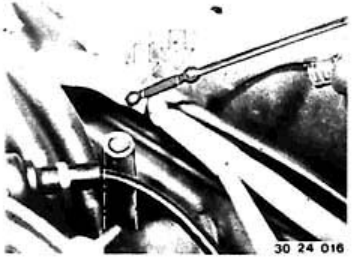


B) Converter Pressure:
Mount Special Tool 24 0 030 on transmission.
Connect Special Tools 24 0 023 and 24 0 021.

Note:
Oil cooler pipe must be loosened for installation of Special Tool 24 0 030 for the adapter version without a hexagon.

Testing:

	Pos.	Gear	Speed in rpm	Pressure in bar (psi)
Pump pressure	D	1	700 ... 1000	5.5 ... 7.7 (78 ... 110)
		2, 3, 4	approx. 2000	4.6 ... 6.0 (65 ... 85)
	R	R	700 ... 1000	11 ... 14 (156 ... 199)
Conv. pressure	D	4	conv. locked	max. 0.7 (10)

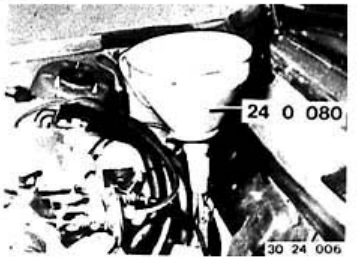


Correct the oil level with selector lever in P, transmission at operating temperature and engine running at idle speed.
Park car on level ground or floor.
Oil level for transmission with operating temperature of approx. 80° C (175° F) must be between both marks.
Volume of oil between min. and max. marks = approx. 0.3 liter (0.6 pint).
Never wipe off oil dipstick with a cloth losing lint.

An oil dipstick with a longer measuring tip (1) is standard since 2.85.
This makes it possible to report the oil level in the transmission earlier.
The oil level should not be below ball (2) after a test drive and an oil temperature of 40° C (104° F).
The oil level should be between the min. and max. marks with an oil temperature of approx. 80° C (175° F).
Correct the oil level if necessary.

Note
The new oil dipstick can be installed retroactively.

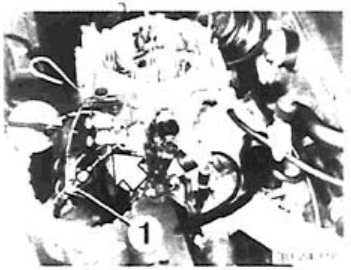
Important!
Oil Dipstick Version with Arrest:
Oil dipstick can be pulled out only after tilting on the grip.



Important!
Oil Level Too High:
Strong foaming, oil splash loss, high temperature when driving fast, oil lost through vent.

Oil Level Too Low:
Valves rattling, foaming, engine slipping in curves, general operating disturbances.

ATF may only be poured in through funnel, Special Tool 24 0 080.

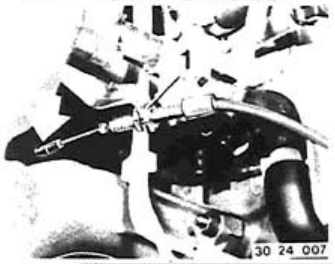


24 00 022 REMOVING AND INSTALLING TRANSMISSION

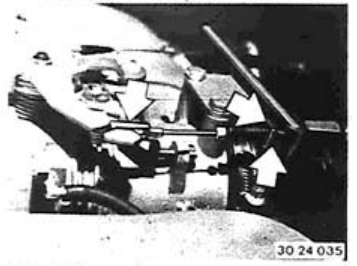
Disconnect battery ground lead.
Unscrew nut (1).
Disconnect throttle cable.

Installation:
Adjust throttle cable of all models – see 24 00 006.

Model 316

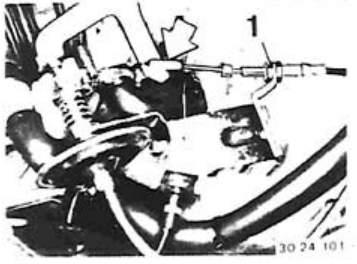


Models 316 i and 318 i
Engine M 10



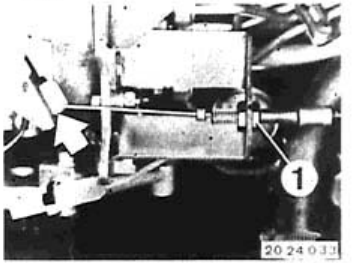
Models 316 i and 318 i
Engine M 40

Disconnect throttle cable.
Compress retainer.
Pull out adjusting screw together with the throttle cable.



Models 320 i, 323 i, 325 e and 325 i

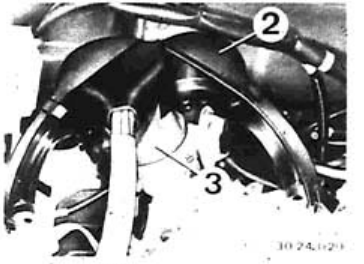
Unscrew nut (1).
Disconnect throttle cable.



Model 324 d

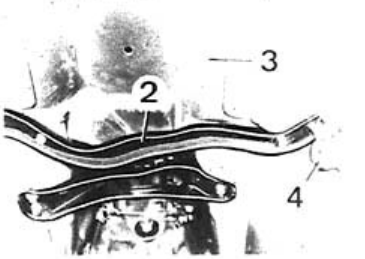
Model 324 d

Take off cap.
Disconnect throttle cable.
Compress retainer.
Pull out adjusting screw together with the throttle cable.



Models 316 and 318 i with Distributor

Remove protective cover (2) and distributor cap (3), to avoid damaging the distributor cap while lowering the transmission.



Only Cars with Splash Guard:
Unscrew splash guard.
Remove exhaust assy. – see 18 00 020.
Model 324 td:
Remove primary and final mufflers.
Model 325 iX:
Remove transfer box – see 27 10 010.
Unscrew connector (2).
Remove heat shield (3).

Installation:
Also mount holder (4).
Tightening torque*.

* See Specifications

Drain ATF.

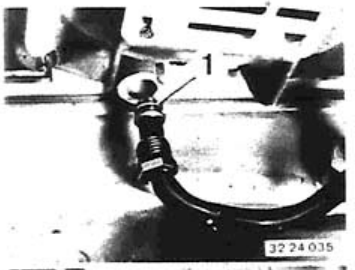
Important!
Never reuse drained ATF.

Installation:
The transmission will have to be disassembled when the ATF has a burnt odor and black color.

Important!
Clean oil cooler and pipes with compressed air and flush twice with ATF, if the transmission was faulty.

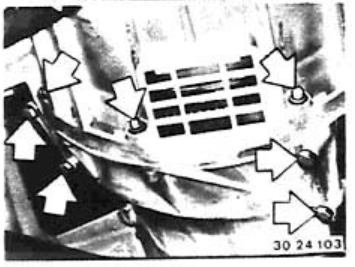
Remove oil filler pipe (1).
Unscrew oil cooler pipes on transmission and plug openings with caps.

Installation:
Tightening torque*:



Version without Adapters:

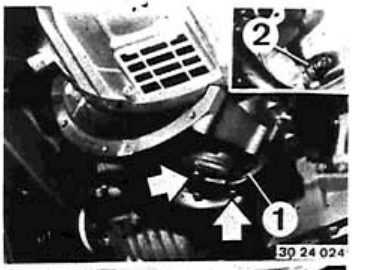
Important! – Installation:
Check O-rings (1).
Replace O-rings if their condition does not permit reusing them.



Remove reinforcement.
Unscrew Torx bolts with a Torx socket**.

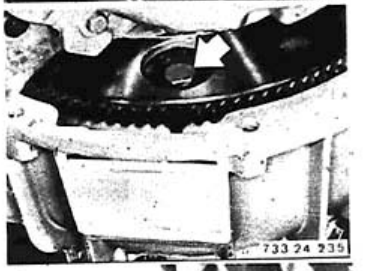
Important! – Installation:
Washers must be used with the Torx bolts to avoid increasing the breaking loose torque.
Tightening torque*.
Lift off grill.

* See Specifications
** Source of Supply: HWB



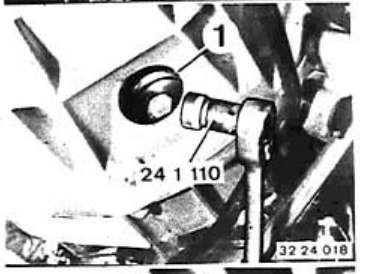
Model 325 IX:
Remove front propeller shaft – see 26 20 000.
Unscrew reinforcement on engine and transmission.
Loosen 2 screws of the oil level switch enough that the reinforcement can be removed after bending holder (1).

Important!
Use spacer (2) between the bolt and case to prevent scraping of Torx bolts on the front propeller shaft.



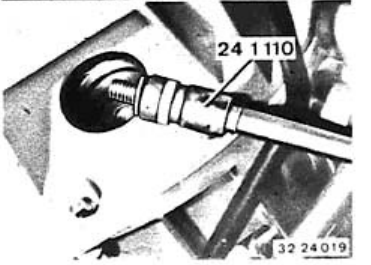
Unscrew torque converter on drive plate at three points.
Turn flywheel for this step.

Important!
Only use size M 10 x 16 mm bolts.
Non-conformance will lead to destruction of the transmission.
Tightening torque*.



Engine M 40:

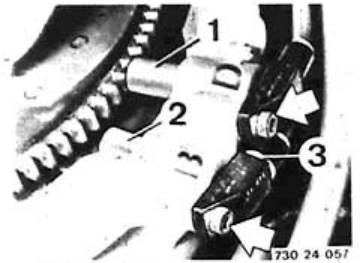
Lift cover out of opening (1) on oil sump.
Unscrew torque converter on drive plate at three points with Special Tool 24 1 110.
Turn flywheel for this step.



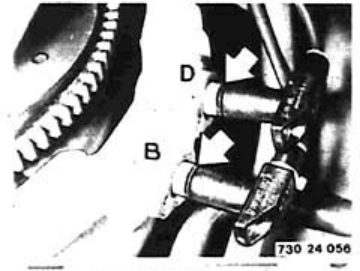
Installation:
Install bolt with Special Tool 24 1 110 and tighten with a torque wrench.
Tightening torque*.

Important!
Only use size M 10 x 16 mm bolts.
Non-conformance will lead to destruction of the transmission.

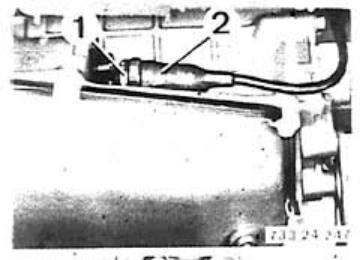
* See Specifications



Cars with DME:
Unscrew bolts.
Pull out speed sender (1) and reference mark sender (2).
Important! - Installation
Check installed position and don't mix up plugs.
Install speed sender (1) in bore (D) and reference mark sender (2) with ring (3) in bore (B).
Engine cannot be started when mixed up.

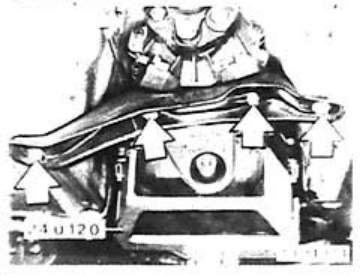


Installation:
Check O-rings.
Install senders with Molykote Longterm 2.
Important!
Keep grease and dirt off of face of DME senders.

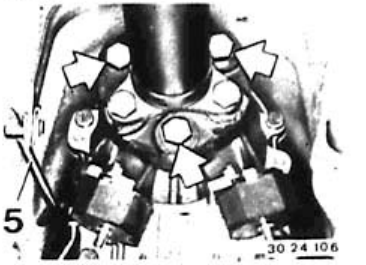


Cars with EH Transmission:
Turn bayonet fastener (1) to the left.
Pull off plug (2).
Lift wire harness out of holders.
Installation:
Connect plug (2) in such a manner that the marks are aligned.

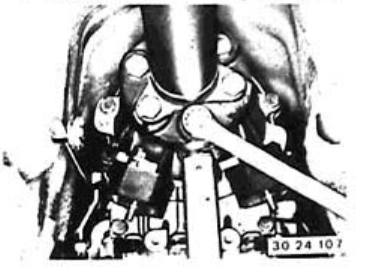
Version with Kickdown Preventer:
Pull off plug.



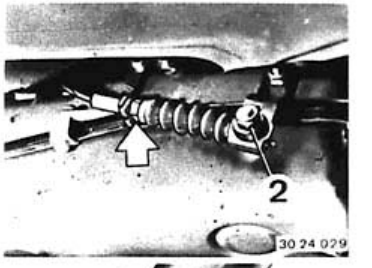
Support transmission with Special Tools 24 0 120 and 00 2 020.
Remove cross member.
Installation:
Center transmission - see Group 26.
Tightening torque*.



Unscrew joint disc on transmission.
Disconnect shift linkage (5).
Installation
Adjust selector lever - see 24 00 006.



Installation:
Replace stop nuts.
Tighten nuts with a standard 17 mm wrench socket and a torque wrench.
Tightening torque*.
Important!
Only tighten the nuts (never bolts) to avoid tension in the joint disc.

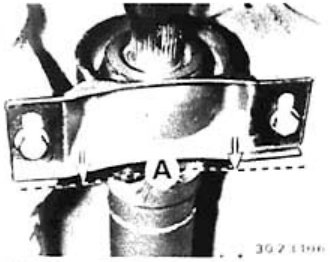


Version with Cable:
Loosen nut (2) (counterhold).
Detach cable on counterholder.
Pull out cable.
Installation:
Tightening torque*.
Adjust shift - see 24 00 006.

Loosen screwed-on ring (1) several turns.
Installation:
Tighten screwed-on ring (1) with Special Tool 26 1 040 after finishing installation.
Tightening torque*.

* See Specifications

* See Specifications



Unscrew center mount.

Installation:
Preload center mount forward by distance A = 4 to 6 mm (0.157 to 0.236").
Tightening torque*.

Bend propeller shaft down and pull off of the centering pin.

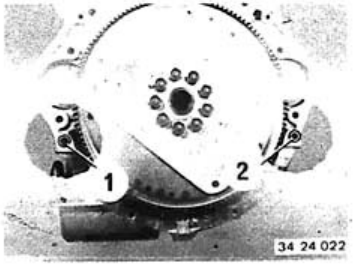
Important!
Suspend propeller shaft from car on a piece of wire to prevent it from falling into the joints.

Lower transmission.
Unscrew transmission on engine.
Unscrew Torx bolts with a Torx socket**.

Important! – Installation:
Use washers with Torx bolts to avoid increasing the breaking-loose torque.
Tightening torque*.

Pull transmission off of the engine, pressing off the torque converter at the same time.

Important!
A special tool hoist with mounted transmission may only be moved in completely lowered position.

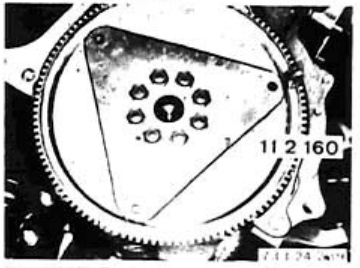


Important!
Check that dowel sleeves (1 and 2) are not missing prior to installation of the transmission.
As applicable, transfer dowel sleeves from the transmission or use new dowel sleeves.

* See Specifications
** Source of Supply: HWB

Important! – Installation:
Check installed position of the torque converter – drive dogs must be located below edge of the case.

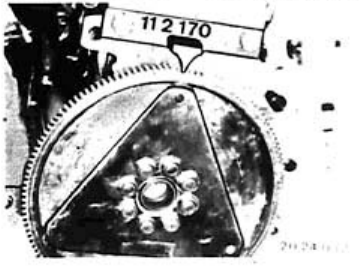
Installation:
Make sure that the torque converter is positioned correctly while installing the transmission; prevent it from slipping out if necessary.



Installation:
Inspect drive plate for ruptures and cracks, replacing if necessary.

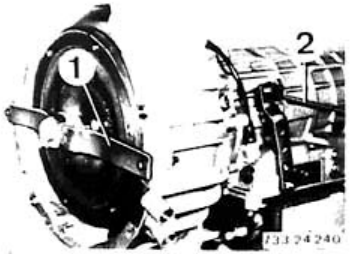
Engine M 10:
Hold flywheel with Special Tool 11 2 160.
Unscrew expansion bolts.

Important!
Replace and install expansion bolts with a bolt cement**.
Only coat the threads.
Clean tapped bores thoroughly.
Tightening torque*.



Engines M 20, M 21 and M 40:
Hold flywheel with Special Tool 11 2 170.

* See Specifications
** Source of Supply: HWB

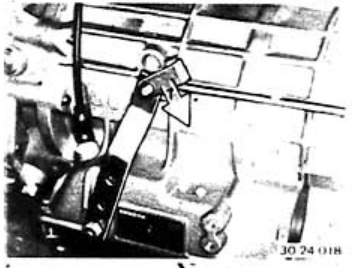


24 00 042 INSTALLING EXCHANGE TRANSMISSION

Remove transmission – see 24 00 022.

Important!
Always clean the oil cooler and pipes with compressed air and flush twice with ATF prior to installation of an exchange transmission.

Transmission code* on data plate.



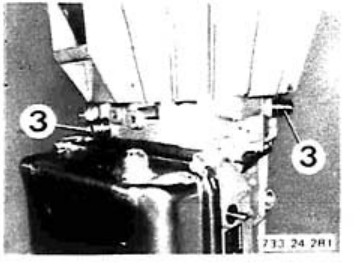
Version with Shift Linkage:
Transfer transporting holder (1) and linkage (2) with lever.

Mount spring clamp from top to bottom.

Important!
Check bearing sleeve.

Version with Shift Cable:
Transfer transporting holder (1), lever (2) and bracket (3).

Transfer rubber mounts and exhaust carrier.



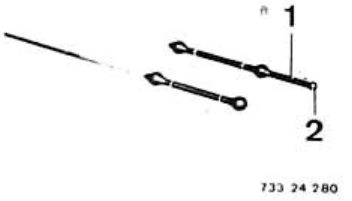
Transfer adapters (3).

Version with Multiple Tooth Threads:
Unscrew adapters with a 12 mm multiple tooth socket or Torx T 55 socket.

Install seals.
Tightening torque*.

* See Specifications

Important! – Installation
Transmissions are supplied filled with oil since 1.86.
Remove plug from oil sump prior to installation of the oil filler pipe.
Catch escaping ATF in a clean container.
Pour in ATF again after installation of the transmission with help of a funnel, Special Tool 24 0 080.



Check oil level.
An oil dipstick with a longer measuring tip (1) is standard since 2.85.
This makes it possible to have an earlier reporting of the oil level in the transmission.
The oil level should not be below ball (2) after a test drive and with an oil temperature of approx. 40° C (104° F).
The oil level should be between the min. and max. marks with an oil temperature of approx. 80° C (175° F).
Correct the oil level when necessary.

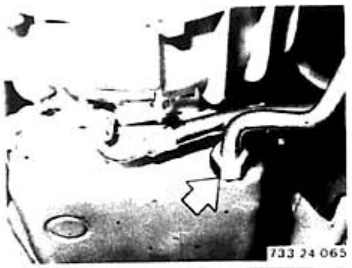
Note:
New oil dipsticks can be installed retroactively.

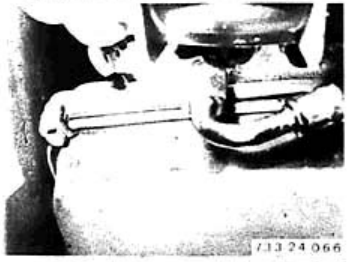
<u>Oil Level Too High:</u>
Strong foaming, splash loss, higher temperature when driving fast, oil lost through the vent.

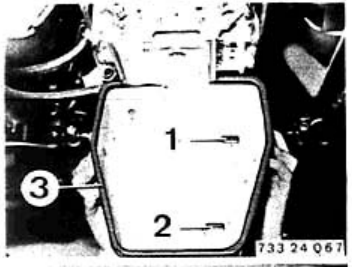
<u>Oil Level Too Low:</u>
Valves rattling, foam, engine slipping, general disturbances.

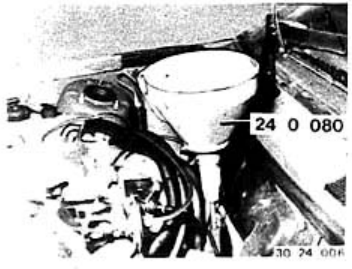
Important!
Oil Dipstick Version with Arrest:

The oil dipstick can be pulled out only after tilting the grip.









24 11 002 REMOVING AND INSTALLING OIL SUMP

Drain oil.

Important!
Never reuse drained oil.

Installation:
The transmission will have to be disassembled, if the oil smells burnt and is black.

Unscrew oil filler pipe on the oil sump.
Unscrew oil sump.

Installation:
Mount oil sump with brackets in such a manner that the short leg presses on the oil sump.
Tightening torque*.

Important!
Both brackets with straight legs must be mounted on the sides.

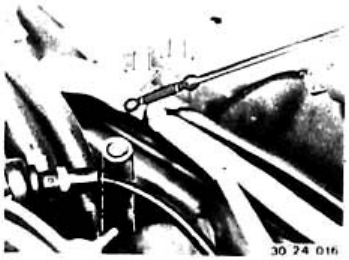
Clean oil pan.

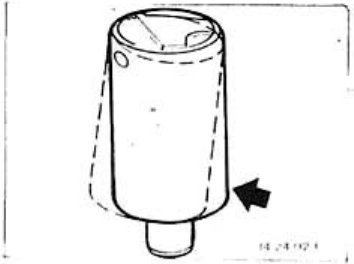
Important!
Place magnets (1 and 2) in the oil sump.
Install gasket (3).

Pour in oil*.

Important!
Only use the funnel, Special Tool 24 0 080, to pour in ATF.

* See Specifications





Test drive car.
Check oil level.
Park car on level floor or ground.
Correct the oil level with the selector lever in P, transmission at operating temperature and engine running at idle speed.
Oil level of transmission at operating temperature = approx. 80° C (175° F) must be between both marks.
Volume of oil between min. and max. marks = approx. 0.3 liter (0.6 pint).

An oil dipstick with a longer measuring tip (1) is standard since 2.85.
This produces an earlier display of the oil level in the transmission.
The oil level must not be below ball (2) after a test drive and with an oil temperature of approx. 40° C (105° F).
The oil level must be between min. and max. marks with an oil temperature of approx. 80° C (175° F).
Correct the oil level, if necessary.

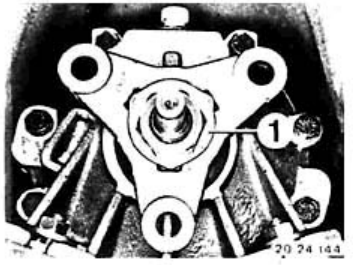
Note:
New oil dipsticks can be installed retroactively.

<u>Oil Level Too High:</u>
Strong foaming, splash loss, higher temperature when driving fast, oil lost through vent.

<u>Oil Level Too Low:</u>
Valves rattling, foaming, engine slipping, general operating disturbances.

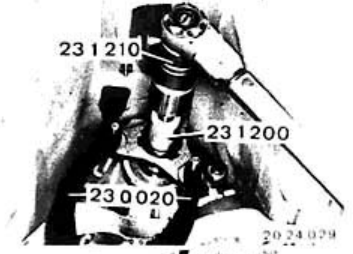
Important!
Oil Dipstick Version with Arrest:

The oil dipstick can be pulled out only after tilting the grip.

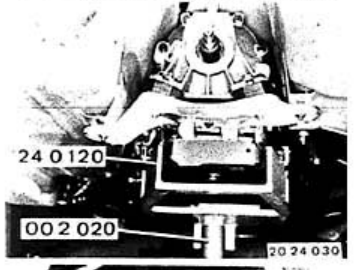


24 11 052 REMOVING AND INSTALLING OR SEALING TRANSMISSION EXTENSION

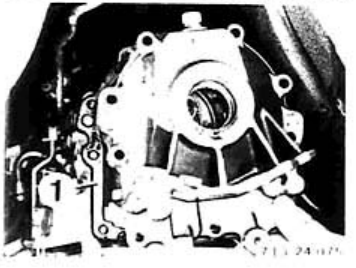
Unscrew propeller shaft - see 24 00 022.
Lift out lockplate (1).



Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Pull off output flange.
Installation:
Install collar nut with Hylomar SQ-32 M universal cement.
Tightening torque*.

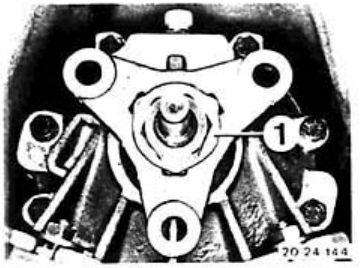


Support transmission with Special Tools 24 0 120 and 00 2 020.
Remove cross member.
Lower transmission.
Installation:
Center transmission - see Group 26.
Tightening torque*.



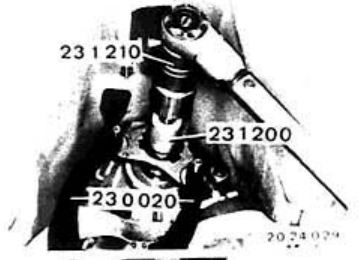
Unscrew transmission extension.
Installation:
Replace gasket (1).
Tightening torque*.

* See Specifications



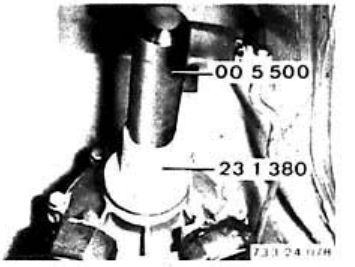
24 12 013 REPLACING RADIAL OIL SEAL FOR OUTPUT FLANGE

Remove propeller shaft – see 24 00 022.
Lift out lockplate (1).
Installation:
Replace lockplate.



Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210*.
Pull off output flange.
Installation:
Install collar nut with Hylomar SQ - 32 M cement.

Pull out radial oil seal with Special Tool 00 5 010.



Lubricate sealing lip with ATF
Drive in radial oil seal with Special Tools 23 1 380 and 00 5 500.

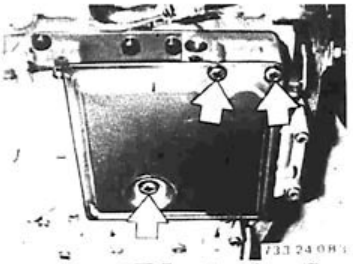
Replace radial oil seal for torque converter see 24 12 . . . in microfilmed Construction Group Repair Manual.

* See Specifications

24 12 103 REPLACING RADIAL OIL SEAL FOR MANUAL SHIFT VALVE SHAFT

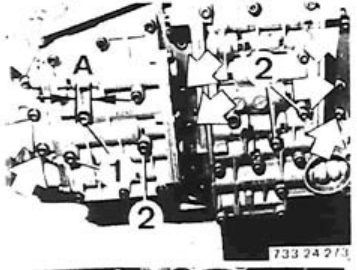
Unscrew selector lever (1) on transmission.

Lift out radial oil seal (2).
Installation:
Lubricate sealing lip with oil (ATF).
Drive in radial oil seal.



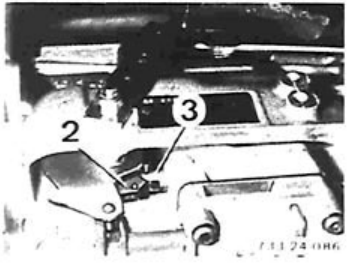
24 30 002 REMOVING AND INSTALLING VALVE BODY

Remove oil sump – see 24 11 002.
Remove oil filter screen.
Installation:
Check length of bolts = 65 mm (2.559").
Tightening torque*.



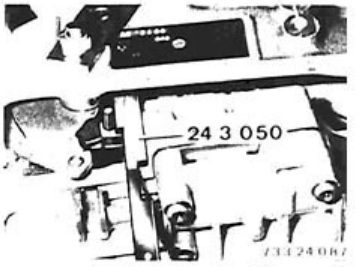
Remove valve body.
Unscrew Torx bolts with Special Tool 00 2 100.
Important!
Only unscrew bolts with bolt head size A = 12 mm.
Installation:
Bolts differ in length.
Bolts (1) with conical head = 65 mm (2.559") long.
Bolts (2) with flat head = 60 mm (2.362") long.

Installation:
Tighten Torx bolts with Special Tools 00 2 100 and 00 2 050.
Tightening torque*

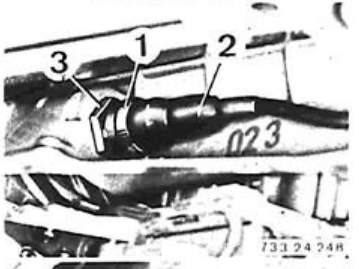


Installation:
Mount valve body that clamp on selector valve can be connected in operating finger of pawl. This requires pulling transmission cable slightly so that throttle cam (2) cannot clamp on throttle pressure valve (3).

* See Specifications

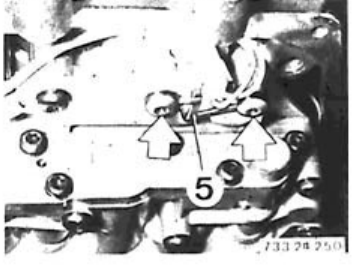


Install valve body and screw in bolts only finger tight.
Align valve body with Special Tool 24 3 050.
If special tool is not available, check that distance from valve body case to pin of throttle pressure piston is 11.5 mm (0.453").
Tighten valve body bolts.



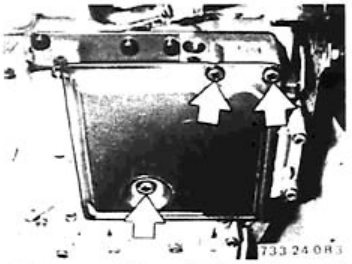
EH Transmission:
Turn bayonet fastener (1) to the left.
Pull off plug (2).
Unscrew nut (3).
Installation:
Connect plug (2) in such a manner that marking lines are aligned.

Pull out socket toward inside.
Installation:
Check O-ring (4), replacing if necessary.
Plug in socket with flat side facing out.
Tightening torque*.



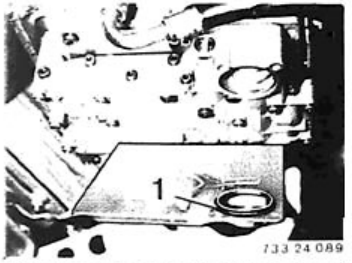
Note:
Also mount pulse transmitter on the valve body.
Tabs on holder (5) must engage in grooves of plug.

* See Specifications

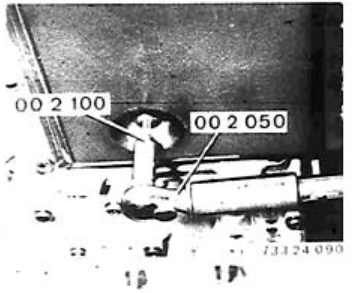


24 31 152 REMOVING AND INSTALLING OIL FILTER SCREEN ON VALVE BODY

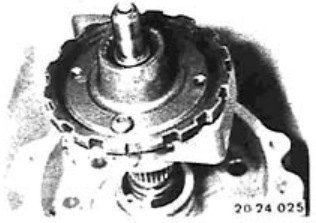
Remove oil sump – see 24 11 002.
Unscrew oil filter screen.
Unscrew Torx bolts with Special Tool 00 2 100.
Installation:
Clean oil filter screen.
Replace an oil filter screen when it starts to gum up with a burnt brown residue.
Tightening torque*.



Check rubber ring (1), replacing if necessary.



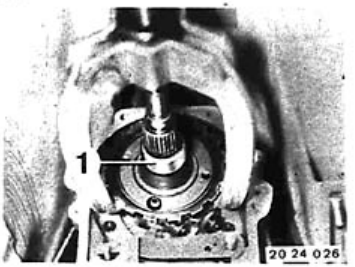
Installation:
Tighten Torx bolts with Special Tool 00 2 100 and a torque wrench.
Tightening torque*.



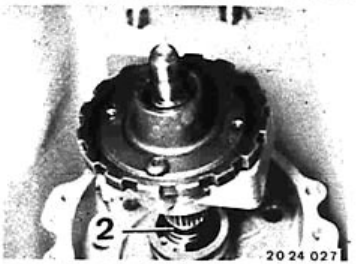
24 32 002 REMOVING AND INSTALLING CENTRIFUGAL GOVERNOR

Remove transmission extension – see 24 11 052.
BMW 325 iX:
Remove transfer box – see 27 10 010.
Pull off parking lock gear with centrifugal governor.

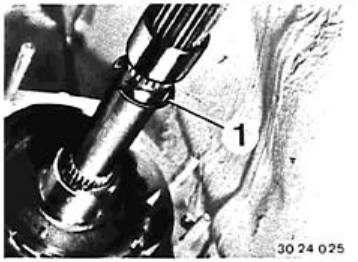
* See Specifications



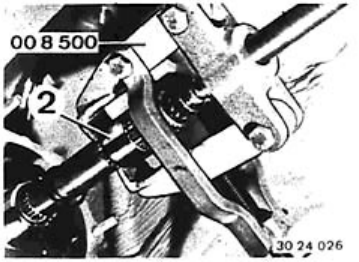
Version with Spacer (1):
Pull off parking lock gear with Special Tool 23 1 050.
Installation:
Heat bearing race (1) to approx. 80° C (175° F) with a hot air blower and slide on to output shaft.



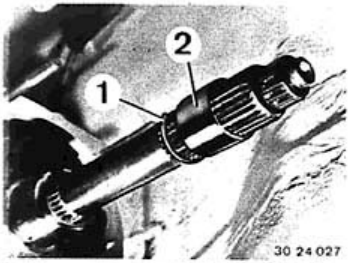
Replace seal (2).
Slide on parking lock gear with centrifugal governor.



BMW 325 iX:
Lift out snap ring (1) and push forward.
Installation:
Replace snap ring.



Pull bearing sleeve (2) off of output shaft with Special Tool 00 8 500.

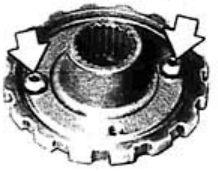


30 24 027

Installation:
Install snap ring (1) in groove of output shaft.
Heat bearing sleeve (2) to approx. 80° C (175° F) with a hot air blower and push on to output shaft against the snap ring.

30 24 028

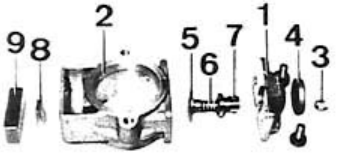
Lift out circlip (3).
Pull off parking lock gear.
EH Transmission:
Remove parking lock pawl – see 24 34 002.



20 24 031

24 32 505 DISASSEMBLING AND ASSEMBLING CENTRIFUGAL GOVERNOR
–Centrifugal Governor Removed–

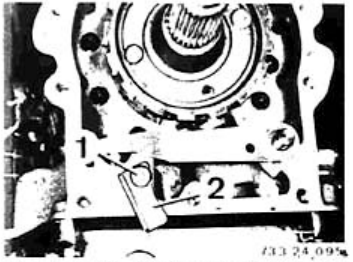
Unscrew parking lock gear on centrifugal governor.
Installation:
Tightening torque*.



733 24 094

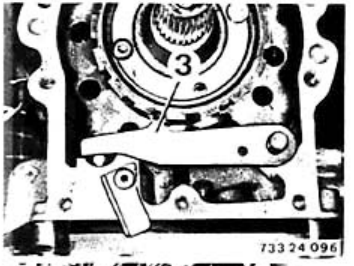
Unscrew cover (1) on housing (2).
Lift out retainer (3) and take off washer (4).
Remove governor plunger (5), spring (6) and governor sleeve (7).
Installation:
Governor plunger must slide easily in the governor sleeve.
Remove spring retainer (8) and balance weight (9).

* See Specifications

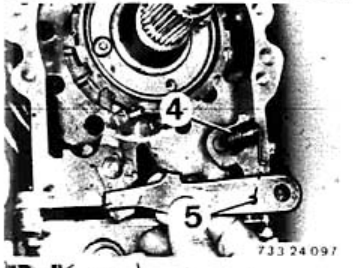


24 34 002 REMOVING AND INSTALLING PARKING LOCK PAWL

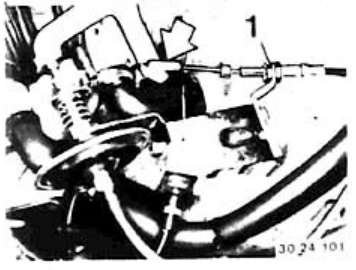
Remove transmission extension 24 11 052.
BMW 325 iX:
Remove transfer box – see 27 10 010.
Loosen bolt (1).
Swing holder (2) down.



Pull off pawl (3).
Caution!
Spring pressure.

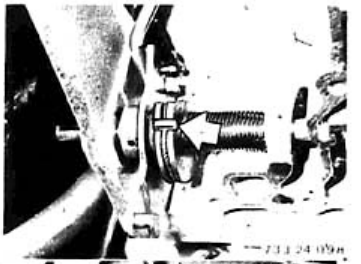


Installation:
Check installed position of spring (4).
It must be possible to connect end of spring (4) in bore (5) of pawl.



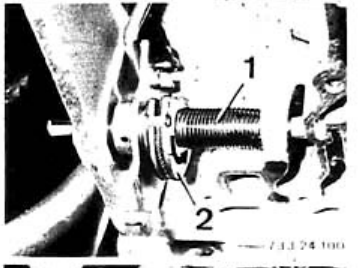
24 34 102 REPLACING THROTTLE CABLE

Unscrew nut (1).
Disconnect throttle cable.
(Refer to 24 00 022 for other models).

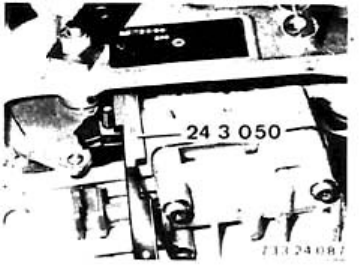


Remove valve body 24 30 002.
Disconnect throttle cable.

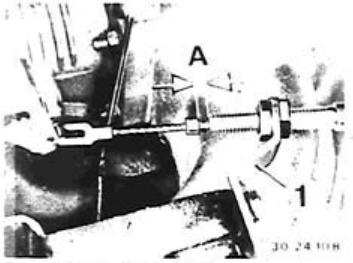
Press throttle cable out of case upwards.
Press new throttle cable into case until retaining tabs engage.



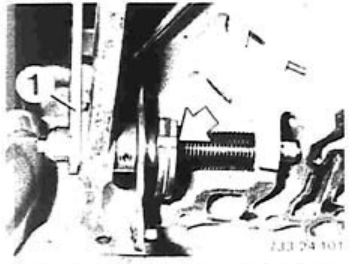
Preload spring (1) by one turn anticlockwise with throttle cam (2).
Connect nipple on throttle cam.



Install valve body.
Insert Special Tool 24 3 050 between valve body case and throttle pressure valve.
Push throttle cam against throttle pressure valve.

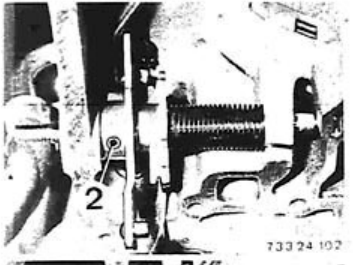


Connect throttle cable in suspension on transmission and holder (1).
Tighten cable.
Squeeze loose lead seal on cable at distance A = 0.25 to 0.50 mm (0.010 to 0.020").
Note:
Lead seal installation is identical for all models.
Adjust throttle cable 24 00 006.

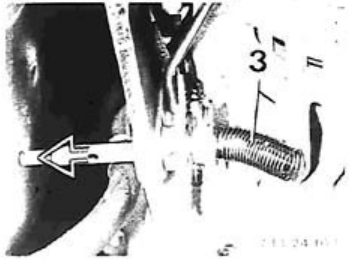


24 34 702 REPLACING SPRING FOR THROTTLE CABLE

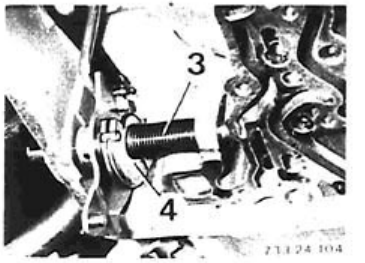
Remove valve body 24 30 002.
Disconnect selector lever (1) on transmission.
Disconnect throttle cable.



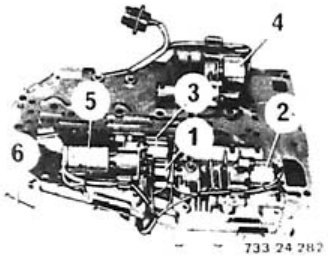
Drive out pin (2) in position N.

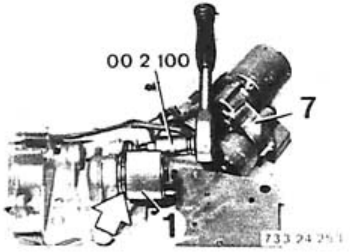


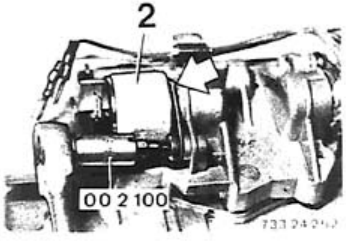
Pull out selector shaft far enough that spring (3) can be removed.



Installation:
Install selector shaft.
Preload spring (3) by one turn anticlockwise with throttle cam (4).
Connect nipple on throttle cam.







24 34 851 REPLACING ALL SOLENOID VALVES
- Valve Body Removed -

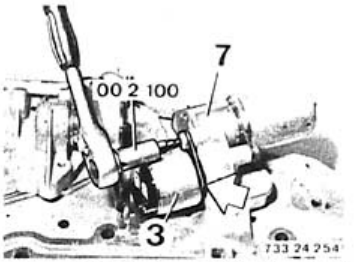
Test to test plan.

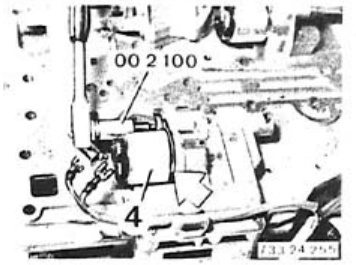
Arrangement:
1 Solenoid, 1st/2nd and 3rd/4th gears
2 Solenoid, 2nd/3rd gears
3 Solenoid, converter lockup clutch
4 Solenoid, reverse gear lock
5 Pressure regulator
6 Pulse sender

a) Solenoid (1), 1st/2nd + 3rd/4th Gears
Unscrew governor housing (7).
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Pull out solenoid.
Installation:
Install holder with tabs facing collar on solenoid.
Lugs must have sufficient clearance to housing or arrow on housing must be between lugs.
Tightening torque*.

b) Solenoid (2), 2nd/3rd Gears
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Pull out solenoid.
Installation:
Install holder with tabs facing collar on solenoid.
Lugs must have sufficient clearance to housing or arrow on housing must be between lugs.
Tightening torque*

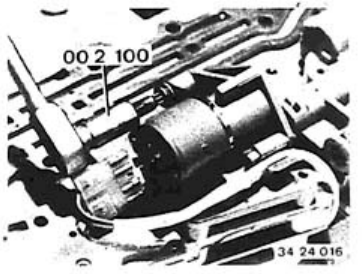
* See Specifications





c) Solenoid (3), Conv. Lockup Clutch
Unscrew governor housing (7).
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Pull out solenoid.
Installation:
Install holder with tabs facing collar on solenoid.
Lugs must have sufficient clearance to housing or arrow on housing must be between lugs.
Tightening torque*.

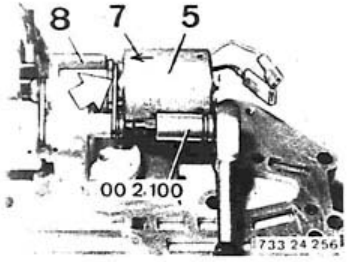
d) Solenoid (4), Reverse Gear Lock
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Remove solenoid.
Installation:
Install holder with tabs facing collar on solenoid.
Lugs must have sufficient clearance to housing or arrow on housing must be between lugs.
Tightening torque*.



24 34 ... REPLACING SOLENOID VALVE FOR KICKDOWN DOWNSHIFT LOCKING
- Valve Body Removed -

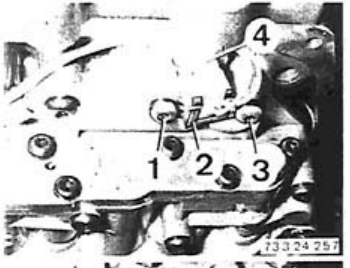
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Pull out solenoid.
Installation:
Install holder with tabs facing collar on solenoid.
Tightening torque*.

* See Specifications



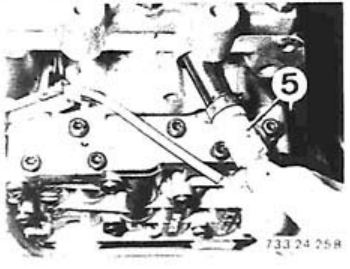
24 34 860 REPLACING PRESSURE REGULATOR
- Valve Body Removed -

Test to test plan.
Pull off wire plug.
Unscrew Torx bolt with Special Tool 00 2 100.
Take off holder.
Pull out pressure regulator (5).
Important! - Installation:
Arrow (7) on pressure regulator must be aligned with rib (8).
Install holder with tabs facing collar on pressure regulator.



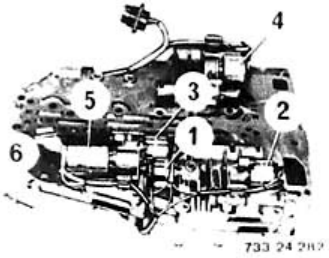
24 34 870 REPLACING PULSE SENDER
- Oil Sump Removed -

Test to test plan.
Unscrew Torx bolts (1 and 3) with Special Tool 00 2 100.
Take off holder (2).
Installation:
Engage tabs of holder (2) in grooves of plug (4).



Pull out pulse sender.
Pull off plug (5).
Installation:
Tightening torque*.

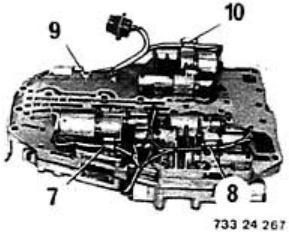
* See Specifications



733 24 267

24 35 500 REPLACING WIRE HARNESS FOR AUTOMATIC TRANSM.

Remove valve body - see 24 30 002.
Pull wire harness female plugs off of solenoids (1 ... 4), pressure regulator (5) and pulse sender (6).
Lift wire harness out of wire clamps.
Installation:
Check wire colors.
Solenoid (1) = gray/violet
Solenoid (2) = green/violet
Solenoid (3) = red/violet
Solenoid (4) = orange/violet
Pressure regulator (5) = blue/violet
Pulse sender (6) = brown/brown
Slide on female plugs against stop and check for tight fit.



733 24 267

Route wire harness and secure in wire clamps (7 ... 10).

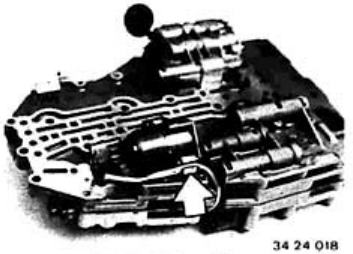
733 24 268

Turn valve body around.
Route wire harness and secure in wire clamps (11 ... 14).

34 24 017

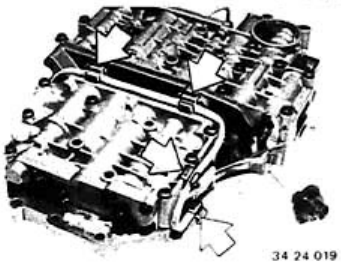
24 35 502 REPLACING WIRE HARNESS FOR KICKDOWN DOWN-SHIFT LOCKING - Valve Body Removed -

Pull plug off of solenoid.
Lift wire harness out of wire clamps.



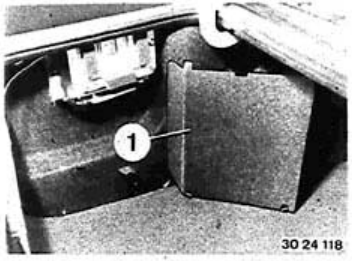
34 24 018

Route wire harness and secure in wire clamp.



34 24 019

Turn valve body around.
Route wire harness and secure in wire clamp.



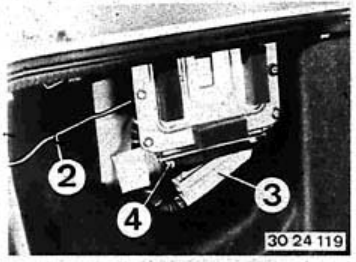
24 61 500 REMOVING AND INSTALLING OR REPLACING CONTROL UNIT (EH)

The control unit for an elec./hydr. transmission is located in the trunk behind the left trunk wall trim panel.

Remove trim panel section (1).

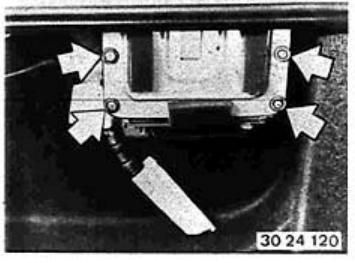
735 24 016

Code is on the data plate.
See Parts Catalog for a cross reference of types and models.

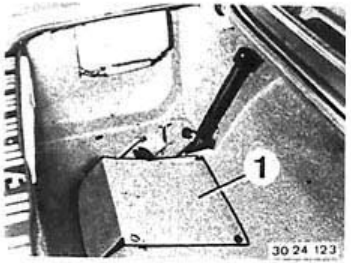


Disconnect ground lead (2) on holder. Pull plug (3) off of the control unit after pushing back spring retainer (4).

Important!
Plug (3) must only be disconnected or connected after the ignition has been turned off.



Unscrew control unit on holder.

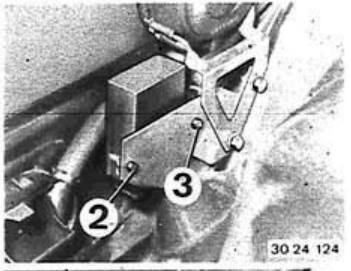


24 61 012/ 014 REPLACING CONTROL UNIT FOR DOWNSHIFT PREVENTION

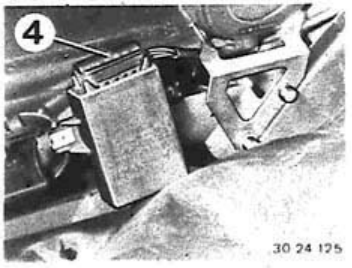
The downshift prevention control unit prevents racing of the engine when operating kickdown in position D and at top speed.
Shifting down from 4th to 3rd gear is prevented by a solenoid in the transmission depending on the signal from the speedometer.
Downshifting is only possible after reducing the road speed.

Location:
Behind left trunk wall trim panel.
Remove trim panel section (1) for the AEGS control unit.
Take out car jack and wheel nut wrench.

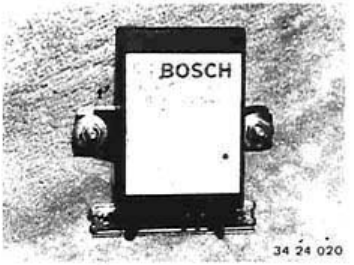
Note:
Downshift prevention control units are omitted since 8.88.
The DME control unit activates the solenoid.



Lift off trunk trim panel as much as necessary.
Unscrew screws (2 and 3).



Remove control unit.
Pull off plug (4).



30 24 126

Downshift Prevention Control Unit Identification:

Transmission H Model	Bosch Number
320 iA before 9.87 320 iCA 325 eA	0 260 002 030
320 iA since 9.87	0 260 002 031
325 iA 325 iCA 325 iXA	0 260 002 020
325 iXA Cat. Conv.	0 260 002 032

Version EH with AEGS:

Transmission EH Model	Bosch Number
320 iA ... 325 iXA	0 260 002 022

Replace kickdown switch – see 35 41 480.
Replace program switch – see 61 31 265.

Condition	Cause	Correction
Position P		
Park will not engage	Selector linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Excessive friction in parking lock mechanism	Replace parking lock parts (connecting rod, pawl) 24 34 002
Park does not hold (slips out)	Selector linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
Engine cannot be started in N or P	Transmission switch defective	Replace transmission switch 25 16 080
Position R		
No reverse gear	Linkage betw. selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Oil screen dirty	Replace oil filter screen Replace transmission if liner bits are found in oil sump
	Clutch B destroyed – in this case also no 3rd gear	Disassemble clutches 24 23 022
	Brake D destroyed – in this case also no engine braking in 1st gear of position 1	Disassemble clutches 24 23 022
	Clutch E destroyed – in this case also no engine braking in 2nd and 3rd gears as well as 1st gear in position 1	Disassemble clutches 24 23 022
	Reverse gear arrest does not cancel	Replace valve body 24 30 002
Slipping or shaking when moving off	Clutch B or E or brake D damaged	Disassemble clutches 24 23 022
Hard engaging jolt P–R or N–R or definite double knock for P–R or N–R shifts (engine speed < 1500 rpm)	Damper B defective – in this case shift 2–3 also not correct	Replace valve body 24 30 002

Condition	Cause	Correction
Backup lights do not come on (electric system okay)	Transmission switch defective	Replace transmission switch 25 16 080
Car moves or creeps	Linkage betw. selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Clutch A defective (bonded)	Replace clutch A 24 23 022
Position D		
No power flow	Oil filter screen dirty	Replace oil filter screen 24 31 152 Replace transmission if liner bits are found in oil sump
	Clutch A defective	Replace clutch A 24 23 022
	1st gear one-way clutch slips	Disassemble transmission 24 00 082
	Linkage betw. selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
Slipping or shaking when moving off	Clutch A damaged	Replace clutch A 24 23 022
Hard engaging jolt N–D (engine speed < 1500 rpm)	Clutch A damaged	Replace clutch A 24 23 022
	Damper A defective	Replace valve body 24 30 002
No shift (warm or cold state) 1–2 / 2–1 shifts	Governor dirty	Clean or replace governor 24 32 002
	Shift valve 1–2 seized	Replace valve body 24 30 002
1–2 shifts	Brake C' and/or C defective	Disassemble clutches 24 23 022
2–3 / 3–2 shifts	Governor dirty	Clean or replace governor 24 32 002
	Shift valve 2–3 seized	Replace valve body 24 30 002
2–3 shift	Clutch B defective	Replace clutch B 24 23 022
3–4 / 4–3 shifts	Governor dirty	Clean or replace governor 24 32 002
	Shift valve 3–4 seized	Replace valve body 24 30 002
3–4 shifts	Brake F defective	Disassemble clutches 24 23 022

Condition	Cause	Correction
Car drives in 2nd gear	Governor bushing seized	Clean or replace governor 24 32 002
	Shift valve 1–2 seized	Replace valve body 24 30 002
Car drives in 3rd gear	Governor bushing seized	Clean or replace governor 24 32 002
	Shift valves 1–2 and 2–3 seized	Replace valve body 24 30 002
Car shifts 1–3	Shift valve 2–3 seized	Replace valve body 24 30 002
Shift Points*		
Zero load shift not correct	Governor dirty	Clean or replace governor 24 32 002
	Shift valve sticks	Replace valve body 24 30 002
Full load shift points not correct	Throttle cable maladjusted	Adjust throttle cable 24 00 006
No kickdown shift.		
1–2 / 2–1	Throttle cable maladjusted	Adjust throttle cable 24 00 006
2–3 / 3–2	Throttle cable maladjusted	Adjust throttle cable 24 00 006
4–3	4–3 kickdown valve seized	Replace valve body 24 30 002
Shift Transitions		
Zero load shifts too hard	Damper defective	Replace valve body 24 30 002
	Modulation pressure too high	Replace valve body 24 30 002
	Plates damaged	Disassemble transmission 24 00 082
Full load and kickdown shifts too long	Damper defective	Replace valve body 24 30 002
	Modulation pressure too low	Replace valve body 24 30 002
	Plates damaged	Disassemble transmission 24 00 082
Full load and kickdown shifts too hard	Modulation pressure deviates	Replace valve body 24 30 002
	Damper defective	Replace valve body 24 30 002

* See Specifications

Condition	Cause	Correction
Position 3 / 3rd Gear		
No engine braking effect	Clutch E damaged	Disassemble clutches 24 23 022
Position 2		
Manual downshift 3–2 not correct	Locking valve 2 sticks	Replace valve body 24 30 002
	Governor hesitates	Replace governor 24 32 002
No engine braking effect	Brake C or clutch E damaged	Disassemble clutches 24 23 022
Position 1		
Manual downshift 2–1 not correct	Locking valve 1 sticks	Replace valve body 24 30 002
	Governor hesitates	Replace governor 24 32 002
No engine braking effect	Brake D or clutch E damaged	Disassemble clutches 24 32 022
Torque Converter		
Shift speed not correct	Converter hysteresis valve sticks	Replace valve body 24 30 002
	No 4th gear	Replace valve body 24 30 002
	Governor pressure not correct	Replace governor 24 32 002
Shift transition too hard	Converter damper defective	Replace valve body 24 30 002
	Converter not okay	Replace converter 24 40 003
No shift	Control unit not okay	Replace valve body 24 30 002
	Converter defective	Replace converter 24 40 003
	No 4th gear	Replace valve body 24 30 002

Condition	Cause	Correction
Throttle cable sticks	Nipple disconnected on throttle cam	Replace throttle cable 24 34 102
	Excessive friction in throttle cable sleeve	Replace throttle cable 24 34 102
Throttle pressure piston seized	Throttle pressure piston clamped	Replace valve body 24 30 002
Noise and power flow interruption after long drive	Oil filter screen on valve body dirty	Replace oil filter screen and, if burnt liner bits are found in oil sump, also replace transmission
No forward or reverse drive loud noise	Drive plate between converter and engine torn off	Replace drive plate or converter 11 22 051 or 24 40 003
Noises		
Loud noise in all positions, especially with cold oil. Oil pump intake noise.	Oil level too low	Correct oil level
	Valve body leaks	Replace valve body 24 30 002
Loud, screeching noise depending on speed in all positions, especially with warm oil; occurring after long drives, sometimes accompanied by breaks in power flow	Oil filter screen dirty	Replace oil filter screen and, if burnt clutch liner bits are found in oil sump, also replace transmission
Loud noise when converter closes	Torsion damper defective	Replace converter 24 40 003
Loud engine grumble when converter closes	Engine speed too low, converter shift point not correct	Replace valve body 24 30 002
Leaks		
Oil dripping out of converter bell housing	Seal in pump body damaged	Replace seal 24 31 002
	Pump body leaks	Replace pump assy. 24 31 002
	Converter leaks on welded seam	Replace converter 24 40 003
	Radial oil seal for converter leaks	Replace radial oil seal 24 12 003
Leak between transmission case and oil sump	Oil sump mounting bolts not tightened correctly	Tighten bolts to specified torque*
	Oil sump gasket damaged	Replace gasket 24 11 002
Leak between transfer plate and transmission case (especially in area of pump pressure bore)	Mounting bolts on converter bell housing loose	Tighten bolts to specified torque*
Oil lost through throttle cable connection	O-ring on connection damaged	Replace O-ring or, if necessary, entire throttle cable 24 34 102

* See Specifications

Condition	Cause	Correction
Oil loss on output	Radial oil seal for output flange damaged	Replace radial oil seal 24 12 003
Oil loss through or on vent	Oil level too high	Correct oil level
	Wrong oil (strong foaming)	Replace oil, if necessary remove transmission and drain completely with torque converter
	Vent cover missing	Mount cover or replace vent
	O-ring on vent damaged	Detach transmission extension and replace O-ring
	Lock washer preload insufficient	Replace lock washer
Oil loss on cooler line	Coupling loose	Tighten bolts to specified torque*
	Cooler line damaged	Replace cooler line
	Cooler leaks	Replace cooler 17 11 000
Oil loss in transfer plate	Plug on transfer plate leaks	Tighten plug to specified torque*
		Replace seal.
Leak between transmission case and transmission extension	Mounting bolts loose	Tighten bolts to specified torque*
	Gasket damaged	Replace gasket 24 11 052

* See Specifications

TROUBLESHOOTING AUTOMATIC TRANSMISSION 4 HP 22 / EH

Requirements for Troubleshooting:

a) Engine in good running condition (valves, DME and idle speed okay).

b) Defect indicator, program indicator and position indicator okay.

c) Battery, plugs and ground points okay.

d) ATF level okay.

General instructions to avoid damage on engine, transmission and control units.

a) Never start the engine when the battery is not connected correctly.

b) Never supply power to wrong poles (e.g. battery connections mixed up).

c) Never use a fast charger to start the engine.

d) Disconnect the battery prior to fast charging.

e) Never disconnect the battery while the engine is running.

f) Only use a second 12 V battery and starting leads for outside starting.

g) Always turn off the ignition before disconnecting or connecting plugs on control units.

h) Only high-ohmic testers (BMW SERVICE TESTER) may be used for testing with a connected control unit.

TROUBLESHOOTING AUTOMATIC TRANSMISSION 4 HP 22 / EH

Condition	Cause	Correction
Position P		
Park will not engage	Selector linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Excessive friction in parking lock mechanism	Replace parking lock parts (connecting rod, pawl) 24 34 002
Park does not hold (slips out)	Selector linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
Engine cannot be started in N or P	Transmission switch defective	Replace transmission switch 25 16 080
Position R		
No reverse gear	Linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Oil filter screen dirty	Replace oil filter screen Replace transmission if liner bits are found in oil sump
	Clutch B destroyed – in this case also no 3rd gear	Disassemble clutches 24 23 022
	Brake D destroyed – in this case also no engine braking in 1st gear of position 1	Disassemble clutches 24 23 022
	Clutch E destroyed – in this case also no engine braking in 2nd and 3rd gears as well as 1st gear in position 1	Disassemble clutches 24 23 022
	Reverse gear arrest does not cancel	Check transmission electronics (see test plan) Replace valve body 24 30 002
Slipping or shaking when moving off	Clutch B or E or brake D damaged	Disassemble clutches 24 23 022
Hard engaging jolt P–R or N–R or definite double knock for P–R or N–R shifts (engine speed < 1500 rpm)	Damper B defective – in this case shift 2–3 also not correct	Replace valve body 24 30 002 Check transmission electronics (see test plan)
Backup lights do not come on (electric system okay)	Transmission switch defective	Replace transmission switch 25 16 080
Car moves or crawls	Linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
	Clutch A defective (bonded)	Replace clutch A 24 23 022

Condition	Cause	Correction
Position D		
No power flow	Oil filter screen dirty	Replace oil filter screen 24 31 152 Exchange transmission, if liner bits are found in oil sump.
	Clutch A defective	Replace clutch A 24 23 022
	1st gear one-way clutch slips	Disassemble transmission 24 00 082
	Selector linkage between selector lever and transmission maladjusted	Adjust selector linkage 24 00 006
Slipping or shaking while moving off	Clutch A damaged	Replace clutch A 24 23 022
Hard engaging jolt N – D (engine speed < 1500 rpm)	Clutch A damaged	Replace clutch A 24 23 022
	Damper A defective	Replace valve body 24 30 002
No shift (warm or cold state)	Kickdown switch defective (only kickdown shifts)	Replace kickdown switch
– Shift 1–2 / 2–1	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
	Control valve 1–2 / 3–4 seized	Replace valve body 24 30 002
	Shift valve 1–2 seized	Replace valve body 24 30 002
– Shift 1–2	Brake C' and/or C defective	Disassemble clutches 24 23 022
– Shift 2–3 / 3–2	Solenoid (2) defective (see test plan)	Replace solenoid 24 34 851
	Shift valve 2–3 seized	Replace valve body 24 30 002
– Shift 2–3	Clutch B defective	Replace clutch B 24 23 022
– Shift 3–4 / 4–3	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
	Control valve 1–2 / 3–4 seized	Replace valve body 24 30 002
	Shift valve 3–4 seized	Replace valve body 24 30 002
– Shift 3–4	Brake F defective	Disassemble clutches 24 23 022
	Program switch defective (see test plan)	Replace program switch
– Shift 1–2 Engine speed does not go beyond stall speed in drive and full load	Pulse transmitter defective (see test plan)	Replace pulse transmitter 24 34 870

Condition	Cause	Correction
Car moves off in 2nd gear	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
	Shift valve 1–2 seized	Replace valve body 24 30 002
Car moves off in 3rd gear	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (1 or 2) defective (see test plan)	Replace solenoid valve 24 34 851
	Shift valve 1–2 and 2–3 seized	Replace valve body 24 30 002
Cars shifts 1–3	Shift valve 2–3 seized	Replace valve body 24 30 002
	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (2) defective (see test plan)	Replace solenoid valve 24 34 851
Shift Speeds		
– Zero load shift not okay	Control unit defective	Replace control unit 24 61 000
– Full load shift points not okay	No full load signal	Check throttle switch 13 63 544
– No kickdown shift	Kickdown switch defective	Check/replace switch (see test plan)
– Only zero load shifts	Zero load switch on engine defective	Check/replace zero load switch 13 66 554
– Only kickdown shifts	Kickdown switch defective	Check/replace switch (see test plan)
Shift Transitions		
– Zero load shifts too hard	Control unit defective	Replace control unit 24 61 000
	Damper defective	Replace valve body 24 30 002
	Modulation pressure too high	Replace valve body 24 30 002
	Plates damaged	Disassemble transmission 24 00 082
– Full load and kickdown shifts too long	Control unit defective	Replace control unit 24 61 000
	Damper defective	Replace valve body 24 30 002
	Modulation pressure too low	Replace valve body 24 30 002
	Plates damaged	Disassemble transmission 24 00 082

Condition	Cause	Correction
– Full load and kickdown shifts too hard	Modulation pressure not okay	Replace valve body 24 30 002
	Damper defective	Replace valve body 24 30 002
	Control unit defective	Replace control unit 24 61 000
Position 3 – 3rd Gear		
No engine braking effect	Clutch E damaged	Disassemble clutches 24 23 022
Position 2		
Manual downshift 3–2 not okay	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (2) defective (see test plan)	Replace solenoid valve 24 34 851
No engine braking effect	Brake C' or clutch E damaged	Disassemble clutches 24 23 022
Position 1		
Manual downshift 2–1 not okay	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
No engine braking effect	Brake D or clutch E damaged	Disassemble clutches 24 23 022
Converter Clutch		
Shift speed not okay	Control unit defective	Replace control unit 24 61 000
Shift transition too hard	Converter clutch damper defective	Replace valve body 24 30 002
	Converter not okay	Replace converter 24 40 003
No shift	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (3) defective (see test plan)	Replace solenoid valve 24 34 851
	Converter defective	Replace converter 24 40 003
Converter clutch always locked (engine stops in drive position)	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (3) defective (see test plan)	Replace solenoid valve 24 34 851

Condition	Cause	Correction
General		
Shifts only as position	Transmission electronics defective	Check transmission electronics (see test plan)
	Program switch defective (see test plan)	Replace program switch
Defect indicator lights up	Transmission electronics defective	Check transmission electronics (see test plan)
	Solenoid (2) defective (see test plan)	Replace solenoid valve 24 34 851
Defect indicator lights up while driving	Transmission electronics defective	Check transmission electronics (see test plan)
	Poor contact of plug on transmission	Check plug connection
Noise and finally interruption of power flow after long drive	Oil filter screen on valve body dirty	Only replace filter screen, if there are no burnt clutch liner bits in oil sump; otherwise exchange transmission
No power flow forward or reverse, loud noise	Drive plate between converter and engine torn off	Replace drive plate or converter 11 22 051 or 24 40 003
Noise		
High-pitched noise in all positions, especially when oil is cold, intake noise of oil pump	Oil level too low	Correct oil level
	Valve body leaks	Replace valve body 24 30 002
High-pitched, screeching, speed-dependent noise in all positions, especially when oil is warm, occurring after long drive, sometimes accompanied by interruptions in power flow	Oil filter screen dirty	Only replace filter screen, if there are no clutch liner bits in oil sump; otherwise replace complete transmission
Loud noise when converter clutch is locked	Torsion damper defective	Replace converter 24 40 003

Condition	Cause	Correction
Leakage		
Oil dripping out of converter bell housing	Seal in pump body damaged	Replace seal 24 31 002
	Pump body leaks	Replace complete pump 24 31 002
	Converter leaks on welded seam	Replace converter 24 40 003
	Radial oil seal for converter leaks	Replace radial oil seal 24 12 003
Leak between transmission case and oil sump	Oil sump mounting bolts not tightened to correct torque	Tighten bolts to correct torque*
	Oil sump gasket damaged	Replace gasket 24 11 002
Leak between transfer plate and transmission case (especially in area of pump pressure bore)	Converter bell housing mounting bolts loose	Tighten bolts to correct torque*
Oil loss on transmission plug	O-ring defective	Replace O-ring 24 30 002
Oil loss on output	Radial oil seal on output damaged	Replace radial oil seal 24 12 013
Oil loss through or on vent	Oil level too high	Correct oil level
	Wrong type of oil (strong foaming)	Replace oil if necessary remove transmission and drain total oil including converter
	Vent cover missing	Mount cover or replace vent
	O-ring on vent damaged	Unscrew transmission extension, replace O-ring
	Circlip pre-load insufficient	Replace circlip
Oil loss on cooler line	Loose connection	Tighten bolts to correct torque*
	Cooler line damaged	Replace cooler line
	Cooler leaks	Replace cooler 17 11 000
Oil loss on transfer plate	Plug on transfer plate leaks	Tighten plug to correct torque*
		Replace seal
Leak between transmission case and transmission extension	Mounting bolts loose	Tighten bolts to correct torque*
	Gasket damaged	Replace gasket 24 11 052

* See Specifications

TROUBLESHOOTING VALVE BODY FOR 4 HP 22 / EH

Condition	Cause	Correction
Position R		
No reverse gear	Solenoid (4) defective (see test plan)	Replace solenoid valve 24 34 851
	Wire to solenoid (4) grounded out (see test plan)	Replace wire harness
	Reverse gear locking valve seized	Replace valve body 24 30 002
	Damper B malfunctions	Replace valve body 24 30 002
No reverse or forward gear	Main pressure valve seized, spring broken	Replace valve body 24 30 002
Insufficient power transmission	Pressure too low in clutch B or E, brake D	Replace valve body 24 30 002
Hard jolt when moving into position R	Damper B malfunctions	Replace valve body 24 30 002
	Modulation pressure too high	
Position D		
No forward gear	Main pressure valve seized, spring broken	Replace valve body 24 30 002
Insufficient power transmission	Pressure too low in clutch A	Replace valve body 24 30 002
No shift function	Pulse transmitter defective (see test plan)	Replace pulse transmitter 24 34 870
	Wire to pulse transmitter grounded out (see test plan)	Replace wire harness
No shift function 1–2 / 2–1	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
	Wire to solenoid (1) grounded out (see test plan)	Replace wire harness
	Shift valve 1–2, control valve 1–2 / 3–4, pressure reducing valve 1 seized	Replace valve body 24 30 002

Condition	Cause	Correction
Position D		
No shift function 2–3 / 3–2	Solenoid (2) defective (see test plan)	Replace solenoid valve 24 34 851
	Wire to solenoid (2) grounded out (see test plan)	Replace wire harness
	Shift valve 2–3 seized	Replace valve body 24 30 002
No shift function 3–4 / 4–3	Solenoid (1) defective (see test plan)	Replace solenoid valve 24 34 851
	Control valve 1–2 / 3–4 seized	Replace valve body 24 30 002
Shifts 1–2 / 2–3 / 3–4 too long	Pressure regulator defective (see test plan)	Replace pressure regulator 24 34 860
	Wire to pressure regulator grounded out (see test plan)	Replace wire harness
	Damper defective	Replace valve body 24 30 002
	Modulation valve, pressure reducing valves 1 and 2 seized	Replace valve body 24 30 002
Upshifts 1–2 / 2–3 / 3–4 too hard	Pressure regulator defective (see test plan)	Replace pressure regulator 24 34 860
	Modulation valve sticks	Replace valve body 24 30 002
	Damper defective	Replace valve body 24 30 002
Downshift 4–3 too hard	Plate F dirty	Replace valve body 24 30 002
Manual downshifts 4–3 / 3–2 too hard	Damper E or C' defective	Replace valve body 24 30 002

Condition	Cause	Correction
Position 1		
Manual downshift 2→1 not okay	Pressure regulator defective (see test plan)	Replace pressure regulator 24 34 860
	Damper D defective	Replace valve body 24 30 002
	Modulation valve sticks	Replace valve body 24 30 002
Converter Lockup Clutch		
No converter clutch locking	Solenoid (3) defective (see test plan)	Replace solenoid valve 24 34 851
	Converter clutch damper defective	Replace solenoid valve 24 34 851
	Converter pressure valve seized	Replace valve body 24 30 002
	Pressure reducing valve 1 seized	Replace valve body 24 30 002
No converter clutch unlocking	Solenoid (3) defective (see test plan)	Replace solenoid valve 24 34 851
	Wire to solenoid (3) grounded out (see test plan)	Replace wire harness
Main pressure too high in all positions	Pressure regulator defective (see test plan)	Replace pressure regulator 24 34 860
	Main pressure valve seized	Replace valve body 24 30 002
	Modulation pressure too high	Replace valve body 24 30 002

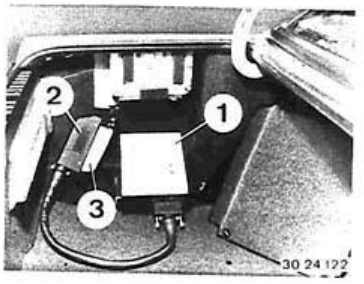
TEST PLAN FOR 4 HP – 22 / AEGS

The control unit for AEGS is located in the trunk behind the left trunk trim panel.
Remove trim panel section.
Caution!
Never disconnect or connect plug (3) with the ignition turned on.
Connect adapter (1), HWB No. 81 12 9 425 091 on plug (3) in conjunction with connecting lead (2), HWB No. 81 12 9 425 092, for all tests / periphery.
Install connecting lead, HWB No. 81 12 9 425 093 between the adapter and control unit for tests in conjunction with the AEGS control unit.



Test Position 1

Requirement for all tests: ground wire okay. Check ground wires 5 and 19 for correct connection. —— no → Break in ground wire. Connection engine wire harness pin 5 to battery – → Repair ground wire to wiring diagram. Make connection.

Signal throttle switch, see 13 63 544.

Explanations for Independent Electronic Transmission Control (AEGS):
There is a comprehensive test of the entire AEGS each time the engine is started.
Turn on ignition.
The yellow defect indicator lamp in the instrument panel will flash twice and must stay on while starting and go out at an engine speed above 450 rpm.

Test Position Defect Indicator	Cause	Correction
Defect indicator does not flash and remains on after starting.	Break in ground wire 5/19. Check voltage between wires 5/19 and 24 with the ignition on. Nominal value: approx. 5 V. AEGS control unit defective.	Repair wire to wiring diagram. Repair wire to wiring diagram. Replace control unit 24 61 000.
Defect indicator flashes, but remains on after starting.	Power supply to AEGS control unit insufficient. Check voltage between wires 5/19 and 35 with the ignition on. Nominal value: > 10 V. Wires to solenoid 1 (Y1), 2 (Y2), reverse gear (Y4) or converter lockup clutch (Y3) have a break or are grounded out. See test plan for checking. No TD signal from DME control unit. No ti signal from DME control unit.	Repair wire to wiring diagram. Repair wires to wiring diagram. Check plug connection (X) and power supply lead to AEGS control unit.
Defect indicator comes on while driving.	Power supply between wires 5/19 and 35 insufficient (drops below 10 V). TD signal stops suddenly. Break in positive wires to solenoids.	Repair wires to wiring diagram. Repair wires to wiring diagram.

Troubleshooting – also refer to Service Information 24 02 85 (422).

Test Position 2

Solenoid Valves

a) Solenoid valve (Y 1) – 1st/2nd and 3rd/4th gears. — no → Wire to solenoid valve damaged/shorted. → Repair wire to wiring diagram.
Resistance test (M 06). Plug receptacles bent. Repair plug receptacles.
Measure resistance between wires 1 and 16. Solenoid valve defective. Replace solenoid valve 24 34 851.
Nominal value: 25 ... 46 ohms.
Note: Specified resistance values for solenoid valves and pressure regulator should be measured with a transmission oil temperature of about 20° C (68° F).

↓

Insulation test (M 06). — no → Wire to solenoid valve damaged/grounded out. → Repair wire to wiring diagram.
Measure resistance between wires 5/19 and 1/16. Solenoid valve grounded out. Replace solenoid valve 24 34 851.
Nominal value: > 500 k-ohms.

↓

b) Solenoid valve (Y 2) – 2nd/3rd gears. — no → Wire to solenoid valve damaged/shorted. → Repair wire to wiring diagram.
Resistance test (M 06). Plug receptacles bent. Repair plug receptacles.
Measure resistance between wires 1 and 17. Solenoid valve defective. Replace solenoid valve 24 34 851.
Nominal value: 25 ... 46 ohms.

↓

Insulation test (M 06). — no → Wire to solenoid valve damaged/grounded out. → Repair wire to wiring diagram.
Measure resistance between wires 5/19 and 1/17.
Nominal value: > 500 k-ohms.

↓

c) Solenoid valve (Y 4) – reverse gear arrest. — no → Wire to solenoid valve damaged/shorted. → Repair wire to wiring diagram.
Resistance test (M 06). Plug receptacles bent. Repair plug receptacles.
Plug pulled off of control unit. Solenoid valve defective. Replace solenoid valve 24 34 851.
Measure resistance between wires 1 and 20.
Nominal value: 25 ... 46 ohms.

Solenoid valve (Y 4) – reverse gear arrest. — no → Wire to solenoid valve damaged/grounded out. → Repair wire to wiring diagram.
Insulation test (M 06). Plug receptacles bent. Repair plug receptacles.
Measure resistance between wires 5/19 and 1/20. Solenoid valve grounded out. Replace solenoid valve 24 34 851.
Nominal value: > 500 k-ohms.

d) Solenoid valve (Y 3) – conv. lockup clutch. — no → Wire to solenoid valve damaged/shorted. → Repair wire to wiring diagram.
Resistance test (M 06). Plug receptacles bent. Repair plug receptacles.
Measure resistance between wires 1 and 25. Solenoid valve defective. Replace solenoid valve 24 34 851.
Nominal value: approx. 25 ... 46 ohms.

Insulation test (M 06). — no → Wire to solenoid valve damaged/grounded out. → Repair wire to wiring diagram.
Measure resistance between wires 5/19 and 1/25. Solenoid valve grounded out. Replace solenoid valve 24 34 851.
Nominal value: > 500 k-ohms.

Test Position 3

Pressure regulator (Y 5). — no → Wire to pressure regulator damaged/shorted. → Repair wire to wiring diagram.
Resistance test (M 06). Plug receptacles bent. Repair plug receptacles.
Measure resistance between wires 1 and 22. Pressure regulator defective. Replace pressure regulator 24 34 860.
Nominal value: 1.8 ... 4.6 ohms.

Insulation test (M 06). — no → Wire to pressure regulator damaged/grounded out. → Repair wire to wiring diagram.
Measure resistance between wires 5/19 and 1/22.
Nominal value: > 500 k-ohms.

Test Position 4

Program switch (S 2).
A magnet return the program switch to position E for each starting procedure.
Resistance test (M 06).
Measure resistance between wires 6 and 14.
Nominal values:
∞ ohms for switch pos. S or 3,2,1
0 ohms for switch pos. E

no → Wire to program switch damaged/shorted. → Repair wire to wiring diagram.
Plug receptacles bent. Repair plug receptacles.
Program switch defective. Replace program switch 61 31 265.

Direct current voltage (M 01).
Measure voltage between black and brown wires (while starting).
Nominal value: > 8 V.

no → Wire damaged. → Repair wire to wiring diagram.

Test Position 5

Kickdown switch.
Resistance test (M 06).
Measure resistance between wires 19 and 2.
R = ∞ ohms.
Accelerator pedal floored (kickdown).
R = approx. 0 ohms.

no → Wire to kickdown switch damaged/shorted. → Repair wire to wiring diagram.
Plug receptacles bent. Repair plug receptacles.
Kickdown switch defective. Replace kickdown switch 35 41 480.

Test Position 6

Position switch (S 1).
Direct current voltage (M 01).
Turn on ignition.
Switch off lights.
Pertinent position lamp on.
Measure voltage betw. wires 19 and 18 Pos. 1,
19 and 28 Pos. 2,
19 and 29 Pos. 3,
19 and 30 Pos. D,
19 and 4 Pos. N.
Nominal value in pertinent position: > 10 V.
All other positions: < 1 V.

no → Wire to position switch damaged/shorted. → Repair wire to wiring diagram.
Position switch defective. Replace position switch.
Display unit defective. Replace display unit.
Fuse no. 9 defective. Replace fuse.
Battery voltage too low. Charge battery.
Plug receptacles bent. Repair plug receptacles.

Test Position 7

Pulse transmitter (Y 6).
Resistance test (M 06).
Measure resistance between wires 8 and 27.
Nominal value: 800 ohms ... 1.6 k-ohms.

no → Wire to pulse transmitter damaged/shorted. → Repair wire to wiring diagram.
Plug receptacle bent/shorted. Repair plug receptacle.
Pulse transmitter defective. Replace pulse transmitter 24 34 870.

↓

Insulation test (M 06).
Measure resistance between wires 5/19 and 8/27.
Nominal value: > 500 k-ohms.

no → Wire to pulse transmitter damaged/grounded out. → Repair wire to wiring diagram.
Pulse transmitter grounded out. Replace pulse transmitter 24 34 870.

↓

Dynamic test (M 22).
Scope test.
Connect test lead between wires 8 and 27 (see operating instructions for BMW service tester).
Support car on trailing arms.
It should be possible to turn rear wheels easily.
Start engine.
Select position D.
Speed approx. 30 km/h (25 mph).
All sine curves must be uniformly larger than 0 ... 10 (left screen scale).

no → Pulse transmitter defective. → Replace pulse transmitter 24 34 870.
Wire to pulse transmitter damaged/grounded out. Repair wire to wiring diagram.

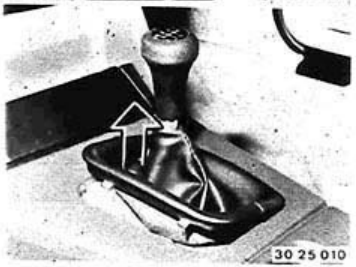
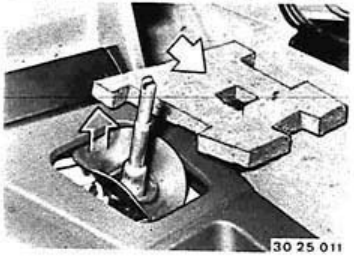
25 11 000 REMOVING AND INSTALLING SHIFT LEVER
–Sheet Metal Shift Console–

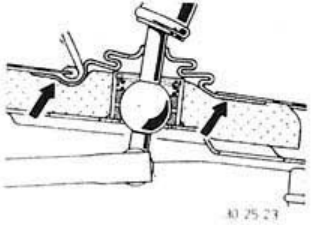
Remove retainer (1).
Take off washer (2).
Pull out shift rod (3).



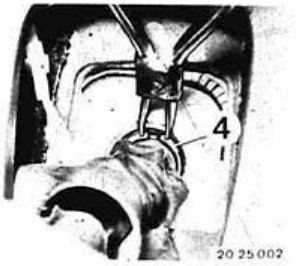
Remove dust cover.



Remove insulating felt.
Pull out cover between body and shift console.



Installation:
Check for correct positioning of cover.



Lift out circlip (4).
Remove shift lever.

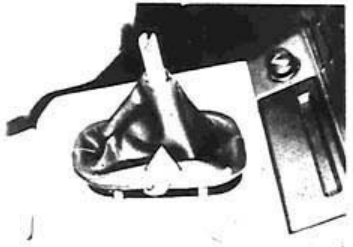
Installation:
Lubricate spherical plates with Klüber Polyup GLY 801*.

* **Source of Supply: HWB**

25 11 000 REMOVING AND INSTALLING SHIFT LEVER
– Aluminum Shift Console –

Pull off shift lever knob.

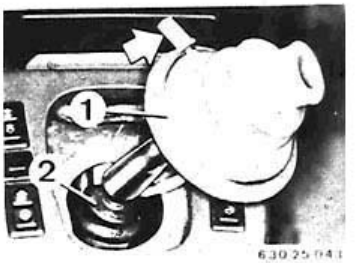
Note:
Force required to pull off knob = approx. 40 kp (88 lbs.).



Lift out dust cover.

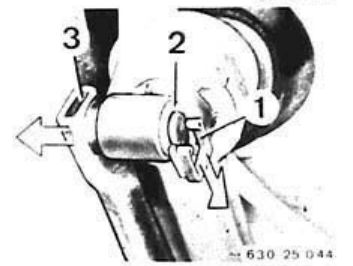
Model M 3:
Be careful of electric leads for the illuminated shift lever knob version when pulling off.

Disconnect plug (1).
Shift lever knob can only be replaced with the electric leads.
This requires pulling the plug out of the dust cover.



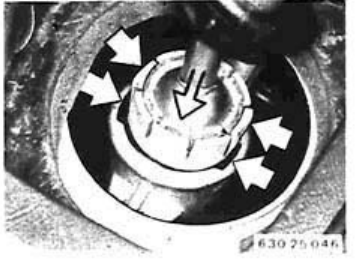
Remove felt.
Disconnect plug on electric leads for backup lights.
Unclip dust cover (1) on the body and pull it off of the shift lever.
Disconnect dust cover (2) on the shift console.

Installation:
Check dust covers.
Make sure of perfect fit.

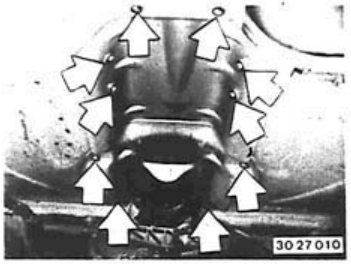


Lift out circlip (1).
Take off washer (2).
Pull out shift rod (3).

Apply Special Tool 25 1 100.
Turn counterclockwise 90°.
Push up spherical plate.
Remove shift lever from above.

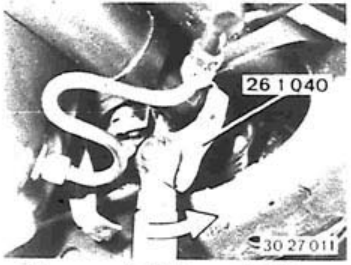


Installation:
Apply spherical plate that tabs on the spherical plate are aligned with openings in the shift console.
Press in shift lever until retaining rabs are heard to engage twice.

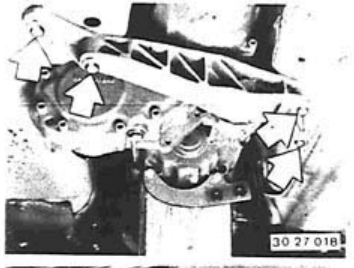


25 11 000 REMOVING AND INSTALLING SHIFT LEVER
– All Wheel Drive –

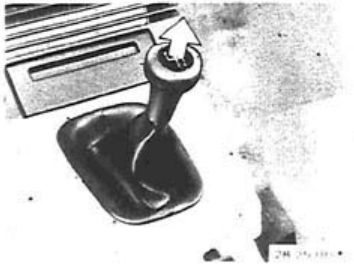
Remove exhaust assembly 18 00 020.
Unscrew heat shields.



Loosen threaded sleeve several turns with Special Tool 26 1 060 or 26 1 040.
Installation:
Tighten threaded sleeve with Special Tool 26 1 060 or 26 1 040 after finishing installation.
Tightening torque*.

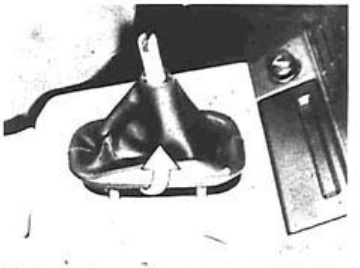


Support transmission.
Unscrew cross member.
Lower transmission to front axle carrier.
Installation:
Check length of bolts.

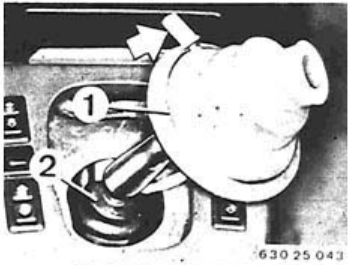


Pull off shift lever knob.

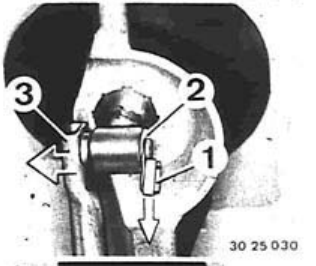
* See Specifications



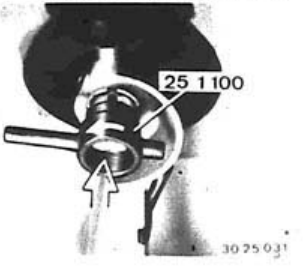
Lift out dust cover.



Remove felt.
Disconnect plug on wires for backup lights.
Unclip dust cover (1) on body and pull off of shift lever.
Disconnect dust cover (2) on shift console.
Installation:
Inspect dust covers.
Check for correct seating.



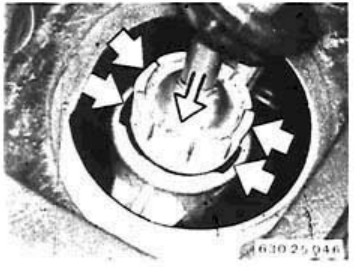
Lift out circlip (1).
Take off washer (2).
Pull out selector rod (3).



Apply Special Tool 25 1 100.
Turn counterclockwise 90°.
Push up spherical plate.
Remove shift lever from above.

Note:
One side of the toggle must be cut off up to max. 12 mm (0.472") in cars with all wheel drive.

30 25 029

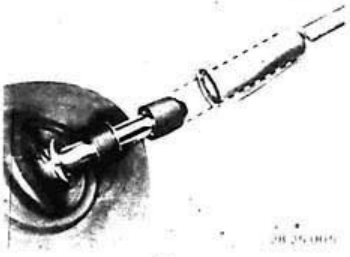


Installation:
Apply spherical plate that tabs on spherical plate are aligned with openings in shift console.
Press in shift lever until retaining tabs are heard to engage twice.

20 25 005

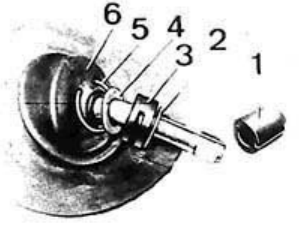
25 11 003 DISASSEMBLING AND ASSEMBLING SHIFT LEVER –Sheet Metal Shift Console–

Remove shift lever – see 25 11 000.
Lift out wire snap ring.



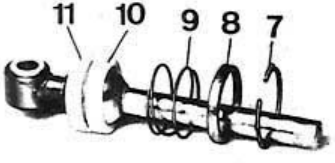
Pull off shift lever upper section.

Installation:
Check installed position.



28 25 002

Pull off cap (1).
Remove circlip (2).
Remove rubber ring (3), washer (4), snap ring (5) and rubber part (6).



20 25 007

Remove circlip (7), spring retainer (8), spring (9), upper spherical plate (10) and lower (ribbed) spherical plate (11).

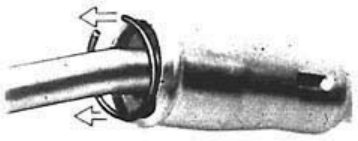
Installation:
Lubricate spherical plates with Klüber Polyup GLY 801*.

* Source of Supply: HWB

32 25 042

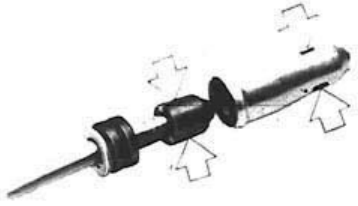
25 11 003 DISASSEMBLING AND ASSEMBLING SHIFT LEVER – Aluminum Shift Console –

New shift levers are installed in some cases beginning with 1988 models and they cannot be disassembled.



32 25 039

Remove shift lever – see 25 11 000.
Lift out wire snap ring.



32 25 040

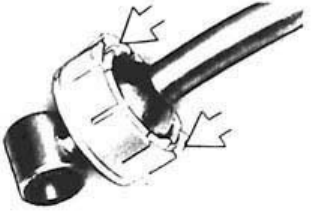
Pull off shift lever upper section.

Installation:
Check the installed position.

32 25 041

Pull off cap (1).
Remove circlip (2).
Remove rubber ring (3), washer (4) and snap ring (5).

Installation:
Coat rubber parts with relaxed water to make installation easier.

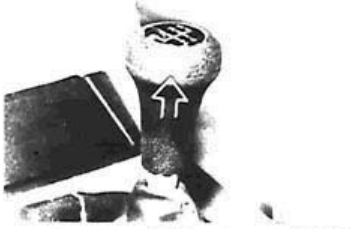


6.01 25 042

Press off bearing plate downward.

Installation:
Lubricate bearing plate and ball with Klüber Polyup GLY 801*.

25 11 081 REPLACING DUST COVER FOR SHIFT LEVER

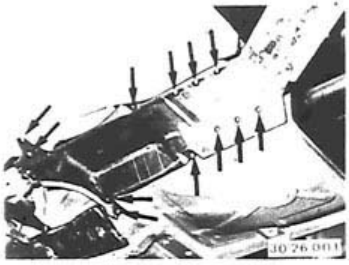


Pull off shift lever knob.

Installation:
Shift lever knob must engage in the twist-preventing lock.
Check position of the shift diagram.

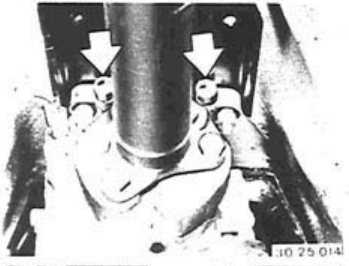
Lift out dust cover.

* Source of Supply: HWB



25 11 111 REPLACING SHIFT ROD JOINT
–Sheet Metal Shift Console–

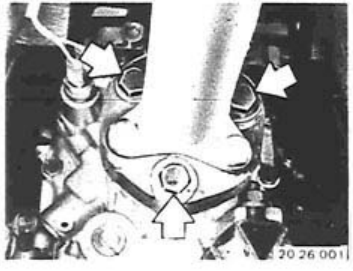
Access to the shift rod joint differs in accordance with the different transmission and propeller shaft versions.
Remove exhaust assy. – 18 00 020.
Remove heat shield with reinforcement carrier.



Version with 4 Speed Transmission:
Unscrew console mounting bolts.

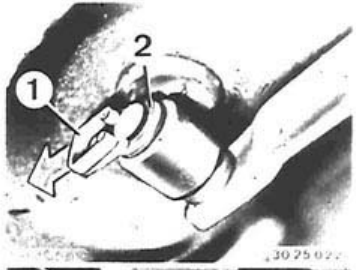
Important!
Self-locking bolts – will be difficult to unscrew.

Installation:
Use new bolts coated with a micro-encapsulating cement.
Tightening torque*.

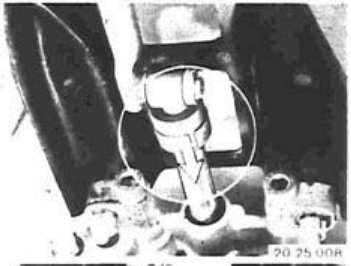


Version with 5 Speed Transmission:
Unscrew propeller shaft on transmission, see 26 11 000.

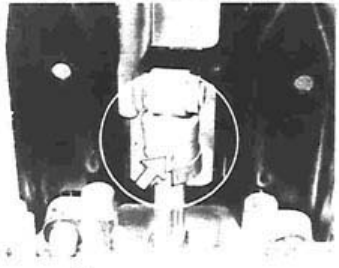
Version with 5 Speed Transmission and Vibration Damper:
Unscrew propeller shaft on transmission, see 26 11 000.
Unscrew output flange with vibration damper on transmission, see 23 12 053.



Engage reverse gear.
Lift out circlip (1).
Take off washer (2).
Pull out shift rod (3).



Push back locking sleeve.



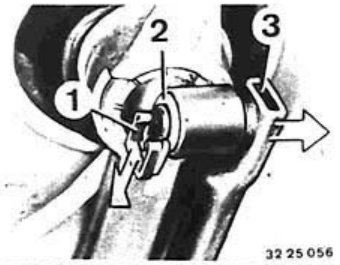
Move shift shaft to 3rd or 5th gear position.
Drive out pin.
Remove shift rod with joint.

Note:
If shift rod joint has an offset bearing sleeve, install the bearing sleeve offset to the right as seen looking forward. Install offset to the left in cars with a vibration damper and bent shift rod.

Installation:
Lubricate bearing surfaces with Klüber Polyup GLY 801**.

* See Specifications

** Source of Supply: HWB



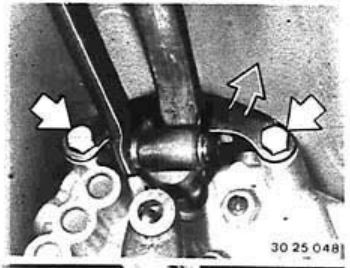
32 25 056

25 11 111 REPLACING SHIFT ROD JOINT – Aluminum Shift Arm –

Unscrew propeller shaft on transmission – see 26 11 000.
Engage reverse gear.
Pull off retainer (1).
Take off washer (2).
Pull out shift rod (3).

32 25 053

Installation:
Check damper in joint, replacing if necessary.



30 25 048

Model M 3:

Loosen bolt of shift arm holder on the left-hand side.
Remove right bolt.
Swing up holder.

32 25 054

Installation:
Offset bearing sleeve to the left as seen looking forward.

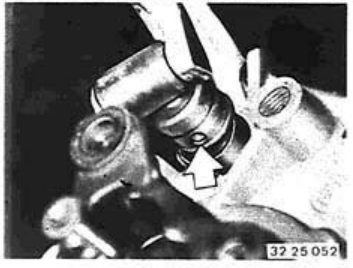
32 25 051

Lift locking sleeve out of groove and slide forward.

32 25 055

Lift out retainer (1).
Take off washer (2).
Pull out shift rod.

Installation:
Inspect rubber rings (3), replacing if necessary.
Lubricate bearing surfaces with Klüber Polyup GLY 801*.



32 25 052

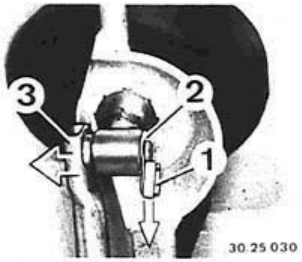
Drive out pin.
Pull out shift rod with joint.

30 25 052

Model M 3:

Lift out retainer (1).
Pull off shift rod with washers (2).

* Source of Supply: HWB



30.25.030

25 11 111 REPLACING SHIFT ROD JOINT
– Four Wheel Drive –

Remove transfer box – see 27 10 010.
Lift out retainer (1).
Take off washer (2).
Pull out shift rod (3).

30.25.047

Lift out retainer (1).
Take off washer (2).
Pull out shift rod.

Installation:
Inspect rubber rings (3), replacing if necessary.
Lubricate bearing surfaces with Klüber Polyup GLY 801*.

30 25 034

Push back locking sleeve.

30 25 035

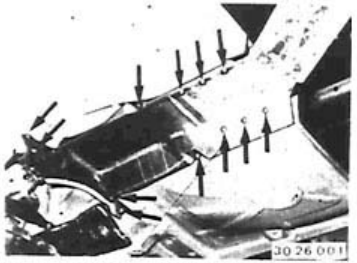
Drive out pin.
Remove shift rod with joint.

Note:
The bearing sleeve is offset to the right as seen looking forward.

32.25.051

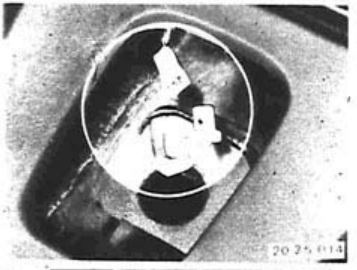
Installation:
Check damper in joint, replacing if necessary.

* Source of Supply: HWB

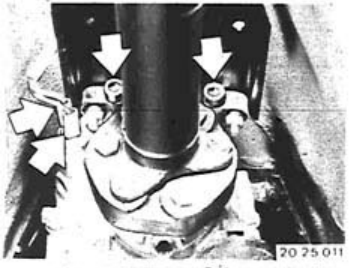


25 11 211 REPLACING SHIFT LEVER CONSOLE
– Sheet Metal Shift Console –

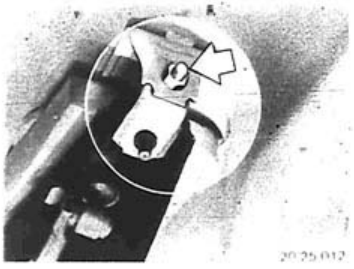
Remove exhaust assembly 18 00 020.
Remove heat shield and reinforcement carrier.
Remove shift lever 25 11 000.



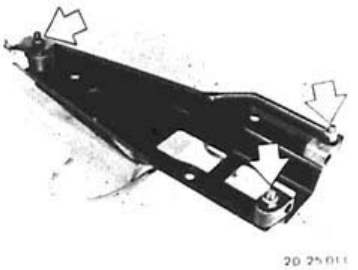
Disconnect plug.



Pull off wires for backup lights.
Unscrew console mounting screws.
Important!
Self-locking screws – will be difficult to unscrew.
Installation:
Use new screws coated with a micro-encapsulated adhesive.
Tightening torque*.

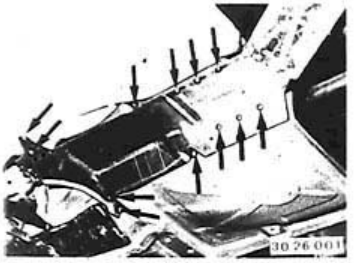


Unscrew mounting bracket.
Installation:
Install the shift lever first to make installation of the rubber cover easier.



Remove console.
Installation:
Check rubber mounts, replacing if necessary

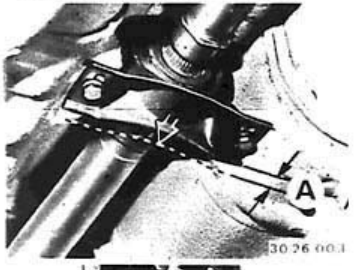
* See Specifications



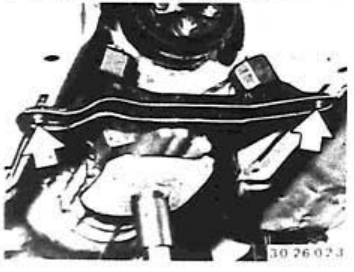
25 11 211 REPLACING SHIFT LEVER CONSOLE
– Aluminum Shift Console –

Remove exhaust assembly 18 00 020.
Unscrew heat shield and reinforcement carrier.
Remove shift lever 25 11 000.

Unscrew threaded sleeve several turns with Special Tool 26 1 040.
Installation:
Tighten threaded sleeve with Special Tool 26 1 040 after finishing installation.
Tightening torque*.

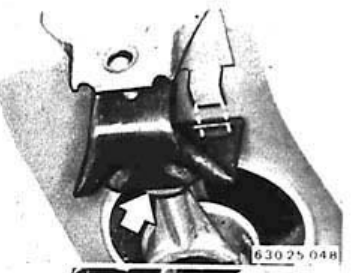


Unscrew center mount.
Installation:
Preload center mount forward by distance A = 4 to 6 mm (0.157 to 0.236").

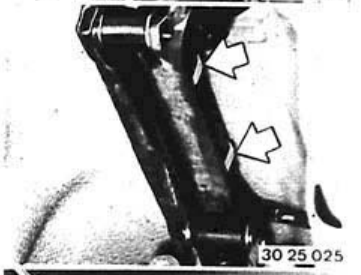


Support transmission.
Unscrew cross member.
Lower transmission to front axle carrier.

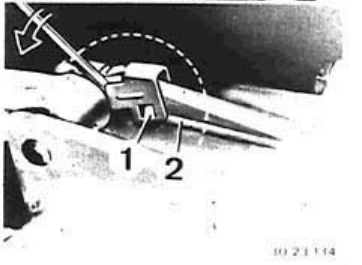
* See Specifications



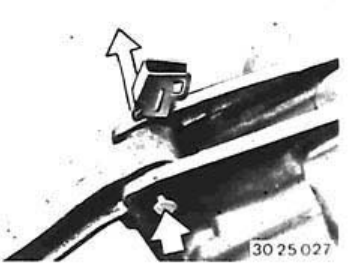
Unscrew bracket.
Installation:
Lubricate support with grease.
Engage bracket in retaining tabs.



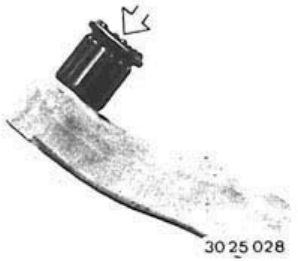
Take wires for backup lights out of holder.



Lift out clip on shaft bolt.
Note:
Clip is accessible with a screwdriver.
Disconnect clip in retaining tab by turning and swing up.



Pull out shaft bolt.
Take off shift console.



Lubricate bearing sleeve with grease and press it into new console.

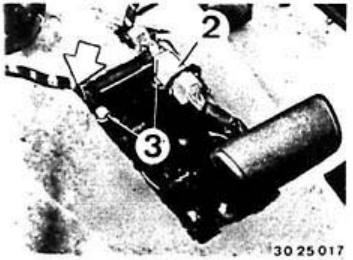
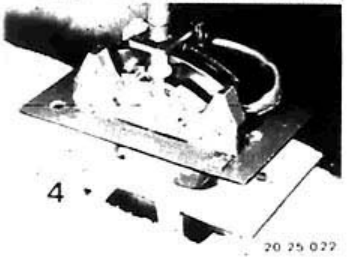
25 16 050 REMOVING AND INSTALLING SELECTOR LEVER COMPLETE WITH BASE
– Version with Shift Rod –

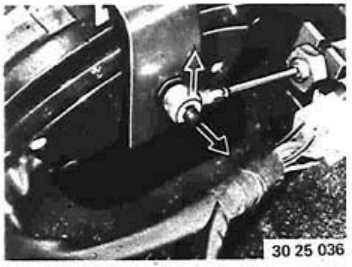
Remove center console – see 51 16 200.
Lift out retainer.
Disengage shift rod.
Installation:
Adjust shift rod – see 24 00 004.



Disconnect plug (2).
Remove bolts (3).
Remove base.
Installation:
Be careful not to pinch the wire harness.

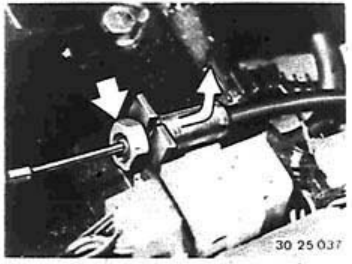


Installation:
Insert insulator (4).

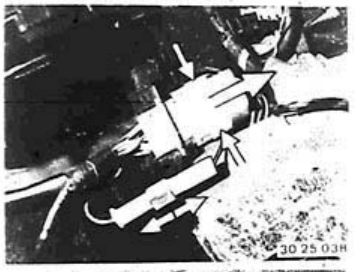


25 16 050 REMOVING AND INSTALLING SELECTOR LEVER COMPLETE WITH BASE
– Version with Cable –
(All Wheel Drive Cars)

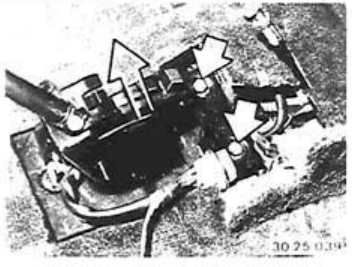
Remove center console – see 51 16 200.
Lift out retainer.
Unscrew eye on pin.
Important!
Don't bend the steel wire.



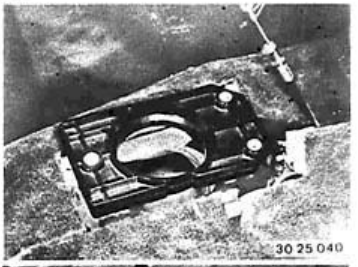
Unscrew nut.
Disengage cable sleeve in holder.



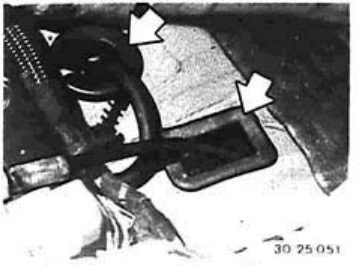
Disconnect plugs.



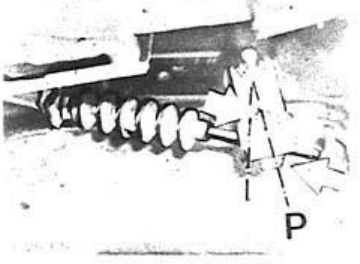
Unscrew bolts.
Remove base.



Installation:
Check installed direction of transfer plate.
Check for correct seating of rubber cover and foam rubber seal.



Installation:
Check for correct seating of rubber seals after finishing installation.



Installation:
Adjust cable.
Shift lever in "P" (most forward position).
Press cable rod opposite forward direction.
Clamp cable rod without tension.
Important!
Tightening torque = 10 to 12 Nm (7 to 9 ft. lbs.).
Don't bend the cable.

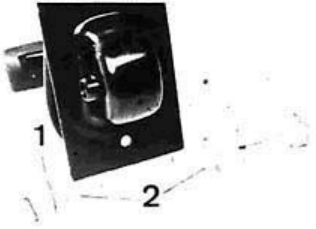
20 25 023

25 16 080 REMOVING AND INSTALLING SELECTOR LEVER
– Version with Shift Rod –

Remove selector lever complete with base – see 25 16 050.
Drive out pin.

30 25 019

Unscrew screw on handle.
Pull off handle.

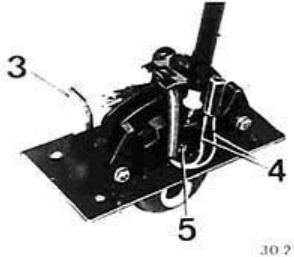


20 25 024

Pull out selector lever lower section.
Remove washer (1) and bearing sleeves (2).
Installation:
Check bearing sleeves, replacing if necessary and lubricating with Molykote Longterm 2.

20 25 028

Installation:
Guide pin of push button into pull rod hole.

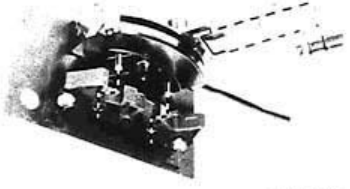


30 25 018

Pull off plug (3).
Disconnect scale light wire (4).
Unscrew screw (5).
Remove transmission switch together with the upper selector lever section.

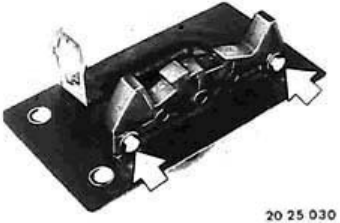
30 25 020

Take pull rod out of selector lever upper section.



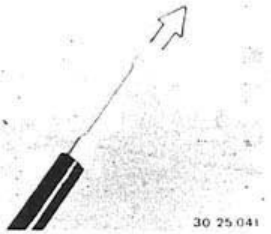
20 25 026

Installation:
Check installed position of transmission switch and drive.



20 25 030

Installation:
Check gate, replacing if necessary.

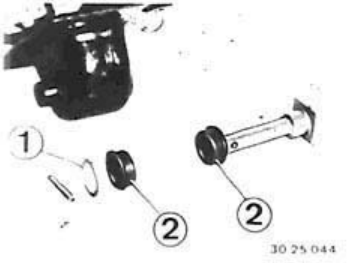


25 16 080 REMOVING AND INSTALLING SELECTOR LEVER – Version with Cable – (Four Wheel Drive)

Remove selector lever complete with console – see 25 16 050.
Take pull rod out of upper selector lever section.

Pull display lamp out of holder.
Unclip electric leads.

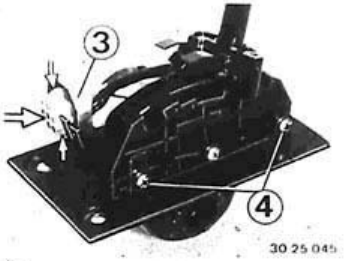
Drive out pin.



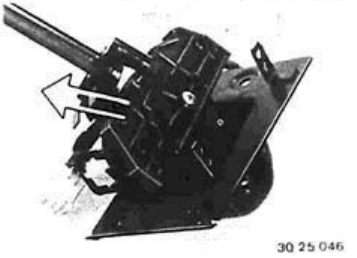
Pull out shaft.
Take off washer (1).
Pull bearing sleeves (2) out of housing.

Installation:
Replace bearing sleeves.
Lubricate bearing surfaces with Klüber Polyup GLY 801*.

* Source of Supply: HWB

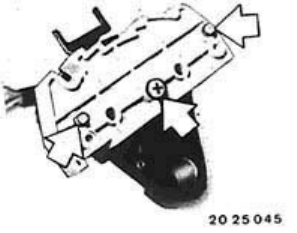


Disconnect plug (3) in holder.
Unscrew screws (4).



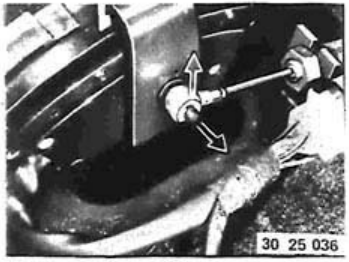
Tilt out shift lever together with transmission switch and shift gate.

Installation:
Swivel on transmission switch engages on the selector lever.



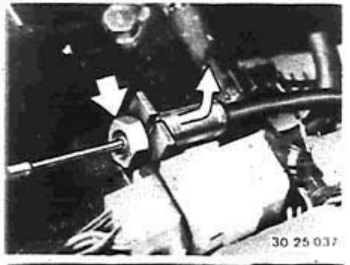
Unscrew shift gate on transmission switch.

Installation:
Make sure that pins on transmission switch engage in bores of the shift gate.



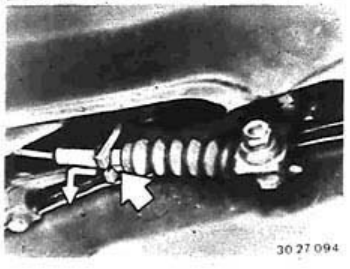
25 16 202 REPLACING CABLE FOR GEAR SELECTOR LEVER

Remove center console - see 51 16 200.
Lift out retainer.
Unscrew eye on pin.
Important!
Don't bend the steel wire.



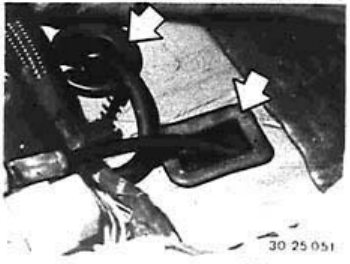
Unscrew nut.
Disconnect cable sleeve in holder.

Loosen nuts.
Important!
Don't bend the steel wire.

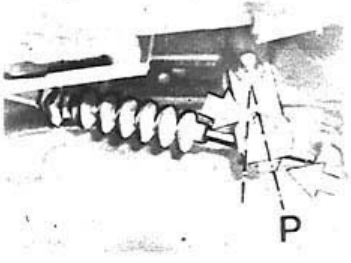


Unscrew nuts.
Push back cable sleeve and take out of holders.
Pull cable out of operating lever.

Pull out rubber grommet and cable from above.



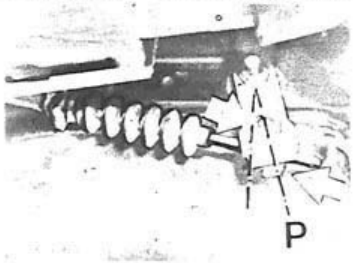
Installation:
Check for correct fit of rubber gaskets after finishing installation.



Installation:
Adjust cable.
Selector lever in position "P" (most forward position).
Press cable rod opposite the forward direction.
Clamp down cable rod without tension.
Important!
Tightening torque: 10 to 12 Nm (7.5 to 8.5 ft. lbs.).
Don't bend the cable.

ADJUSTING CABLE FOR GEAR SELECTOR LEVER

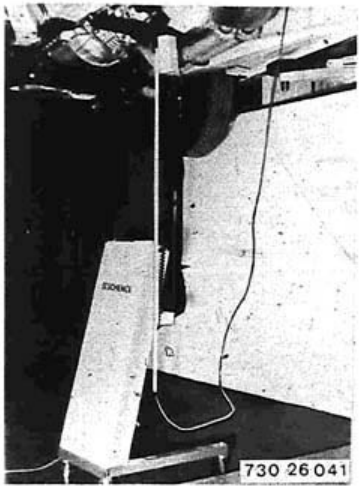
Selector lever in position "P" (most forward position).
Loosen nut until cable rod is cleared.



Selector lever in position "P" (most forward position).
Press cable rod opposite the forward direction.
Clamp down cable rod without tension.
Important!
Tightening torque: 10 to 12 Nm (7.5 to 8.5 ft. lbs.).
Don't bend the cable.

26 Propeller Shaft

	Propeller shaft vibration and noise – eliminate	26- 1
26 11 000	Propeller shaft – remove and install	26- 3
	Propeller shaft – remove and install (four wheel drive)	26- 5
051	Joint disc for propeller shaft, rear – replace	26- 6
	Joint disc for propeller shaft, rear – replace (four wheel drive)	26- 8
160	Constant velocity joint for propeller shaft – replace	26- 8.2
501	Centre for propeller shaft, front – replace	26- 9
26 12 001	Propeller shaft centre mount assembly – replace	26- 10
26 20 000	Propeller shaft, front – remove and install (four wheel drive)	26- 12
020	Sealing cap for propeller shaft, front – replace (four wheel drive)	26- 13
051	Joint disc for propeller shaft, front – replace (four wheel drive)	26- 14
	Troubleshooting propeller shaft	26- 15



ELIMINATING PROPELLER SHAFT VIBRATION AND NOISE

Vibration or Noise:

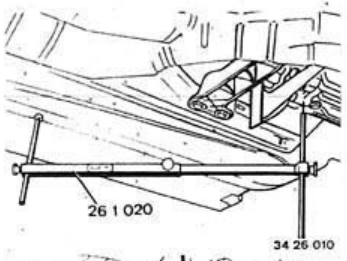
Requirement:
Propeller shaft in perfect optical condition.
Balance propeller shaft if balance plates are missing or propeller shaft is suspected to have imbalance (refer to instructions supplied with balancing equipment).

Caution!
A jacked up car may only be test operated when the suspension of the driven wheels is supported (deflection angle of output shafts).
Never exceed the maximum speed specified for a car jacked up or on a dynamometer.
Conform with safety regulations!

Adjust transmission laterally until the special tool gage has the same distance on left and right sides.

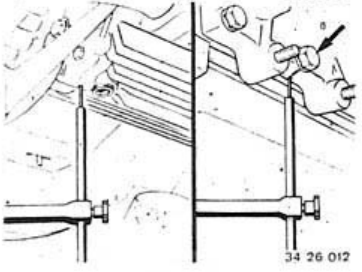
Checking Propeller Shaft Deflection Angle:

Remove exhaust assembly, heat shield and, if applicable, splash guard.

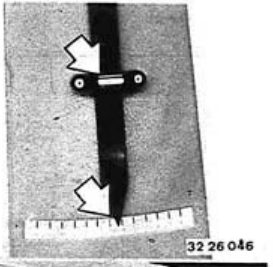


Aligning Propeller Shaft:

Loosen exhaust assembly, engine's rubber mounts and transmission's cross member.
Apply Special Tool 26 1 020.



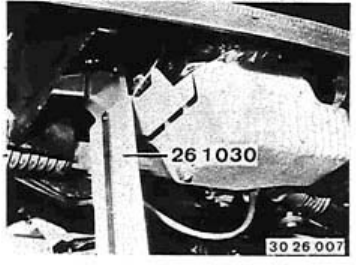
Checkpoints:
Rear bore of engine carrier.
Manual transmissions: center cast rib.
Automatic transmissions: center bolt of transmission extension.
Mark checkpoints with a punch.



Apply Special Tool 26 1 030 on a surface of the engine which is perpendicular or parallel to the crankshaft.

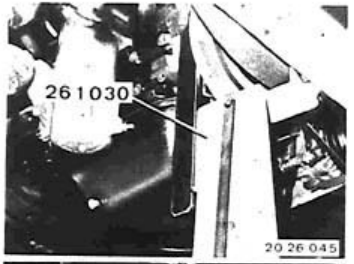
Position the indicator perpendicular with the water level.
Read the number of degrees.

Note:
Always apply the special tool gage with the sacle in the same direction (for example: scale toward right side).
One graduation = 5'.
Position of the car is not important, since only the different angles are compared.

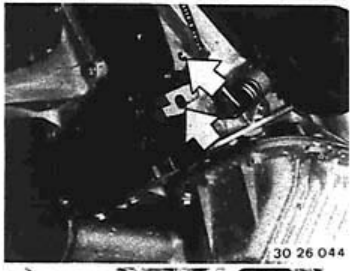


The following bearing surfaces can be used depending on the engine type and version.

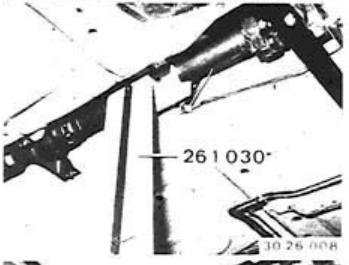
Apply Special Tool 26 1 030 on the oil sump flange and measure inclination of the engine.



Place Special Tool 26 1 030 and a helping rail (steel ruler) on the vibration damper and measure the angle of engine inclination.



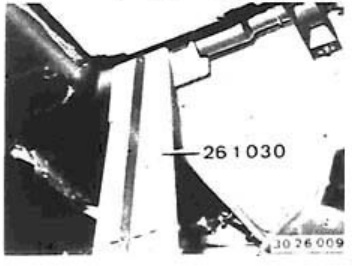
Place Special Tool 26 1 030 and a helping rail (steel ruler) on a level engine block surface which is perpendicular to the crankshaft. (For example: M 40 engine)



Apply gage on propeller shaft front section and measure angle. Measure deflection angle* of joint disc and, if necessary, correct it with shims (up to max. 3 mm / 0.118") on the transmission suspension or center mount.

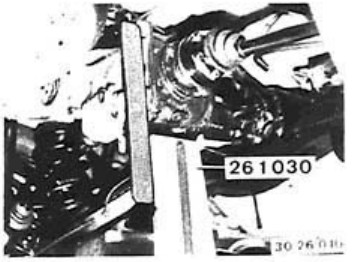
Example:

Engine angle	2° 16'
Propeller shaft angle	- 2° 06'
Joint disc defl. angle	+0° 10'



Apply gage on propeller shaft rear section and measure angle. Determine deflection angle* of center mount and, if necessary, correct it with shims (up to max. 3 mm / 0.118") on transmission suspension or center mount.

* See Specifications



Apply gage on final drive with helping rail (steel ruler) and measure angle. Determine deflection angle* of the universal joint and, if necessary, correct it with shims (up to max. 3 mm or 0.118") on the center mount.

Note:
When correcting a deflection angle by installing shims, remember that the deflection angles of the adjacent joints will also change.
In general joints should have as small as possible deflection angles.

* See Specifications

Hard Movement on Slide:

– Slide on Center Mount –

Important!

The propeller shaft was balanced in assembled state and must not be turned in the slide.

Mark position of propeller shaft sections to each other.

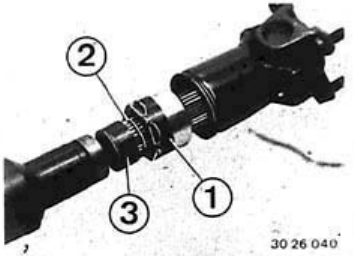
Remove threaded sleeve (1), washer (2) and rubber ring (3).

Check rubber ring, replacing if necessary.

Disconnect propeller shaft on slide.

Clean and lubricate keyway with Molykote Longterm 2**.

Assemble propeller shaft that marks are in one plane.



Hard Movement on Slide:

– Propeller Shaft for All Wheel Drive –

Important!

The propeller shaft was balanced in assembled state and must not be turned in the slide.

Mark position of propeller shaft sections to each other.

Remove threaded sleeve (1), washer (2) and rubber ring (3).

Check rubber ring, replacing if necessary.

Disconnect propeller shaft on slide.

Clean and lubricate keyway with Molykote Longterm 2**.

Assemble propeller shaft that marks are in one plane.

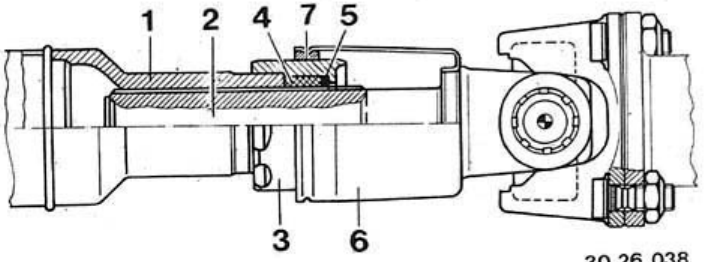
Installation:

Check seal in dust cap, replacing if necessary.

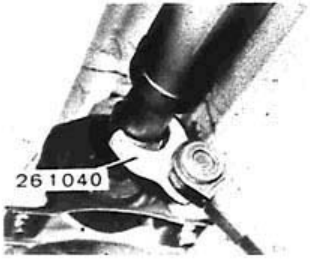
Note:

Propeller shaft sections are mounted in such a manner that universal joints are in one plane.

If the slide had been disassembled by mixtake without marking, it will only mean the possibility of installing the propeller shaft wrong by 180° because of balancing.



1 Front propeller shaft section
2 Rear propeller shaft section
3 Clamping nut
4 Clamp
5 Washer
6 Dust cap
7 Seal



After finishing installation:

Tighten threaded sleeve with Special Tool 26 1 040.

Tightening torque*.

* See Specifications

** Source of Supply: HWB

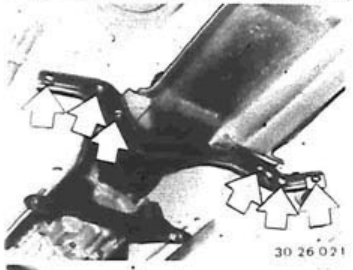
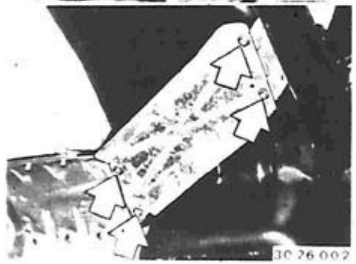
26 11 000 REMOVING AND INSTALLING PROPELLER SHAFT

Remove and install primary and final mufflers 18 12 000.
Unscrew heat shield.

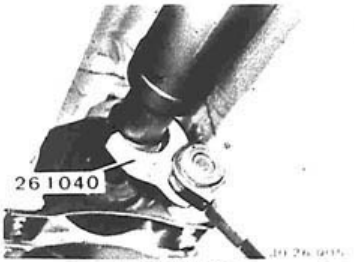


Since 1983 Models:
Unscrew connector.

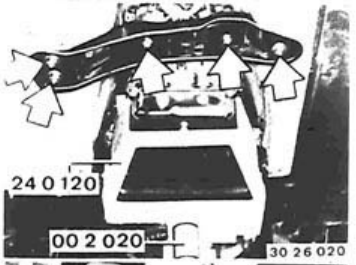
Installation:
Also bolt on holder for oxygen sensor plug on cars with catalytic converter.



Unscrew heat shield.
Installation:
Check for sufficient space between tank and heat shield.

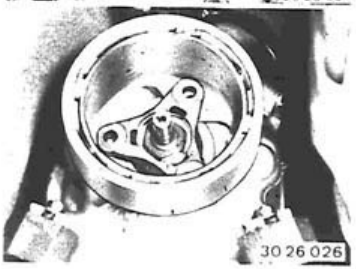


Unscrew threaded sleeve several turns with Special Tool 26 1 040.
Installation:
Tighten threaded sleeve with Special Tool 26 1 040 after finishing installation.
Tightening torque*.



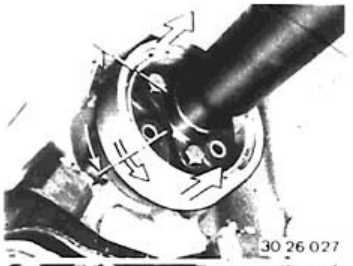
Cars with 4 HP 22 Automatic Transmission:
Support transmission with Special Tools 20 0 120 and 00 2 020.
Unscrew transmission suspension.

Unscrew propeller shaft on transmission.



Cars with Bolted Vibration Damper (325 i):
The vibration damper is mounted on the output flange on the transmission end.

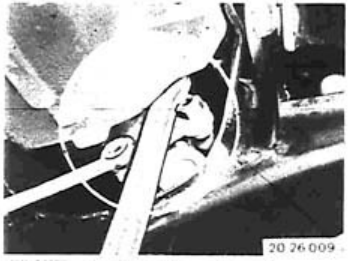
* See Specifications



Unscrew propeller shaft on the transmission.
Turn and bear the vibration damper on the joint disc.
The vibration damper is removed together with the propeller shaft.

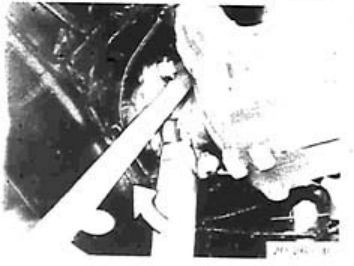
Installation:
Replace stop nuts.
Tightening torque*.

Important!
Only turn nuts or bolts on the flange end whenever possible by design, to avoid tension in the joint disc.



<u>Version with Universal Joint:</u>

Unscrew propeller shaft on rear axle final drive.



Installation:
Replace stop nuts.
Tightening torque*.

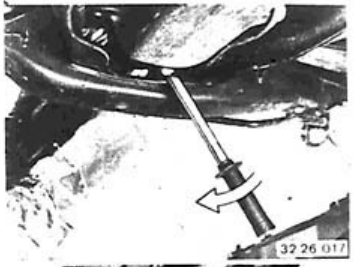
* See Specifications

Version with Constant Velocity Joint:

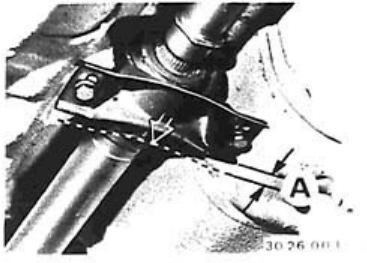
Unscrew propeller shaft on rear axle final drive.

Installation:
Check gasket, replacing if necessary.

Important!
The constant velocity joint is not encapsulated. Protect joint against dirt with the transporting cap or something similar.
Check grease filling*.



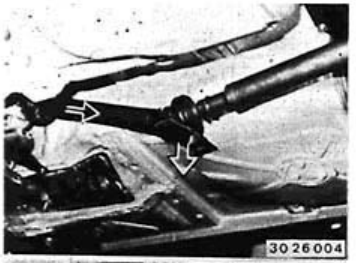
Installation:
Replace stop nuts.
Tightening torque*.



Unscrew center mount.

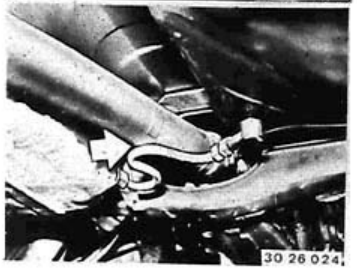
Installation:
Preload center mount forward by distance A = 4 to 6 mm (0.157 to 0.236").

* See Specifications

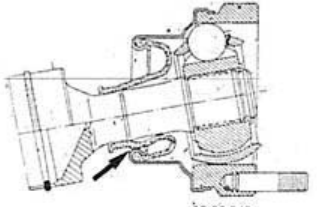


Bend propeller shaft down and pull out of centering pin on the transmission. If applicable, push back propeller shaft on the slide completely.

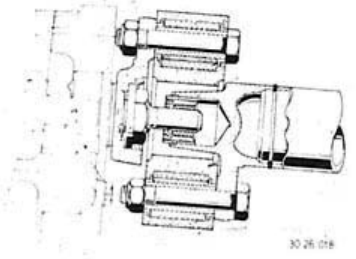
Installation:
Propeller shaft was balanced as an assembly and can only be replaced as such.



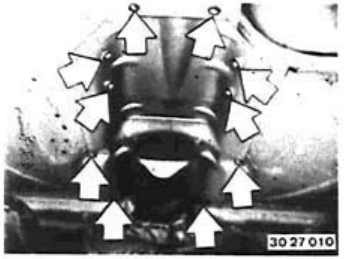
Important!
Don't allow the propeller shaft to bear on the connecting pipe on the fuel tank.



Important!
Don't allow the propeller shaft to fall into the joints. This would damage the rubber cover especially on a constant velocity joint.



Installation:
Check center, lubricating with Molykote Longterm 2 if necessary.
Replace a damaged center.

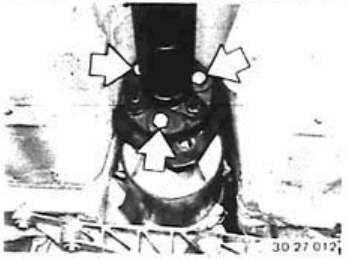


26 11 000 **REMOVING AND INSTALLING PROPELLER SHAFT**
– Four Wheel Drive –

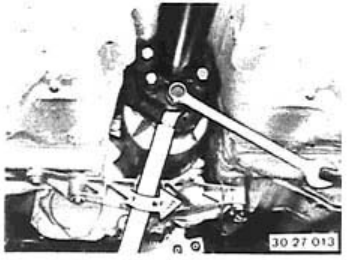
Important!
Never move a car by engine power after removal of the propeller shaft (visco central lock in the transfer box would be damaged).
Remove exhaust assembly – 18 00 020.
Remove heat shields.

Loosen the threaded sleeve several turns with Special Tool 26 1 060 or 26 1 040.

Installation:
Tighten the threaded sleeve with Special Tool 26 1 060 or 26 1 040 after finishing installation.
Tightening torque*.



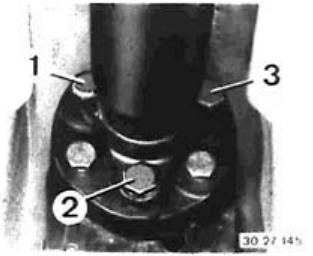
Unscrew propeller shaft on the transfer box.



Installation:
Replace stop nuts.
Tightening torque*.

Important!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.

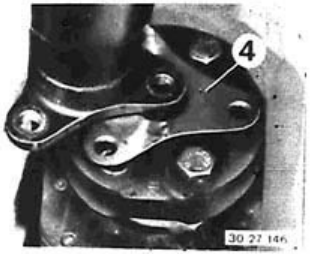
* See Specifications



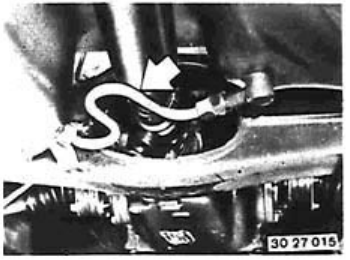
Version without Slide:

Bolts (1 ... 3) must be loosened to take propeller shaft off of transmission.
Joint disc remains on transmission.

Installation:
Tightening torque*.

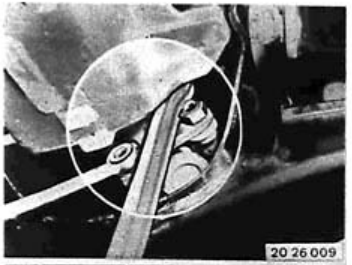


Pull propeller shaft off intermediate flange (4).
Suspend propeller shaft from car on piece of wire.



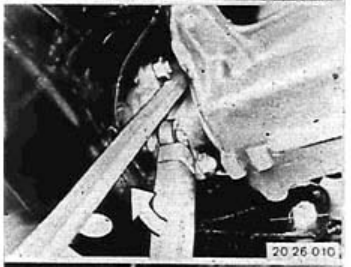
Caution!
Never allow propeller shaft to bear on connection pipe on fuel tank.

* See Specifications



Version with Universal Joint:

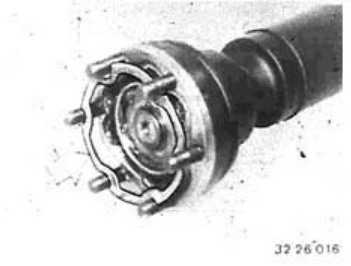
Unscrew propeller shaft on rear axle final drive.



Installation:
Replace stop nuts.
Tightening torque*.

Version with Constant Velocity Joint:

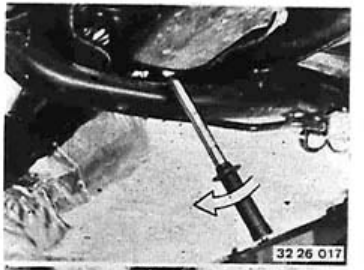
Unscrew propeller shaft on rear axle final drive.



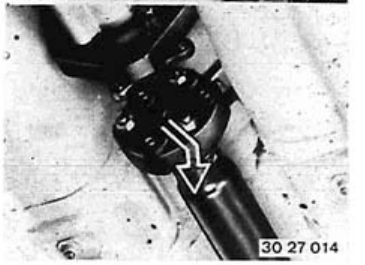
Installation:
Check gasket, replacing if necessary.

Important!
Constant velocity joint is not encapsulated. Protect joint against dirt with transporting cap or something similar. Check grease filling*.

* See Specifications



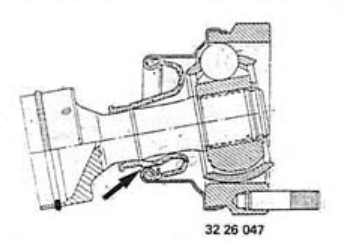
Installation:
Replace stop nuts.
Tightening torque*.



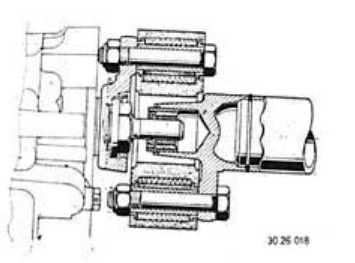
Push propeller shaft together and pull out of center on transfer box.
Remove propeller shaft.

Note!
Propeller shaft was balanced as an assembly and must only be replaced as such.

Caution!
Don't allow propeller shaft to fall on connecting pipe.

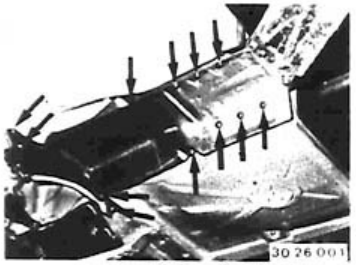


Caution!
Don't allow propeller shaft to fall into joints as this would damage rubber covers especially on constant velocity joints.



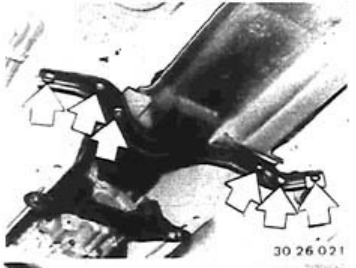
Installation:
Check center, lubricating with Molykote Longterm 2 if necessary.
Replace center if damaged.

* See Specifications



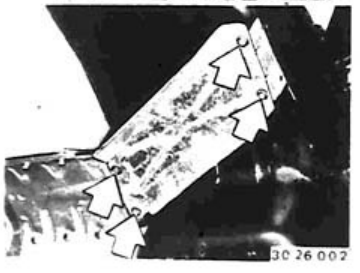
26 11 051 REPLACING JOINT DISC FOR REAR PROPELLER SHAFT

Remove primary and final mufflers 18 12 000.
Unscrew heat shield.

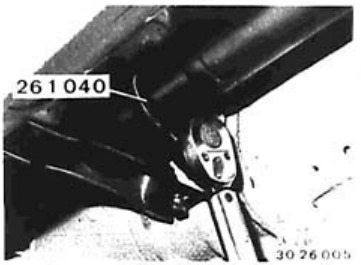


Since 1983 Models:
Unscrew connector.

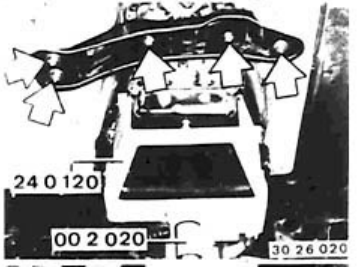
Installation:
Also bolt on holder for oxygen sensor plug on cars with catalytic converter.



Unscrew heat shield.
Installation:
Check for sufficient space between tank and heat shield.

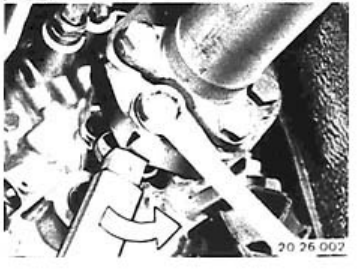


Loosen threaded sleeve several turns with Special Tool 26 1 040.
Installation:
Tighten threaded sleeve with Special Tool 26 1 040 after finishing installation.
Tightening torque*.



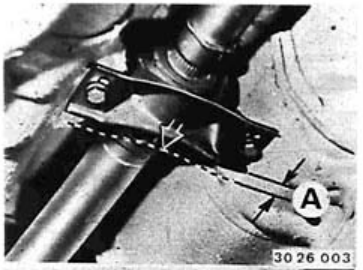
Cars with 4 HP 22 Automatic Transmission:
Support transmission with Special Tools 24 0 120 and 00 2 020.
Unscrew transmission suspension.

Unscrew propeller shaft on transmission.

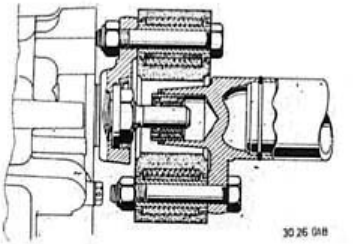


Installation:
Replace stop nuts.
Tightening torque*.
Important!
Only turn on nuts and bolts on flange side whenever permitted by design, to avoid stress in coupling.

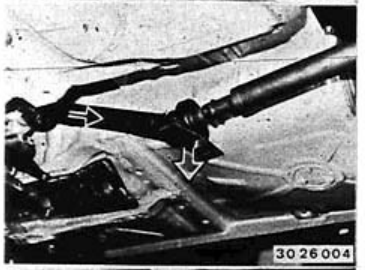
* See Specifications



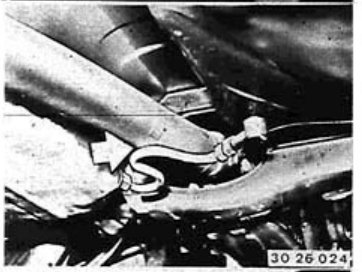
Unscrew center mount.
Installation:
Preload center mount in forward direction A = 4 to 6 mm (0.157 to 0.236").



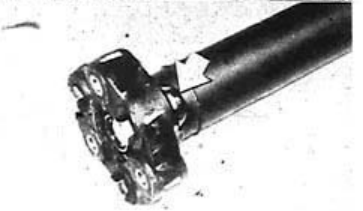
Installation:
Check center, lubricating with Molykote Longterm 2 if necessary.
Replace a damaged center.



Bend propeller shaft down and pull out of centering pin on transmission.
Push propeller shaft together completely on slide if necessary.
Note:
Propeller shaft was balanced in assembled state and may only be replaced as such.
Do not disconnect propeller shaft on slide.

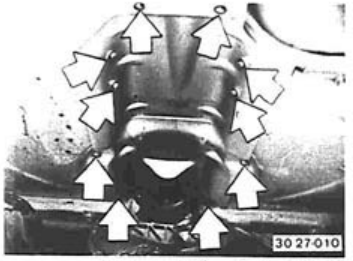


Caution!
Don't let propeller shaft rest on fuel tank connecting line.



Replace coupling.
Install coupling that arrows face flange arms.
Tightening torque*.

* See Specifications

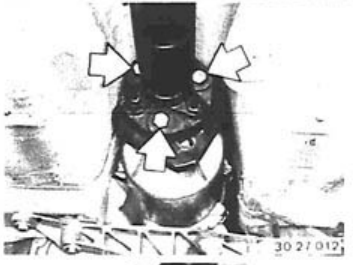


26 11 051 REPLACING JOINT DISC FOR PROPELLER SHAFT (REAR) – Four Wheel Drive –

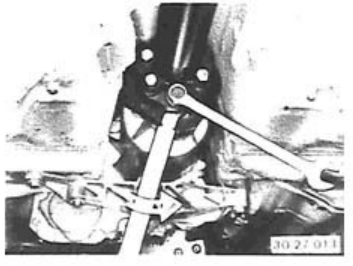
Remove exhaust assembly - see 18 00 020.
Unscrew heat shield.

Loosen threaded sleeve several turns with Special Tool 26 1 060 or 26 1 040.

Installation:
Tighten threaded sleeve with Special Tool 26 1 060 or 26 1 040 after finishing installation.
Tightening torque*.



Unscrew propeller shaft on transfer box.



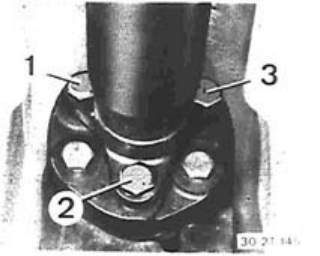
Installation:
Replace stop nuts.
Tightening torque*.

Important!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.

* See Specifications

Push propeller shaft together and pull out of center on transfer box.

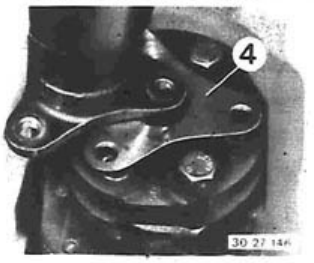
Note!
Propeller shaft was balanced as an assembly and must only be replaced as such.



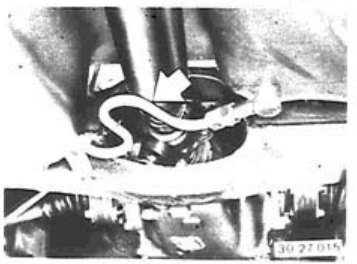
Version without Slide:

Bolts (1 ... 3) must be loosened to remove propeller shaft from gearbox. Joint disc remains on gearbox.

Installation:
Tightening torque*.

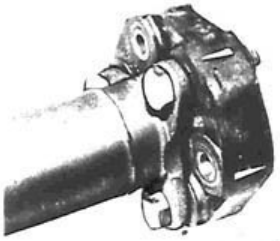


Pull propeller shaft off intermediate flange (4).
Suspend propeller shaft from car on piece of wire.



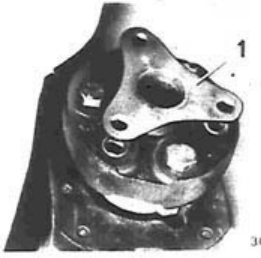
Caution!
Never allow propeller shaft to bear on connection pipe on fuel tank.

* See Specifications



Replace joint disc.
Mount joint disc that arrows point to flange arms.
Tightening torque*.

Caution!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.



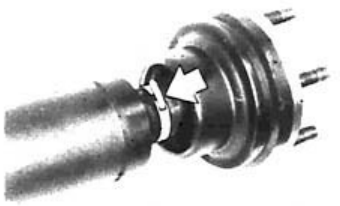
Version with Intermediate Flange:

Pull intermediate flange (1) off centering pin.
Check center, lubricating with Molykote Longterm 2 if necessary.
Replace center if damaged.

Unscrew joint disc from transmission.
Replace joint disc.
Mount joint disc that arrows point to flange arms.
Tightening torque*.

Caution!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.

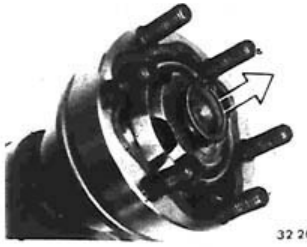
* See Specifications



32 26 035

26 11 160 REPLACING CONSTANT VELOCITY JOINT FOR PROPELLER SHAFT

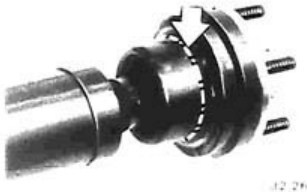
Remove propeller shaft – see 26 11 000.
Remove hose clamp.



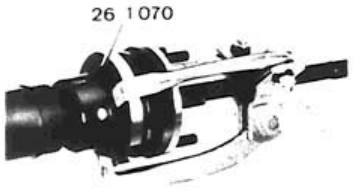
32 26 036

Lift out circlip.

Installation:
Replace circlip.



Saw through metal sleeve along line all around.



Push back sleeve.
Apply Special Tool 26 1 070.
Pull off constant velocity joint with a standard puller.

32 26 039

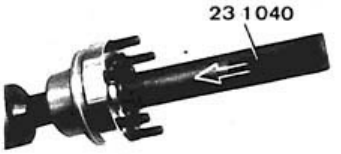
Fill new constant velocity joint with 80 grams of grease**.

Note:
Don't cant inner race with cage, since balls would fall out.

32 26 040

Clean splines to remove grease and coat with bolt cement**.

Important!
Keep bolt cement out of ball paths.



32 26 041

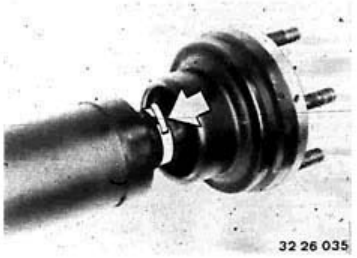
Drive constant velocity joint on propeller shaft with Special Tool 23 1 040.

32 26 042

Install circlip.

Note:
Check for correct and tight fit.

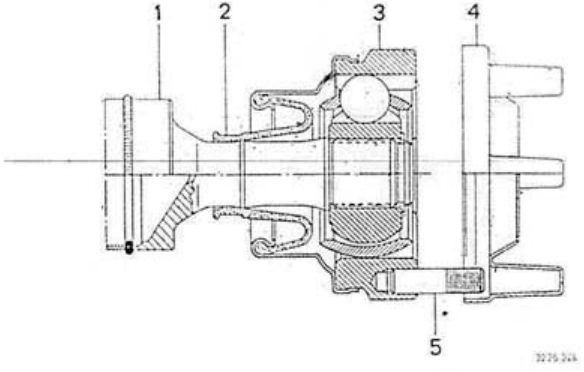
** Source of Supply: HWB



Install hose clamp on dust cover.

Constant Velocity Joint Assembly

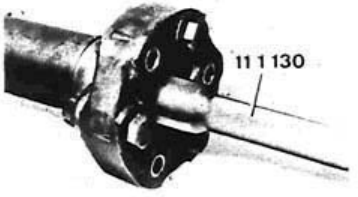
1 Propeller shaft
2 Dust cover
3 Constant velocity joint
4 Transporting cap
5 Stud



26 11 501 REPLACING FRONT CENTER FOR PROPELLER SHAFT – PROPELLER SHAFT REMOVED –

20 26 018

Pack center with a viscous grease.
Insert a 14 mm diameter mandrel (0.551").
Apply hammer knocks on mandrel to produce pressure and drive out center.

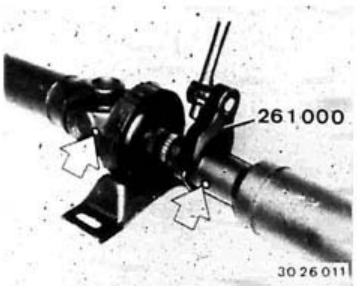


20 26 019

Lubricate center with Molykote Longterm 2 and drive in with Special Tool 11 1 130.
Sealing lip faces out.

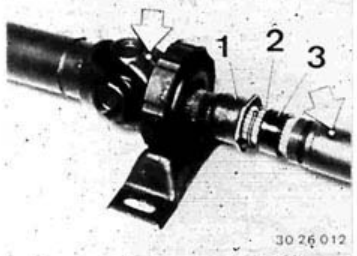
20 26 020

Protrusion A = 4.5 mm (0.177").

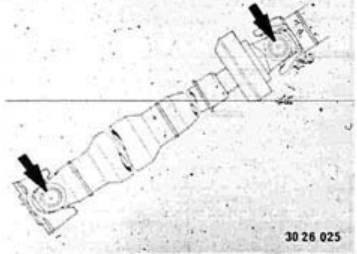


26 12 001 REPLACING PROPELLER SHAFT CENTER MOUNT ASSEMBLY

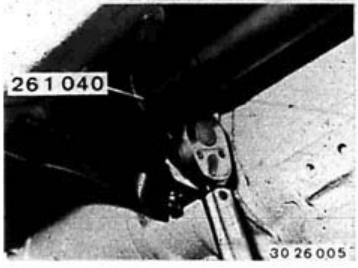
Remove propeller shaft 26 11 000.
Unscrew threaded sleeve with Special Tool 26 1 040.
Pull off front propeller shaft section.
Important!
Propeller shaft was balanced in assembled state and must not be turned in slide.
Punch mark an unmarked propeller shaft.



Installation:
Lubricate slide with Molykote Longterm 2**.
Install threaded sleeve (1), washer (2) and rubber ring (3).
Assemble propeller shaft that punch marks are aligned.

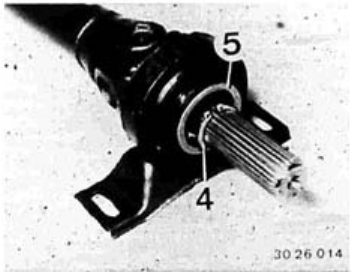


Note:
Propeller shaft sections are installed that universal joints are in one plane.
If slide had been disassembled by mistake without marking, only wrong installation by 180° is possible because of balancing.

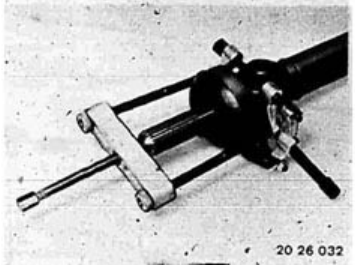


Installation:
Tighten threaded sleeve with Special Tool 26 1 040 after finishing installation.
Tightening torque*.

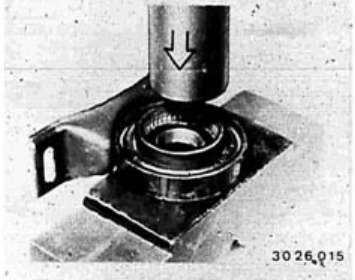
* See Specifications
** Source: HWB



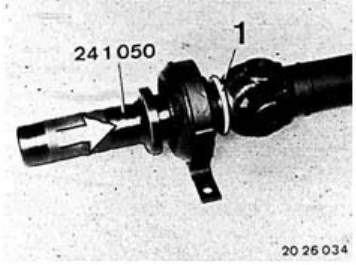
Lift out circlip (4) and remove dust guard (5).



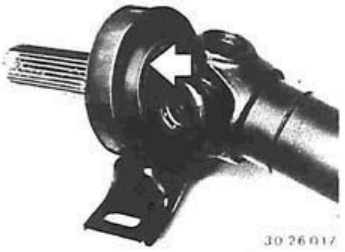
Pull off center mount complete with grooved ball bearing.



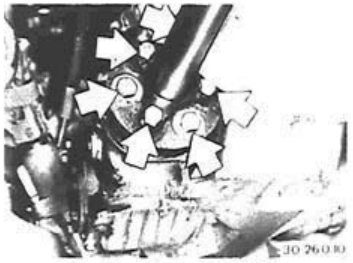
Press grooved ball bearing into center mount.



Install dust guard (1).
Drive on center mount with Special Tool 24 1 050.



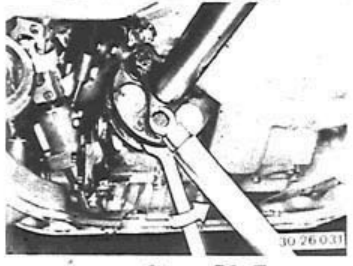
Installation:
Check that dust guard is installed flush with center mount.
Important!
Check that center mount has clearance.



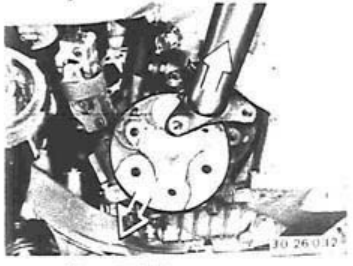
26 20 000 REMOVING AND INSTALLING FRONT PROPELLER SHAFT – All Wheel Drive –

Caution!
Never operate car on its own engine power after removal of the propeller shaft (this would damage the central lock in the transfer box).

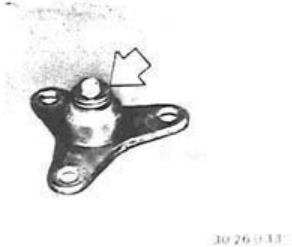
Remove all six bolts.



Installation:
Replace stop nuts.
Tightening torque*.
Important!
Only turn nuts or bolts on flange end whenever possible by design, to avoid tension in joint disc.

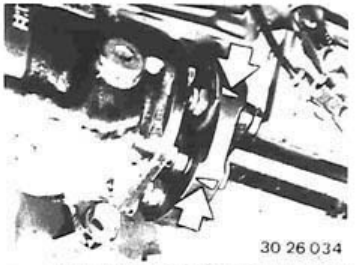


Push back propeller shaft.
Remove joint disc with centering disc.
Installation:
Mount centering disc on flange of propeller shaft.

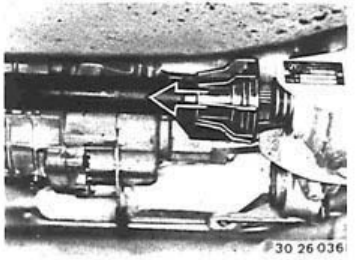


Installation:
Check seal, replacing if necessary.

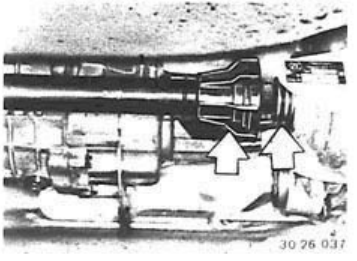
* See Specifications



Installation
Install joint disc that arrows face flange arms.

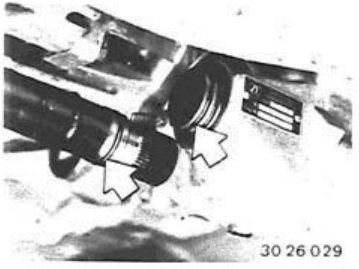


Pull propeller shaft and cap off of transfer box.



Installation:
Check gap and seal, replacing if necessary.
Slide cap on to transfer box after finishing installation.

30 26 028

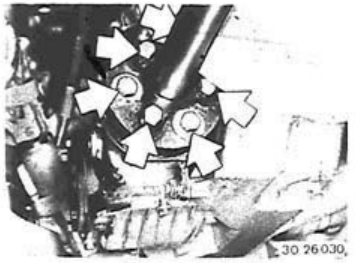


30 26 029

26 20 020 REPLACING CAP FOR FRONT PROPELLER SHAFT
– All Wheel Drive –

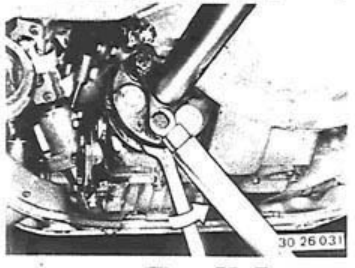
Remove front propeller shaft 26 20 000.
Pull off cap.

Installation:
Check seals on propeller shaft and power divider.

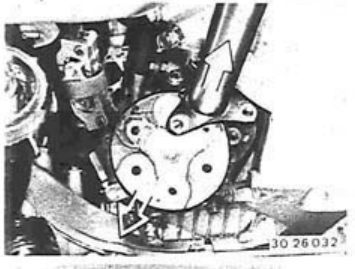


26 20 051 REPLACING JOINT DISC FOR FRONT PROPELLER SHAFT – All Wheel Drive –

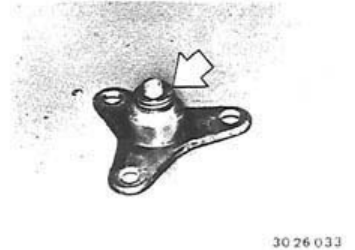
Remove all six bolts.



Installation:
Replace stop nuts.
Tightening torque*.
Important!
Only turn nuts or bolts on flange end whenever possible by design, to avoid tension in joint disc.



Push back propeller shaft.
Remove joint disc with centering disc.
Installation:
Mount centering disc on flange of propeller shaft.



Installation:
Check seal, replacing if necessary.

Installation:
Install joint disc that arrows face flange arms.

Installation:
Slide cap on to power divider after finishing installation.

* See Specifications

TROUBLESHOOTING PROPELLER SHAFT

Condition	Cause	Correction
Drumming (stationary car)	Propeller shaft without influence	Check engine tuning, remove stress in exhaust line
Vibration while moving off forward/reverse (center mount knocking)	Propeller shaft not aligned precisely	Align propeller shaft (S.I. 26 01 77 (235))
	Runout on centering pin, transmission or final drive flanges	Check centering pin and flanges for runout with dial gage – see Specifications; offset or replace final drive flange
	Center mount rubber damaged. Propeller shaft axial compensation.	Replace center mount – 26 12 001. Important! Tighten screw-on bushing to correct torque* with Special Tool 26 1 040.
	Universal joints worn or seized	Check clearance and movement, replacing propeller shaft if necessary – 26 11 000.
	Engine/transmission suspension not okay	Check mounts, aligning or replacing if necessary
	Joint coupling rubber damaged	Replace joint coupling – 26 11 051
Vibration at 40 to 50 km/h (25 to 30 mph)	Propeller shaft not aligned precisely	Align propeller shaft
	Runout on centering pin, transmission or final drive flanges	Check centering pin and flanges for runout with dial gage – see Specifications; offset or replace final drive flange
	Center mount rubber damaged. Propeller shaft axial compensation.	Replace center mount – 26 12 001. Important! Tighten screw-on bushing to correct torque* with Special Tool 26 1 040.
	Universal joints worn or seized	Check clearance and movement, replacing propeller shaft if necessary – 26 11 000.
	Joint coupling rubber damaged	Replace joint coupling – 26 11 051

* See Specifications

TROUBLESHOOTING PROPELLER SHAFT

Condition	Cause	Correction
Drumming from 60 km/h (35 mph) on	Propeller shaft not aligned precisely or installed with stress – axial compensator	Align propeller shaft or check movement of axial compensator, lubricating slide with Molykote Longterm 2 and tightening screw-on bushing to correct torque* if necessary.
	Center damaged	Replace center – 26 11 501
	Runout on centering pin, transmission or final drive flanges	Check centering pin and flanges for runout with dial gage – see Specifications; offset or replace final drive flange.
	Centering error due to worn flange bores (loose bolts)	Replace transmission or final drive flange
	Excessive propeller shaft imbalance; balance plate missing	Balance or replace propeller shaft – see 26 11 000.
	Universal joints worn or seized	Check clearance and movement, replacing propeller shaft if necessary – 26 11 000.
Center mount noise while driving	Center mount not perpendicular to propeller shaft; no or insufficient preload	Preload center mount in forward direction at right angle to propeller shaft.
	Center mount grooved ball bearing not okay	Replace grooved ball bearing – 26 12 001.

* See Specifications

27 Transfer Box

27 10 000	Visco central lock – check in car	27- 1
010	Transfer box – remove and install (manual transmission)	27- 4
010	Transfer box – remove and install (automatic transmission)	27- 7
	Gear set layout for transfer box	27- 11
. . .	Transfer box – disassemble and assemble	27- 12
23 71 003	Rubber mounts for transmission suspension – replace	27- 23
503	Rubber mounts for transmission suspension – replace	27- 25

27 10 000 CHECKING CENTRAL LOCK IN CAR

The condition of a central lock can be checked on a brake test stand with help of the BMW service tester.

Caution!

If only one axle turns in a test on the brake test stand, the central lock will be subjected to strong loads and could be destroyed from excessive heat.

Never exceed the total running time = warm-up time + test time of 60 seconds on the brake test stand.

Make a break of at least 30 minutes after each test cycle. These times are applicable to cold and warm operated cars.

The roller speed of the brake test stand must not exceed 7.5 km/h (4.5 mph).

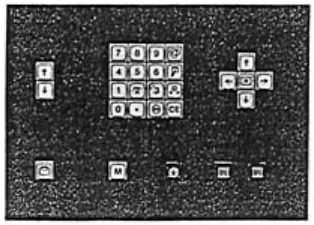
If the roller speed of the brake test stand without load is not known, it can be determined with a '3' series car with ABS, but without all wheel drive, to the methods described in the testing procedures. In so doing the warm-up phase and measuring the braking force are omitted.

30 27 002

Check tire inflation pressure and tire size.
Park rear wheels of car in test stand rollers.
Front wheels are on floor.
Shift lever in neutral.

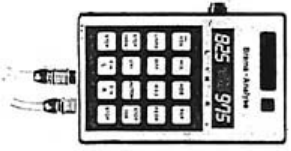
30 27 003

Car must be connected on the BMW service tester, to determine test stand speed (wheel speed) under load.
Switch off electric equipment and ignition.
Connect T-plug (4) between ABS control unit (2) and ABS wire harness (1).



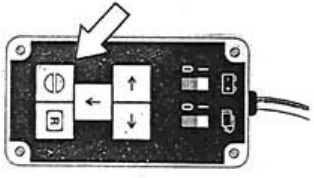
30 27 004

Select test program 03 ABS on BMW service tester.
Select ABS test step 03.
Turn on ignition.



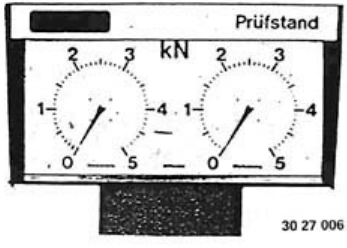
30 27 005

Switch on both rollers of brake test stand.
Run brake test stand approx. 40 seconds (warm-up phase).



30 27 008

Press reset button on BMW service tester after the warm-up time.
The value in ms now appearing at rear left or right is equal to the roller speed.
See diagram.



30 27 006

Read braking force of both wheels on brake test stand and add.

Caution!

Total running time: max. 60 seconds.

Transfer period of time (ms) in diagram.

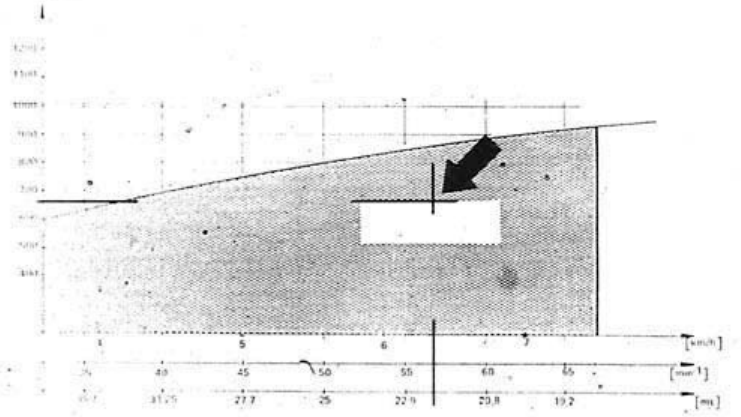
Transfer sum of braking force of both front wheels in diagram.

The condition of the visco central lock is evident from the point of intersection of both lines.

Example:
Pulse wheel period of time: 22 ms.

Braking force of left wheel	300 N (66 lbs.)
Braking force of right wheel	+ 350 N (77 lbs.)
Total braking force	650 N (143 lbs.)

Intersection point of both lines in shaded area.
Visco central lock is faulty.

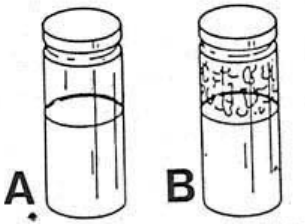


30 27 007

Additional Testing Method:

Normally insufficient locking effect of a visco clutch will be caused by escaping visco liquid.

Visco liquid can be detected in gear lube as described below.



30 27 103

Take an oil sample and pour this oil into a pluggable lab glass or something similar.
Now shake the glass and observe the oil running down the side of the glass after waiting about one minute.
Visco liquid will not mix completely with oil and will run down cloudy due to its greater viscosity.

A = Without visco liquid
B = With visco liquid

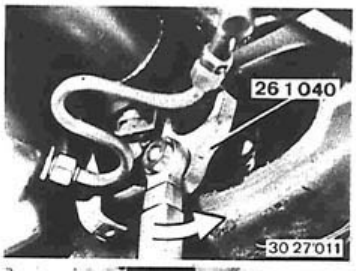
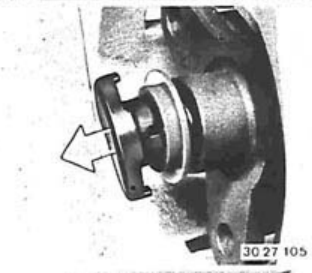
27 10 010 REMOVING AND INSTALLING TRANSFER BOX
– Four Wheel Drive with Manual Transmission –

Note:
When installing a new or exchange transfer box it is important to know that transfer boxes in manual transmission version are supplied filled with oil. Vent bore is sealed off with a plug.

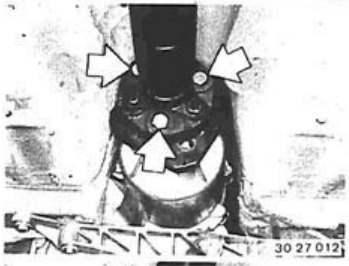


Loosen threaded sleeve several turns with Special Tool 26 1 060 or 26 1 040.

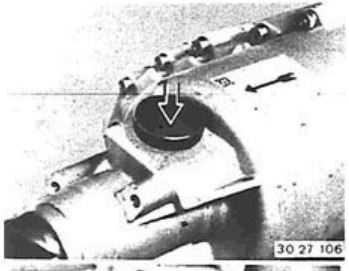
Installation:
Tighten threaded sleeve with Special Tool 26 1 060 or 26 1 040 after completed installation.
Tightening torque*.



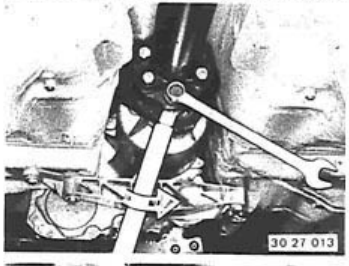
Work vent off protective sleeve of output shaft.



Unscrew propeller shaft on transfer box.

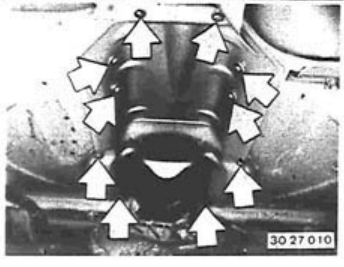


Lift out plug.
Press in vent.
Check oil level after completed installation — also refer to information on label.



Installation:
Replace stop nuts.
Check tightening torque*.

Important!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.

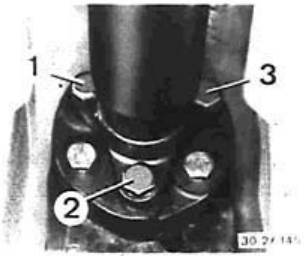


Remove exhaust assembly – see 18 00 020.
Unscrew heat shield.

Push propeller shaft together and pull out of centering pin on transfer box.
Suspend propeller shaft from car on piece of wire.

Note:
Propeller shaft was balanced as an assembly and may only be replaced as such.
Never separate propeller shaft at slide.

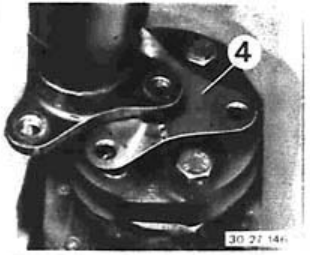
* See Specifications



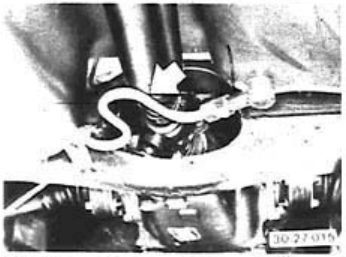
Version without Slide:

Boolts (1 ... 3) must be loosened to remove propeller shaft from transmission.
Joint disc remains on transmission.

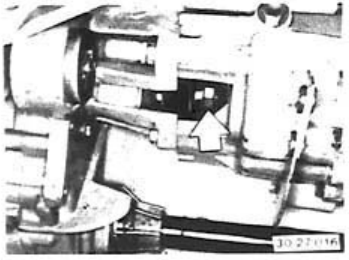
Installation:
Tightening torque*.



Pull propeller shaft off intermediate flange (4).
Suspend propeller shaft from car on piece of wire.

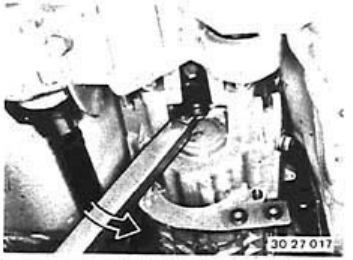


Caution!
Don't allow propeller shaft to bear on connection pipe on fuel tank.



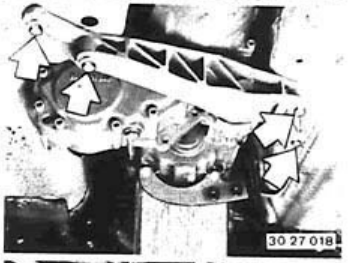
Unscrew joint disc between manual transmission and transfer box from output flange of manual transmission.

* See Specifications



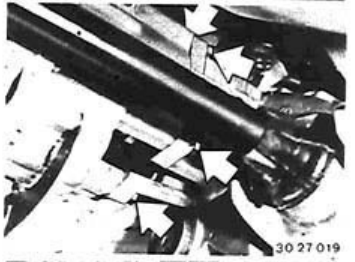
Installation:
Replace stop nuts.
Tightening torque*.

Important!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.



Support transmission from underneath.
Unscrew cross member.

Note:
Different lengths of bolts!



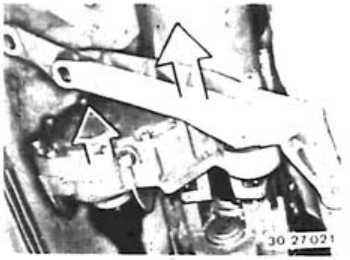
Lower transmission.
Unscrew bolts.

Note:
Upper bolts are accessible with a 17 mm socket, joint and extension in 3/8" version.

Push protective cap forward.

Caution!
Danger of breaking.

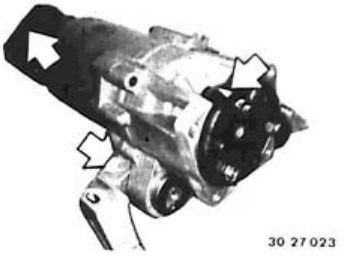
* See Specifications



Pull off transfer box from manual transmission and front propeller shaft (weight of transfer box = approx. 25 kg or 55 lbs.).

Installation:
Check dowel sleeves.
Lubricate guide pins and splines of front propeller shaft lightly with Molykote Longterm 2.
Check position of output flange on transmission to joint disc.

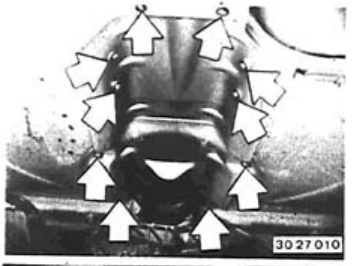
Important!
Check diameter of output shaft journal when exchanging manual transmission. Journal diameter and inside diameter of centering sleeve (1) must be same. If necessary, install different centering sleeve with required inside diameter.



If applicable, remove cross member, joint disc and vibration damper.

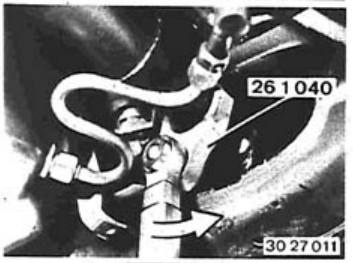
Installation:
Mount joint disc that arrows point to flange arms.
Tightening torque*.
Check and, if necessary, correct oil level after completed installation.

* See Specifications



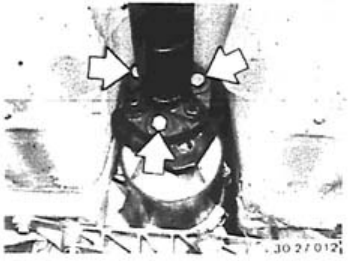
27 10 010 REMOVING AND INSTALLING TRANSFER BOX
– Four Wheel Drive with Automatic Transmission –

Remove exhaust assembly - see 18 00 020.
Unscrew heat shield.

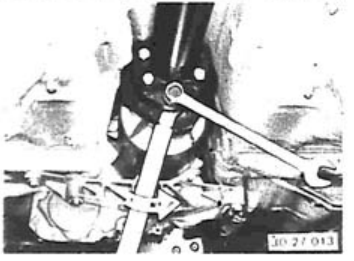


Loosen threaded sleeve several turns with Special Tool 26 1 060 or 26 1 040.

Installation:
Tighten threaded sleeve with Special Tool 26 1 060 or 26 1 040 after completed installation.
Tightening torque*.



Unscrew propeller shaft on transfer box.



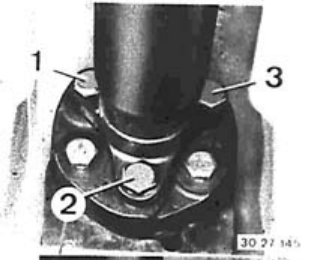
Installation:
Replace stop nuts.
Tightening torque*.

Caution!
Only turn nuts or bolts on flange end whenever possible by design to avoid strain in joint disc.

* See Specifications

Push propeller shaft together and pull out of centering pin on transfer box.
Suspend propeller shaft from car on piece of wire.

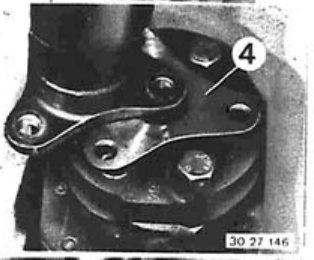
Note:
Propeller shaft was balanced as an assembly and may only be replaced as such.
Never separate propeller shaft on slide.



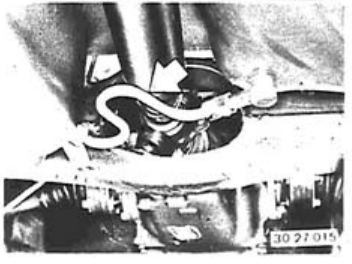
Version without Slide:

Bolts (1 ... 3) must be loosened to remove propeller shaft from transmission.
Joint disc remains on transmission.

Installation:
Tightening torque*.



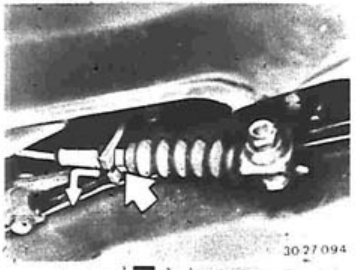
Pull propeller shaft off intermediate flange (4).
Suspend propeller shaft from car on piece of wire.



Caution!
Don't allow propeller shaft to bear on connection pipe on fuel tank.

* See Specifications

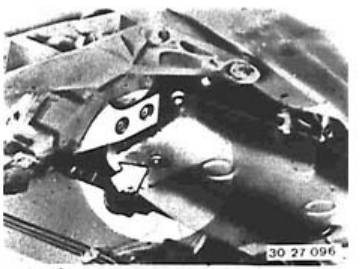
Disconnecting Cable for Range Selector Lever:
Loosen nuts.
Important!
Don't bend the steel wire.



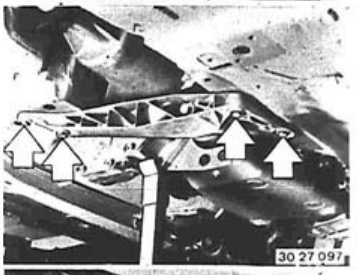
Unscrew nuts.
Push back cable sleeve and disconnect in holder.
Pull cable out of operating lever.

Installation:
Check arrangement of washers.
Check rubber mounts, replacing if necessary.
Adjust shift – see 25 16 050.

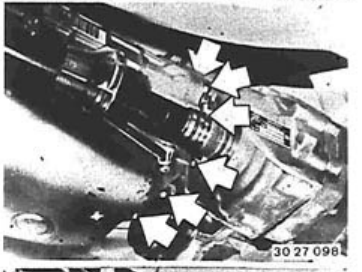
Front Propeller Shaft Section:
Push protective cap forward.



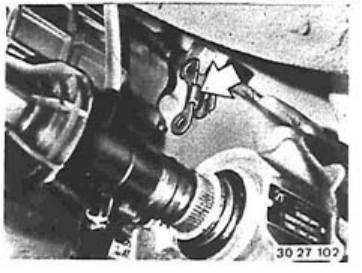
Drain oil in automatic transmission.
Installation:
Fill transmission with ATF – see Group 24.



Support transmission from underneath.
Unscrew cross member.

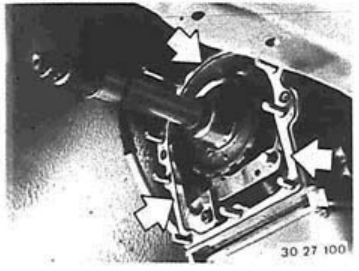


Unscrew nuts (nine) on the transmission/transfer box connection.



Installation:
Also bolt down holder for wires.

Pull off transfer box toward rear.
Installation:
Mesh splines of front propeller shaft section by turning.



Installation:
Check sealing surfaces.
Replace gasket.
Check dowel pins in transfer box.
Check oil level after finishing installation, correcting if necessary.
Fill automatic transmission with ATF.

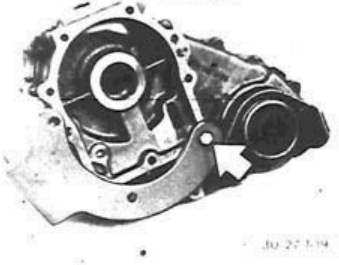
27 10 ... DISASSEMBLING AND ASSEMBLING TRANSFER BOX

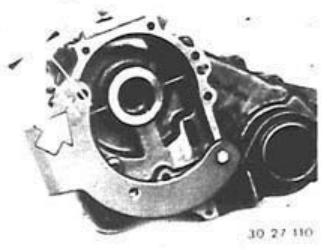
Disassembling Transfer Box:

Mount Special Tool 27 1 000 on Special Tool 00 1 490.
Bolt transfer box on Special Tool 27 1 000.
Manual Transmission:
Three M 10 x 4 bolts with nuts.
Automatic Transmission:
Two M 8 x 40 bolts with nuts.
Drain oil.
Old Special Tool 27 1 000 has to be machined for automatic transmission versions.

Drive out the dowel pin.



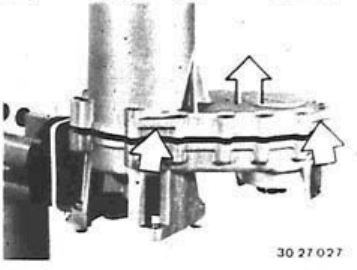
Screw special tool holder on shown bore with a M 8 x 40 bolt only finger tight.



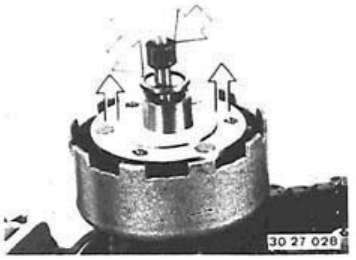
Position holder in such a manner, that a new 10 mm (0.394") dia. hole can be drilled about 5 mm (0.197") away from the old hole.
Mark center point, drill 10 mm (0.394") dia. hole and deburr edges of hole.

Drive dowel pins out of case at rear

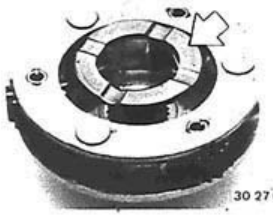
Unscrew all bolts.



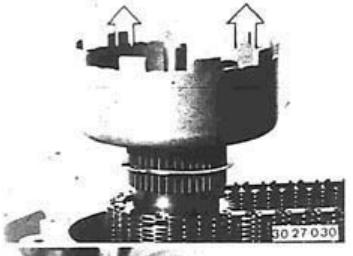
Knock off rear case with uniform knocks from a nylon hammer on the webs.
Lift off rear case.
Remove gasket.



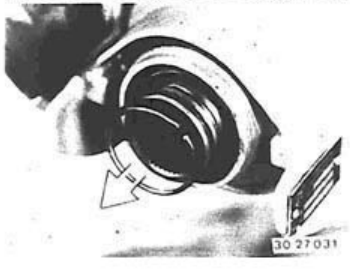
Lift off needle bearing (only manual transmissions), spacer and planet gear set.



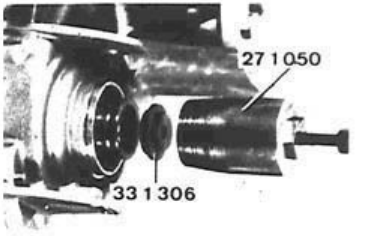
Note:
Check thrust washer in planet gear set.
Oil grooves face the drive shell.



Lift off drive shell.

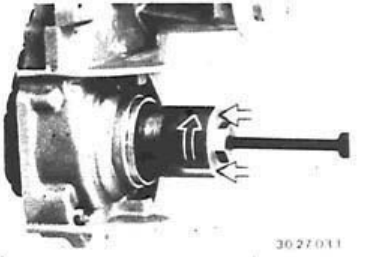


Lift out circlip and O-ring.



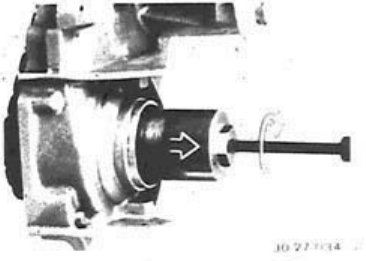
30 27 032

Apply Special Tools 33 1 306 and 27 1 050



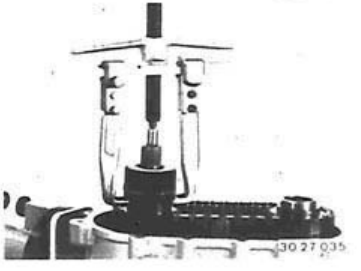
30 27 033

Screw Special Tool 27 1 050 into radial oil seals (two) up to the stop while applying pressure.
Important!
Make sure that the spindle is unscrewed far enough.



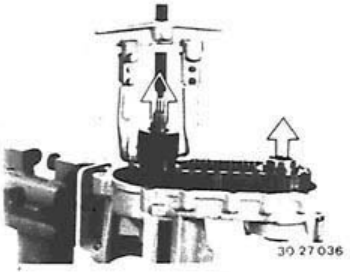
30 27 034

Pull out both radial oil seals by screwing in the spindle.

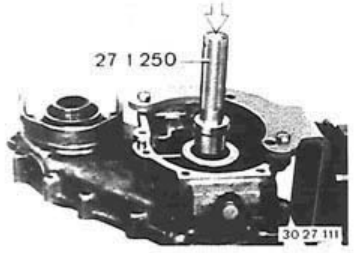


30 27 035

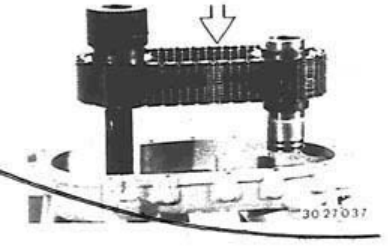
Manual Transmission:
Apply a standard puller



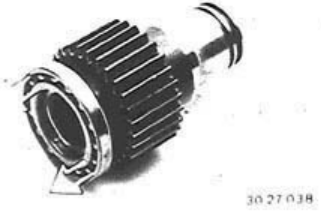
Pull off sprocket, driving off the front drive sprocket with a plastic hammer at the same time.
Important!
Don't cant the chain.



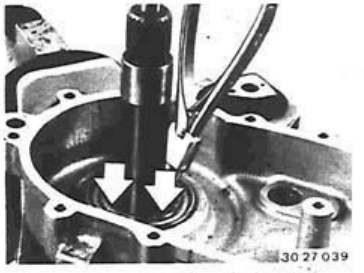
Automatic Transmission:
Insert Special Tool 27 1 250 in the sprocket main shaft.
Drive out both shafts uniformly with a plastic hammer.
Important!
Don't cant the chain.



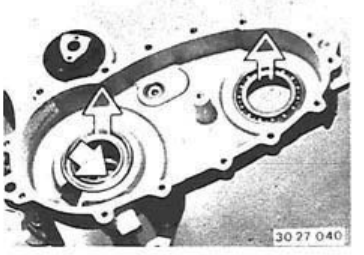
Lift off sprockets with chain.
Note:
Mark running direction of chain, if it can be reused.



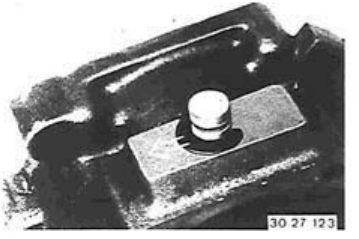
Note:
Grooved ball bearing will remain on the sprocket or in the case, depending on tolerances.
Pull off grooved ball bearing, if necessary.



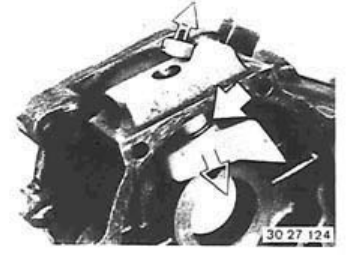
Manual Transmission:
Lift out circlip.
Pull out drive shaft.



Pull out grooved ball bearing, if applicable.
Remove shaft seal (two for automatic transmissions).

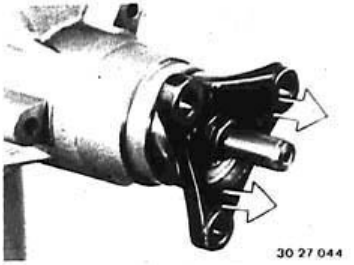


Automatic Transmission:
Pull off clamp.



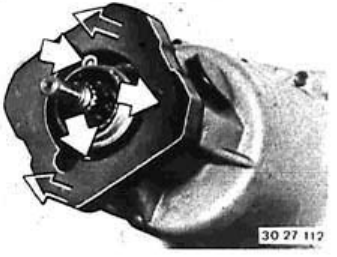
Pull off cap.
Remove vent.
Check O-ring.

Automatic Transmission :
Pull out needle bearing with Special Tool 00 8 550.

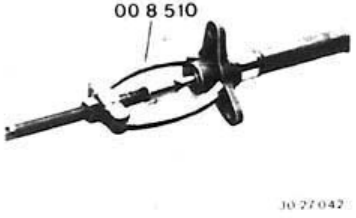


Pull off output flange.

Manual Transmission:
Drive out needle bearing with Special Tool. 23 1 040.

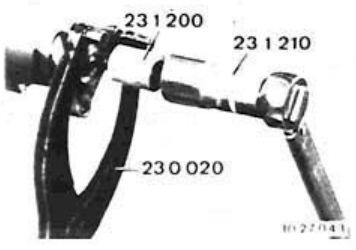


Unscrew damper.



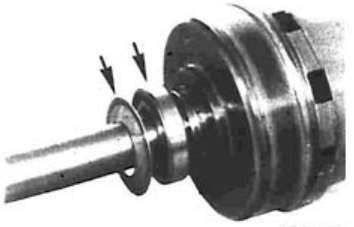
Manual Transmission:
Pull out centering sleeve with Special Tool 00 8 510 together with an expanding sleeve for 14 mm (0.551") diameters.

Drive output shaft out of case with a plastic hammer.



Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.

Drive radial oil seal and grooved ball bearing out of case.



30 27 113

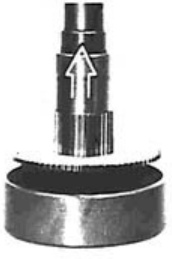
Note:
Grooved ball bearing remains on shaft or in case, depending on tolerances.
Lift off washer, if applicable.
Pull off grooved ball bearing.
Curved surface of washer faces the output flange.

30 27 047

Lift off washer and visco clutch.

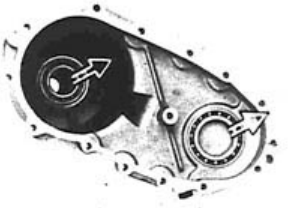
30 27 048

Lift out circlip.



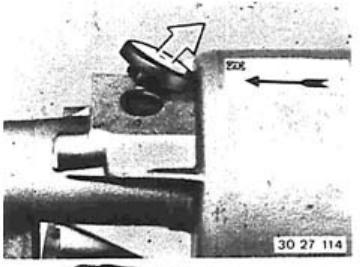
30 27 049

Lift output shaft off of hollow gear wheel.



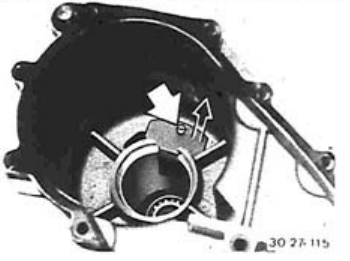
30 27 050

Remove both grooved ball bearings in case.



30 27 114

Lift out vent.

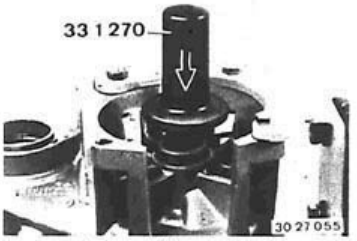


30 27 115

Unscrew oil baffle plate.

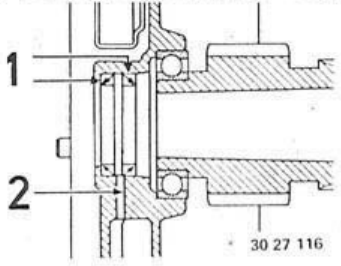
Assembling:

Transfer Box Front Section:
Lubricate all sliding surfaces and seals with the approved grade of oil* when assembling.
Drive in centering sleeve flush with Special Tool 27 1 160.

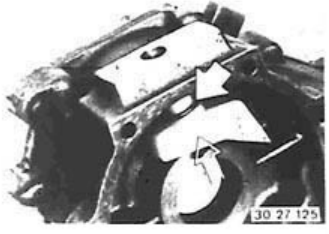


Manual Transmission:
Drive in radial oil seal with Special Tool 33 1 270.

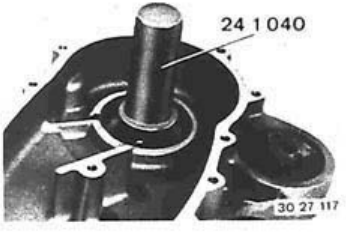
Press in needle bearing with Special Tool 33 1 308.



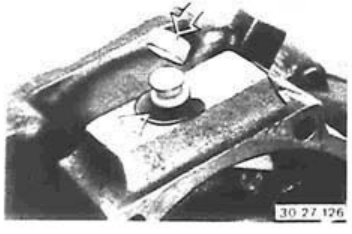
Automatic Transmission:
Two radial oil seals (1) are installed in the version for automatics, one each with its sealing lip facing out and in. Make sure that leak oil bore (2) is not covered.
Radial oil seals can only be installed after disassembling the transfer box.



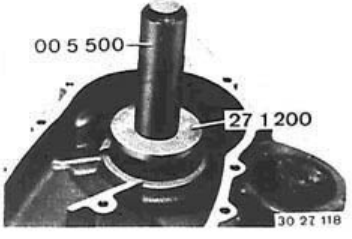
Automatic Transmission:
Place O-ring on vent.
Insert vent.



Automatic Transmission:
Drive in radial oil seal (1) against the stop with Special Tool 24 1 040 - the sealing lip faces out.



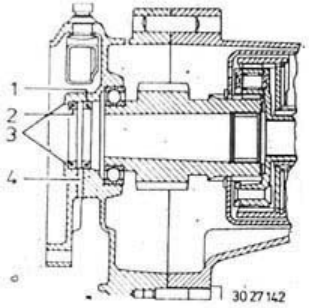
Install clamp.
Install cap.



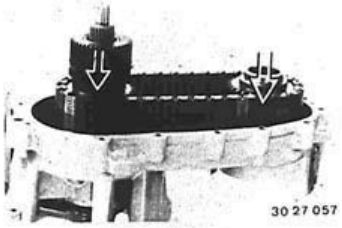
Automatic Transmission:
Drive in radial oil seal (2) with Special Tools 27 1 200 and 00 5 500 - the sealing lip faces in.

* See Operating Fluid Specifications

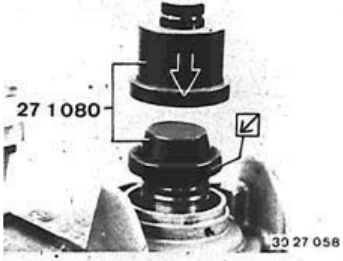
* See Specifications



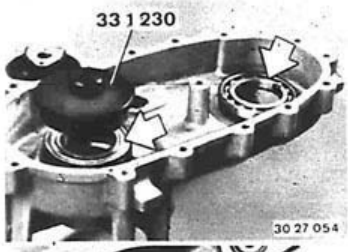
Automatic Transmission:
Bearing collar (3) is omitted on the case since 11.87 for assembling reasons.
Radial oil seals can be installed from the outside.
Check installed position.
Drive in radial oil seal (1) with Special Tools 27 1 270 and 27 1 271 - sealing lip facing IN.
Drive in radial oil seal (2) with Special Tool 27 1 270 - sealing lip faces OUT.
Leak oil bore (4) must not be covered.



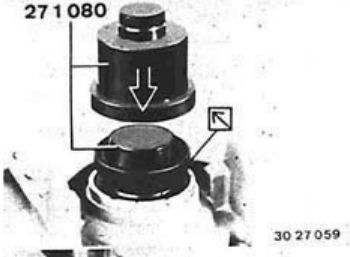
Mount sprockets complete with chain (check running direction if applicable).
Drive both sprockets into bearings with a plastic hammer at the same time.
Important!
Don't cant the chain.



Apply slip sleeve of Special Tool 27 1 080.
Install the first radial oil seal with the sealing lip facing in.
Drive in radial oil seal with Special Tool 27 1 080.

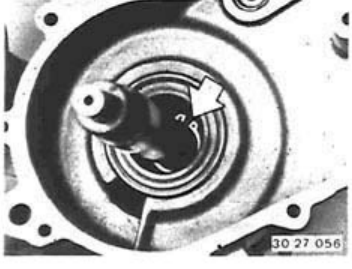


Heat case.
Install both grooved ball bearings with Special Tool 33 1 230.

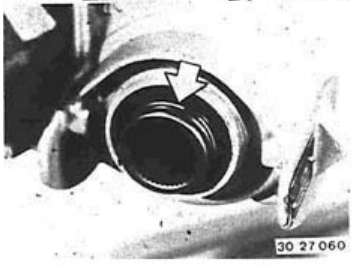


Install the second radial oil seal with the sealing lip facing out.
Drive in both radial oil seals with Special Tool 27 1 080.

Note:
The second radial oil seal is installed without a spiral spring. Parts only supplies radial oil seals with spiral springs. When replacing, it is therefore necessary to remove the spiral spring for the outside radial oil seal.

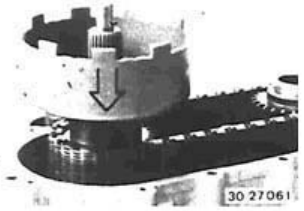


Manual Transmission:
Place input shaft in case.
Install circlip.
Note:
Input shaft is guided only by the radial oil seal or guide pin on the manual transmission.



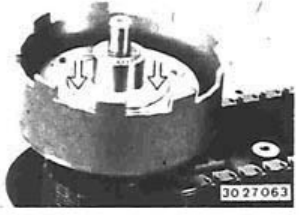
Install circlip and O-ring.

Mount drive shell.

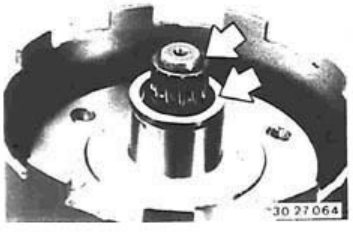


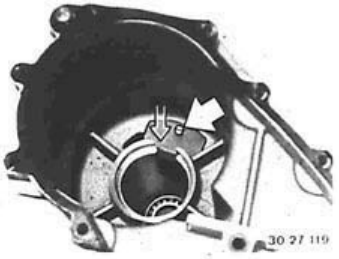
Hold thrust washer in the planet gear set with a small amount of grease.
Note:
Oil grooves face the drive shell.

Mount planet gear set.



Install spacer and needle bearing.

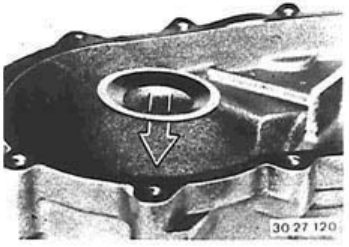




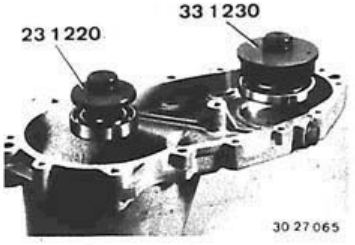
Transfer Box Rear Section:

Install oil baffle plate.
Install bolt with a bolt cement* for locking and sealing.

Note:
The vent is installed only after finishing the assembling procedures and filling some of the oil.



Install washer with curved surface facing down in the ball bearing seat for the main shaft.

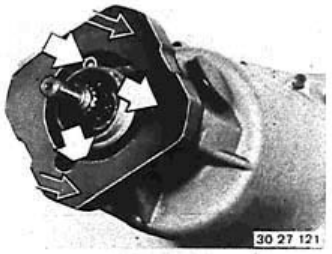


Heat rear case section.
Install grooved ball bearing with Special Tool 33 1 230 or 23 1 220.

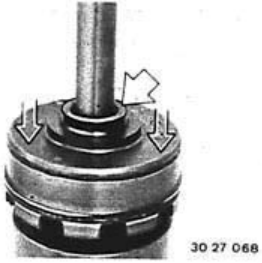
Install grooved ball bearing with Special Tool 32 1 150.

* Source of Supply: HWB

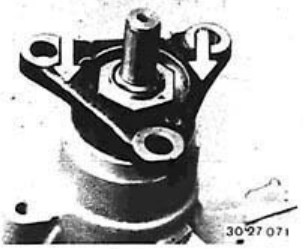
Insert output shaft in hollow gear wheel.
Install circlip.



Mount and screw on damper.



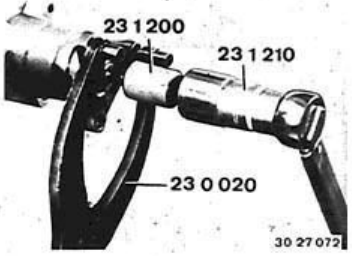
Mount visco clutch and washer.



Mount output flange.
Coat threads with a bolt cement**.
Important!
Use a new collar nut.

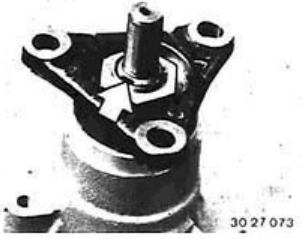
Screw on new collar nut.

Insert output shaft in case.
Apply Special Tools 27 1 120 and 23 1 300.
Pull output shaft into case.



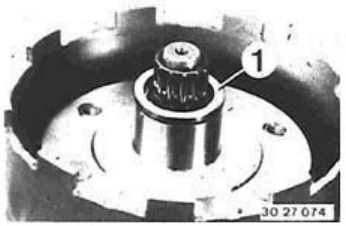
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.

Install radial oil seal with Special Tool 27 1 090.

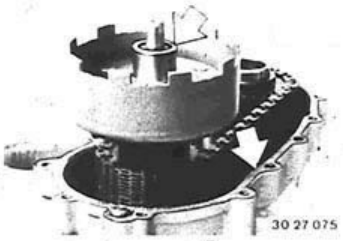


Lock collar nut in the provided recess.

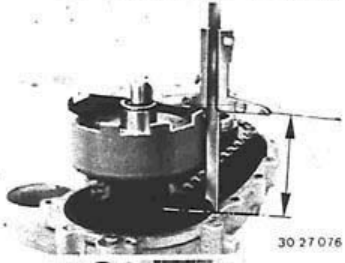
* See Specifications
** Source of Supply: HWB



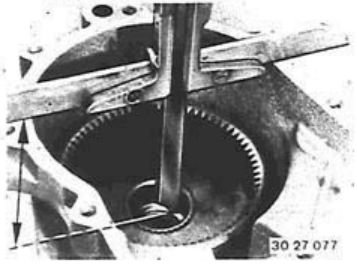
Note:
The thickness of shim (1) has to be determined again, if parts of the input/rear output shaft unit (such as case, bearings, shafts, sprocket, planet gear set, visco clutch or shims) had been replaced.



Install gasket.
Install old shim.



Measure distance from shim to sealing surface on front case section.

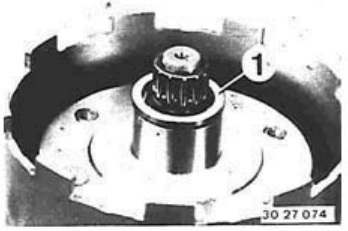


Measure distance from bearing surface for shim to sealing surface on rear case section.

Determine size of gap*.
Example:

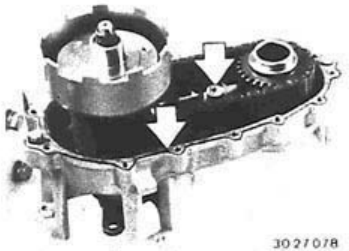
Distance on rear section	101.5 mm (3.996")
Distance on front section –	100.9 mm (3.972")
Size of gap	0.6 mm (0.024")

Note:
The distance on the rear case section must always be larger than that on the front case section, in order to have play between the input and output shafts.



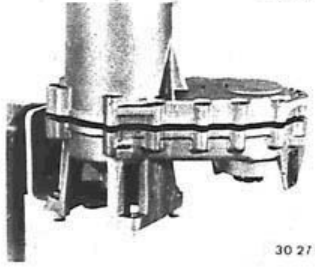
Adjust gap to 0.4 ... 0.6 mm (0.016 to 0.024") by replacing shim (1).
Shims are available from 1.5 to 3.0 mm (0.059 to 0.118") thick in steps of 0.3 mm (0.012").

* See Specifications



30 27 078

Install gasket and seal.

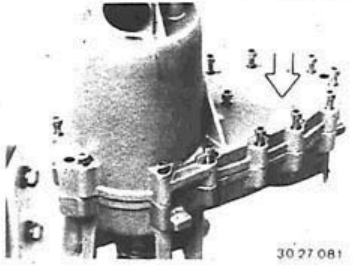


30 27 079

Mount rear case on front case section.

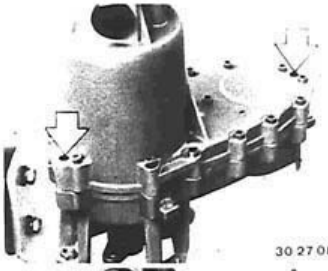
30 27 080

Turn the output flange (while holding the input flange) to have the planet gear set mesh.
Pins on the drive shell must engage in recesses of the visco clutch.



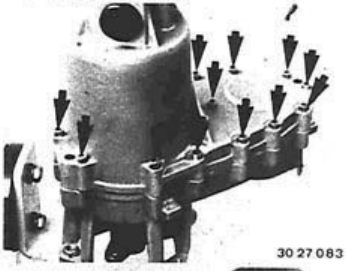
30 27 081

Insert bolts (bolts have different lengths). Drive the case sections together by applying light knocks with a plastic hammer in the front output shaft end area.



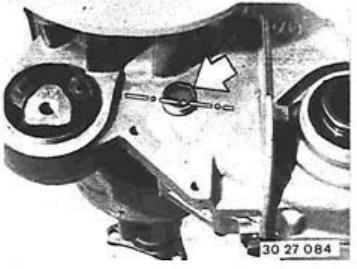
30 27 082

Drive in dowel pins.



30 27 083

Tighten bolts in several steps.
Tightening torque*.

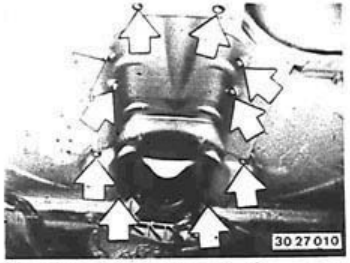


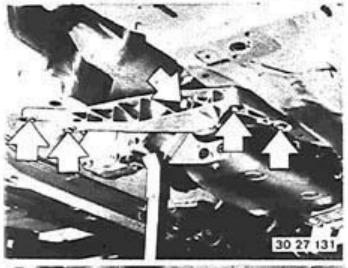
30 27 084

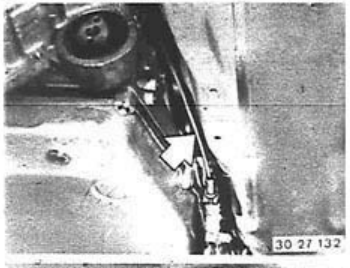
Pour in oil*.

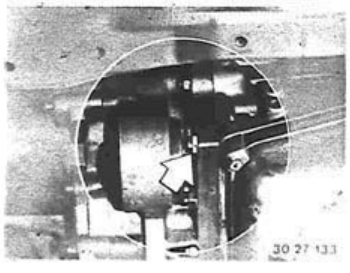
Pour part of the oil (0.06 dm^3) into the vent bore after removing the vent of a removed transmission in case of a completely drained transmission, e.g. after disassembling a transmission. This will guarantee the supply of oil to the rear transmission section when operated initially. The remaining amount of oil should be poured in through the filler neck after installation of the transmission. If too much oil is poured in through the vent, it will flow via the baffle plate to the front axle drive and does not have to be compensated there. Always replace a vent, which has been removed.

* See Specifications









23 71 003 REPLACING RUBBER MOUNTS FOR TRANSMISSION SUSPENSION - Transfer Box Installed- (Cars with Manual or Automatic Transmission)

Remove exhaust assembly and heat shield.

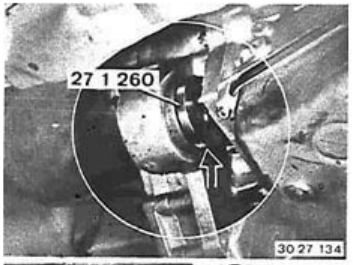
Support transmission from underneath.
Unscrew cross member.
Installation:
Bolts differ in length.
Tightening torque*.

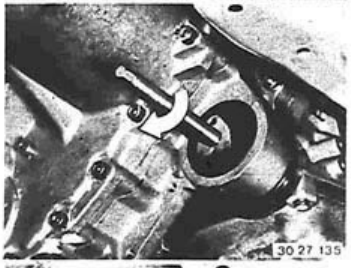
Lower transmission.
Important!
Lower an automatic transmission only enough that the shift operating cable is without tension.

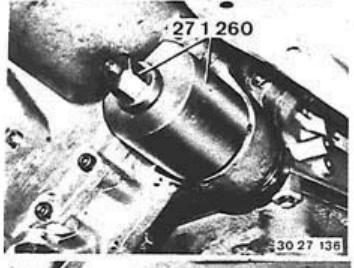
Cars with Automatic Transmission:
Unscrew nut on transfer box/automatic transmission connection.

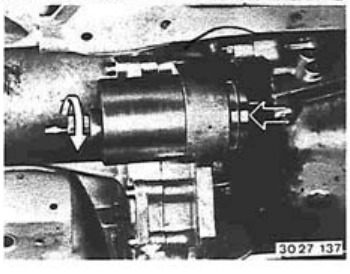
Installation:
Screw on nut again before pressing in a new rubber mount.

* See Specifications









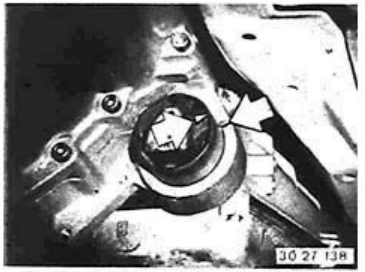
Removal:

Apply plate from Special Tool 27 1 260.

Screw spindle into threads of rubber mount and plate against the stop.

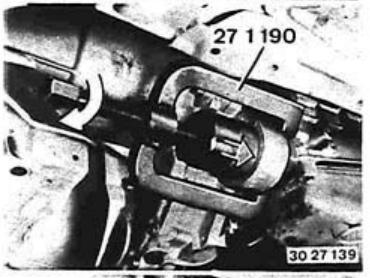
Apply bushing and spindle nut.

Pull out rubber mount.



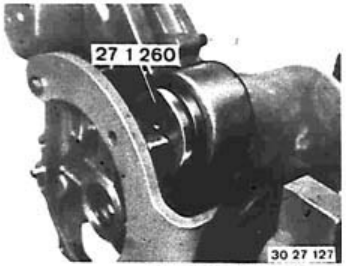
Installation:

Mount new rubber mount.
Arrow on case must be aligned with mark (bead) on rubber mount.
Protruding inner bushing faces toward the rear.



Apply Special Tool 27 1 190.

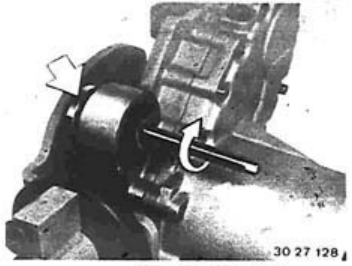
Press in rubber mount flush with the transmission case.



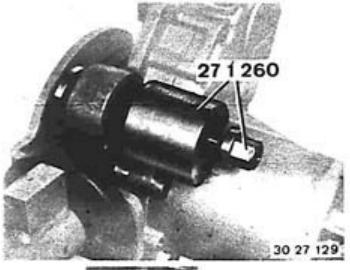
23 71 503 REPLACING RUBBER MOUNT FOR TRANSMISSION SUSPENSION
– Transfer Box Removed –
(Cars with Manual or Automatic Transmission)

Removal:

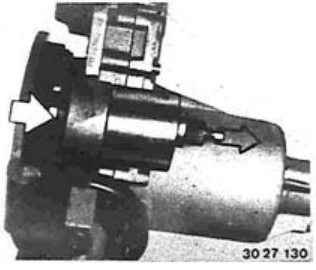
Apply plate from Special Tool 27 1 260.



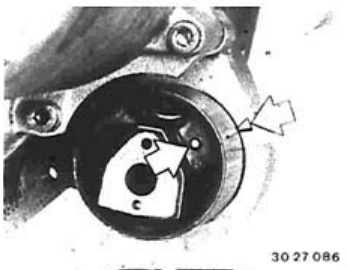
Screw spindle into threads of rubber mount AND plate against the stop.



Apply bushing and spindle nut.

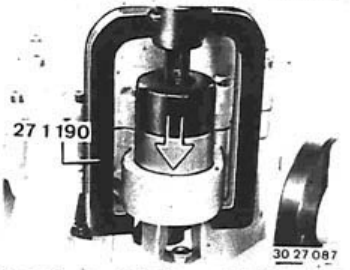


Pull out rubber mount.

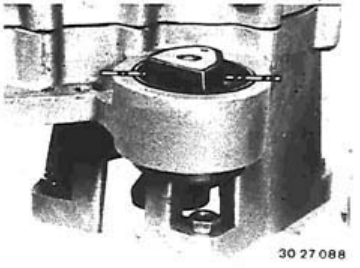


Installation:

Mount new rubber mount.
Arrow on case must be aligned with mark (bead) on rubber mount.
Protruding inner bushing faces back.



Apply Special Tool 27 1 190.



Press in rubber mount flush with transmission case.

31 Front Axle

	Front wheel suspension layout	31- 1
31 10 000	Front axle assembly – remove and install	31- 2
31 11 001	Front axle carrier – replace	31- 4
	Front axle carrier – replace (four wheel drive)	31- 5a
31 12 000	Control arm, left or right – remove and install	31- 6
	Control arm, left or right – remove and install (four wheel drive)	31- 6a
048	Bracket for control arm, left or right – remove and install or replace	31- 7
130	Rubber mounts for control arm, left or right – replace	31- 8
31 21 121	Wheel hub (drive flange), left or right – remove and install (four wheel drive)	31- 9
151	Bearings of wheel hub (drive flange), left or right – replace	31- 9a
180	Bearings (wheel hub) for front wheel – replace (four wheel drive)	31- 10

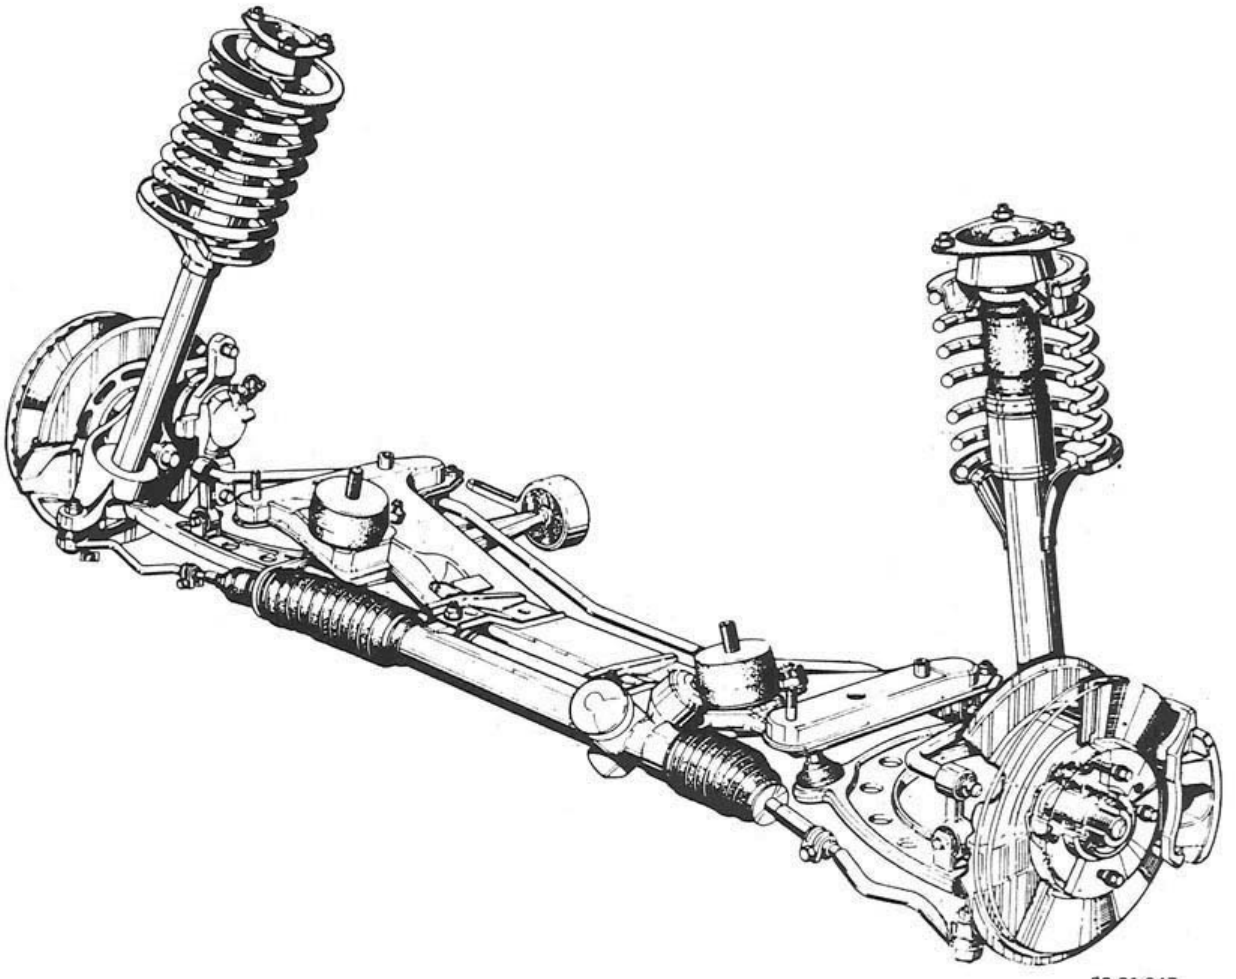
31 50 000	Front axle final drive – remove and install or replace	31- 22
31 51 010	Shaft seal for drive flange of front axle final drive – replace	31- 23
015	Shaft seal for output shaft, left – replace	31- 25
020	Shaft seal for output shaft, right – replace	31- 25
31 52 505	Drive pinion / ring gear – remove and install (front axle final drive removed)	31- 26
	Drive pinion / ring gear layout	31- 27
510	Bearing for drive pinion – replace (front axle final drive removed)	31- 27
520	Drive pinion and ring gear – replace (front axle final drive removed)	31- 30
31 53 050	Bearing (in console) for output shaft, right – replace	31- 32
500	Differential – remove and install (front axle final drive removed)	31- 33
	Differential bearing layout	31- 34
31 53 510	Differential gears – replace (front axle final drive removed)	31- 34
520	Differential bearings (both) – replace (front axle final drive removed)	31- 37
	Adjustments on front axle final drive	31- 39
31 60 000	Output shaft, left or right – remove and install or replace	31- 45
020	Constant velocity joint (outer) of output shaft – replace	31- 47
021	Constant velocity joint (inner) of output shaft – replace	31- 47
030	Dust cover of output shaft, left or right – replace	31- 48

31-1

FRONT WHEEL SUSPENSION ASSEMBLY DRAWING

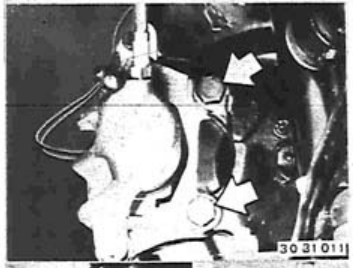


30 31 047

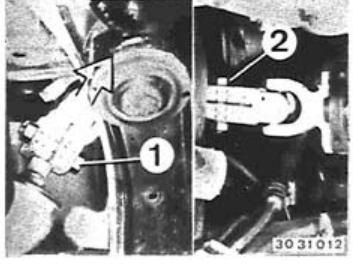
31 10 000 REMOVING AND INSTALLING FRONT AXLE ASSEMBLY

Only Cars With SRS:
Remove steering wheel – see Group 32.
Remove front wheels – see Group 36.
Note:
Check front wheel alignment with an optical tester after installation – see Group 32.

Disconnect plugs for brake pad wear indicator and EDC (see information in Group 37).
Unscrew ground lead.
Disconnect wires and brake hoses in holders on left and right spring struts.
Remove ABS pulse sender – see Group 61.

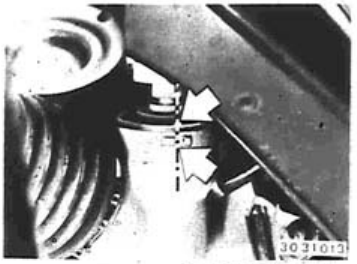


Unscrew left and right brake calipers and suspend from body on pieces of wires.
Brake hoses remain connected.
Installation:
Tightening torque*.

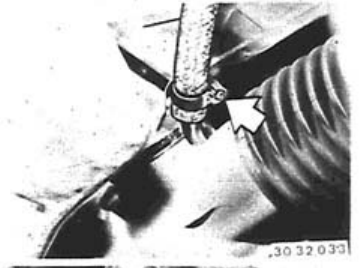


Remove bolt (1).
Loosen bolt (2).
Press steering spindle off of steering gear and remove.
Installation:
Bolt (1) must be located in groove of steering shaft.
Replace self-locking nut.
Tightening torque*.

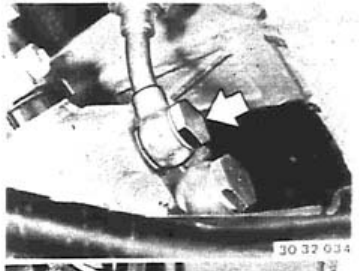
* See Specifications of Gr. 32 and 34



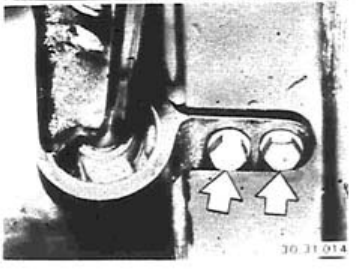
Installation:
Steering wheel and front wheels in straight ahead position. (marks on case and steering shaft aligned).
Mount steering spindle on the steering gear in such a manner, that clamping slot of universal joint is aligned with mark on steering gear.



Cars with Power Steering:
Draw off hydraulic fluid in tank.
Disconnect hydraulic return hose.
Important!
Never reuse drained hydraulic fluid.

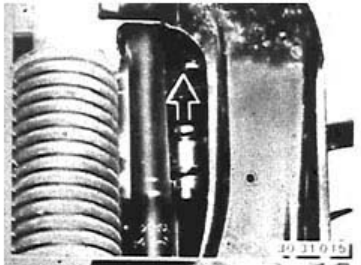


Disconnect pressure hose.
Plug open connections with dust caps.
Installation:
Replace seals.
Tightening torque*.
Fill power steering – see Group 32.

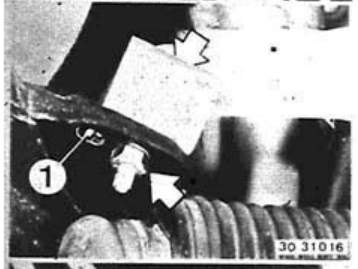


Unscrew holders for left and right control arms.
Remove heat shield for right control arm holder.
Installation:
Tightening torque*.

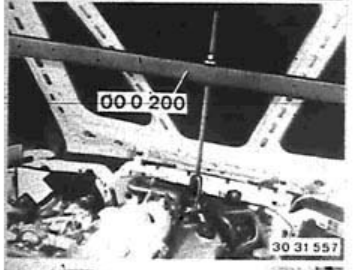
* See Specifications of Gr. 32



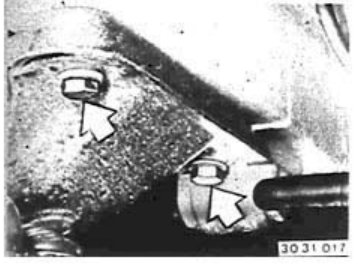
Four Cylinder Models:
Unscrew engine damper on front axle carrier.



Unscrew left and right engine mounts on front axle carrier.
Loosen right engine mount at top.
Installation:
Engine mount turning lock (1) must engage in the bore.
Tightening torque*.

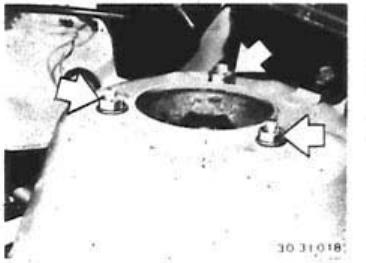


Attach Special Tool 00 0 200 on the engine.
Adapters bear on bolts of side panel walls.
Support front axle carrier from underneath with a shop jack.



Unscrew bolts on left and right sides.
Installation:
Tightening torque*.

* See Specifications of Gr. 11

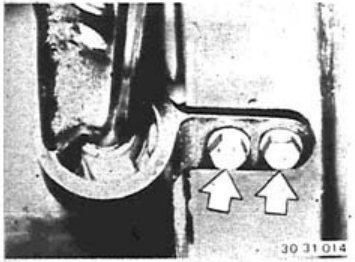


Unscrew nuts on left and right sides.
Lower front axle slowly.
Caution!
Don't let spring struts tilt out or sag through
This would damage the ball joints.
Installation:
Replace self-locking nuts.
Tightening torque*.

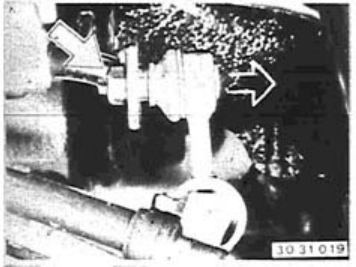
* See Specifications

31 11 001 REPLACING FRONT AXLE CARRIER

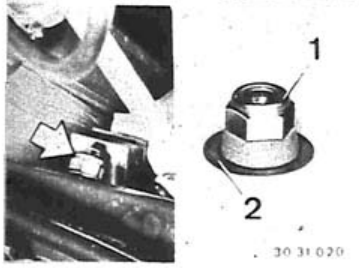
Remove front wheels – see Group 36.
Installation:
Check front wheel alignment with optical tester after installation – see Group 32.



Unscrew brackets for left and right control arms.
Installation:
Tightening torque*.



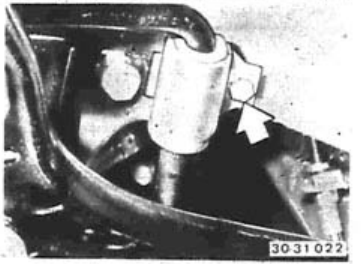
Unscrew left and right push rods on stabilizer.
Installation:
Tightening torque*.



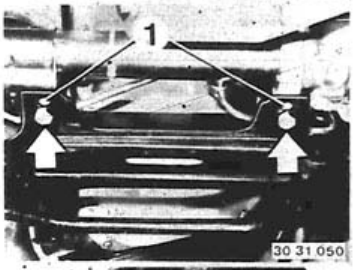
Unscrew nuts on left and right sides.
Installation:
Keep grease off and out of pins and bores.
Install rock nut (1) and washer (2) instead of the standard polystop nut.
Tightening torque*.

* See Specifications

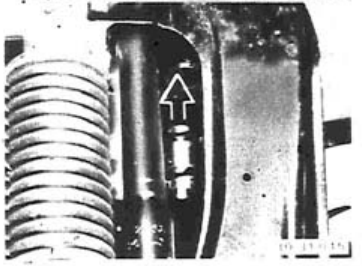
Knock pin loose with a plastic hammer.



Remove stabilizer.
Installation:
Tightening torque*.

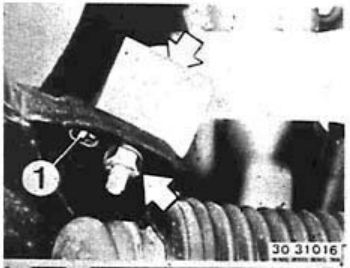


Unscrew steering gear on front axle carrier.
Installation:
Bores (1) are for steering gear without power support.
Replace self-locking nuts.
Tightening torque*.

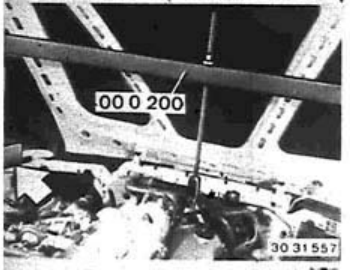


4 Cylinder Models:
Unscrew engine damper on front axle carrier.

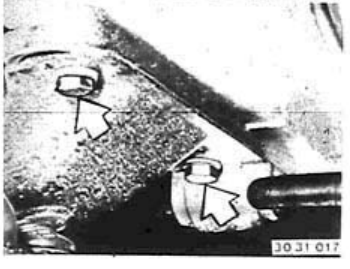
* See Specifications of Group 32



Unscrew left and right engine mounts on front axle carrier.
Loosen right engine mount at top.
Installation:
Engine mount turning lock (1) must engage in bore.
Tightening torque*.



Attach Special Tool 00 0 200 on engine.
Adapters bear on bolts of side walls.



Unscrew left and right bolts.
Remove front axle carrier.
Installation:
Tightening torque*.

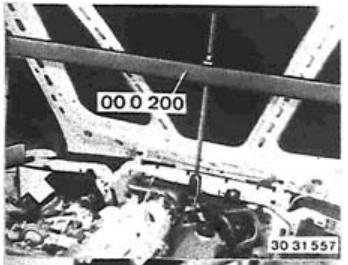
* See Specifications

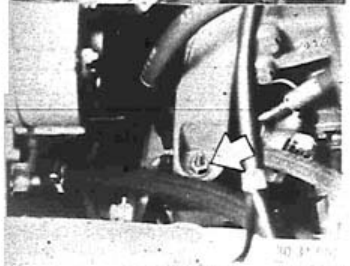
31 11 001 REPLACING FRONT AXLE CARRIER – Four Wheel Drive –

Remove splash guard – see Group 51.
Remove front wheels – see Group 36.
Remove air cleaner – see Group 13.
Draw off hydraulic fluid in tank.

Installation:
Check front wheel alignment after installation – see Group 32.
Bleed power steering – see Group 32.

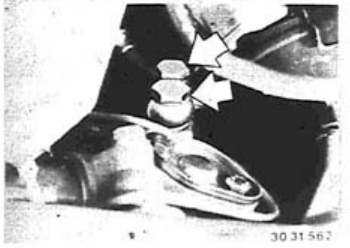
Attach Special Tool 00 0 200 on engine.
Supports bear on bolts of side walls.





Unscrew left and right engine mounts.

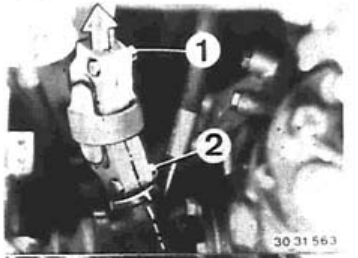
Installation:
Tightening torque*.



Unscrew hydraulic fluid pipes.
Plug openings.

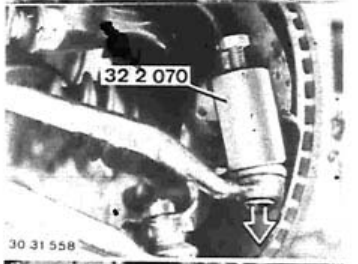
Installation:
Replace gaskets.
Tightening torque*.

* See Specifications of Gr. 31 and 32



Loosen bolt (1).
Remove bolt (2) and pull steering spindle off steering gear.

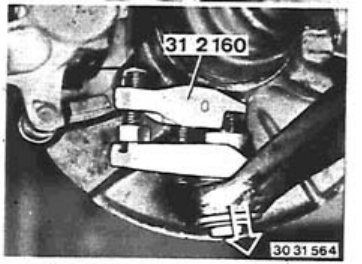
Installation:
Slot of steering spindle faces mark of cap.
Bolt (2) must be in locking groove of steering shaft.
Replace self-locking nuts.
Tightening torque*.



Unscrew left and right nuts and pry off tie rods with Special Tool 32 2 070.

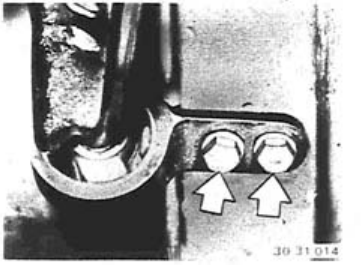
Installation:
Bore and pin free of grease.
Replace self-locking nuts.
Tightening torque*.

Caution!
Don't turn power steering as far as stop – radial oil seal would be damaged.



Unscrew left and right nuts and pry off control arms with Special Tool 31 2 160.

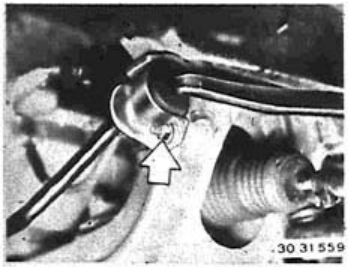
Installation:
Bore and pin free of grease.
Tightening torque*.
Lock nuts with cotter pins.



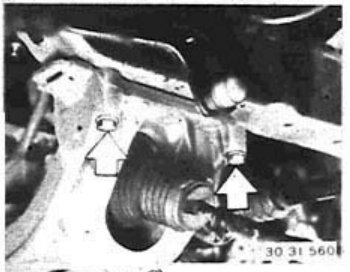
Unscrew brackets for left and right control arms.

Installation:
Tightening torque*.

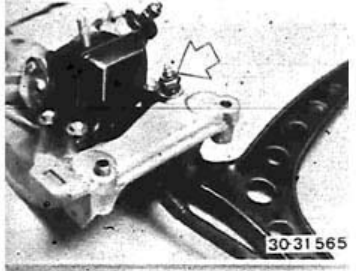
* See Specifications of Gr. 31 and 32



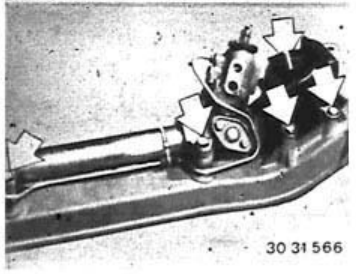
Unscrew left and right stabilizer mounts.



Support front axle carrier with Special Tool 00 2 020 and a workshop jack.
Unscrew bolts and lower front axle carrier.
Installation:
Clean tapped bores.
Always replace and install bolts with a bolt cement**
Tightening torque*.

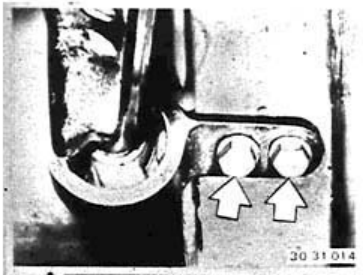


Unscrew both control arms.
Installation:
Mount control arms in installed position, so that rubber parts of tapered joints are not turned wrong.
Replace self-locking nuts.
Tightening torque*.



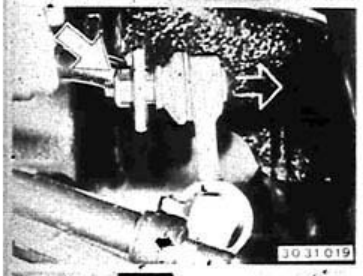
Unscrew engine mounts and steering gear.
Installation:
Replace self-locking nuts.
Tightening torque*.

* See Specifications of Groups 31 and 32
** Source of Supply: HWB

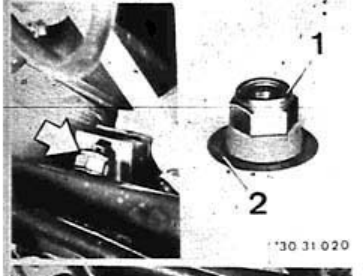


31 12 000 REMOVING AND INSTALLING LEFT OR RIGHT CONTROL ARM

Remove front wheel – see Group 36.
Unscrew holder for control arm.
Installation:
Tightening torque*.

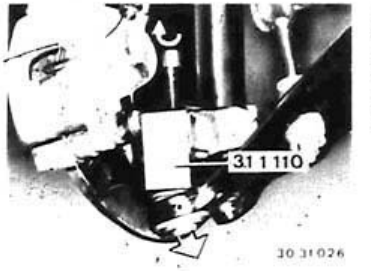


Unscrew push rod on stabilizer.
Installation:
Tightening torque*.



Unscrew nut.
Installation:
Keep grease off of pins and bores.
Install locknut (1) and washer (2) instead of the standard polystop nut.
Tightening torque*.

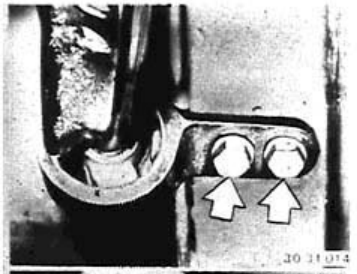
Knock pin loose with a plastic hammer.



Unscrew nut and press off guide joint with Special Tool 31 1 110 (or 31 2 160 for M 3 cars).
Installation:
Keep grease off of pins and bores.
Replace self-locking nut.
Tightening torque*.

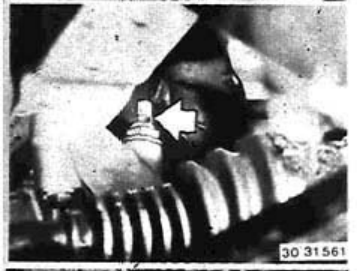
* See Specifications

* See Specifications

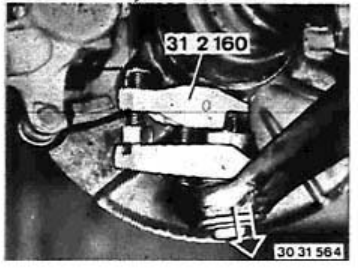


31 12 000 REMOVING AND INSTALLING LEFT OR RIGHT CONTROL ARM
– All Wheel Drive –

Remove front wheel – see Group 36.
Unscrew control arm bracket.
Installation:
Tightening torque*.

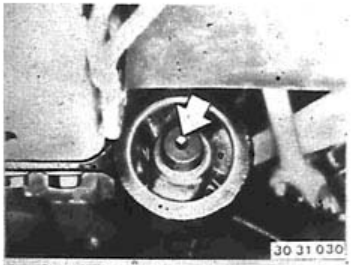


Unscrew nut.
Installation:
Replace self-locking nut.
Tightening torque*.



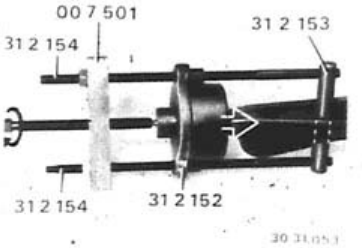
Unscrew nut.
Press off control arm with Special Tool 31 2 160.
Installation:
Keep grease out of bore and off of pin.
Tightening torque*.
Lock nut with cotter pin.

* See Specifications

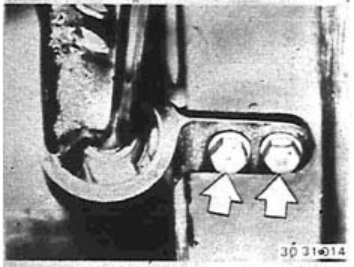


31 2 048 REMOVING AND INSTALLING/ REPLACING BRACKET FOR LEFT OR RIGHT CONTROL ARM

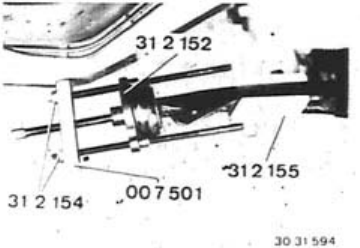
Punch mark center of control arm.



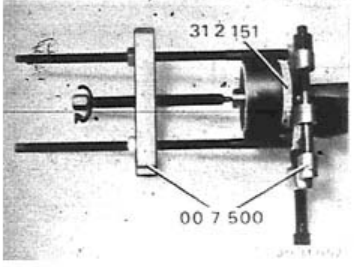
Coat control arm journal with an approved lubricant**.
Engage Special Tool 31 2 153 in control arm bore.
Pull on bracket/mount against stop on control arm with Special Tools 31 2 152/154 and 00 7 501.



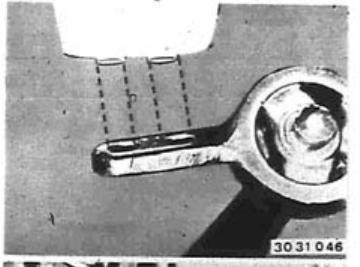
Unscrew control arm bracket.
Remove heat shield, if applicable.
Installation:
Tightening torque*.



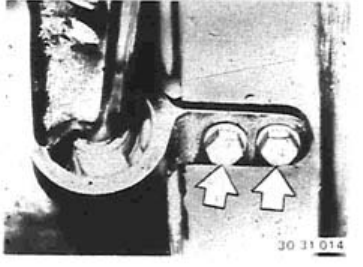
All Wheel Drive:
Use Special Tool 31 2 155 instead of Special Tool 31 2 153.



Pull bracket off of control arm with Special Tools 31 2 151 and 00 7 500.
Important!
Never reuse a rubber mount pulled off of the control arm.
The rubberized inner sleeve will be destroyed when pulled off dry.
Replace rubber mounts 31 12 130.
Always replace left and right mounts and use mounts of same make (visible on mount).



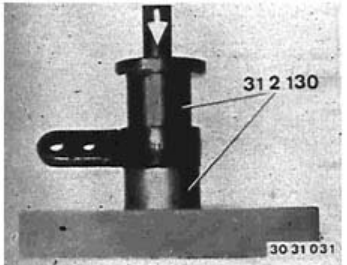
Note:
Centering bores (large diameter) of bracket face engine carrier.

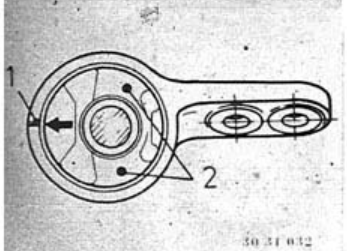


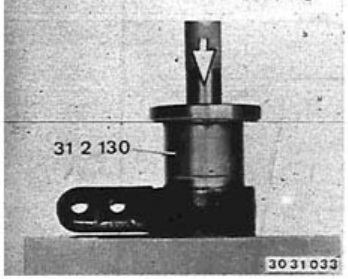
Important!
Bolt bracket on body immediately.
Tightening torque*.
Load down car to normal position*.
Leave car in normal position at least 30 minutes and avoid any suspension movement.
The lubricant will evaporate after 30 minutes, so that the control arm fits tight and is positioned correctly in the rubber mount.
Non-conformance with these procedures could impair handling considerably!

* See Specifications

* See Specifications
** Source of Supply: HWB





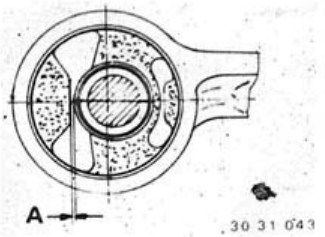


31 12 130 REPLACING RUBBER MOUNT FOR LEFT OR RIGHT CONTROL ARM

Important!
Always replace left and right rubber mounts and use rubber mounts of same make (shown on mounts).
Remove bracket for control arm – see 13 12 048.
Press out rubber mounts with Special Tool 31 2 130.

Installation:
Check installed position!
Arrow on rubber mount points to cast boss (1) on bracket.
Bracket and rubber mount cleaned to remove grease.
Rubber mounts for six cylinder models and M 3 are marked with dot (2) of "orange" paint.

Press ruber mount into bracket flush from bevelled end [redacted] Special Tool 31 2 130.



Checking Rubber Mounts:
Car loaded down to normal position*.
Measure gap (A) with feeler gage blade.
Specification:
A = 0.7 ... 1.7 mm /0.028 ... 0.067").
If measured value deviates from specification, replace rubber mount.

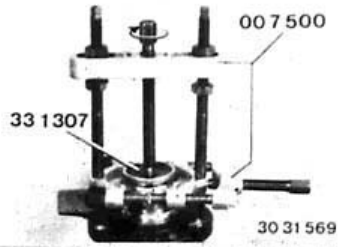
* See Specifications

31 21 121 REMOVING AND INSTALLING LEFT OR RIGHT WHEEL HUB (DRIVE FLANGE)
– All Wheel Drive –

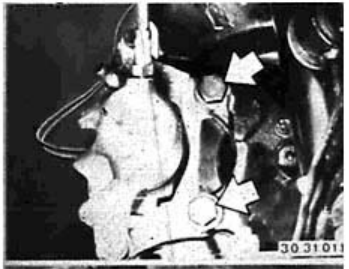
Pulling off the drive flange will destroy the wheel bearing, which must always be replaced.
Procedures are identical with those described in 31 21 151.

31 21 151 REPLACING BEARING OF LEFT OR RIGHT WHEEL HUB (DRIVE FLANGE) – All Wheel Drive –

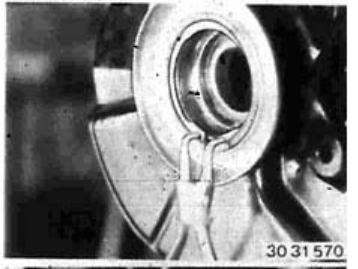
Remove output shaft – 31 60 000.
Mount control arm again finger tight, so that the spring strut is held in position for further procedures.



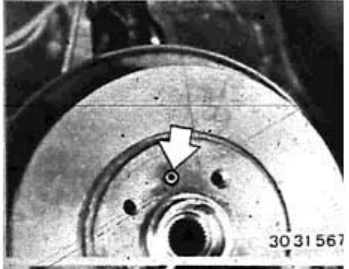
Note:
If applicable, pull bearing inner race off of drive flange with Special Tools 33 1 307 and 00 7 500.



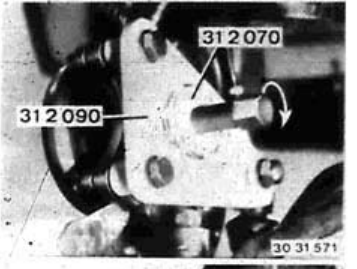
Unscrew brake caliper and suspend from body on a piece of wire.
Brake line remains connected.
Installation:
Tightening torque*.



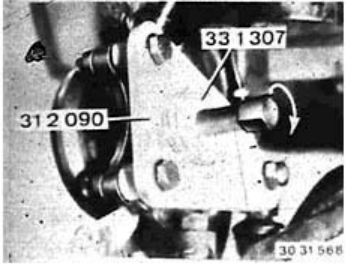
Lift out circlip.



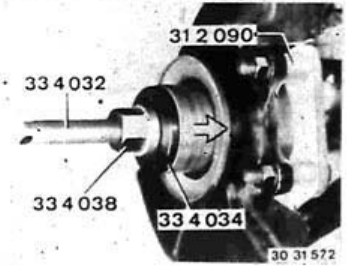
Unscrew brake disc.



Remove Special Tool 31 2 090, apply Special Tool 31 2 070, mount Special Tool 31 2 090 again and press out bearing.
Special Tool 31 2 090 remains installed.

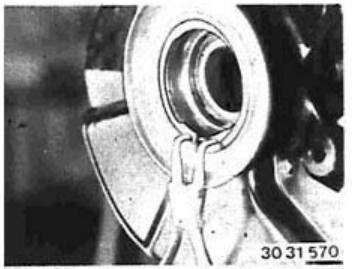


Apply Special Tool 33 1 307.
Mount Special Tool 31 2 090 with the hook attached on tie rod arm and press off the drive flange.

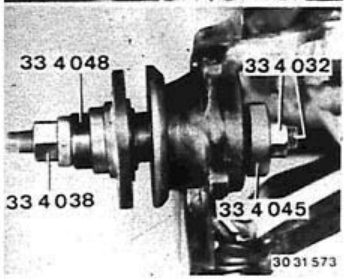


Unscrew spindle of Special Tool 31 2 090 and screw in Special Tool 33 4 032 flush.
Pull in new bearing with Special Tools 33 4 034 and 33 4 038.
Remove Special Tool 31 2 090.

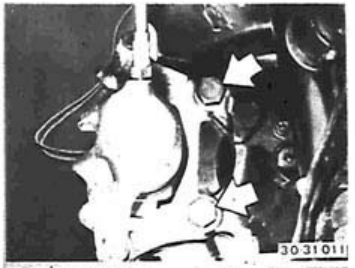
* See Specifications of Group 34



Important!
Install circlip with open end facing down.

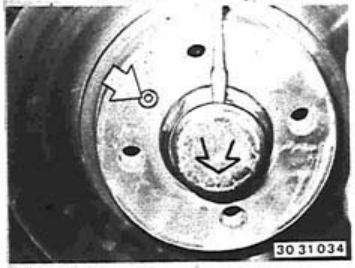


Pull in drive flange with Special Tools 33 4 032 / 038 / 045 / 048.

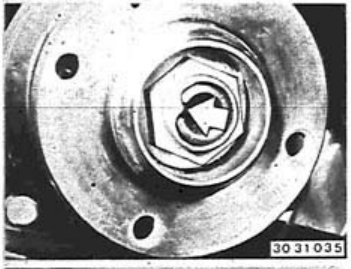


31 2 180 REPLACING BEARING FOR FRONT WHEEL

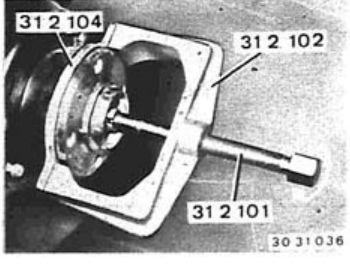
Remove front wheel – see Group 36.
Unscrew and suspend brake caliper from body on a piece of wire, – brake hose remains connected.
Installation:
Tightening torque*.



Unscrew brake disc and take off grease cap.
Important!
Always replace grease caps.
Install new grease cap with cement, HWB No. 81 22 8 407 420.

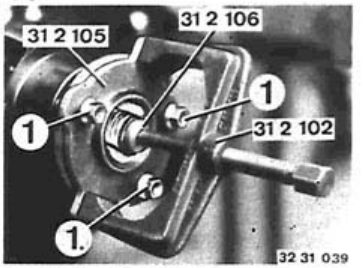


Break the collar nut with a cross chisel and unscrew with Special Tool 11 2 180.
M 3:
Special Tool 31 2 080.
Installation:
Replace collar nut.
Tightening torque*.
Lock collar nut.

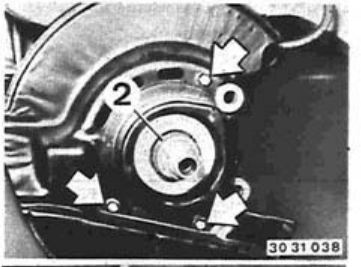


Pull off bearing unit with Special Tools 31 2 101/102/104.
Important!
A pulled off bearing unit must not be reused.

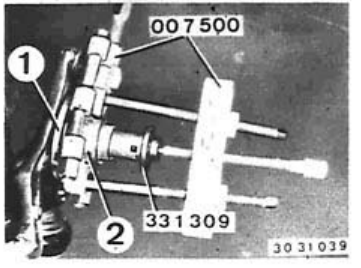
* See Specifications of Gr. 34



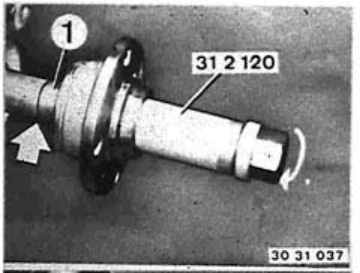
M 3:
Pull off bearing unit with Special Tools 31 2 102/105/106 and wheel bolts (1).
Bearing unit must not be reused.



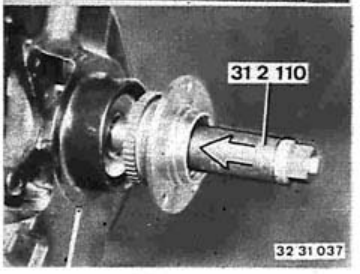
Important!
Remove the guard, if the inside bearing inner race (2) remains on the stub axle after pulling off the bearing unit.



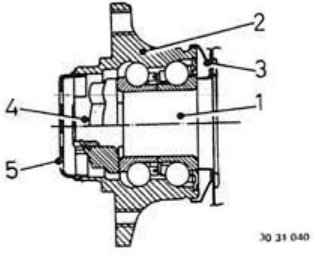
Bend dust guard (1) back and pull off bearing inner race (2) with Special Tool 00 7 500 and Special Tool 33 1 309.
Installation:
Replace dust guard (1).



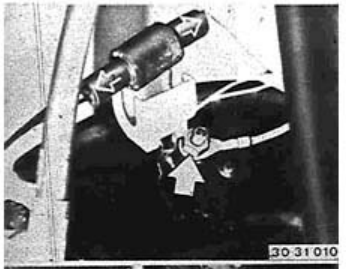
Installation:
If applicable, install guard.
Screw in guide sleeve (1) entire length of threads.
Pull on new bearing unit with Special Tool 31 2 120.
M 3:
Special Tool 31 2 110.



Installation:
M 3:
If applicable, install guard.
Pull on new bearing unit with Special Tool 31 2 110.

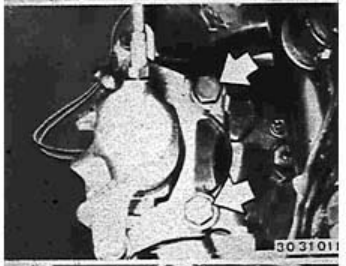


1 Stub axle
2 Wheel hub
3 Dust guard
4 Collar nut
5 Cover



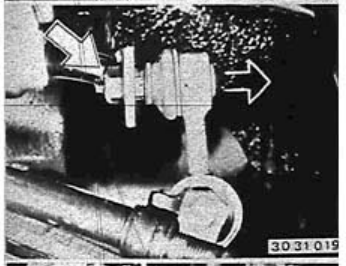
31 31 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT SPRING STRUT ASSEMBLY

Remove front wheel – see Group 36.
Disconnect plugs for brake pad wear indicator and EDC (see Group 37 for information).
Disconnect ground lead.
Take lead and brake hose out of holder on spring strut.
Remove ABS pulse sender – see Group 61.



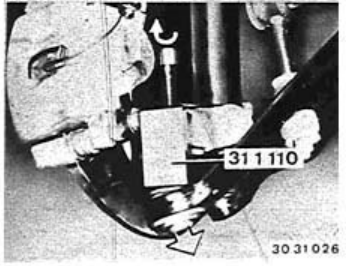
Unscrew and suspend brake caliper from body on piece of wire.
Brake pipe remains connected.

Installation:
Tightening torque*.



Unscrew push rod on stabilizer.

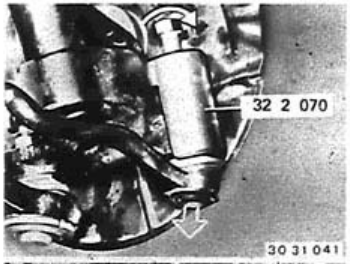
Installation:
Tightening torque*.



Unscrew nut and press off guide joint with Special Tool 31 1 110 or, for M 3, Special Tool 31 2 160.

Installation:
Replace self-locking nut.
Journal and bore cleaned of grease.
Tightening torque*.

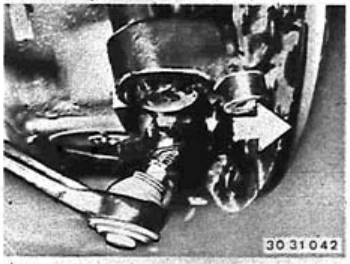
* See Specifications of Gr. 34



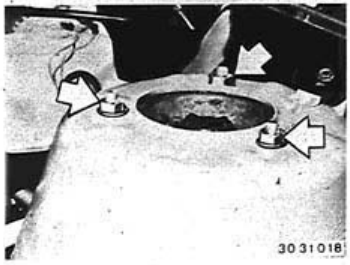
Unscrew nut and press off tie rod joint with Special Tool 32 2 070 or, for M 3, Special Tool 31 2 160.

Installation:
Replace self-locking nut.
Journal and bore cleaned of grease.
Tightening torque*.

Important!
Don't turn power steering as far as stop — this would damage radial oil seal.



Press out and push spring strut over guide joint journal.



Support spring strut from underneath.
Unscrew nuts.

Installation:
Replace self-locking nuts.
Tightening torque*.

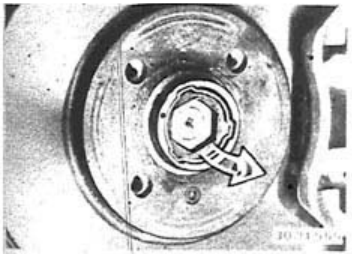
Important!
Only store shock absorbers upright. Shock absorbers with run-in piston rods stored laying down will cause knocking noise when installed again.

Remedy:
Store shock absorber with run-out piston rod upright at room temperature for 24 hours.

* See Specifications of Gr. 32

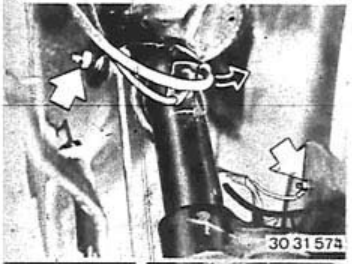
31 31 000 REMOVING AND INSTALLING LEFT OR RIGHT FRONT SPRING STRUT ASSEMBLY – Four Wheel Drive –

Remove front wheel – see Group 36.
Remove ABS pulse sender – see Group 61.



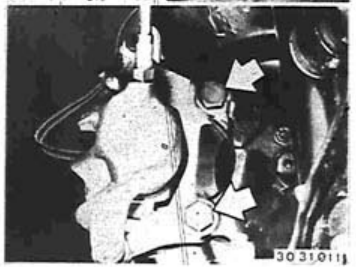
Pry out lockplate with a screwdriver.
Unscrew collar nut.

Installation:
Tightening torque*.
Replace lockplate, knocking it on with Special Tools 00 5 500 and 33 4 050.



Disconnect plug for brake pad wear indicator.
Disconnect ground lead.
Take lead and brake hose out of holder on spring strut.
Unscrew push rod.

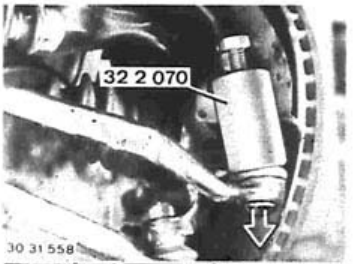
Installation:
Tightening torque*.



Unscrew and suspend brake caliper from body on piece of wire.
Brake pipe remains connected.

Installation:
Tightening torque*.

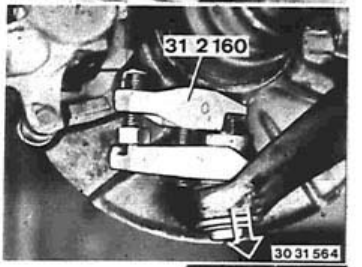
* See Specifications of Gr. 31 + 34



Unscrew nut and press off tie rod joint with Special Tool 32 2 070.

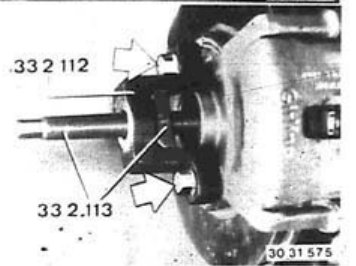
Installation:
Journal and bore cleaned of grease.
Replace self-locking nut.
Tightening torque*.

Important!
Don't turn power steering as far as stop — this would damage radial oil seal.

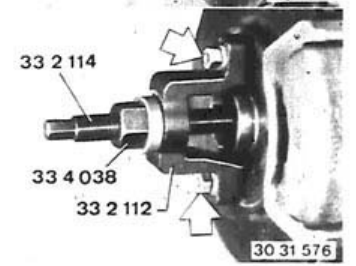


Unscrew nut and press off guide joint with Special Tool 31 2 160.

Installation:
Bore and journal cleaned of grease.
Tightening torque*.
Lock nut with cotter pin.

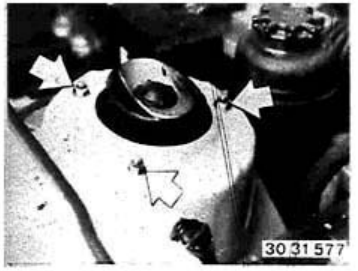


Mount Special Tools 33 2 112 / 113 with two wheel bolts and press off output shaft.



Installation:
Lubricate splines of output shaft lightly with oil and pull in output shaft with Special Tools 33 2 112 / 114 and 33 4 038.

* See Specifications of Gr. 31 + 32

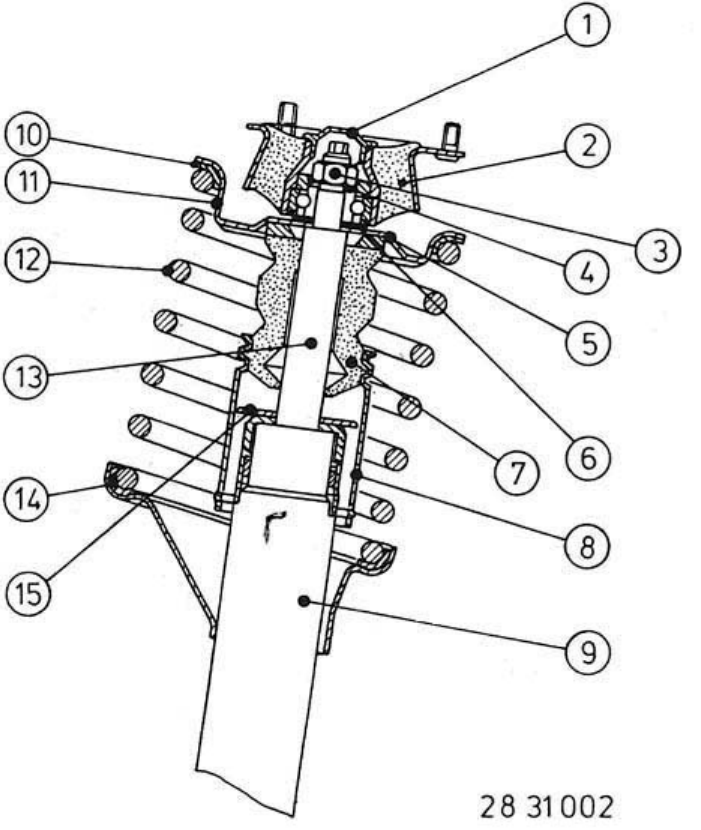


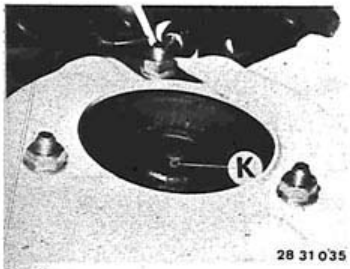
Support spring strut.
Unscrew nuts and take off spring strut.
Installation:
Replace self-locking nuts.
Tightening torque*.

* See Specifications

LAYOUT DRAWING OF SHOCK ABSORBER WITH MOUNT AND COIL SPRING

1 Cap
2 Mount
3 Self-locking nut
4 Washer
5 Insulator
6 Washer
7 Rubber damper
8 Protective tube
9 Spring strut tube
10 Upper rubber ring
11 Upper spring retainer
12 Coil spring
13 Shock absorber piston rod
14 Lower rubber ring
15 Screw-on ring

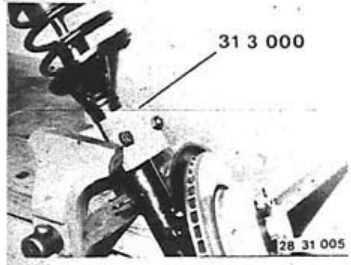




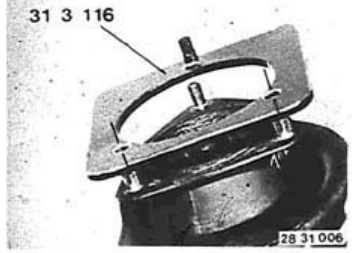
31 32 001 REPLACING FRONT SPRING STRUT SHOCK ABSORBER

Important!
Always replace shock absorbers with ones having same code K.
To know whether shock absorbers have to be replaced, check installed absorbers with a "Shock Tester" or removed in an absorber testing machine.
Also refer to Service Information 37 02 83 (177).

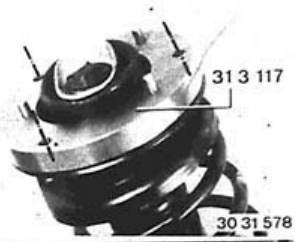
Cars with Electronic Absorber Control (EDC): Refer to information in Group 37.



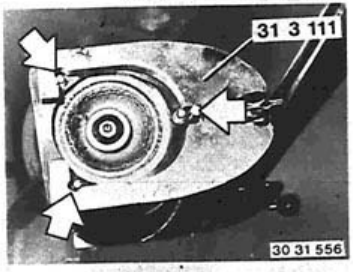
Remove spring strut assembly – see 31 31 000.
Take up spring strut in a vise with Special Tool 31 3 000.



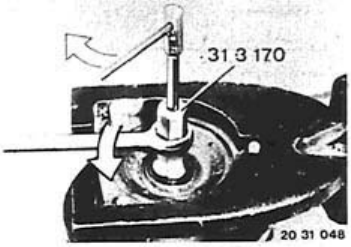
Set up Special Tool 31 3 116 on mount.



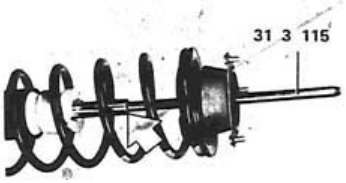
All Wheel Drive Cars:
Set up Special Tool 31 3 117 on mount.



Compress coil spring with Special Tool 31 3 111.
Important!
Pins must fit in openings.



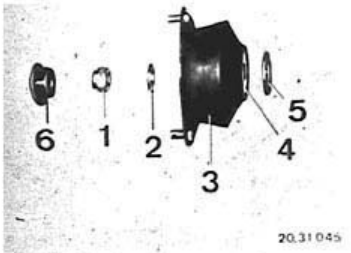
Lift off cap.
Unscrew self-locking nut with Special Tool 31 3 170 – counterholding on the piston rod.
Installation:
Replace self-locking nut.
Tightening torque*.



Take off washer (2).
Screw in Special Tool 31 3 115 entire length of threads.
Release and take off special tool compressor.

28 31 020

* See Specifications



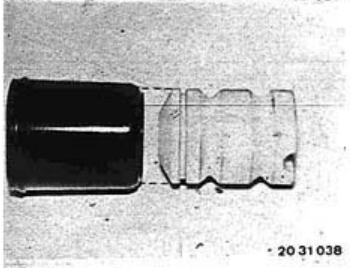
20.31045

Lift off mount.
Installed Order:
1 Self-locking nut
2 Washer with small diameter
3 Mount
4 Insulator
5 Washer with large diameter
6 Cap
Concave surface of insulator (4) faces the mount.

730 31 057

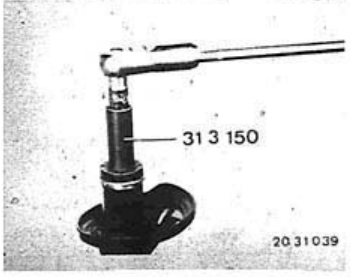
Lift off upper spring retainer with rubber ring and coil spring.

Installation:
Inspect upper and lower rubber rings, replacing if necessary.
End of coil spring must bear on the shoulders in the lower and upper spring retainers.



20 31 038

Installation:
Inspect protective tube and damper or rubber sleeve, replacing if necessary.

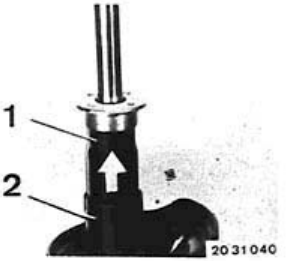


20.31039

Unscrew screw-on ring with Special Tool 31 3 150 or 31 3 180.

Installation:
Tightening torque*.

* See Specifications



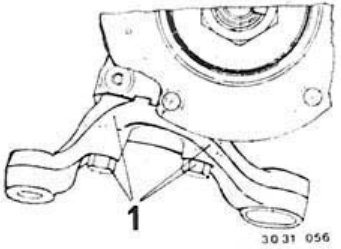
20 31 040

Pull out shock absorber (1).

Installation:
Remove old oil in spring strut pipe (2).
Fill with engine oil** before installing a new shock absorber.
Oil volume*.
The engine oil is required to transfer heat from the shock absorber to the spring strut pipe.

Important!
Oil must not be filled in a gas pressure single-pipe front wheel cartridge, recognized on the piston rod diameter = at least 33 mm (1.299") – also refer to Service Information of Group 37.

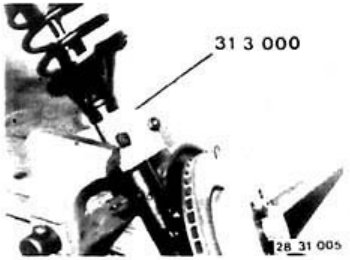
Only store shock absorbers standing upright. Storing shock absorbers in horizontal position with the piston rods run in could lead to noise when used in a car again.
Remedy:
Store shock absorbers standing upright and with the piston rods run out at room temperature for 24 hours.



30 31 056

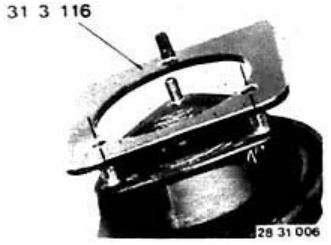
M 3 with EDC:
Install bolts (1) with a bolt cement (source of supply: HWB).
Tightening torque*.

* See Specifications
** See Operating Fluids



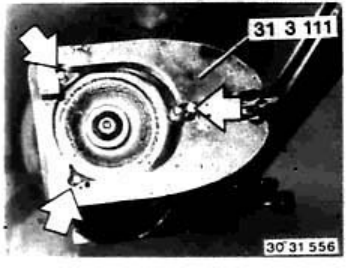
31 33 001 REPLACING SPRING STRUT MOUNT

Remove spring strut assembly – see 31 31 000.
Take up spring strut in a vise with Special Tool 31 3 000.
Important!
If a correction mount (see Group 32) is used, install a new mount with the same code.

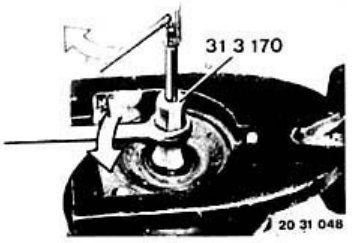


Set up Special Tool 31 3 116 on mount.

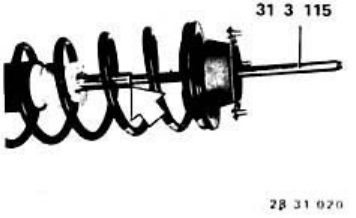
All Wheel Drive Cars:
Set up Special Tool 31 3 117 on mount.



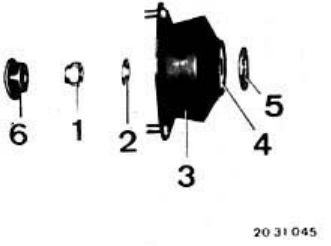
Compress coil spring with Special Tool 31 3 111.
Important!
Pins must fit in openings.



Pull off cap.
Unscrew self-locking nut with Special Tool 31 3 170.
Installation:
Replace self-locking nut.
Tightening torque*.



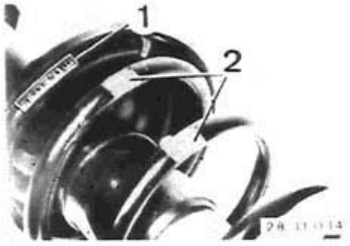
Remove washer (2).
Screw in guide sleeve 31 3 115 entire length of threads.
Release and remove special tool compressor.



Lift off mount.
Installed Order:
1 Self-locking nut
2 Washer with small diameter
3 Mount
4 Seal
5 Washer with large diameter
6 Cap
Internal curved surface of seal (4) faces the mount.

Lift off upper spring retainer with rubber ring and coil spring.
Installation:
Check upper and lower rubber rings, replacing if necessary.
Ends of coil spring must rest on shoulders in lower and upper spring retainers.

* See Specifications



28 11 013

31 33 100 REMOVING AND INSTALLING/ REPLACING LEFT OR RIGHT FRONT SPRING STRUT COIL SPRING

Remove spring strut mount 31 33 001.
Remove upper spring retainer with rubber ring and coil spring.

Important!

Only install pairs of springs on one axle with same BMW number (1) (on end of spring) and same color code (2) (either with or without a red paint stripe).
Refer to spare part microfiche for cross reference of springs and vehicle types as well as, if applicable, special equipment (air conditioner, sport suspension, etc.) and introduction dates.

The BMW number on the spring can be used to find the spare part number and therefore the spring belonging to a vehicle type as shown on the spare part micorfiche.
Example:

1. Spring with red color code:
   Number on spring, e.g. 1 125 332
   Add 1 = part number = 1 125 333
2. Spring without red color code:
   Number on spring, e.g. 1 125 332
   Add 2 = part number = 1 125 334

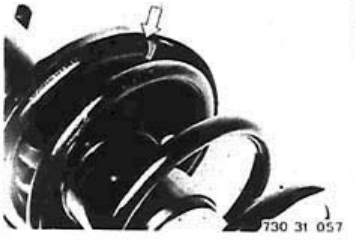
Installation:
Install upper rubber ring* with thickness (A) for coil springs with red color code.
A = 9 mm (0.354").

28 31 011

* See Specifications of Gr. 31

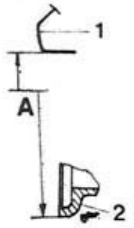
20 31 038

Installation:
Check protective tube and rubber damper, replacing if necessary.



730 31 057

Installation:
Check upper and lower rubber rings, replacing if necessary.
Ends of coil spring must rest on shoulders in lower and upper spring retainers.



28 32 091

31 33 ... CHECKING AND CORRECTING HEIGHT

- Load down car to normal position*.
- Measure actual height (A) from wheel house lower edge (1) to rim flange (2) at wheel center height. Determine the mean value of each wheel after lifting and lowering the car body, and then the mean value of the axle.
- Determine any deviation from the nominal height value*.
- Identify the install springs - see 31 33 100.
- Find correction spring in the table. The numbers are height deviation (nominal values in mm) between the pertinent springs.

Example:

The car is equipped with coil springs having BMW No. 112 6 516 and is, for example, 7 mm (0.275") too deep due to so many optional extra equipment parts.
The nominal height* is reached by installing springs with BMW No. 112 7 282 (see 31 33 100 for information on determining part numbers).

Table for
316, 318 i, 320 i, 323 i, 324 d/until 1988 Models
325 3 until 1987 Models

A = Equipment after correction

B = Equipment of delivered car

a = Adjusted higher

b = Adjusted lower

Information:
Thick spring ring for coil springs with a red stripe.
Thin spring ring for coil springs without a red stripe.
The height can be adjusted additionally by ± 5 mm (0.197") by exchanging these spring rings.

B \ A (a / b)	1 127 935	1 126 397	1 127 279	1 126 516	1 127 282	1 128 349	1 129 880	1 125 341	1 127 503	1 125 726
1 127 935		±6	+14	+20						
1 126 397	-6		+8	+14	+21

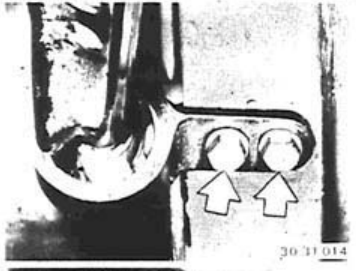
31 35 000 REMOVING AND INSTALLING OR REPLACING FRONT STABILIZER

Disconnect thrust rods on stabilizer at left and right sides.
Installation:
Tightening torque*.



Disconnect left bracket for control arm.
Installation:
Tightening torque*.

Disconnect left and right stabilizer mounts.
Remove stabilizer.
Installation:
Tightening torque*.

* See Specifications

TROUBLESHOOTING FRONT AXLE

Condition	Cause	Correction
Grinding noise (louder in curves)	Wheel bearings defective	Replace wheel bearings (wheel hub)
Vibration	Wheels unbalanced	Balance wheels
	Wheel rim lateral/radial runout	Replace rims, if necessary
	Tire lateral runout	Match or replace tires
	Output shaft defective	Replace output shaft
Steering wheel shake	Wheels unbalanced	Balance wheels
	Wheel rim lateral/radial runout	Replace rims, if necessary
	Shock absorber effect insufficient	Replace shock absorbers
	Control arm rubber mounts defective	Replace control arm rubber mounts
	Output shaft defective	Replace output shaft
Rattling noise	Shock absorber cartridge loose in spring strut	Tighten threaded ring (inspect threads)
	Ball joints of control arms worn	Replace control arms
	Stabilizer rubber mounts worn	Replace rubber mounts
	Front axle carrier mounted loosely on body	Tighten bolts (inspect threads)
Load change knock	Backlash excessive	Adjust backlash
	Output shaft defective	Replace output shaft
Acceleration or deceleration noise	Backlash excessive or insufficient	Adjust backlash
Oil loss	Radial oil seals leak	Replace radial oil seal
	Vent plugged	Clean vent
	Oil grade* incorrect	Replace front axle final drive oil

* See Service Information of Gr. 00

TROUBLESHOOTING FRONT AXLE

Condition	Cause	Correction
Body wipping long time after driving over rough road	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers
Body rising up when driving on rough road for long time	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers
Car lifting while accelerating	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers
Wheels jumping even on normal road surface	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers
Car breaks out while braking	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers
Unsafe in curves (skidding) due to insufficient directional stability	Shock absorbing performance insufficient (see Troubleshooting Shock Absorbers)	Replace shock absorbers

TROUBLESHOOTING SHOCK ABSORBERS

The condition of shock absorbers can only be checked with a Shock Tester or in a shock absorber testing machine.

Condition	Cause	Correction
Shock absorbers knocking through (bottoming)	a) Rubber damper defective	a) Check rubber damper, replacing if necessary
	b) Shock absorbing performance insufficient	b) Replace shock absorbers
Shock absorber noise	a) Shock absorber cartridge loose	a) Tighten screw-on ring – inspect threads
	b) Newly installed shock absorber had been stored laying down with its piston rod run in	b) Store shock absorber standing upright with its piston rod run out at room temperature 24 hours
	c) Shock absorber shot	c) Replace shock absorbers
Poor car handling	a) Shock absorber performance insufficient	a) Replace shock absorbers
Bald (flat) spots on tires	a) Shock absorbers shot	a) Replace shock absorbers

FRONT AXLE FINAL DRIVE

Type of Teeth:	Gleason hypoid spiral teeth, spiral direction right, – Code F 86 on ring gear and pinion –
Ratio*:	On data plate (oil sump)
Oil grade:	See Operating Fluids
Oil volume*:	Pour in oil slowly – recheck oil level about 30 seconds after the first overflow.

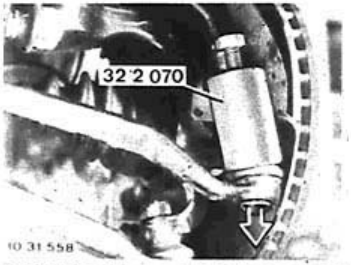
Breaking-in After Exchanging or Repairing Front Axle Final Drive:

The same breaking-in procedures and oil change interval for new cars are applicable. Up to 1,000 km (600 miles) the max. permissible road speed is 2/3rds of the top road speed. The driver must be informed about this with a label or tag.

* See Specifications

31 50 000 REMOVING AND INSTALLING OR REPLACING FRONT AXLE FINAL DRIVE

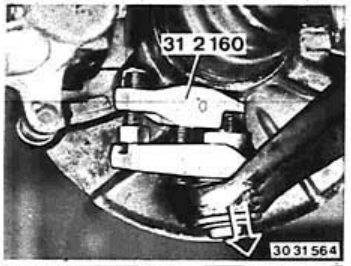
Remove front propeller shaft – see Group 26.
Remove left front wheel – see Gr. 36.
Remove splash guard – see Group 51.



Unscrew left nut and press off tie rod with Special Tool 32 2 070.

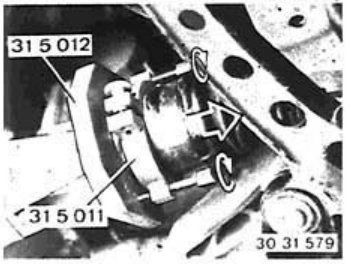
Installation:
Bore and journal cleaned of grease.
Replace self-locking nut.
Tightening torque*.

Important!
Don't turn power steering as far as stop — this would damage radial oil seal.



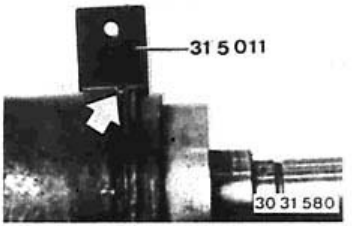
Unscrew left nut and press off control arm with Special Tool 31 2 160.

Installation:
Bore and journal cleaned of grease.
Tightening torque*.
Lock nut with cotter pin.

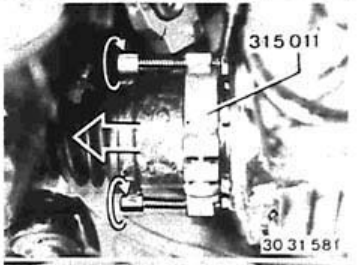


Pull right output shaft out of front axle final drive about 15 mm (0.591") with Special Tools 31 5 011 / 012.
Screw in pressure spindles alternately.

* See Specifications

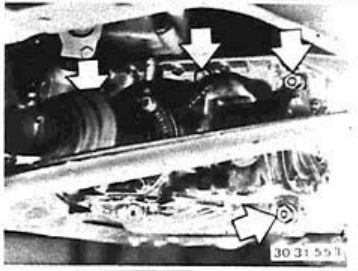


Note:
Ring of Special Tool 31 5 011 bears in groove of shaft.



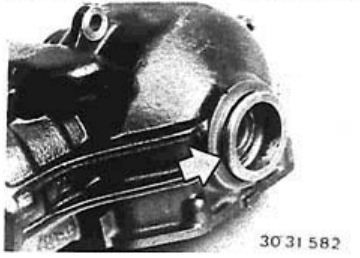
Pull off left output shaft with Special Tool 31 5 011.
Pressure spindles bear on heads of bolts.
Screw in pressure spindles alternately.
Press out spring strut until output shaft slides out of front axle final drive.

Installation:
Refer to 31 60 000.



Unscrew nut and take off front axle final drive.

Installation:
Tightening torque*.

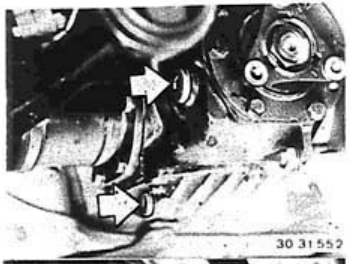


Note:
Replace round seal.

* See Specifications

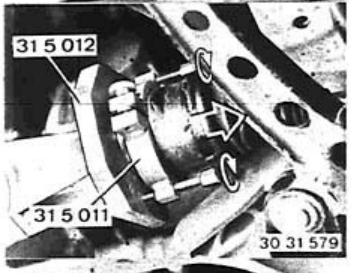
31 51 010 REPLACING SHAFT SEAL FOR DRIVE FLANGE OF FRONT AXLE FINAL DRIVE

Remove splash guard – see Group 51.
Remove front propeller shaft – see Group 26.



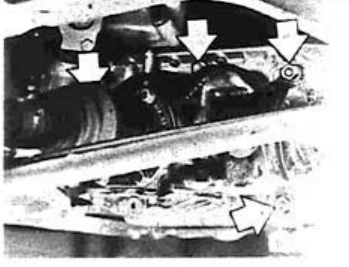
Drain final drive oil.

Installation:
Fill final drive oil**.
Tightening torque*.



Pull right output shaft out of front axle final drive about 15 mm (0.591") with Special Tools 31 5 011 / 012.

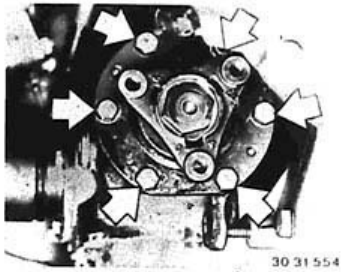
Installation:
Refer to information for output shaft.



Unscrew nuts and press front axle final drive away from engine oil pan about 10 ... 15 mm (0.394 ... 0.591").

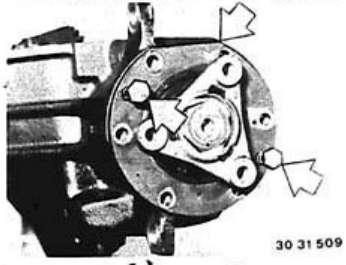
Installation:
Tightening torque*.

* See Specifications
** See Operating Fluids

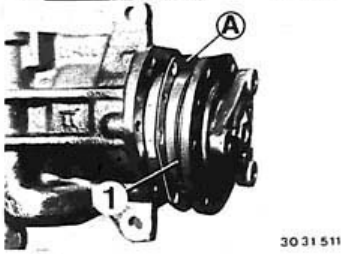


Unscrew bolts.

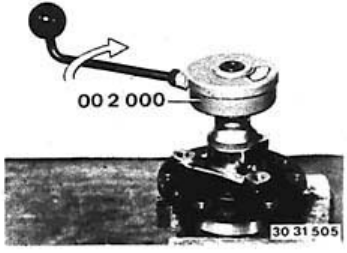
Installation:
Flat surface of pinion faces flat surface on case.
Tightening torque*.



Pull pinion out of case by screwing in two M 8 x 30 bolts uniformly.
If both tapped bores are not accessible, pinion must be knocked out of case with a plastic-hammer.

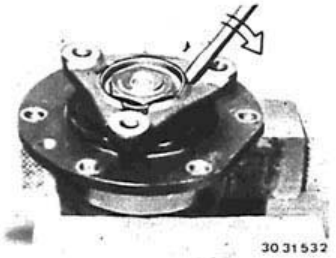


Installation:
Install old shim (A) and new seal (1).

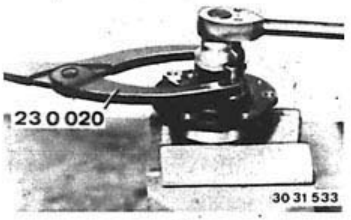


Clamp pinion in aluminum jaw vise. Measure friction torque with Special Tool 00 2 000 while turning uniformly and note value.

* See Specifications

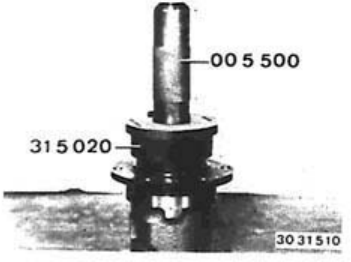


Lift out lockplate with a screwdriver.



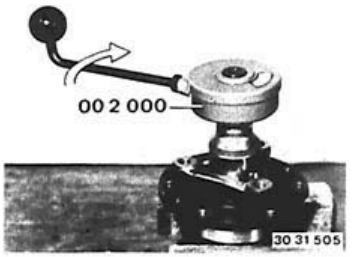
Hold flange with Special Tool 23 0 020 and unscrew collar nut.
Take off flange.
Note:
Replace flange, if bearing surface on flange for the shaft seal is scored seriously.

Pull out shaft seal with Special Tools 00 5 010 and 33 1 309.



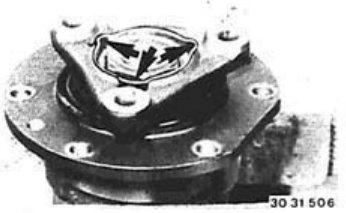
Dip shaft seal in gear lube* and drive in against stop with Special Tools 00 5 500 and 31 5 020.

* See Specifications



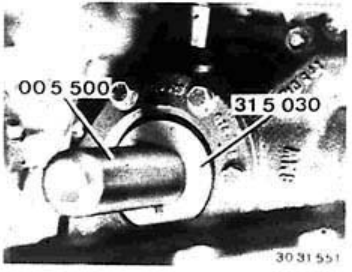
Mount flange and tighten collar nut in steps until previously measured friction torque + 0.2 Nm (1.4 ft. lbs.) for new shaft seal is reached.

Install and lock new lockplate.



31 51 015 REPLACING SHAFT SEAL FOR LEFT OUTPUT SHAFT

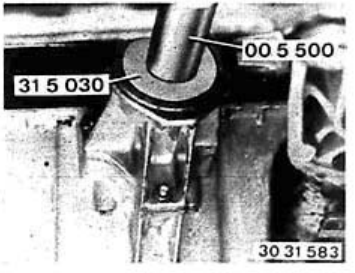
Remove output shaft 31 60 000, however only loosen collar nut of output shaft.



Lift out shaft seal.
Dip new shaft seal in gear lube and drive in against stop with Special Tools 31 5 030 and 00 5 500.

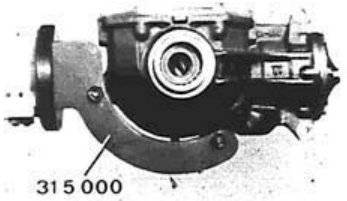
31 51 020 REPLACING SHAFT SEAL FOR RIGHT OUTPUT SHAFT

Remove output shaft 31 60 000



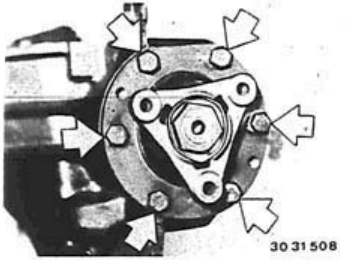
Lift out shaft seal.
Dip new shaft seal in gear lube and drive in against stop with Special Tools 31 5 030 and 00 5 500.

31 52 505 REMOVING AND INSTALLING PINION
– Front Axle Final Drive Removed –



30 31 507

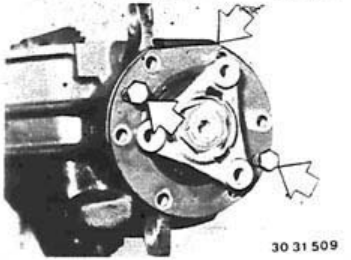
Take up front axle final drive in assembly stand with Special Tool 31 5 000.



30 31 508

Unscrew bolts.

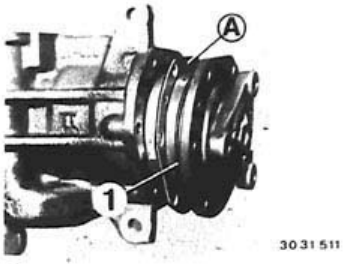
Installation:
Tightening torque*.



30 31 509

Pull pinion out of case by screwing in two M 8 x 30 bolts uniformly.
If both tapped bores are not accessible, pinion must be knocked out of case with a plastic hammer.

Installation:
Flat surface of pinion faces flat surface on case.

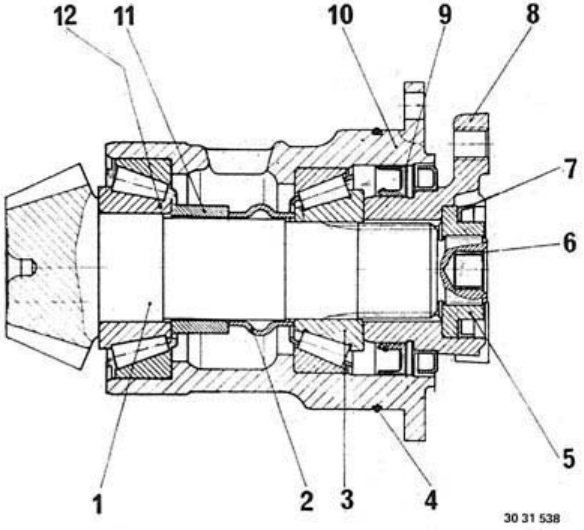


30 31 511

Measure and note thickness of shim (A).

Installation:
Replace round seal (1).

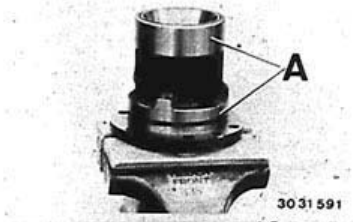
* See Specifications



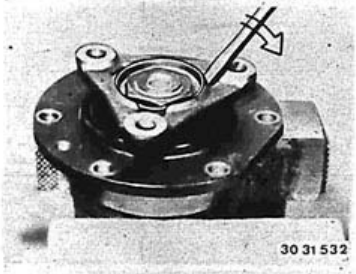
1 Bevel gear
2 Bushing
3 Tapered roller bearing
4 O-ring
5 Collar nut
6 Centering sleeve
7 Lockplate
8 Flange
9 Shaft seal
10 Case
11 Bushing
12 Tapered roller bearing

31 52 510 REPLACING BEARINGS FOR DRIVE PINION
– Front Axle Final Drive Removed –

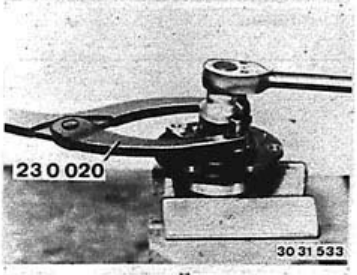
Always replace both bearings.
Remove drive set of front axle final drive – 31 52 505.
Important!
Surfaces A are finish machined (fit) – be careful not to damage them.



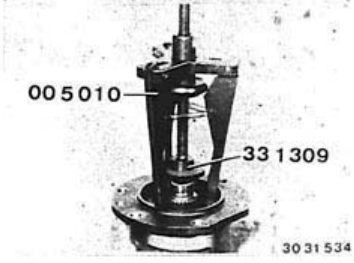
Clamp drive set in a vise fitted with aluminum jaws.
Lift out lockplate with a screwdriver.

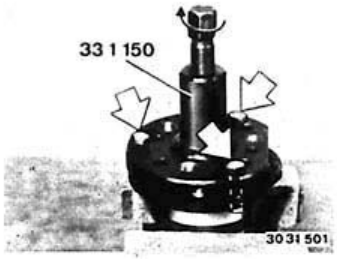


Hold flange with Special Tool 23 0 020 and unscrew collar nut.
Take off flange.
Note:
Replace flange, if shaft seal bearing surface on flange is scored seriously.



Pull out shaft seal with Special Tools 00 5 010 and 33 1 309.

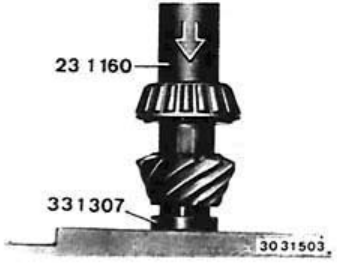




Bolt down Special Tool 33 1 150 with M 8 x 30 bolts and nuts.
Press off bevel gear.

Take off bushing (1) and spacer (2).

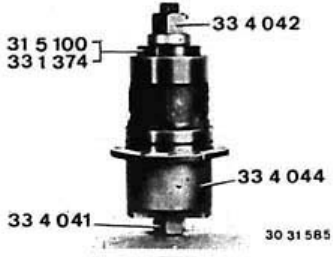
Pull off tapered roller bearing with Special Tools 31 5 090 and 33 1 301.



Press on new bearing with Special Tools 23 1 160 and 33 1 307.

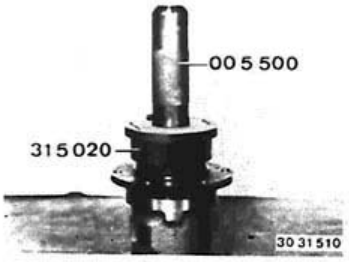
Install spacer (2) and new bushing.

Press both bearing outer races out of case with Special Tools 33 1 370, 33 4 041 and 33 4 042 / 044.

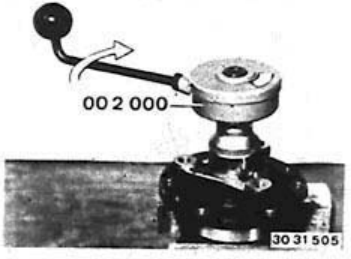


Press in new bearing outer races with Special Tools 31 5 100, 33 1 374 and 33 4 041 / 042 / 044.

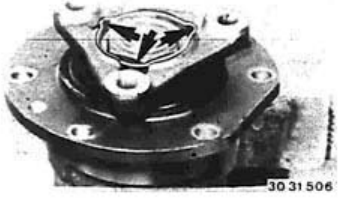
Slide bevel gear into case (1).
Drive in new bearing with Special Tool 23 1 160 far enough that rollers have light contact on bearing outer race.



Dip new shaft seal in gear lube and drive in against stop with Special Tools 31 5 020 and 00 5 500.



Mount flange and tighten collar nut in steps until specified friction torque* is reached, turning uniformly with Special Tool 00 2 000.
Replace bushing and repeat adjusting procedures, if friction torque is exceeded.

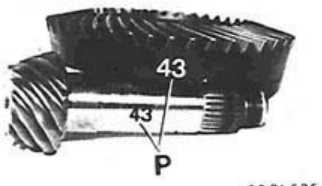


Install and lock new lockplate.
Important!
Because of new bearings, it is necessary to adjust
a) ring gear/pinion block distance,
b) backlash of ring gear and
c) tooth contact pattern.
See adjustments on front axle final drive.

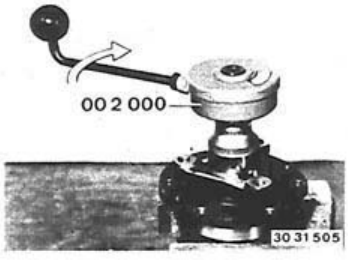
* See Specifications

31 52 520 REPLACING DRIVE PINION AND RING GEAR –Frt. Axle Final Drive Removed–

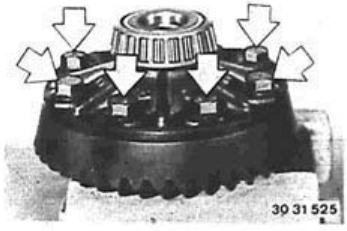
Disassemble drive set and replace drive pinion. Procedures are identical with those for replacing bearings for drive pinion – 31 52 510.



Important!
Drive pinion and ring gear were matched in a special machine for maximal quiet running. The pair code (P), e.g. 43, is electrically inscribed in the drive pinion and ring gear. Never install ring gear and drive pinion with different pair codes (P) together.

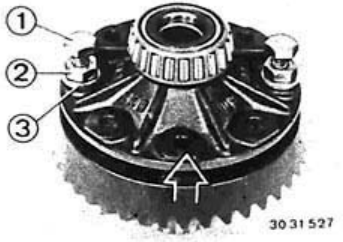


Remove drive set 31 52 505.
Measure friction torque with Special Tool 00 2 000 while turning uniformly and note value.
The friction torque must be adjusted to this friction torque value + 0.2 Nm (0.14 ft. lbs.) for new shaft seal, when reusing the bearings.



Remove differential 31 53 500.
Clamp differential in a vise fitted with aluminum jaws.
Unscrew bolts.

Place differential on Special Tool 33 1 309.
Screw two M 10 x 50 bolts in tapped bores against stop.
Loosen ring gear on differential case by applying alternate knocks on both bolts.



3031527

Pull new ring gear on to differential case by tightening both nuts uniformly.
1 = M 10 x 50 bolt
2 = Washer
3 = M 10 nut

3031528

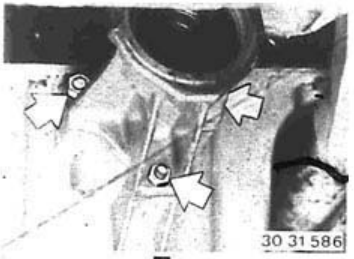
Always replace bolts.
Install new bolts with bolt cement** and tighten in order of 1 through 8.
Tightening torque* and torque angle*.

Important!
Adjust front axle final drive:
a) Ring gear/pinion block distance
b) Backlash
c) Tooth contact pattern
See adjustments on front axle final drive.

* See Specifications
** Source of Supply: HWB

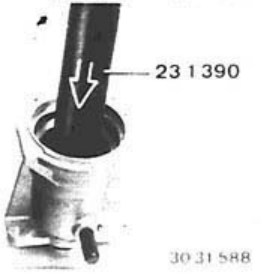
31 53 050 REPLACING BEARING (IN CONSOLE) FOR RIGHT OUTPUT SHAFT

Remove output shaft 31 60 000.

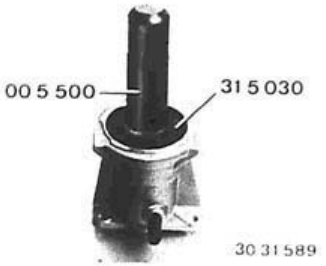


Unscrew console.
Installation:
Replace seal.
Tightening torque*.

Pull off bearing with Special Tools 00 8 550 and 31 5 012.



Press in new bearing with Special Tool 23 1 390.

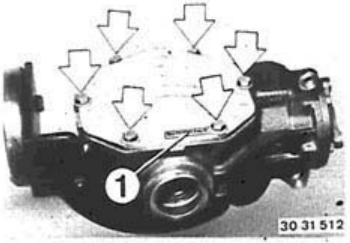


Dip new shaft seal in gear lube and drive in against stop with Special Tools 00 5 500 and 31 5 030.

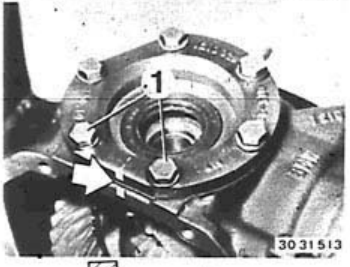
* See Specifications

31 53 500 **REMOVING AND INSTALLING DIFFERENTIAL**
– Front Axle Final Drive Removed –

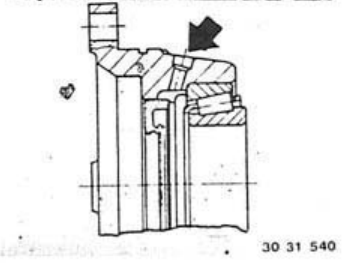
Remove drive set for front axle final drive – 31 52 505.



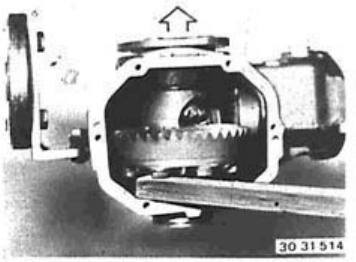
Unscrew bolts and take off oil pan,
Installation:
Replace gasket.
If applicable, clean sealing surfaces on case and oil pan.
Reinstall data plate (1).
Tightening torque*.



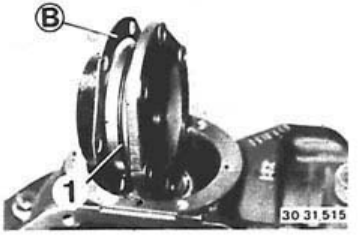
Mark position of bearing cover to case.
Unscrew bolts.
Installation:
Install bolts (1) with a bolt cement**.
Tighten bolts while turning tapered roller bearings simultaneously.
Tightening torque*.



Note:
Bore in cover faces up in installed position of case.



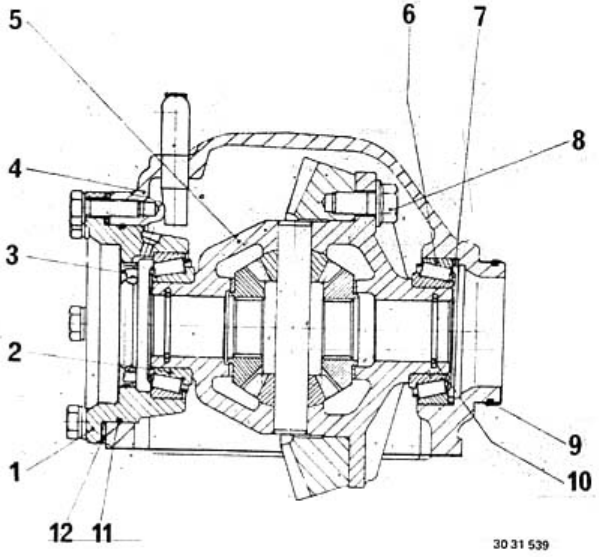
Push up differential with a piece of wood and take off bearing cover.



Measure and note thickness of shim (B).
Remove differential
Installation:
Replace seal (1).

* See Specifications
** Source of Supply: HWB

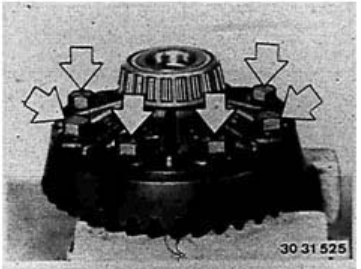
DIFFERENTIAL BEARINGS



1 Bearing cover
2 Tapered roller bearing
3 Shaft seal
4 Case
5 Differential case
6 Bearing outer race
7 Shim
8 Ring gear bolt
9 O-ring
10 Circlip
11 O-ring
12 Shim

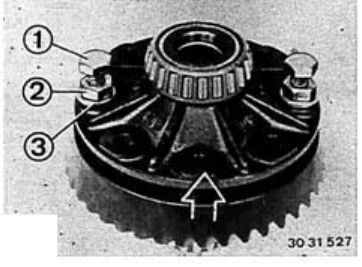
31 53 510 REPLACING DIFFERENTIAL GEARS
– Front Axle Final Drive Rmvd. –

Remove differential for front axle final drive – 31 53 500.



Clamp differential in vise fitted with aluminum jaws.
Unscrew bolts.

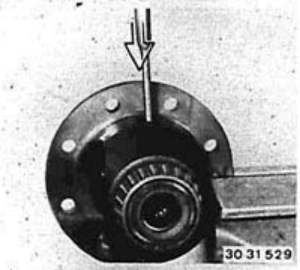
Place differential on Special Tool 33 1 309.
Screw two M 10 x 50 bolts into tapped bores against stop.
Loosen ring gear on differential case by applying alternating knocks on the bolts.



Installation:
Clean tapped bores of ring gear with a tapper.
Pull ring gear on to differential case by tightening both nuts uniformly.
1 = M 10 x 50 bolt
2 = Washer
3 = M 10 nut

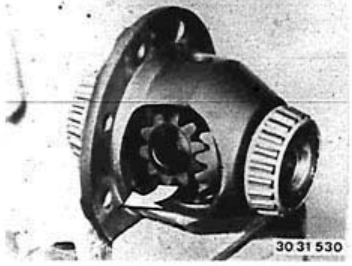
30 31 528

Installation:
Always replace bolts.
Install new bolts with bolt cement** and tighten in order of 1 through 8.
Tightening torque* and torque angle*.



30 31 529

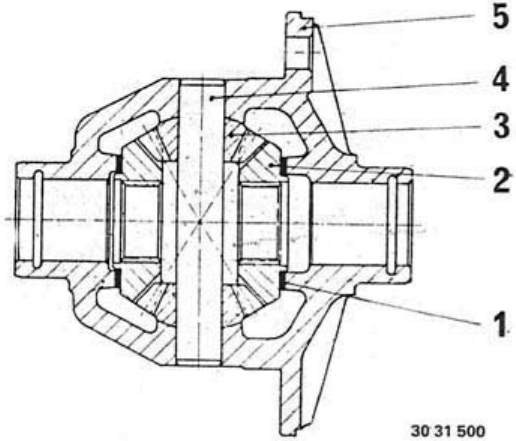
Drive out differential gear shaft with a mandrel.



30 31 530

Turn out differential gears.

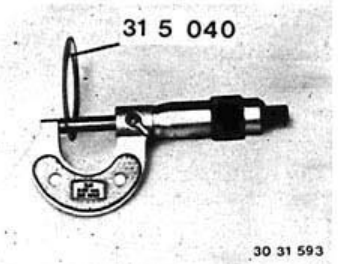
New differential gears must be adjusted with shim (1), whereby there must still be a play of 0.01 to 0.07 mm (0.0004 ... 0.0028").



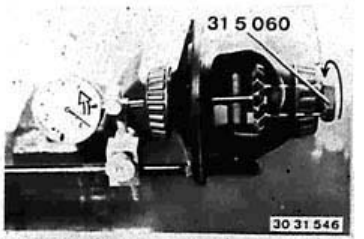
30 31 500

1 Shim
2 Shaft gear
3 Differential gear
4 Differential gear shaft
5 Case

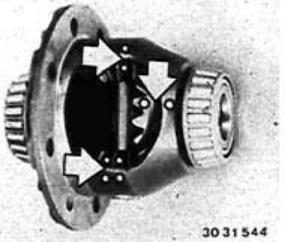
* See Specifications
** Source of Supply: HWB



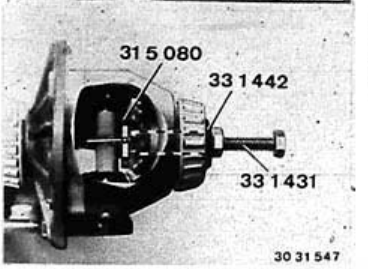
Measure thickness of washer (Special Tool 31 5 040) on four different points with a micrometer and note largest value.
For example: 1.30 mm (0.051").
Install new shaft gear and washer (Special Tool 31 5 040) in differential case.



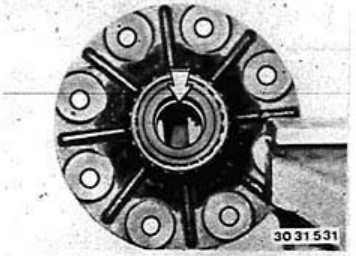
Turn shaft gear at least once with Special Tool 31 5 060.
Observe dial gage and determine maximum deflection in counterclockwise direction.
Set dial gage to zero in this position.



Install new differential gears and drive in differential gear shaft flush.
Mark position of differential gears and shaft gear to case.



Apply Special Tool 31 5 080 (flat surface facing dial gage point).
Screw in Special Tools 33 1 431 / 442 and move shaft gear against block by tightening nut.

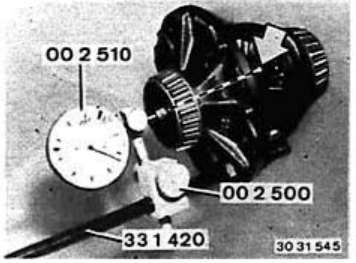


Press open end of circlips into groove and knock circlip out of groove with one blow.

Read dial gage and note value, e.g. 0.30 mm (0.012").
Correct shim thickness comes from:

circlip thickness, e.g.	1.30 mm (0.051")
+ read value, e.g.	+ 0.30 mm (0.012")
	1.60 mm (0.063")
– specified play (0.01 to 0.07 mm) (0.0004 ... 0.0028")	– 0.02 mm (0.001")
= shim thickness (available in steps of 0.05 mm (0.002"))	1.58 mm (0.062")

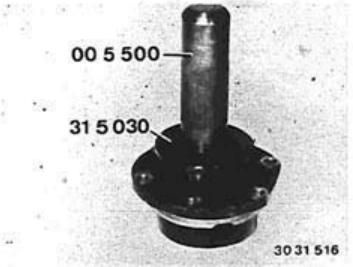
Important!
Mark shim for shaft gear.
Determine shim for second shaft gear – assemble differential.



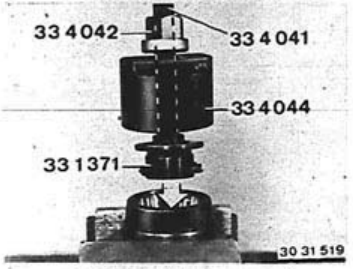
Mount dial gage 00 2 510 with Special Tools 00 2 500 and 33 1 420.
Apply gage needle on shaft gear with pre-load.

31 53 520 REPLACING BOTH BEARINGS FOR DIFFERENTIAL
– Front Axle Final Drive Removed –

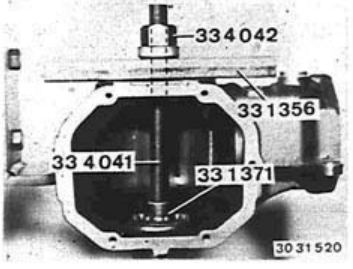
Always replace both bearings.
Remove differential for front axle final drive – 31 53 500.



Drive shaft seal out of bearing cover.
Installation:
Replace shaft seal.
Dip new shaft seal in front axle final drive gear lube* and drive in with Special Tools 00 5 500 and 31 5 030.

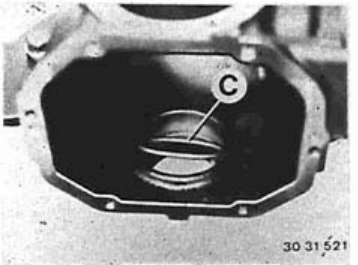


Clamp bearing cover in vise fitted with aluminum jaws.
Pull out bearing outer race with Special Tools 33 1 371 and 33 4 041 / 042 / 044.

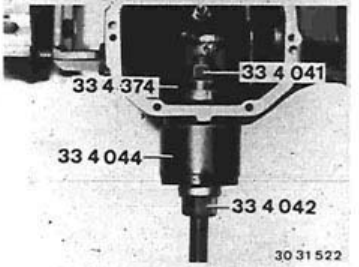


Pull out bearing outer race with Special Tools 33 1 356 / 371 and 33 4 041 / 042.

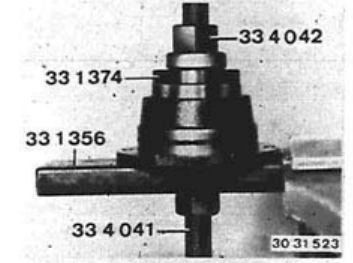
* See Operating Material Specifications



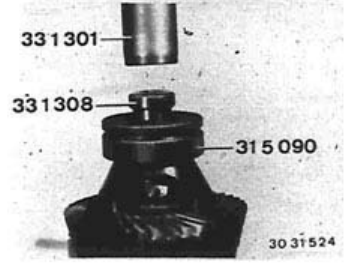
Measure and note thickness of shim (C).



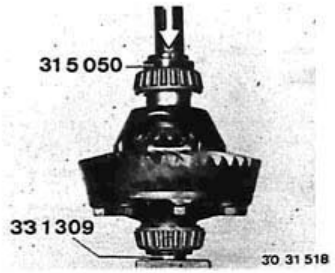
Install shim (C) and pull in bearing outer race with Special Tools 33 1 374, 33 4 041 / 042 / 044.



Pull in bearing outer race with Special Tools 33 1 356 / 374 and 33 4 041 / 042.



Clamp differential in vise fitted with aluminum jaws.
Pull off both tapered roller bearings with Special Tools 33 1 301 / 308 and 31 5 090.



Press on tapered roller bearings with Special Tools 33 1 309 and 31 5 050.

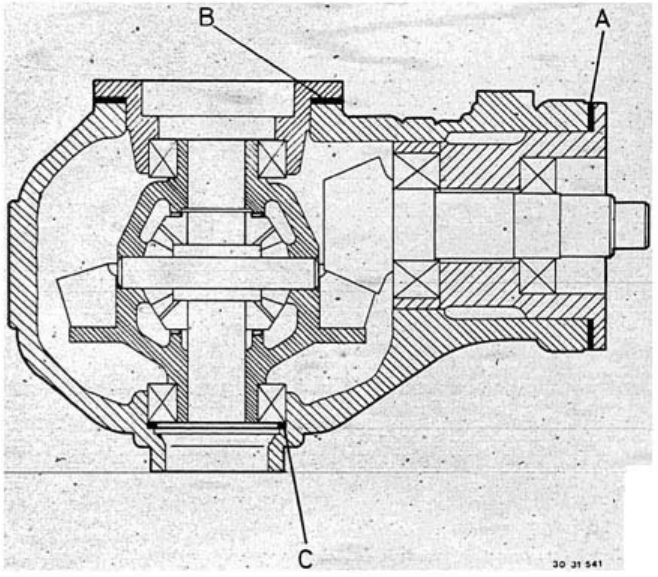
Important!
Adjustments necessary because of new bearings:

a) Friction torque of tapered roller bearings
b) Backlash of ring gear
c) Tooth contact pattern

See adjustments on front axle final drive.

ADJUSTMENTS ON FRONT AXLE FINAL DRIVE

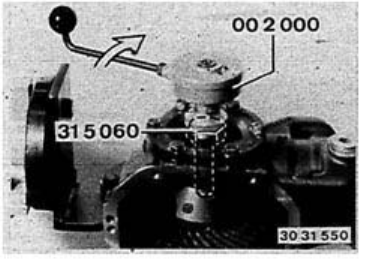
Adjustments are made with shims A, B and C, which are available in appropriate thicknesses.



A = Shim for block distance adjustment
B and C = Shim for differential bearing friction torque adjustment
Shim for backlash adjustment

1. Friction Torque Adjustment of Differential Tapered Roller Bearings:

Dip bearings in gear lube**.
Install differential with the originally installed shim (B).

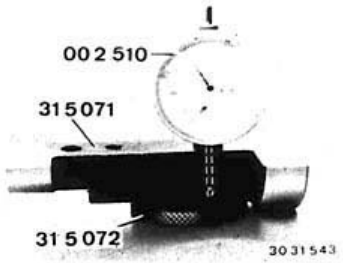


Measure friction torque with Special Tools 31 5 060 and 00 2 000, while turning uniformly.
Nominal value*.
Friction Torque Excessive.
Install thicker shim (B) until nominal value* is reached.
Friction Torque Insufficient:
Install thinner shim (B) until nominal value* is reached.
Shims are available in steps of 0.03 (0.0012"), 0.02 (0.0008") and 0.01 mm (0.0004").

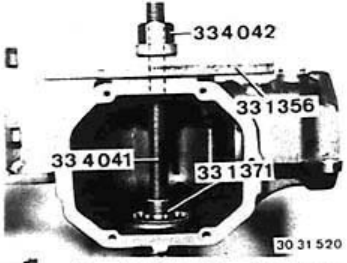
Add thicknesses of shims (B + C).
This total thickness must be maintained while adjusting the backlash afterwards.

* See Specifications
** See Operating Material Specifications

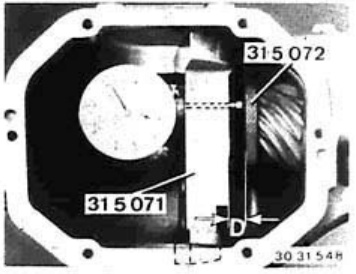
2. Block Distance Adjustment from Ring Gear and Pinion



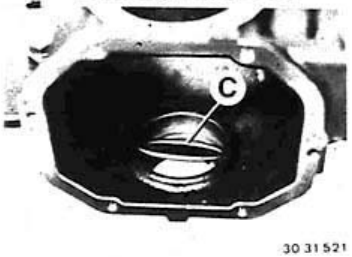
Mount dial gage 00 2 510 in Special Tool 31 5 071.
Apply Special Tool 31 5 072 and set dial gage to zero with pre-load.



Pull out bearing outer race with Special Tools 33 1 356 / 371 and 33 4 041 / 042.

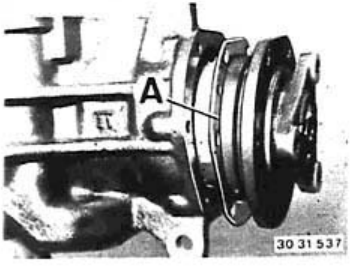


Place Special Tool 31 5 072 on pinion.
Insert Special Tool 31 5 071 in case bores.
Read distance (D) to special tool gage and note value, for example:
D actual = 3.90 mm (0.153").



Important!
Measure and note thickness of shim (C).

Determine D target.
D target = 4.00 mm / 0.157" (predetermined basic distance) + e or - e, e.g. - 2 (plus/minus sign and number indicating 100ths mm are engraved in pinion).



Install drive set with the originally installed shim (A), e.g. A = 1.80 mm (0.071"), and bolt.

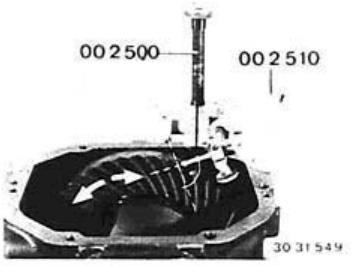
Example:
D target = 4.00 mm - 0.02 mm = 3.98 mm
(0.157" – 0.001" = 0.156")

Determine shim thickness.
Example:

Installed shim (A)	1.80 mm (0.071")
+ D target	+ 3.98 mm (0.156")
	5.78 mm (0.227")
– D actual	– 3.90 mm (0.153")
Shim thickness (A)	1.88 mm (0.074")

Max. deviation from determined shim thickness = ±0.01 mm (0.0004").
This means in our example, for instance, a shim with a thickness of 1.89 mm (0.0744") must be installed.

Shims are available in appropriate thickness steps.



3. Backlash Adjustment for Ring Gear/Pinion

Mount dial gage 00 2 510 and Special Tool 00 2 500, with dial gage point at right angle to tooth, and measure play.
Nominal value*.

Backlash excessive = install thicker shim (C).
Backlash insufficient = install thinner shim (C).
Change shims until nominal value is reached.
Note:
The difference between the actual backlash and nominal backlash*, multiplied by the factor 1.15, produces the amount of which shim (C) must be thicker or thinner.
Example:

Measured backlash	0.19 mm (0.0075")
– specified min. play	0.06 mm (0.0024")
Difference	0.13 mm (0.0051")

Difference x factor =
0.13 mm x 1.15 = 0.15 mm or
0.0051" x 1.15 = 0.0059".

The thickness of installed shim (C), e.g. 2.01 mm (0.079"), must be increased by 0.15 mm (0.006").
Shims are available in thickness steps of 0.03 mm (0.0012").

Important!
The total thickness of shims (B + C) must not be changed.
If, for example, the thickness of shim (C) is reduced, the thickness of shim (B) must be increased by the same amount, or vice versa.

Check the tooth contact pattern to control the ring gear/pinion adjustment.

* See Specifications

4. Tooth Contact Pattern

Type of teeth – Gleason.
Coat ring gear with printer's ink.
Turn differential several times in both directions and stop ring gear suddenly with a piece of wood.

BASIC INFORMATION FOR TOOTH CONTACT PATTERN ADJUSTMENTS

Gleason Teeth

A Correct tooth contact pattern without load.

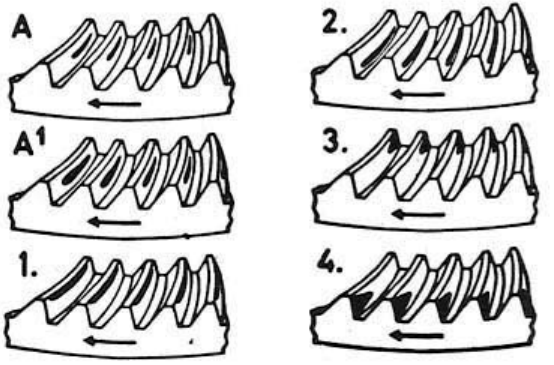
A 1 Loads will displace the tooth contact pattern slightly more toward the outside. Moving the ring gear will mainly change the backlash and also the tooth contact pattern in longitudinal direction of the teeth.
Moving the drive pinion will change the tooth contact pattern in direction of tooth height, while the backlash will be changed only slightly.
Here are the four basically wrong tooth contact patterns, which normally occur in combination and the knowledge of which will make practical adjustments easier.

1. High, narrow tooth contact pattern (head) on ring gear.
Move drive pinion toward ring gear axis and possibly correct backlash by pressing ring gear away from drive pinion.

2. Deep, narrow tooth contact pattern (base) on ring gear.
Move drive pinion away from ring gear axis and possibly correct backlash by pressing ring gear closer.

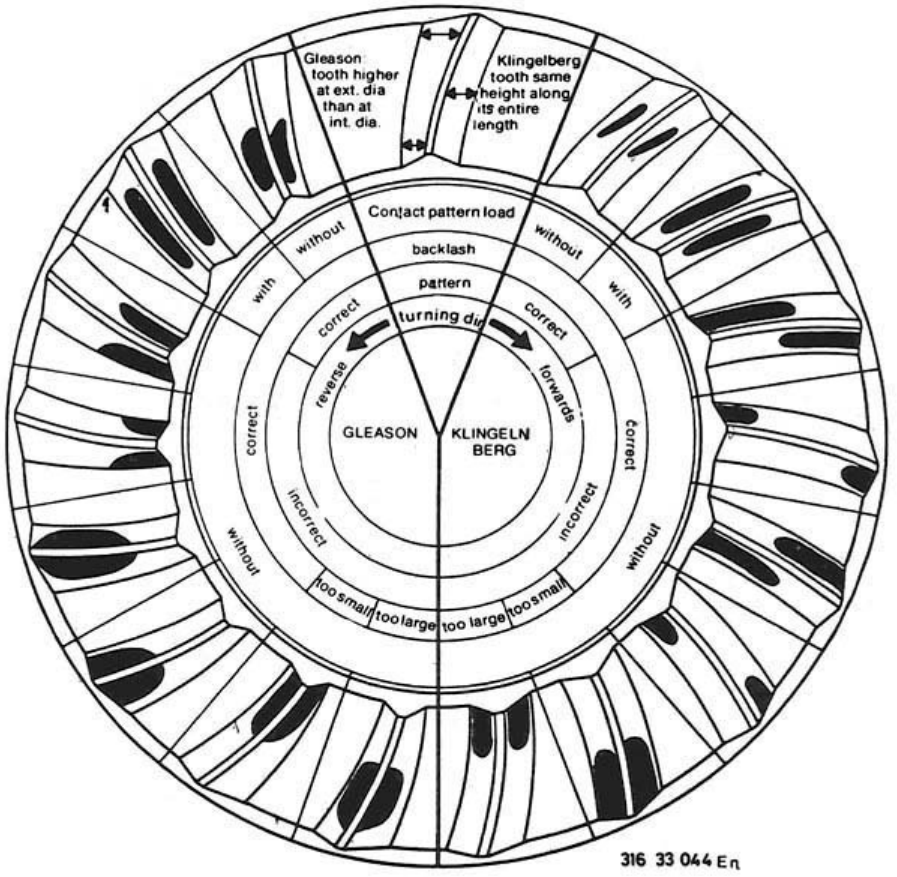
3. Brief tooth contact pattern on small tooth end (tip) of ring gear.
Move ring gear away from drive pinion. If applicable, move drive pinion closer to ring gear axis.

4. Brief tooth contact pattern on large tooth end (heel) of ring gear.
Move ring gear closer to drive pinion. If applicable, move drive pinion away from ring gear axis.



28 33 030

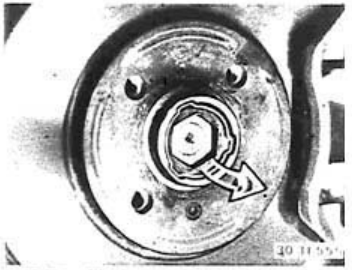
Adjustment of contact pattern



31 60 000 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT OUTPUT SHAFT

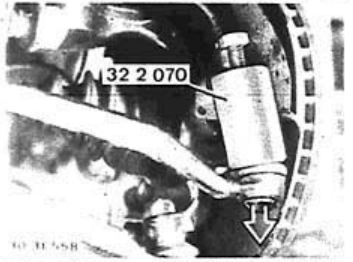
Remove front wheel – see Group 36.
Drain final drive oil.

Installation:
Fill final drive oil**.
Tightening torque*.



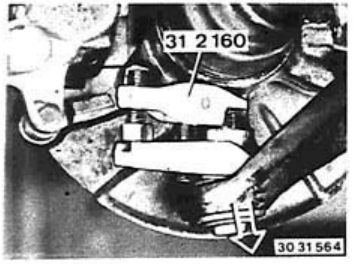
Pry out lockplate with a screwdriver.
Unscrew collar nut.

Installation:
Tightening torque*.
Knock on new lockplate with Special Tools 33 4 050 and 00 5 500.



Unscrew nut and press off tie rod with Special Tool 32 2 070.

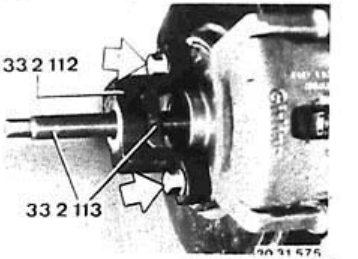
Installation:
Replace self-locking nut.
Tightening torque*.



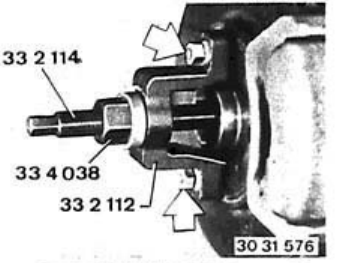
Unscrew nut and press off control arm with Special Tool 31 2 160.

Installation:
Tightening torque*.
Lock nut with cotter pin.

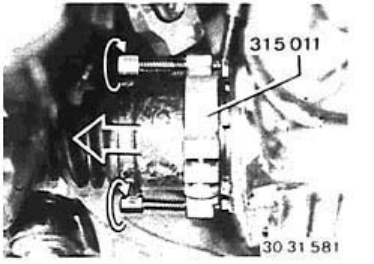
* See Specifications
** See Operating Fluids



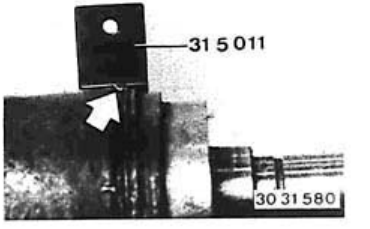
Mount Special Tools 33 2 112 / 113 with two wheel bolts and press off output shaft.



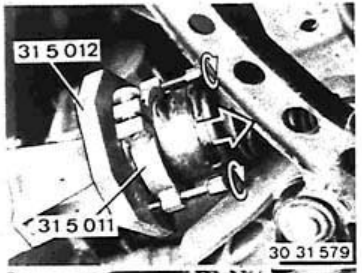
Installation:
Lubricate splines of output shaft lightly with oil and pull in with Special Tools 33 2 112 / 114 and 33 4 042.



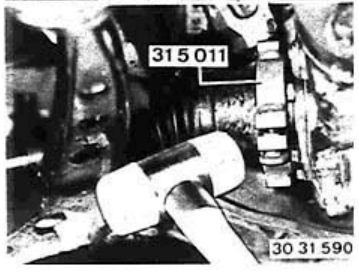
Left Side:
Pull off output shaft with Special Tool 31 5 011.
Pressure spindles bear on heads of bolts.
Screw in pressure spindles alternately.



Note:
Ring of Special Tool 31 5 011 bears in groove of shaft.



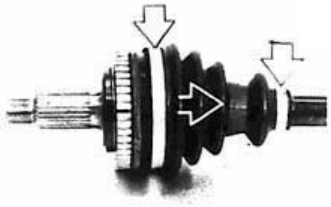
Right Side:
Apply Special Tool 31 5 012 and pull off output shaft with Special Tool 31 5 011. Screw in pressure spindles alternately.



Installation:
Slide output shafts into front axle final drive until circlip in case engages in groove of shaft.
If necessary, apply knocks on Special Tool 31 5 011 with a plastic hammer to drive in shaft until circlip engages.

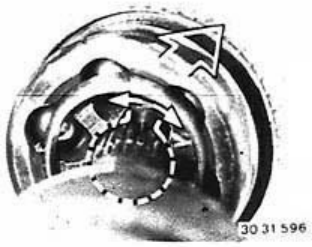
31 60 020 REPLACING ONE CONSTANT VELOCITY JOINT (OUTER)
31 60 021 REPLACING ONE CONSTANT VELOCITY JOINT (INNER) OF OUTPUT SHAFT

Remove front output shaft 31 60 000.



30 31 595

Loosen both hose clamps and pull dust cover off of joint.



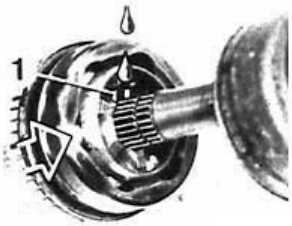
30 31 596

Spread open circlip and drive joint off of the shaft with a plastic hammer.

30 31 597

Constant Velocity Joint (Outer):
Add about half of the grease in a 80 gr. tube .

Constant Velocity Joint (Inner):
Add grease from a 80 gr. tube.



30 31 598

Clean and remove grease on splines of shaft and joint.
Coat splines of shaft completely with Loctite No. 270.
Drive joint on to shaft with a plastic hammer until circlip (1) engages.

Outer Joint:
Add remaining amount of grease in joint.

Inner Joint:
Add grease of 70 gr. tube in joint.

31 60 030 REPLACING ONE DUST COVER OF LEFT OR RIGHT OUTPUT SHAFT

Procedures are identical with those described in 31 60 020/021.
Clean joint to remove the old grease.
Do not disassemble a joint or let it fall apart.

32 Steering and Wheel Alignment

	General information and definitions	32- 0
32 00 . . .	Front and rear wheel alignment – check with optical tester	32- 3
	Front wheel alignment – troubleshoot	32- 4

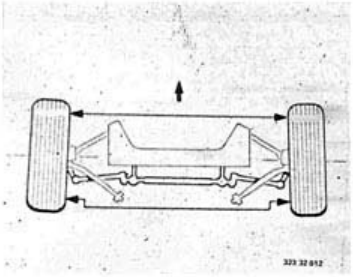
020	Airbag crash sensor – remove and install or replace	32- 60
040	Airbag safety switch – replace	32- 61

Information:

Steering Gear:
Damage could occur on the steering gear from jolt-type loads in accidents or accident-similar operating conditions. Always conform with factory specifications for reasons of safety – see Service Information 32 01 88 (828).

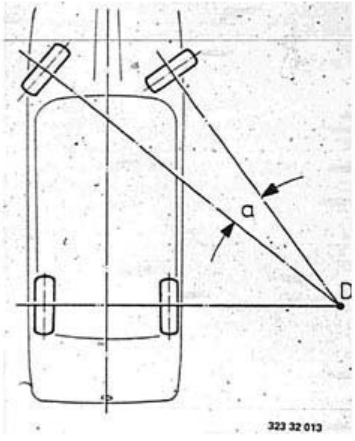
Steering Gear:
Steering rattle, variable steering ratio – see Service Information 32 04 87 (803).

GENERAL INFORMATION AND DEFINITIONS



Toe

is the reduction in distance of front of front wheels to rear of front wheels. Toe prevents the wheels from running apart while driving and consequently wheel shimmy and grinding, excessive tire wear, excessive loads on steering linkage and joints as well as hard steering of car. Toe is measured in "straight ahead position".

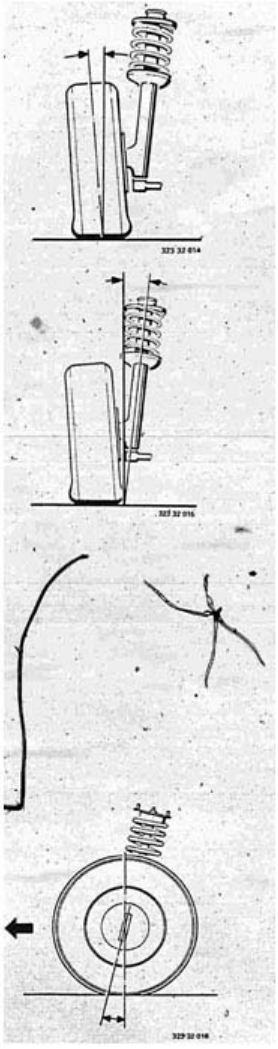


Toe Difference Angle

is the angular position of the wheel on the inside of a curve to the wheel on the outside of a curve when driving in a curve. The steering is designed that the angular position of the wheels changes as steering lock progresses. The toe difference angle provides information on the pertinent operation of the steering trapezoid for left or right steering lock from the center position. A correctly adjusted toe difference angle produces equal values for left and right lock in due consideration for plant tolerances.

a = Toe difference angle

D = Turning circle center point



Camber

is the inclination of the wheel to the car's axial plane, measured in the car's lateral plane with "straight ahead drive".

King Pin Inclination

is the angle, by which the king pin is inclined inward from a perpendicular line to the lateral axis of the car.
The king pin inclination produces returning forces, which return the road wheels and steering wheel to straight ahead after driving through a curve or around a corner.

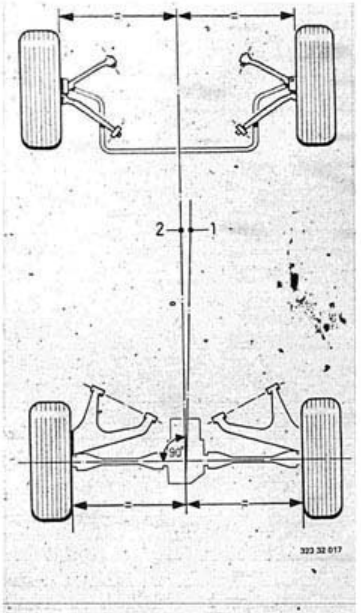
Camber and king pin inclination determine the location of the wheel contact point with the road surface. King pin inclination reduces the leverage, on which frictional forces are engaged, which makes it easier to turn the wheels to left or right lock. In addition, the jolts from rough road surfaces do not have strong influence on the steering.

Caster

is the inclination of the king pin* in forward direction as seen from the side.

The wheels are pulled and not pushed because of caster. In a similar manner to king pin inclination, when driving in curves or around corners returning forces are produced to help return the wheels to straight ahead position.

* The "king pin" is equal to a line through the center point of the spring strut mount and control arm ball joint.

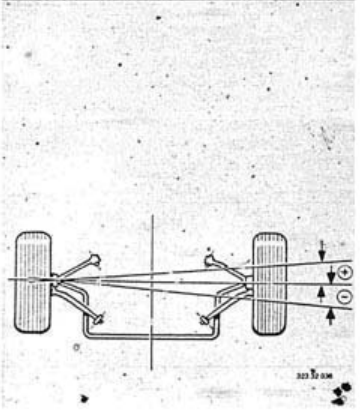


Geometrical Axis 1

is the bisecting line of an angle from the total rear wheel toe. Front wheel measurements are taken in reference to this axis.

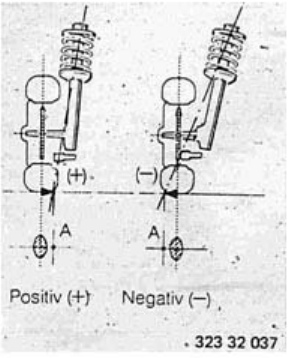
Symmetrical Axis 2

is a center line running through the front and rear axles.



Wheel Offset

is the angle, by which one front wheel is displaced more toward front or rear than the other front wheel.



Scrub Radius / Wheel Offset

is the distance from the center of the wheel contact surface to the intersection point of an extension of the kingpin*.
Scrub radius is influenced by camber, kingpin inclination and wheel offset.

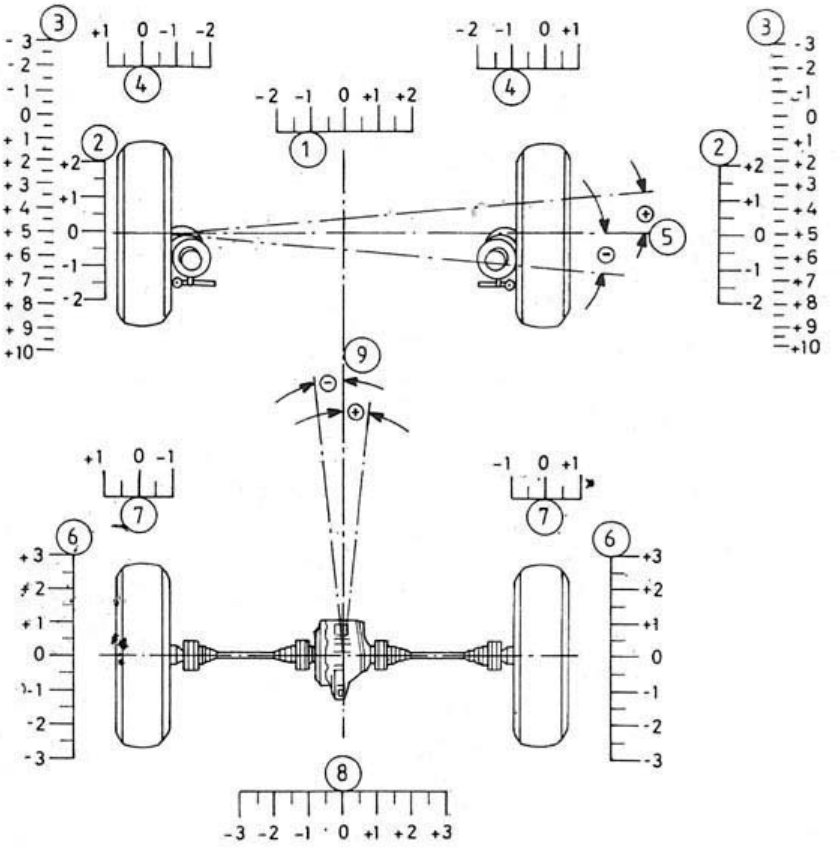
* The "king pin" is equal to a line through the center point of the spring strut mount and control arm ball joint.

32 00 ... CHECKING AND ADJUSTING FRONT AND REAR WHEEL ALIGNMENT WITH OPTICAL TESTER

Requirements Prior to Checking Wheel Alignment:

1. Good, uniform tire treads.
2. Specified tire inflation pressure**.
3. Wheel rims in perfect condition*.
4. Specified wheel bearing play*.
5. Car brought to normal position*.
6. Specified height*.

Check actual values with an optical tester.
Fill in test sheet.
Nominal values*.

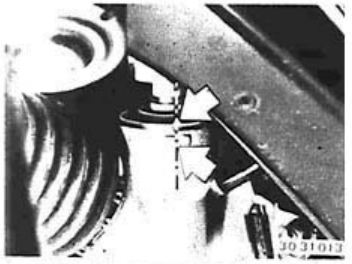


1 = Toe
2 = Camber
3 = Caster (with 10° or 20° wheel lock)
4 = Toe difference angle (with 20° wheel lock)
5 = Wheel offset
6 = Camber
7 = Rear wheel position
8 = Toe
9 = Geometrical axis

* See Specifications of Gr. 31/32/33/36
** See Service Information of Gr. 36

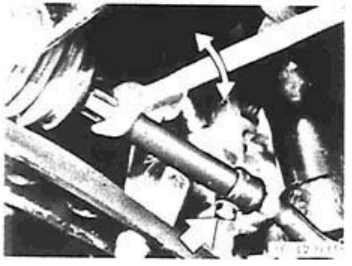
TROUBLESHOOTING FRONT WHEEL ALIGNMENT

Condition	Cause	Correction
1 Toe deviation	a) Car not in normal position b) Tie rod(s) bent c) Track arm on spring strut deformed d) Tie rod ball socket joints on steering gear or wheel end worn e) Rubber mount in control arm defective f) Ball socket joints in control arm defective	a) Height level, see Specifications of Group 31 b) Replace tie rod(s) c) Replace spring strut d) Replace ball joint e) Replace rubber mount f) Replace control arm
2 Camber deviation Camber is given by design and cannot be adjusted.	a) Rubber mount in control arm defective b) Control arm deformed c) Spring strut deformed d) Guide joint worn e) Suspension sag excessive f) Front axle carrier deformed g) Wheel house deformed (spring strut mount holder deformed) h) Distortion in floor assembly (engine carrier) i) Unfavorable summary of tolerances	a) Replace rubber mount b) Replace control arm c) Replace spring strut d) Replace control arm e) Height level, see Specifications of Group 31 Replace coil springs f) Replace front axle carrier g) Repair front end h) Repair body i) Install eccentric mounts, see camber correction
3 Caster deviation Caster is given by design and cannot be adjusted.	a) Control arm bent b) Spring strut deformed c) Wheel house deformed d) Distortion in floor assembly (engine carrier)	a) Replace control arm b) Replace spring strut c) Repair front end d) Repair body
4 Toe difference angle deviation	Assuming camber and caster are correct: a) Tie rods not adjusted uniformly b) Track arm on spring strut bent	a) Adjust toe on left and right sides to same value b) Replace spring strut
5 Wheel offset deviation (alignment tester Type F 1600)	Assuming front wheels have equal single toe to geometrical axis: a) Front axle carrier deformed b) Engine carrier deformed c) Control arm deformed	a) Replace front axle carrier b) Repair body c) Replace control arm



32 00 . . . ADJUSTING TOE AND TOE DIFFERENCE ANGLE

Position steering gear in straight ahead (marks on case and steering shaft aligned).



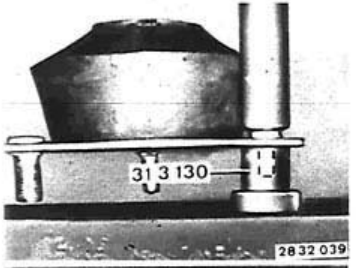
Loosen bolts of tie rods.
Adjust toe on left and right wheels to nominal value* by turning the tie rods.
Installation:
Make sure that ball joints and dust covers are not twisted.
Tightening torque*.

* See Specifications

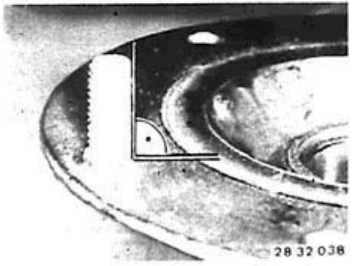
Correcting Camber:
If necessary because of the summation of unfavorable tolerances, correct front wheel camber by installing eccentric mounts for ± 30' correction.

Important!
Changes in vehicle geometry (axis – body) caused by accident must never be eliminated with this measure.

Example:	
Nominal camber value	– 10' ... – 1° 10'
Actual camber value	– 1° 30'
Correction	+ 30'
New actual value	– 1°



Eccentric mounts are marked with + and – at bores.
Press knurled bolts depending on situation (see example) into "+" or "–" bores with Special Tool 31 3 130.



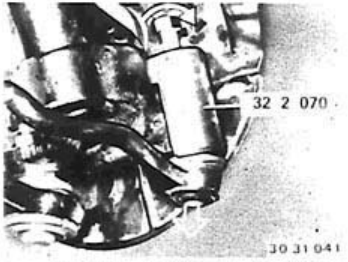
Important!
Knurled bolts must be vertical and flush in mount.
Replace front spring strut mount 31 33 001.

TROUBLESHOOTING REAR WHEEL ALIGNMENT

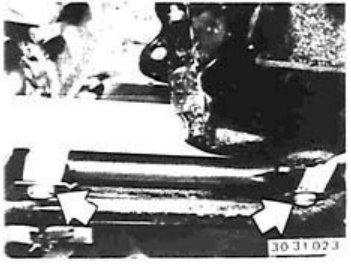
Condition	Cause	Correction
6 Camber deviation	a) Rubber mounts on rear axle carrier defective	a) Replace rubber mounts
	b) Rubber mounts on final drive defective	b) Replace rubber mounts
	c) Silent blocks in trailing arms defective	c) Replace silent blocks
	d) Rear axle carrier deformed	d) Replace rear axle carrier
	e) Trailing arms deformed	e) Replace trailing arms
	f) Distortion in floor assembly	f) Repair body
7 Rear wheel positioning incorrect	a) Rear axle carrier displaced laterally	a) Check rubber mounts on rear axle carrier, replacing if necessary
	b) Distortion in floor assembly	b) Repair body
8 Toe deviation	a) Rear axle carrier deformed	a) Replace rear axle carrier
	b) Trailing arms deformed	b) Replace trailing arms
	c) Silent blocks in trailing arms defective	c) Replace silent blocks
	d) Rubber mounts on rear axle carrier defective	d) Replace rubber mounts
	e) Suspension sag excessive or car not in normal position	e) Height level see Specifications of Group 33 Replace coil springs if necessary
	f) Unfavorable summation of tolerances	f) Install eccentric silent blocks, see 33 22 561
9 Deviation in geometrical axis (alignment tester Type F 1600)	Assuming total rear wheel toe is correct:	
	a) Distortion in floor assembly	a) Repair body

32 11 000 REMOVING AND INSTALLING STEERING GEAR ASSEMBLY

Remove and install front wheels 36 10 340.
Remove and install steering spindle 32 31 070.
Note:
Check toe after installation – see 32 00 004.



Unscrew nuts and press left and right tie rods off of spring struts with Special Tool 32 0 070.
Installation:
Clean pins and bores to remove grease.
Replace self-locking nuts.
Tightening torque*.



Unscrew steering gear on front axle carrier.
Installation:
Mount steering gear in front bores of front axle carrier.
Replace self-locking nuts.
Tightening torque*.

* See Specifications

32 13 006 FILLING AND BLEEDING POWER STEERING

1. Filling with Stopped Engine:
   Fill oil tank up to "MAX" mark on oil dipstick.
2. Bleeding:
   Turn steering wheel two times each against left and right locks.
3. Check oil level with engine stopped.
   Add hydraulic fluid* until level is at "MAX" mark.

* See Specifications

32 13 060 REMOVING AND INSTALLING POWER STEERING GEAR – Four Wheel Drive –

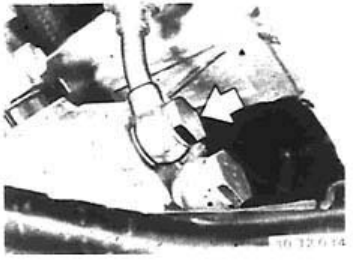
Procedures are identical with those for replacing the front axle carrier – see 31 11 001.

32 13 060 REMOVING AND INSTALLING POWER STEERING GEAR

Remove front wheels – see 36 10 340.
Remove steering spindle – see 32 31 070.
Note:
Check toe after installation – see 32 00 004.
Important!
Don't turn power steering as far as stop as this would damage radial oil seal.

Draw hydraulic fluid* out of tank.
Unscrew hydraulic fluid return pipe.

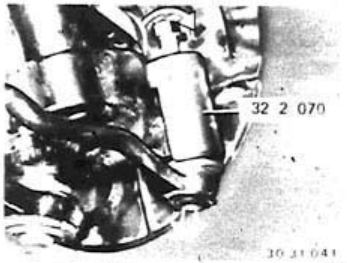
Important!
Never reuse the drained oil.



Unscrew pressure pipe.
Plug connections with dust caps.

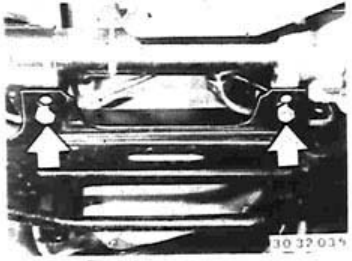
Installation:
Replace seals.
Tightening torque*.

* See Specifications



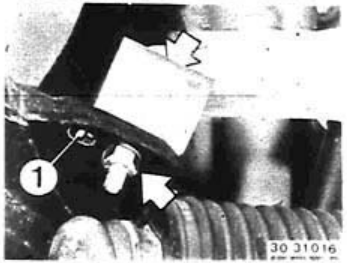
Unscrew left and right nuts and press tie rods off of tie arms with Special Tool 32 0 070.
M 3:
Special Tool 31 2 160.

Installation:
Pins and bores free of grease.
Replace self-locking nuts.
Tightening torque*.



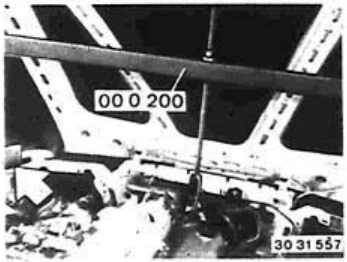
Unscrew steering gear on front axle carrier.

Installation:
Mount steering gear on rear bores.
Replace self-locking nuts.
Tightening torque*.
Fill power steering – see 32 13 006.



If applicable, unscrew additional left and right engine mounts.

Installation:
Twist-preventing lock (1) of engine mount must engage in the bore.
Tightening torque*.



Attach Special Tool 00 0 200 on the engine and pull up engine about 5 cm (2"). Supports bear on the bolts of the side walls.
Remove steering gear.

* See Specifications

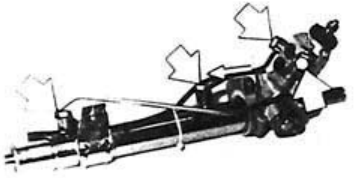
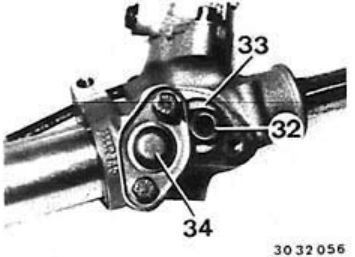
32 13 503 DISASSEMBLING/ASSEMBLING POWER STEERING GEAR – POWER STEERING GEAR REMOVED

Remove and install tie rods 32 21 251.
Working on steering gears requires utmost care and cleanliness.



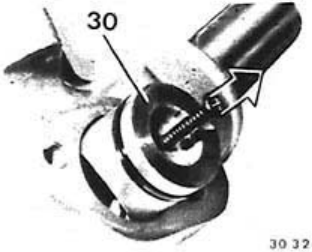
30 32 055

Disconnect lines.
Pull off leak oil line.



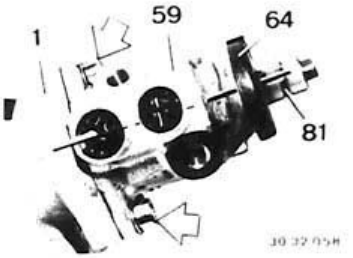
30 32 056

Unscrew bolts.
Take off cover (34), spring (32) and washer (33).



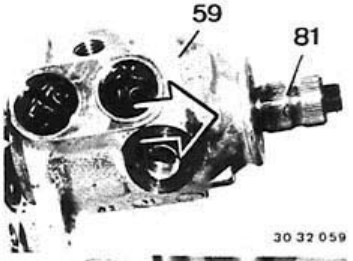
30 32 057

Screw self-tapping screw in bore and pull out pressure piece (30).



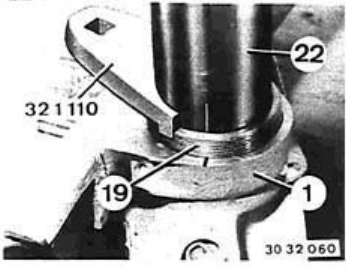
30 32 058

Pull protective cap (64) off of steering spindle stub.
Turn steering to straight ahead (take half of total steering wheel turns).
Mark position of steering spindle (81), valve housing (59) and case (1) to each other in this position.
Unscrew bolts.



30 32 059

Pull steering spindle (81) and valve housing (59) out of case.

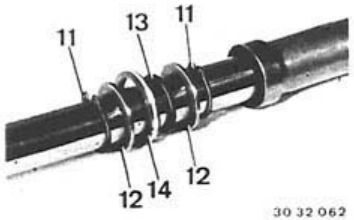


30 32 060

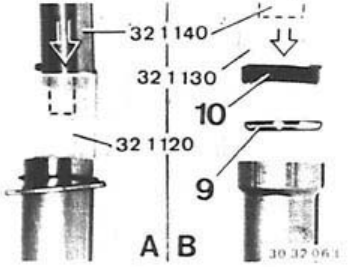
Mark position of cylindrical tube (22) and case (1) to each other.
Unscrew round nut (19) with Special Tool 32 1 110.
Remove cylindrical tube.

30 32 061

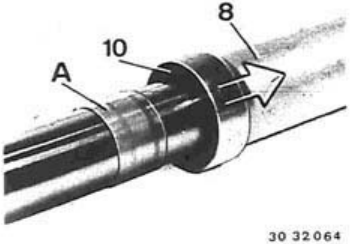
Pull rack (3) out of case.



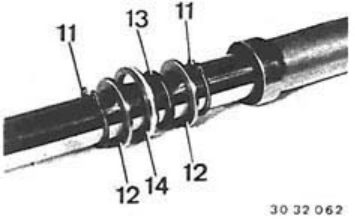
Take off circlip (11), washers (12), piston (14) and round seal (13).
Pull off cylindrical tube on rack.



A) Knock out seal (10) with Special Tool 32 1 120 / 140.
B) Insert support (9) with chamfer facing down.
Knock in seal (10) against stop (open end facing up) with Special Tool 32 1 130/ 140.
Coat sealing lip with hydraulic fluid*.

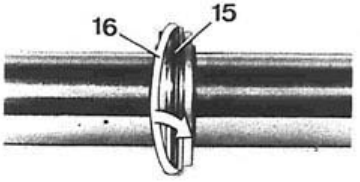


Fill cuts in rack with grease (A) to avoid damage on seal (10).
Slide cylindrical tube (8) on to rack.
Remove grease.

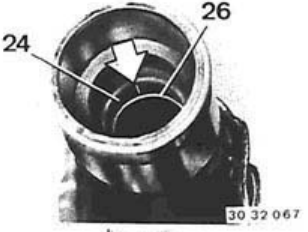


Replace round seal (13).
Insert washers (12), piston (14) and circlips (11).

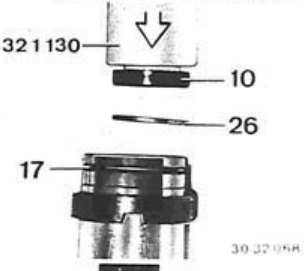
* See Operating Material Specifications



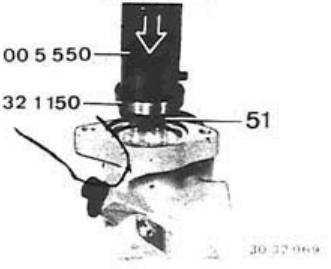
Replace round seal (15) and piston ring (16), and coat with hydraulic fluid*.



Apply screwdriver in slot of bearing sleeve (24) and knock out support (26) with seal (10).



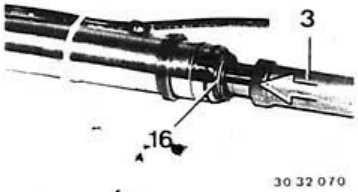
Insert support (26) and knock in seal (10) against stop (open end facing up) with Special Tool 32 1 130 / 140.
Replace round seal (17).



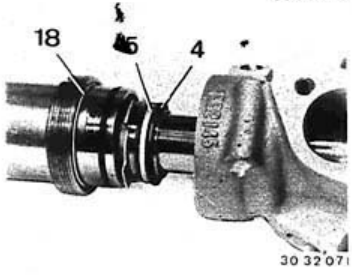
Knock in radial oil seal (51) against stop (open end facing up) with Special Tools 32 1 150 and 00 5 500.
Fill sealing lip with grease*.

* See Operating Material Specifications

Guide rack (3) into cylindrical tube.
Caution!
Don't damage piston ring (16).

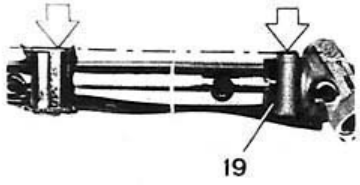


30 32 070



30 32 071

Replace spacer (5) and round seal (4).
Lubricate splines of rack with grease*.
Measure and note diameter of snap ring (18).
Guide cylindrical tube into body.



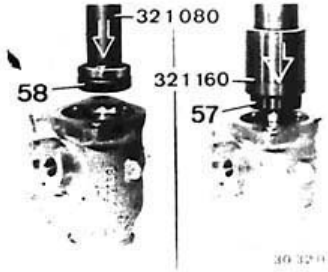
30 32 072

Align mounting flanges horizontally – check marks – and tighten ring nut (19).
Tightening torque depends on wire gauge diameter of snap ring (18).
2.5 mm (0.098") dia. = 120 Nm (87 ft. lbs.).
3.5 mm (0.138") dia. = 150 Nm (108 ft. lbs.).
Lock ring nut with a punch mark.

30 32 073

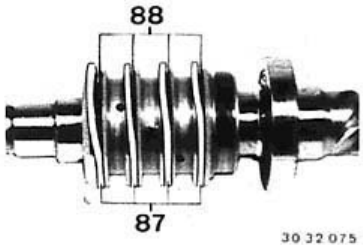
Pull valve body (81) out of valve housing (59).

* See Operating Material Specifications



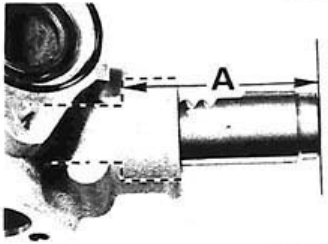
30 32 074

Knock out radial oil seal (58) with Special Tool 32 1 140.
Knock in new radial oil seal (58) against stop (open end facing in) with Special Tool 32 1 080 and coat with hydraulic fluid*.
Knock in bearing (57) against stop with Special Tool 32 1 160.



30 32 075

Replace round seals (87) and seals (88) located underneath, and coat with hydraulic fluid*.



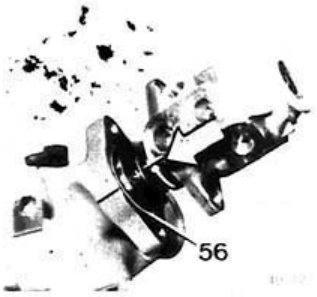
30 32 076

Set rack (3) to straight ahead position.
Distance A from end of rack to stop in cylindrical tube is 72 mm (2.835") for both left and right sides.

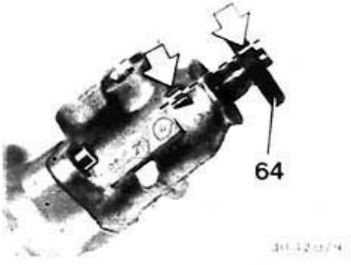
30 32 077

Dip pinion splines in grease* and install pinion in body.
The marks made prior to disassembling must align.

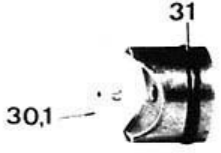
* See Operating Material Specifications



Replace round seal (56).
Slide valve housing over valve body carefully to avoid damaging the seal and tighten bolts.
Tightening torque = 17 to 20 Nm (13 to 14 ft. lbs.).

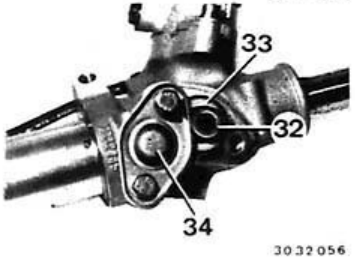


Pack protective cap (64) with grease* and mount on steering spindle with steering gear in center position.
Tab of protective cap faces mark on valve housing.



30 32 080

Replace plastic sheet inlet (30.1) and round seal (31).



3032056

Insert pressure piece (30), spring (32) and spacer (33), and bolt down with cover (34).
Tightening torque = 17 to 20 Nm (13 to 14 ft. lbs.).

* See Operating Material Specifications

30 32 081

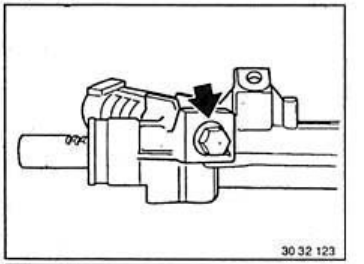
Replace round seals of hollow union bolts and screw on lines.
Tightening torque = 20 Nm (14 ft. lbs.).

Complete installation of steering gear and then check its operation.

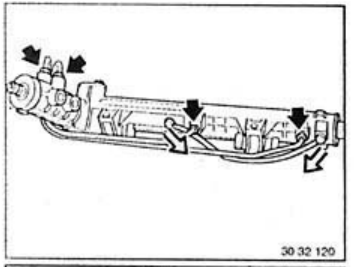
32 13 503 DISASSEMBLING AND ASSEMBLING POWER STEERING GEAR (Code No. 7832 955 139) – Power Steering Gear Removed)

Remove tie rods – see 32 21 251.

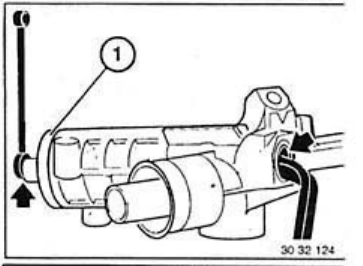
Work on steering gear must always be carried out carefully and with absolute cleanliness.



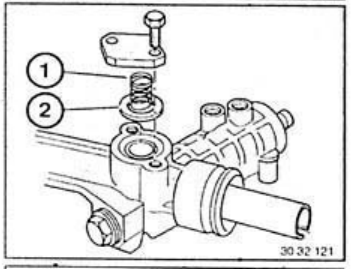
Unscrew plug.



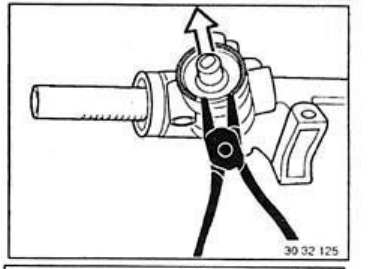
Unscrew pipes.
Pull off leak oil pipe.



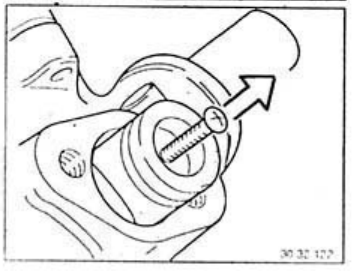
Pull cap (1) off steering spindle.
Unscrew nut, while counterholding on double-flats of steering spindle.



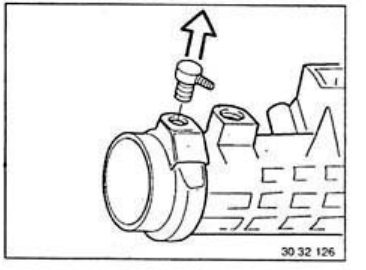
Unscrew cap.
Take off spring (1) and washer (2).



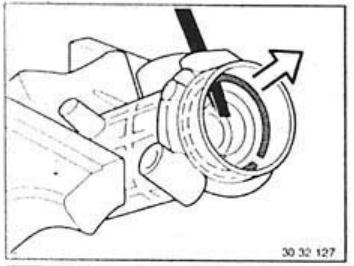
Lift out circlip.
Pull steering spindle out of case.



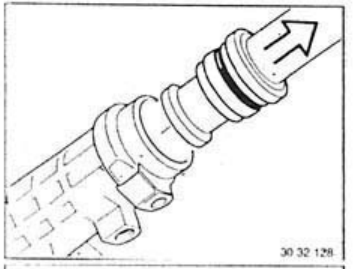
Screw self-tapping screw in bore and pull out pressure piece.



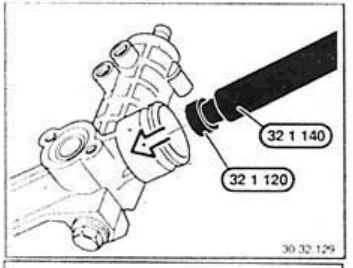
Pull off connector for leak oil pipe.



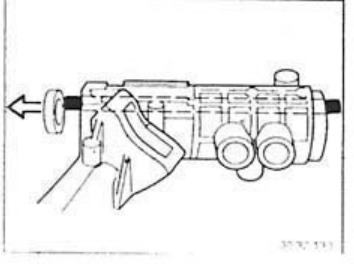
Unlock circlip through bore of leak oil pipe and pull out of case.



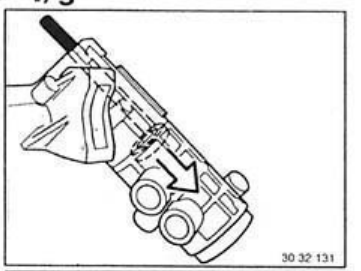
Pull rack out of case.



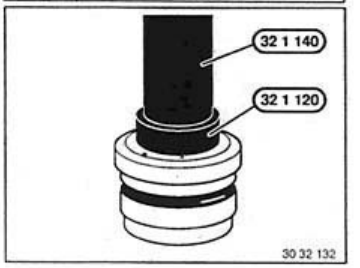
Drive radial oil seal out of case with Special Tools 32 1 140 / 120.



Drive bearing out of case with a punch.

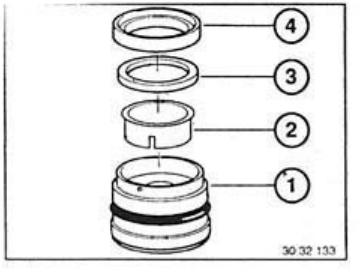


Drive radial oil seal out of case with a punch.



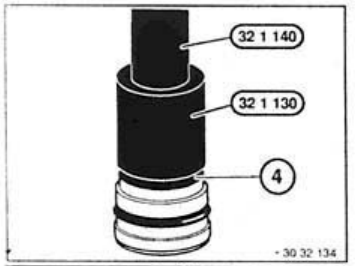
Drive radial oil seal out of bearing sleeve with Special Tools 32 1 140 / 120.

Clean all parts thoroughly.
Coat new seals with hydraulic fluid*.

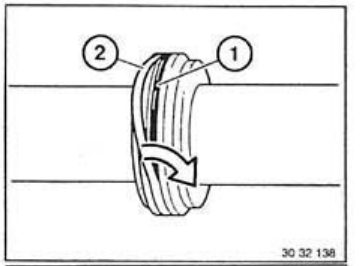


Replace seal (1).
Place new plastic sleeve (2) and support washer (3) in bearing sleeve.

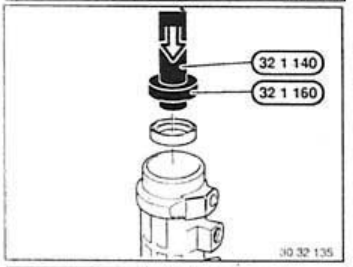
* See Operating Fluids



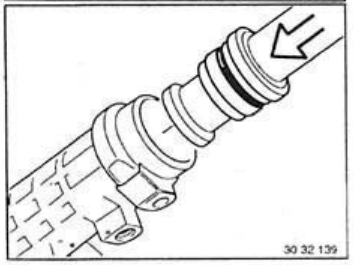
Drive in radial oil seal (4) – open end facing up – as far as stop with Special Tools 32 1 140 / 130.



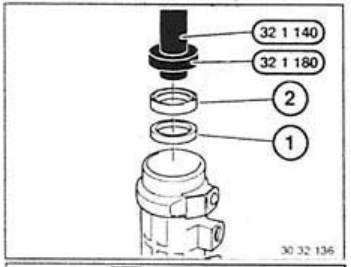
Replace round seal (1) and piston ring (2).



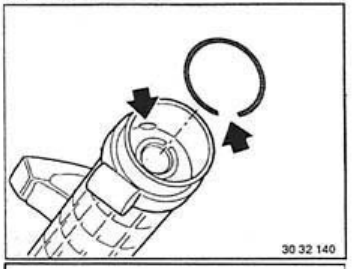
Drive in radial oil seal – open end facing up – as far as stop with Special Tools 32 1 140 / 160.



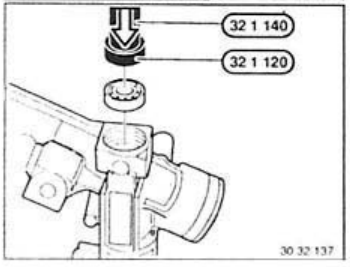
Guide rack into case carefully. Place bearing sleeve on rack.



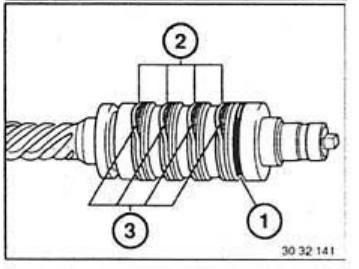
Insert support washer (1).
Drive in radial oil seal (2) – open end facing up – as far as stop with Special Tools 32 1 140 / 180.



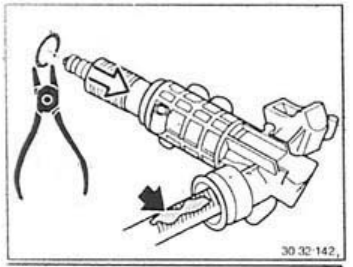
Install circlip with open end opposite leak oil bore.



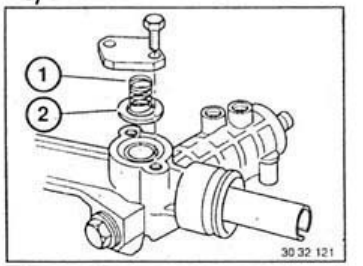
Drive in bearing as far as stop with Special Tools 32 1 140 / 120.



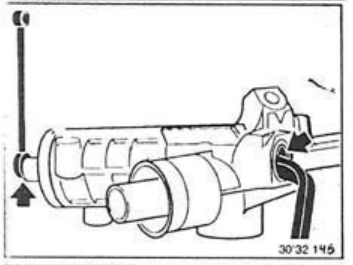
Replace seal (1).
Replace piston rings (2) and O-rings (3) located underneath.



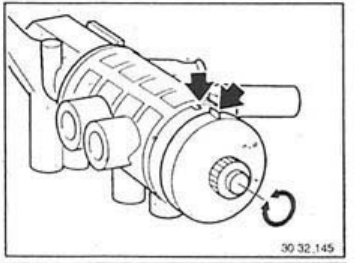
Lubricate teeth on rack and pinion with grease*.
Guide steering head into case and insert circlip.



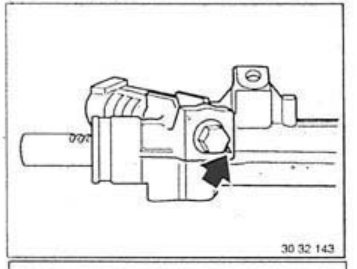
Insert pressure piece with spring (1) and washer (2).
Screw on cap.



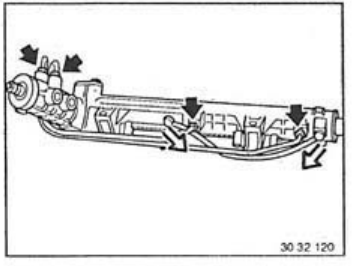
Replace and tighten self-locking nut with 17 Nm (12 ft. lbs.) torque.



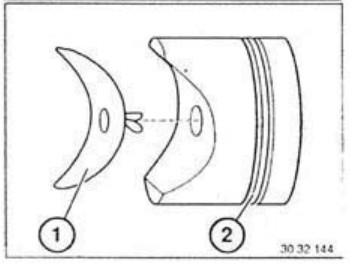
Move steering gear to straight ahead driving position by determining half of total turns.
Install new protective cap in this position.
Mark on cap must be aligned with mark on case.



Tighten plug with 32 Nm (23 ft. lbs.) torque and lock by punching.

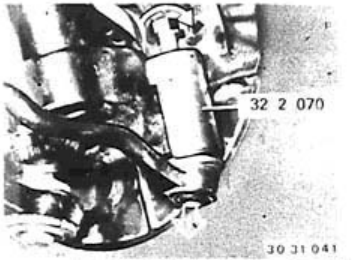


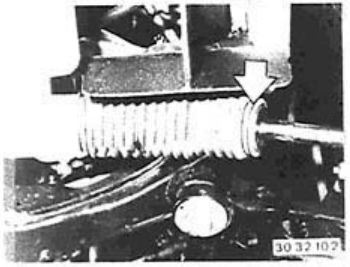
Install connector for leak oil pipe.
Screw on leak oil pipe and pressure pipes.
Tightening torque = 8 Nm (6 ft. lbs.).

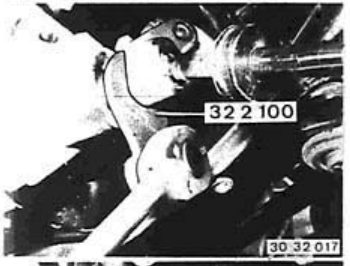


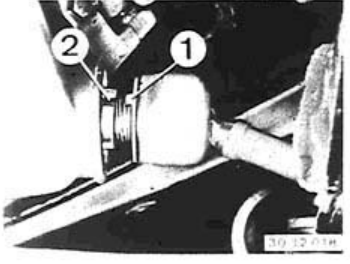
Replace foil insert (1) and seal (2).

* See Operating Fluids









32 21 251 REPLACING LEFT OR RIGHT TIE ROD

Remove front wheel – see Group 36.
Unscrew nut and press tie rod end off track arm with Special Tool 32 0 070 or, for M 3, with Special Tool 31 2 160.

Installation:
Replace self-locking nut.
Journal and bore cleaned of grease.
Tightening torque*.
Adjust toe – see 32 00 004.

Loosen retaining strap.

Installation:
Check dust cover, replacing if necessary.

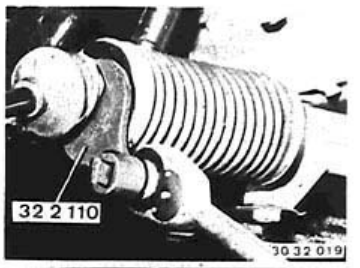
Important!
Don't turn power steering as far as stop as this would damage radial oil seal.

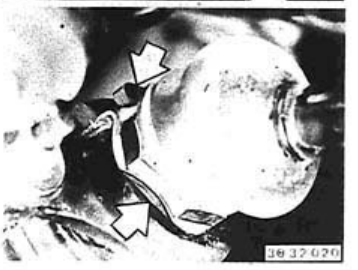
Unlock lockplate.
Remove tie rod with Special Tool 32 2 100.

Caution!
Unlock lockplate with a pliers (never with a hammer) to avoid damaging rack and bearings.

Installation:
Replace lockplate.
Shoulder (1) of lockplate bears in opening (2) of rack.
Tightening torque*.

* See Specifications



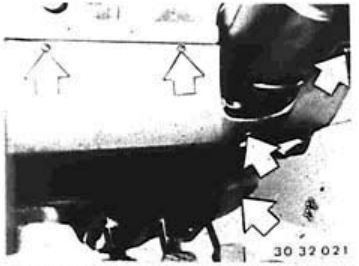


Version with Steering Damper:

Unlock lockplate.
Remove tie rod with Special Tool 32 2 110.

Installation:
Replace lockplate.
Shoulder of lockplate bears in opening of damper bracket.
Tightening torque*.
Lock lockplate by bending with water pump pliers.

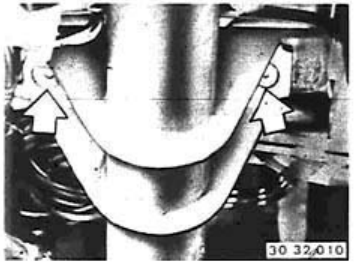
* See Specifications



32 31 001 REPLACING STEERING COLUMN CASING UPPER SECTION

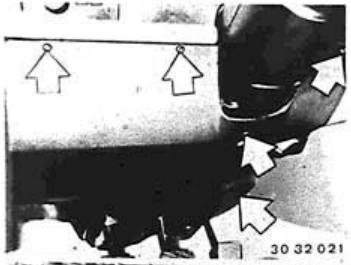
Remove and install steering wheel 32 33 000.
Disconnect battery ground lead.
Remove instrument panel trim.

Remove steering column casing lower section.



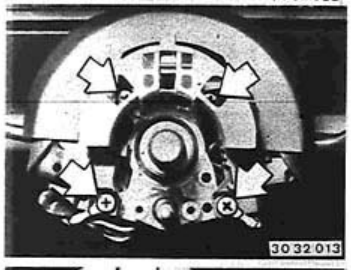
Remove shear-off screws with a chisel.
Take off steering column casing upper section.
Transfer cover for ignition lock.
Installation:
Tighten Torx shear-off screws up to point of shearing off.

32 31 061 REPLACING (UPPER) STEERING SPINDLE

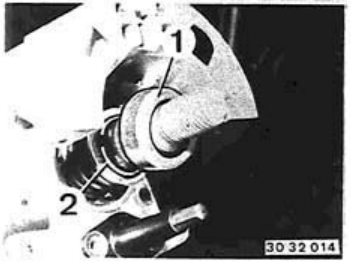


Disconnect battery ground lead.
Remove and install steering wheel 32 33 000.
Remove instrument panel trim.

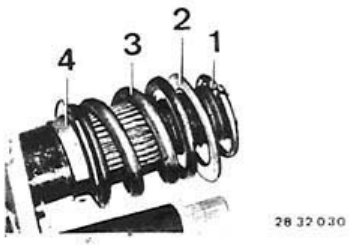
Remove steering column casing lower section.



Disconnect turn signal and wiper switch.

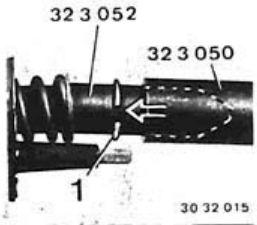


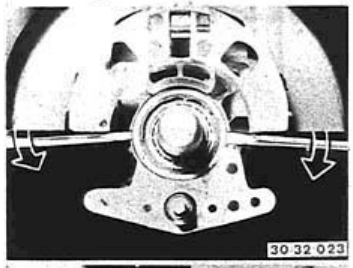
Remove collar ring (1).
Installation:
Notch of collar ring (1) must lock snap ring (2).



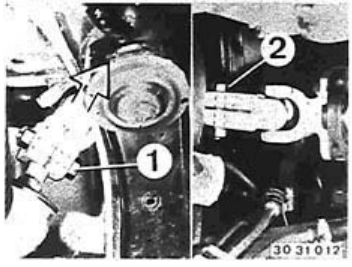
Remove snap ring (1), washer (2), spring (3) and ring (4).
Installation:
Stem of ring (4) faces bearing.

Installation:
Install snap ring (1) with Special Tools 32 3 052 and 23 3 050 (knock from hammer and steering spindle held on bottom).



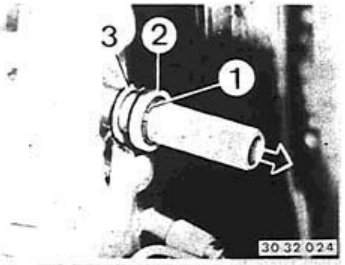


Lift out steering spindle bearings with a screwdriver.
Installation:
For steering spindles with groove in area of bearing, insert and lightly coat O-ring with grease.
Drive in bearing with Special Tool 00 5 550.

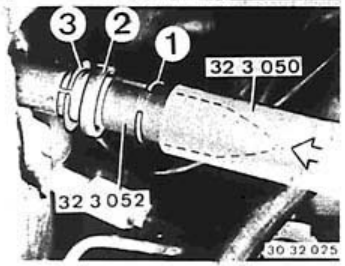


Remove bolt (1) and loosen bolt (2).
Press steering spindle off of steering gear and remove.
Installation:
Bolt (1) must be located in locking groove of steering shaft.
Replace self-locking nuts.
Tightening torque*.

* See Specifications



Pull steering spindle out of bearing.
Remove snap ring (1), collar ring (2) and ring (3).
Pull out steering spindle from above.



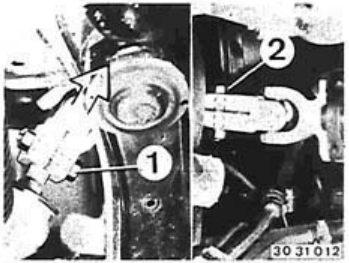
Installation:
Notch of collar ring (2) must lock snap ring (1).
Stem of ring (3) faces bearing.
Install snap ring with Special Tools 32 3 052 and 32 3 050.

If applicable, shove steering spindle down and drive out bearings.
Drive in bearings with Special Tool 00 5 550.

32 31 070 REMOVING AND INSTALLING OR REPLACING LOWER STEERING SPINDLE

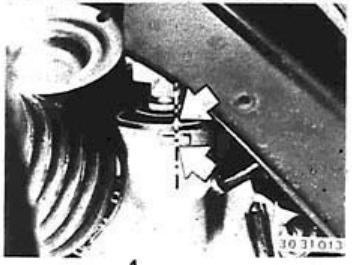
The entire steering spindle should always be replaced when a coupling or universal joint is faulty.
Remove steering wheel – see 32 33 000.

Installation:
Mount steering wheel in straight ahead position.

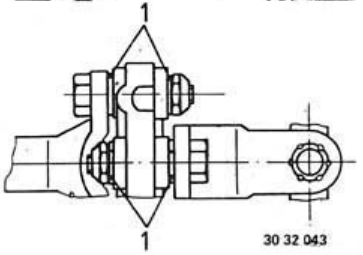


Remove bolt (1) and loosen bolt (2).
Press steering spindle off of steering gear and remove.

Installation:
Bolt (1) must be located in the locking groove of the steering shaft.
Replace self-locking nuts.
Tightening torque*.

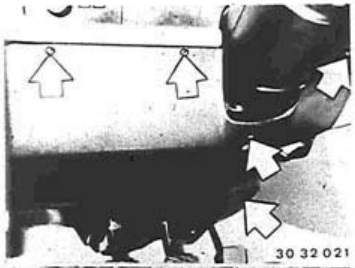


Installation:
Steering wheel and front wheels positioned straight ahead (marks on housing and steering shaft aligned).
Mount steering spindle on steering gear in such a manner that the slot of the universal joint is aligned with the mark on the steering gear.



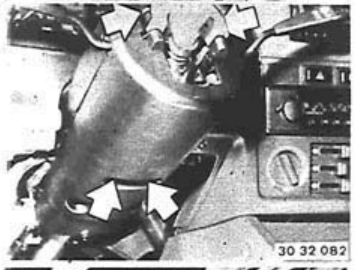
Make sure spring washers (1) are installed between coupling and steering spindle or universal joint when assembling a new steering spindle.
Tightening torque*.

* See Specifications



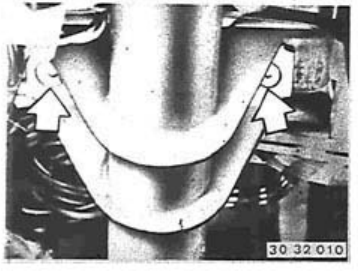
32 31 090 REMOVING AND INSTALLING STEERING COLUMN

Disconnect battery ground lead.
Remove steering spindle – see 32 31 070.
Remove steering wheel – see 32 33 000.
Remove instrument panel trim bottom section.

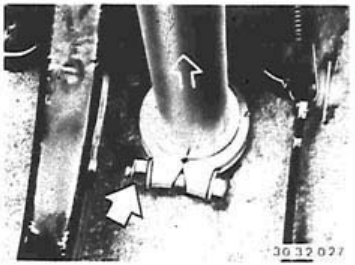


Remove lower section of steering column casing.

Disconnect central electric wire plug.



Remove shear-off screws with a chisel.
Take off upper section of steering column casing.
Installation:
Tighten shear-off screws until heads shear off.



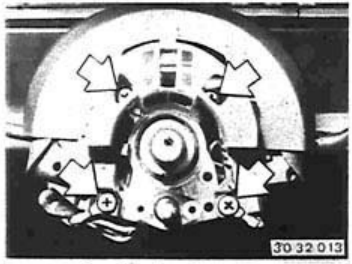
Loosen clamp and remove steering column.

32 31 171 REPLACING BOTH STEERING SPINDLE BEARINGS

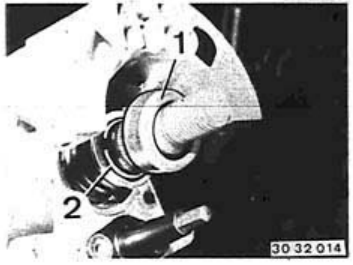
Procedures are identical with those for replacing upper steering spindle – see 32 31 061.

32 32 001 REPLACING STEERING LOCK ASSEMBLY

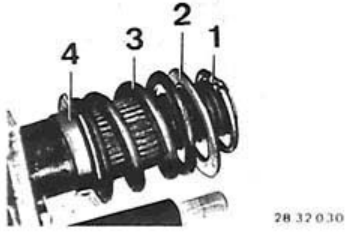
Disconnect battery ground lead.
Remove and install steering wheel 32 33 000.
Remove steering column casing lower section.



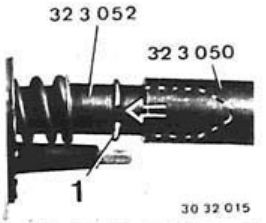
Disconnect turn signal and wiper switch.



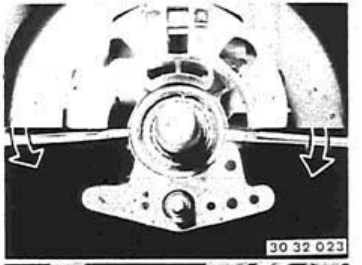
Remove collar ring (1).
Installation:
Notch of collar ring (1) must lock snap ring (2).



Remove snap ring (1), washer (2), spring (3) and ring (4).
Installation:
Stem of ring (4) faces bearing.

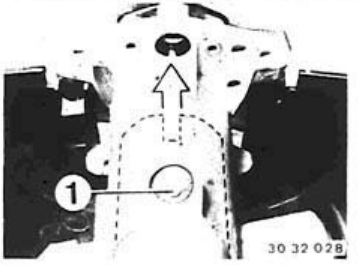


Installation:
Install snap ring (1) with Special Tools 32 3 052 and 32 3 050 (hammer knock).

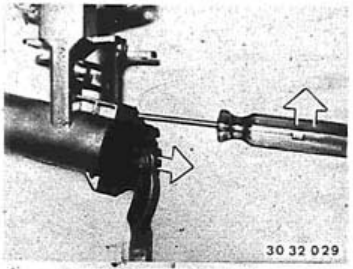


Lift out steering spindle bearings with a screwdriver.
Installation:
Drive in bearings with Special Tool 00 5 550.

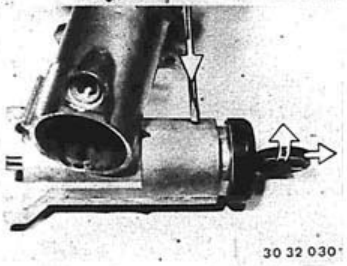
Disconnect central electric plug.



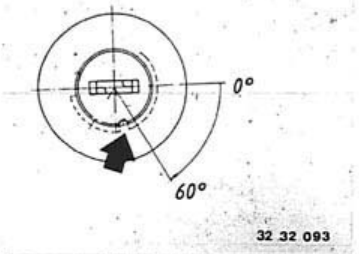
Remove shear-off screw (1) with a chisel.
Pull steering lock with casing upper section off of outer tube.
Installation:
Tighten Torx shear-off screws.



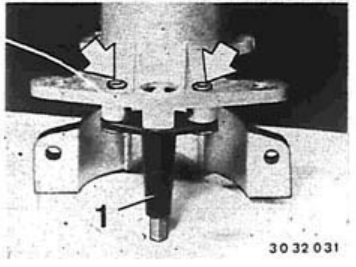
Press down locking hook and remove ignition/ starter switch.
Installation:
Check position of ignition/starter switch and steering wheel lock.



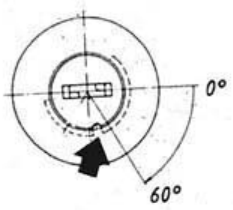
Press down lock with a screwdriver.
Turn key to point of locking and pull out lock cylinder.



Since 1987 Models:
Insert ignition key in lock cylinder and turn to position "R" = 60°.
Push a 1.2 mm (3/64") dia. wire into bore of cylinder and pull out the lock cylinder.



Drill out rivets and bolt carbon contact (1) on new steering lock.



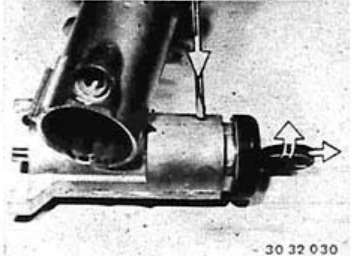
32 32,093

32 32 050 REMOVING AND INSTALLING OR REPLACING STEERING LOCK CYLINDER

Insert ignition key in lock and turn lock cylinder to "R" = 60°
Push a 1.2 mm (3/64") dia. wire into bore of the cylinder and pull out the lock cylinder.

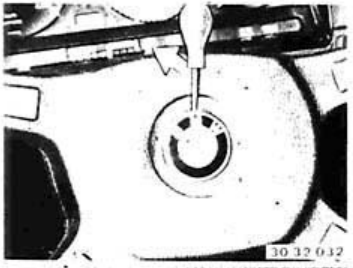
30 32 082

If There is No Bore in Lock Cylinder:
Remove steering wheel — see 32 33 000.
Remove steering column casing lower section.
Disconnect battery ground lead.



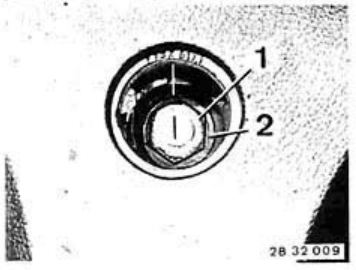
30 32 030

Press down lock with a screwdriver.
Turn key to point of locking and pull out lock cylinder.

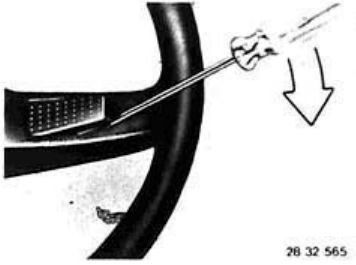


32 33 000 REMOVING AND INSTALLING STEERING WHEEL

Lift off BMW emblem.

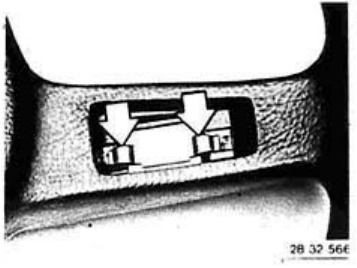


Mark position of steering wheel to steering spindle.
Unscrew nut (1) and remove washer (2).
Important!
Steering wheel can only be pulled off after unlocking steering lock.
Installation:
Replace self-locking nut.
Tightening torque*.



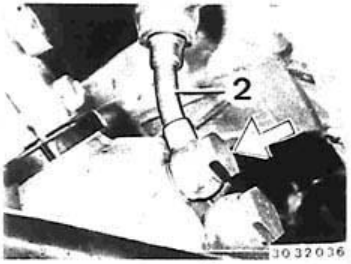
32 33 041 REPLACING HORN BUTTON ON STEERING WHEEL

Lift off horn button carefully with a screwdriver.



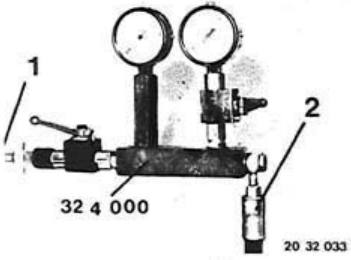
Installation:
Insert spring contact with arcs facing up.

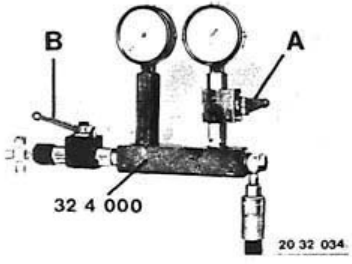
* See Specifications



32 41 009 CHECKING FUNCTION OF POWER STEERING PUMP – ENGINE AT OPERATING TEMPERATURE –

1. Checking Power Steering Pump:
Detach pressure line (2) on steering gear and connect on tester 32 4 000.
Connect pressure line (1) of tester 32 4 000 on steering gear.
Installation:
Tightening torque*.
Bleed power steering 32 13 006.

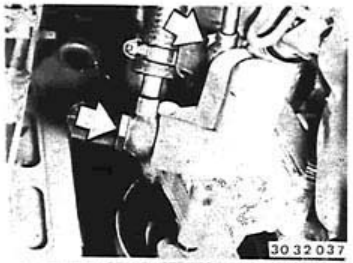




Test:
Valve (A) must always be closed for high pressure testing (would damage pressure tester).
Open valve (B) and bleed power steering 32 13 006.
With engine running shut valve (B) for max. 10 seconds and read pressure.
Rated pump pressure* must be reached within ± 10 %.
If this pressure is not reached, check drive belt tightness 32 41 109.
Recheck.
If pressure is still not reached, replace power steering pump 32 41 060.

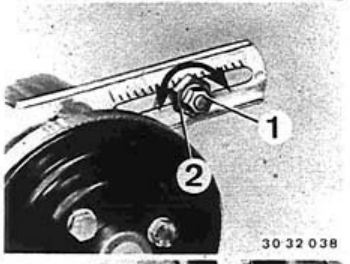
2. Checking Power Steering:
Run engine.
Pull steering wheel against final left lock with a force of 100 N (22 lbs.) about 5 seconds; use a force meter.
Read pressure from tester 32 4 000.
Repeat same test on right lock.
If pressure values are less than the previously measured pump pressure, replace steering gear 32 13 060.

* See Specifications

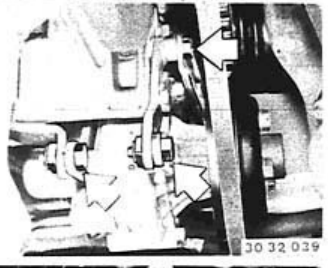


32 41 060 REMOVING AND INSTALLING POWER STEERING PUMP

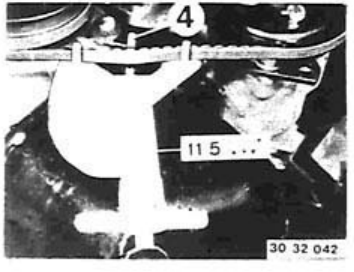
Draw off hydraulic fluid in tank.
Disconnect lines.
Plug connections with dust caps.
Installation:
Replace seals.
Tightening torque*.
Check for sufficient space between hoses and body-mounted parts.
Important!
Never reuse drained oil.



Loosen nut (1) and relax drive belt by turning toothed element (2).

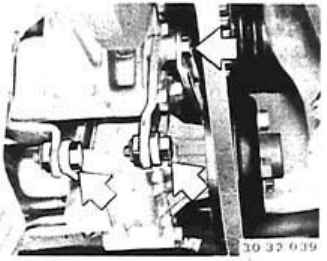


Unscrew bolts and take off pump.
Installation:
Tighten drive belt before tightening bolts.



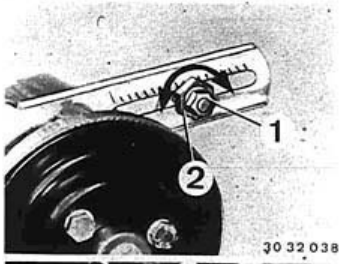
Tightening Drive Belt:
Tighten toothed element to torque of 8 ... 8.5 Nm (5.8 ... 6.1 ft. lbs.) and lock with nut.
Check or correct drive belt tightness with tester 11 5 . . ..
Hook (4) rests on tip of tooth.
Bleed power steering 32 12 006.

* See Specifications

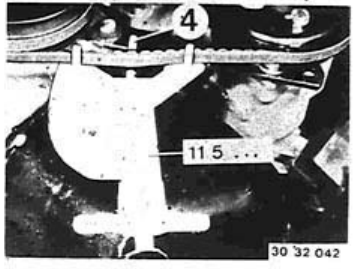


32 41 109 TIGHTENING POWER STEERING PUMP DRIVE BELT

Loosen bolts.

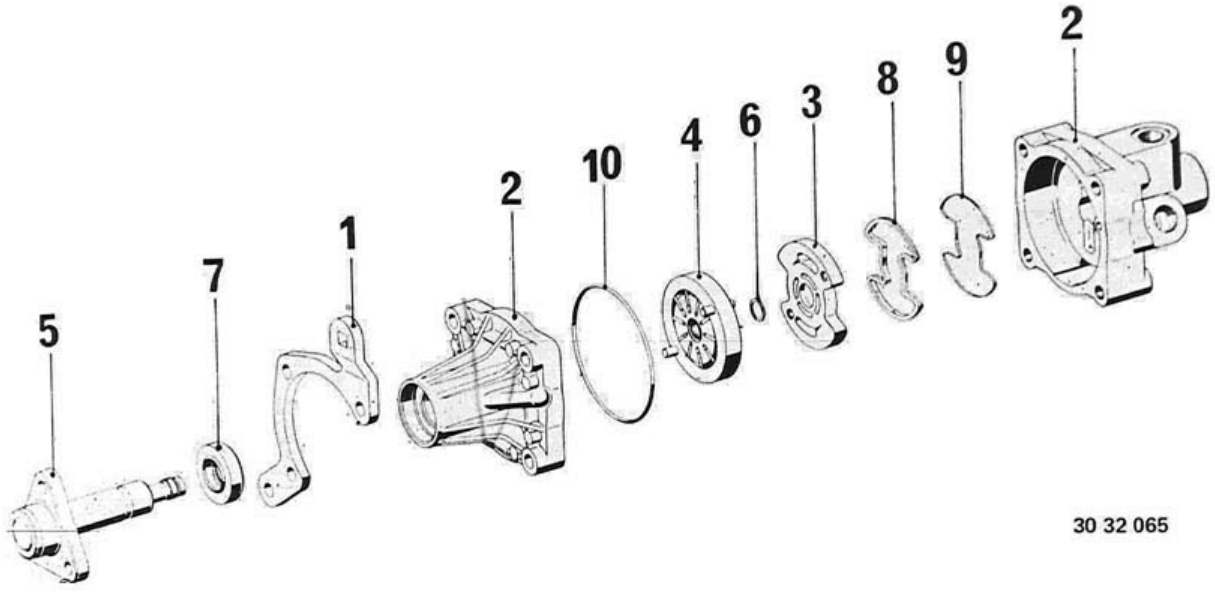


Loosen lock nut (1).
Tighten toothed element (2) to torque of 8 ... 8.5 Nm (5.8 ... 6.1 ft. lbs.) and tighten lock nut again.



Check or tighten drive belt with tester 11 5 . . . .
Hook (4) rests on tip of tooth.
Tighten bolts.
Important!
Check for sufficient space between hoses and body-mounted parts, making corrections on hose connections if necessary.

POWER STEERING PUMP – CODE NO. 7681 955 . . .

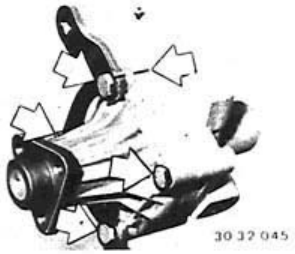


30 32 065

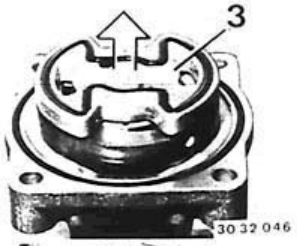
1 Holder
2 Body
3 Face plate
4 Rotor
5 Shaft
6 Snap ring
7 Radial oil seal
8 Seal
9 Guide
10 O-ring

32 41 553 DISASSEMBLING/ASSEMBLING POWER STEERING PUMP – PUMP REMOVED –

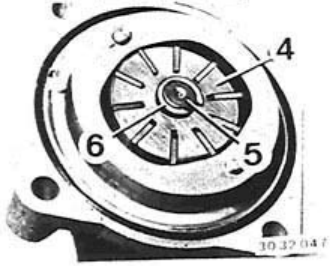
Power steering pump code no.: 7681 955 .
Absolute cleanliness is required for working on power steering pumps.



Mark position of holder (1) to pump body (2).
Unscrew bolts and separate body.

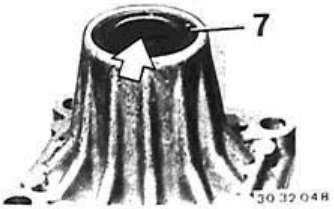


Take off face plate (3).

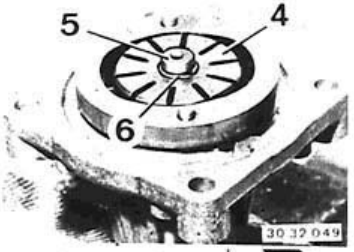


Press down on rotor (4) on shaft (5).
Remove circlip (6) and pull shaft out of body.
Remove rotor (4) with blades.

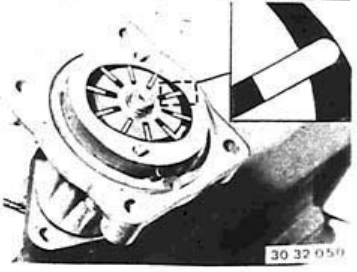
Assembling:
Clean and lubricate all parts with hydraulic fluid.
Replace radial oil seal (7) – sealing lip faces in and pack space between sealing lip and dust lip with grease.



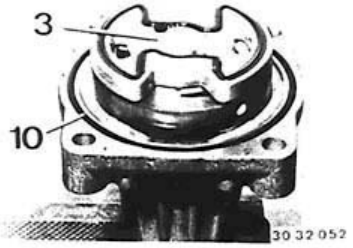
Guide shaft (5) into body.
Install rotor (4) – undercut for snap ring facing up – and insert snap ring (6) in radial groove of shaft.



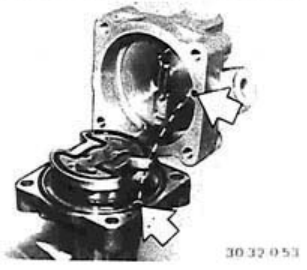
Insert blades with polished, rounded-off outside surfaces facing cam ring.
Make sure that blades move easily.



Insert seal (8) – wide end facing down – and guide (9) in face plate (3).



Install face plate (3) on dowel pins.
Replace O-ring (10).



Mount body that bores match and bolt down with holder.
Tightening torque: 16 to 19 Nm (12 to 13 ft. lbs.).

Check operation after installation of power steering pump.

TROUBLESHOOTING POWER STEERING PUMP

Condition	Cause	Correction
Noise	a) Insufficient hydraulic fluid in system	a) Eliminate leak and add hydraulic fluid.
	b) Pump drawing in air through leaking intake hose connections	b) Check/tighten intake hose connections. Replace seals if necessary.
	c) Pump drawing in air through pump shaft	c) Replace radial oil seal or, with strongly scored pump shaft, replace pump.
	d) Intake hose bent sharply/crushed	d) Route intake hose correctly.
Pressure too low	a) Drive belt loose	a) Tighten drive belt.
	b) Seal or support ring in pump faulty	b) Install set of new seals.
	c) Pump worn	c) Replace pump.
Pump leaks	a) Seals in pump faulty	a) Install set of new seals.

AIRBAG (SUPPLEMENT RESTRAINT) SYSTEM

COMPONENTS

a) Airbag steering wheel with impact shell and padded cap, in which airbag, gas generator and ignition pill are integrated.

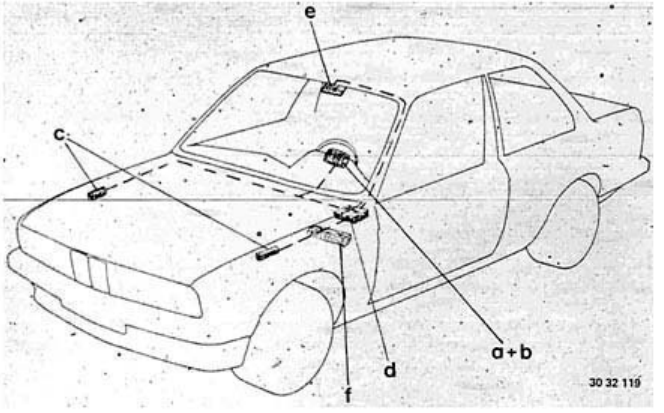
b) Contact ring – guarantees power supply to ignition pill.

c) Two crash sensors (front left and right on wheel house) and safety switch (left).

d) Electronic diagnosis unit underneath dashboard trim panel with integrated safing sensor (prevents unwanted activation).

e) Airbag control lamp integrated in Check Control.

f) Knee guard.



DESCRIPTION

The airbag does not replace fastening the seat belts!

The system is activated by sensors, whereby there must be car deceleration equal to a direct head-on collision of at least 18 km/h (11 mph) against a solid (non-giving) obstacle.

The electric circuit is made and a gas generator ignited. This causes sudden burning of a solid fuel mixture, which in turn releases a non-poisonous gas to completely inflate the folded airbag in the airbag steering wheel within approximately 30 milliseconds.

The crash inflated airbag reduces the severity of injury to the head and upper part of the body in head-on collisions. Discharging takes place through two holes on the side of the airbag facing away from the driver.

MONITORING

The airbag system is monitored continuously by a diagnosis unit from ignition switch position 1 on. The airbag control lamp comes on and goes out again after about 6 seconds to show that the system is ready for use.

If there is a detected fault in the system, a fault display will be as follows depending on the diagnosis unit:

A Control lamp on continuously – see Troubleshooting A

B Control lamp flashes (about 5 minutes) and then remains on continuously – see Troubleshooting B.

SAFETY REGULATIONS FOR HANDLING "AIRBAG" GAS GENERATORS

Non-conformance with these instructions could lead to unwanted activation of the system and injury.

The airbag unit is a pyrotechnical object. Handling, transporting and storing are subject to "legislation concerning explosive materials" (Explosive Substance Laws of Sept. 13, 1976).

The specifications listed below are in reference to the Federal Republic of Germany. There must always be conformance with pertinent legislation in other countries.

1. Transporting:

1.1 It is forbidden to transport airbag gas generators in the passenger compartment of a car!

1.2 Company level transportation must always be in the trunk (luggage compartment) or cargo room of a vehicle and in packed state – the quantity of units is limited to 50.

2. Storing:

2.1 The maximum permitted quantity of "airbag" gas generators in one working room is twenty (20).

2.2 Storage of up to 200 units is permitted in a suitable and lockable room.

2.3 Airbag generators must be stored in packaging suitable for transportation.

3. Installation and Removal:

Airbag components and plugs can be recognized immediately on the orange color code.

Tests and installation/removal may only be performed by personnel with qualified training in BMW service.

Working on the "airbag restraint system" always requires the battery to be disconnected, the negative pole to be covered and the airbag plug (steering column) to be disconnected. If work on airbag system has to be interrupted, the airbag gas generator must not be left laying around without supervision.

Components of the airbag restraint system may not be repaired, but must always be replaced.

Conformance with the following points is essential.

- Never treat the airbag unit with cleaning solutions or grease.
- Never subject an airbag unit to temperatures above 100° C (212° F).
- Airbag units, front sensors and electronic diagnosis units, which have fallen down from a height of 0.5 meter (1 and 1/2 feet) or more, cannot be installed in cars again.
- The airbag restraint system can only be checked electrically in the car, see "Trouble-shooting", and only with testers shown in pertinent section.
- Airbag units may only be stored with the upholstered side facing up, since if the generator of an airbag facing down would be ignited, the generator would be catapulted up and cause injury.
- The ignition pill of airbag gas generators must never be aimed at persons regardless of circumstances.

Procedures for Repairs and After Accidents:

Always disconnect the battery, cover the negative pole or terminal and disconnect both plugs of front sensors in engine compartment and the airbag plug (steering column), to be sure that power supply to the airbag gas generator is interrupted, prior to performance of body straightening work or welding work with an electric welder. Also refer to other instructions in this repair manual.

After Accidents:

If the airbag had been activated, always replace all components with exception of wiring when not damaged.

4. Scrapping "Airbag" Vehicles:

In accordance with accident prevention regulations "airbag" gas generators must be rendered unusable prior to scrapping. This is necessary since the gas generator is a pyrotechnical object and could cause injury if activated incorrectly (for example with a torch during scrapping). Airbag gas generators must be ignited in the vehicles meant for scrapping from the outside and with doors of vehicles closed. The igniter, Special Tool 62 1 270, developed by BMW must be used for this purpose.

Non-ignited generators are a source of danger (also for the environment)!

1. Remove lower section of steering column casing and disconnect airbag plug (orange).
2. Connect airbag plug and igniter together.
3. Connect igniter on a 12 V battery placed 10 meters (32 feet) away from car.
4. Keep as far away from car as the length of the igniter's lead – always stand in front of car (this also concerns other persons).
5. Operate switch of igniter.

Caution!
The burning off of the solid fuel will heat the airbag unit – danger of burning hands!
Wash hands after touching ignited generators!

TROUBLESHOOTING A – Indicator Lamp On Continuously – (Cipro Diagnosis Unit)

The "airbag system" employs a fault detector and memory, even for briefly occurring faults. If the "airbag indicator lamp" does not go out after starting, there could be one or more faults. A flashing code from the indicator lamp will help only personnel with qualified training in BMW service to pinpoint and eliminate the faults.

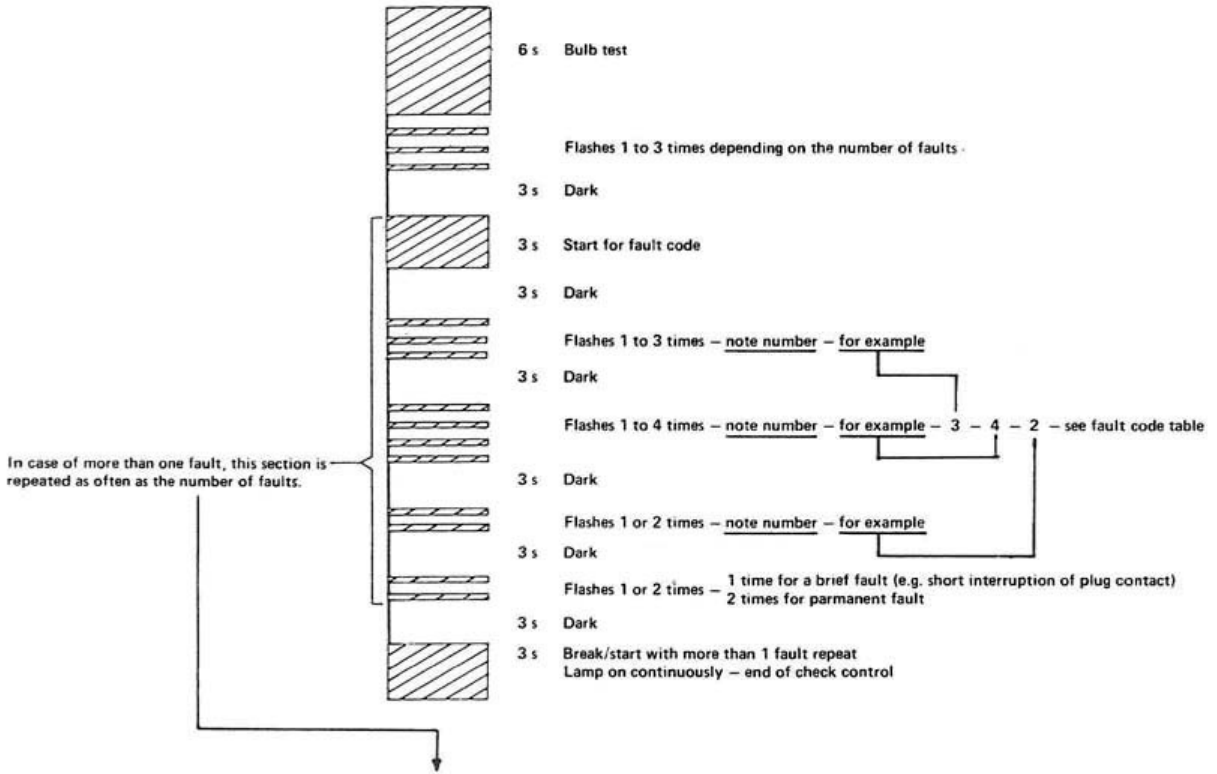
The flashing code can be called by performing the following procedures and as often as desired.

A) Turn off the ignition.

B) Connect airbag diagnosis plug 62 1 250 in the engine diagnosis socket (pins 1 and 6 are bridged), use adapter 62 1 140 if necessary.

C) Turn the ignition lock to position 1.

Flashing code will now run off and the number of flashes must be counted.



DEFECT CODE TABLE

1	1	1	=	B
1	1	2	=	A
1	4	1	=	H
1	4	2	=	G
2	1	1	=	K
2	1	2	=	J
2	2	1	=	M
2	2	2	=	L
2	3	1	=	O
2	3	2	=	N
2	4	1	=	Q
2	4	2	=	P
3	1	1	=	S
3	1	2	=	R
3	2	1	=	U
3	2	2	=	T
3	3	1	=	W
3	3	2	=	V
3	4	1	=	Y

Example: 3 – 4 – 2 = X – see defect code X in testing instructions

TESTING INSTRUCTIONS A

After finishing the flashing code call, always disconnect the battery for troubleshooting and cover the negative pole or terminal. Make tests with a BMW Service Tester or Digital Tester II at room temperature. Using different testers could activate the airbag. Pull off the airbag diagnosis plug.

After finishing repairs the last step would be connecting the battery again and checking the function of the system.

If there was a brief defect, cancel the memory of the diagnosis unit by disconnecting and connecting the battery. Check pertinent parts for tight fit and damage with the ignition on. Replace pertinent parts, if a fault is displayed.

Fault Code A or B =

Higher or lower resistance in gray-white/gray wire to airbag unit.

Disconnect plug for diagnosis unit. Connect airbag test plug 62 1 260 and check wire with an ohmmeter. 3.0 to 5.0 ohms? — yes

- Fault Code A: Measure resistance of wire against car ground. Resistance 200 to 600 ohms? — yes — See Fault Code H.
  - no: Replace diagnosis unit.
- Fault Code B: Replace diagnosis unit.

no

Disconnect plug (behind cap on steering column). Connect airbag test plug 62 1 260 and check wire with an ohmmeter. 3.0 to 5.0 ohms? — yes — Replace wire.

no

Take airbag unit out of steering wheel and pull off plug. Connect wires of airbag test plug 62 1 260 and measure resistance on disconnected plug with two test points. 1.4 to 1.8 ohms? — yes — Replace airbag unit.

no

Replace contact ring.

Defect Code H = G =

Insulation of power supply wire to SRS unit against ground or against positive insufficient.

↓

Visual inspection of wires and plugs for cracks, dirt and moisture, replacing if necessary.

Defect Code K = J =

Insulation of power supply wire to left sensor against ground or against positive insufficient. — / → or break in wire (only J or L)

↓

Visual inspection of wires and plugs for cracks, dirt (salt film) and moisture, replacing if necessary.

↓

Disconnect 4-pin plug on diagnosis unit and measure wire resistance.

9.5 to 10.5 k-ohms? — yes → Replace diagnosis unit.

↓ no

Defect Code M = L =

Right sensor – see K + J above.

Defect Code O =

Insufficient ground connection between sensors or diagnosis unit and body.

↓

Visual inspection of mounting parts and plugs for corrosion, replacing if necessary.

↓

Disconnect plug on front sensor and measure resistance of front sensor.

9.5 to 10.5 k-ohms? — yes → Replace wire.

↓ no

Defect Code N + H + K =

Left front sensor closed.

↓

Replace left front sensor.

Defect Code N + H + M =

Right front sensor closed.

↓

Replace right front sensor.

Defect Code N + V + K =

See K.

Defect Code N + V + M =

See M.

Defect Code Q, P, S, R, U, T, W, Y, X =

Defect in diagnosis unit.

↓

Replace diagnosis unit.

↓

Replace front sensor.

32-55.1

TROUBLESHOOTING B – Control Lamp Flashes (Siemens Diagnosis Unit)

The "airbag system" employs a fault detector and memory, even for briefly occurring faults. If the "airbag control lamp" flashes after starting (about 5 minutes) and remains on afterwards, there could be one or more faults. The flashing code via the control lamp or BMW DIAGNOSING SYSTEM will help only personnel with qualified training in BMW service to pinpoint and eliminate the faults.

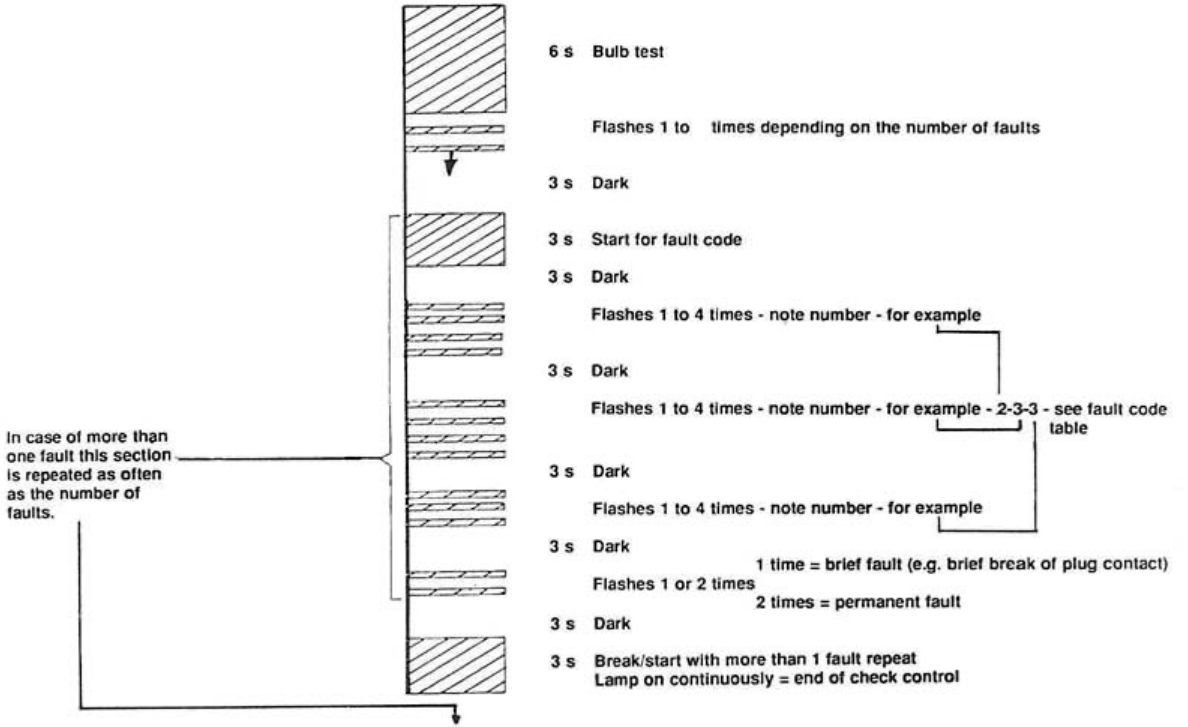
The flashing code can be called by performing the following procedures and as often as desired.

A) Turn off ignition.

B) Connect airbag diagnosis plug 62 1 290 to operating instructions.

C) Turn ignition lock key to position 1.

Flashing code will now run off and the number of flashes must be counted.



FAULT CODE TABLE

1 - 1 - 1 = 07
1 - 1 - 3 = 03
1 - 1 - 4 = 18
1 - 2 - 1 = 08
1 - 2 - 4 = 05
1 - 3 - 1 = 13
1 - 3 - 2 = 01
1 - 3 - 4 = 20
1 - 4 - 3 = 04
2 - 1 - 1 = 08
2 - 1 - 4 = 02
2 - 2 - 1 = 11
2 - 2 - 4 = 06
2 - 3 - 1 = 15

Example: 2 - 3 - 3 = 04 see fault code 04 in test plan

2 - 3 - 4 = 20
2 - 4 - 1 = 02
2 - 4 - 2 = 03
3 - 1 - 1 = 10
3 - 1 - 4 = 19
3 - 2 - 1 = 13
3 - 2 - 2 = 01
3 - 2 - 3 = 04
3 - 2 - 4 = 19
3 - 3 - 1 = 13
3 - 3 - 2 = 03
3 - 3 - 4 = 20
4 - 1 - 1 = 11
4 - 1 - 3 = 03
4 - 1 - 4 = 19
4 - 2 - 1 = 15
4 - 3 - 1 = 15
4 - 3 - 4 = 20
4 - 4 - 3 = 17

TESTING INSTRUCTIONS B

After finishing the flashing code call, always disconnect the battery for troubleshooting and cover the negative pole or terminal. Make tests with a BMW Service Tester or Digital Tester II at room temperature. Using different testers could activate the airbag.

After finishing repairs the last step would be connecting the battery again and cancelling the faults with the airbag diagnosis plug in accordance with operating instructions.

If there is a brief fault, cancel the memory of the diagnosis unit. Check pertinent parts for tight fit and damage with the ignition on. Replace pertinent parts, if a fault is displayed.

Fault Code 01= Ignition capacitor faulty

Replace capacitor.
Clean contact suafces.

Fault Code 02 = Diagnosis unit malfunctions

Tighten diagnosis unit mounting screws (ground connection).
Cancel fault.
Replace diagnosis unit, if fault code 02 is displayed again.

Fault Code 03 = Insufficient insulation of driver's airbag power supply wire

Visually inspect driver's airbag power supply wire and plug connection for cracks, moisture and dirt.
Replace power supply wire when necessary.

Fault Code 04 = **Driver's airbag power supply wire faulty**

Disconnect 2-pin plug X 4 on diagnosis unit. Connect test leads. Measure resistance.
3.0 to 5.0 ohms?

— yes — **Replace diagnosis unit.**

no

Disconnect 2-pin plug X 5 on steering column. Connect test leads and measure resistance.
3.0 to 5.0 ohms?

— yes — **Replace wire between plugs X 4 and X 5.**

no

Connect ends of test lead. Take off impact plate. Pull off plug. Measure resistance on disconnected plug with test points.
1.4 to 1.8 ohms?

— yes — **Replace impact plate.**

no

Replace contact ring.

Fault Code 05 / 07 / 08 =	Left crash sensor faulty	=	Replace left crash sensor
Fault Code 06 / 10 / 11 =	Right crash sensor faulty	=	Replace right crash sensor

Fault Code 13 = Insufficient resistance in left crash sensor power supply wire

↓

Visually inspect power supply wire and plug connections for cracks, moisture and dirt (film of salt), replacing wire if necessary.

↑

Fault Code 15 = Insufficient insulation in right crash sensor power supply lead

Fault Code 17 = Warning lamp shorted

|

Disconnect 6-pin plug X 6 on diagnosis unit. Is there power flow between vehicle ground and pin 6 (measure toward lamp)? — yes — Check power supply wire for warning lamp. Replace power supply wire or lamp as applicable.

|

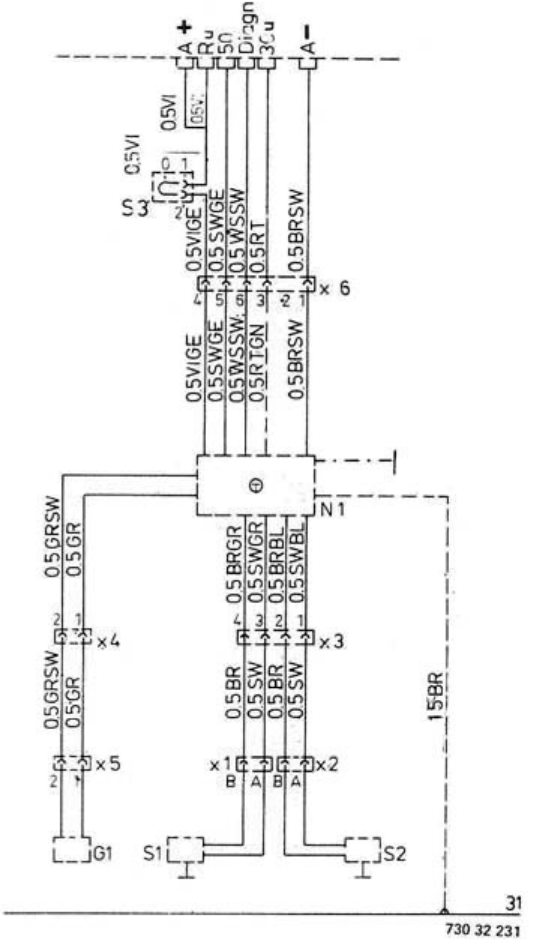
no

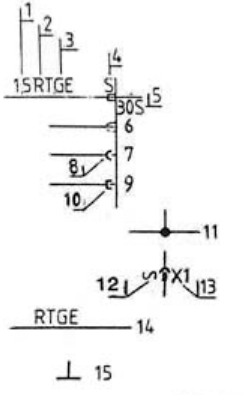
|

Replace diagnosis unit.

Fault Code 18 =	Warning lamp faulty	=	Replace warning lamp.
Fault Code 19/20 =	Diagnosis unit faulty	=	Replace diagnosis unit.

WIRING DIAGRAM





630 71 057

Explanation of Wiring Diagram Codes:

1 = Wire cross section size in mm²
2 = Basic wire color
3 = Spiral wire color
4 = Socket number
5 = Terminal designation
6 = Screwed connection (wire connector)
7 = Round male plug
8 = Round female plug
9 = Flat male plug
10 = Flat female plug
11 = Soldered point or connector
12 = Socket number
13 = Plug designation
14 = Wires without size data always 0.75 mm²
15 = Ground

Wire Color Codes:

BL blue
BR brown
GE yellow
GN green
GR gray
RT red
SW black
VI violet
WS white
TR transparent

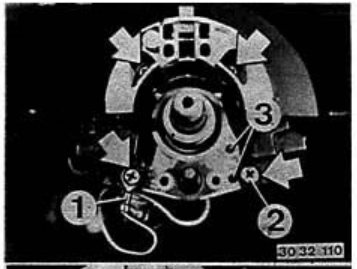
A (+, –) check control
G1 Generator driver
N1 SRS electronics
S1 Front sensor, left
S2 Front sensor, right
S3 Safety switch

X1 Plug - front sensor left
X2 Plug - front sensor right
X3 Plug - electronics
X4 Plug - generator electronics
X5 Plug - generator steering column
X6 Plug - wire harness center section

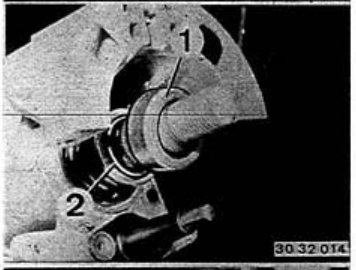
– – – Electronics - Cipro
–.–.– Electronics - Siemens

32 31 090 REMOVING AND INSTALLING COMPLETE STEERING COLUMN (AIRBAG)

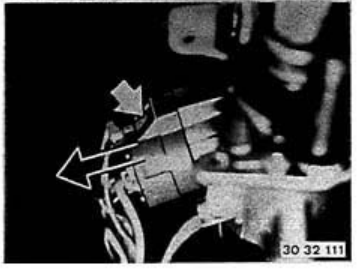
Caution!
Observe safety regulations!
Remove instrument panel trim at bottom left – 51 45 180.
Remove steering wheel – 32 33 000.



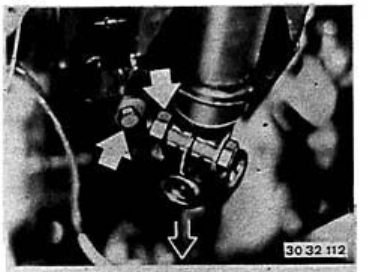
Remove flasher relay.
Pull off plug on horn contact.
Remove switch.
Installation:
Mount both ground wires (1).
With cruise control switch screw (2) = M 5 x 15.
Tabs of switch must engage in bore (3).



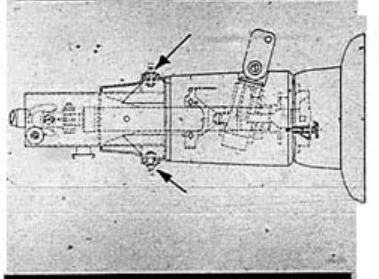
Take off collar (1).
Installation:
Recess of collar (1) locks circlip (2).



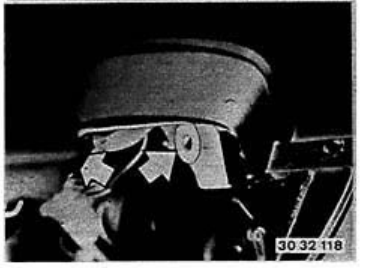
Press down locking hooks and take off ignition switch.



Unscrew bolt.
Remove clamping bolt and pull joint off of steering spindle.
Installation:
Clamping bolt must be in locking groove of steering spindle.
Replace self-locking nut.
Tightening torque*.

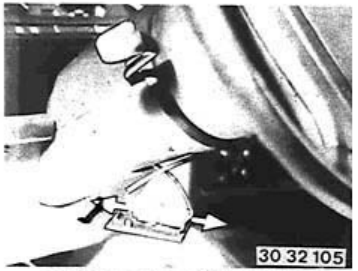


Remove both shear-off screws with a chisel or similar tool.
Take off steering column.



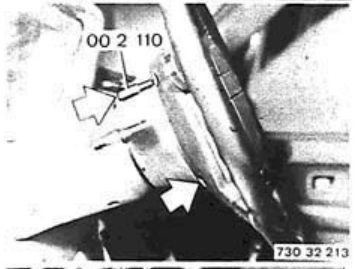
Installation:
Use spacer.
Pull up steering column completely.

* See Specifications



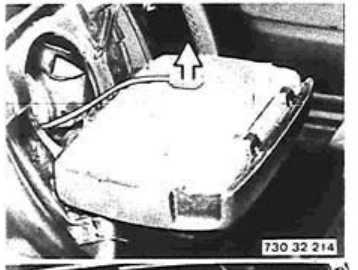
32 33 000 REMOVING AND INSTALLING STEERING WHEEL (AIRBAG)

Caution!
Conform with the safety percautions! Disconnect the battery and cover the negative pole or terminal.
Lift cap out of the lower steering wheel casing section and disconnect the plug.



Unscrew four bolts with Special Tool 00 2 110.

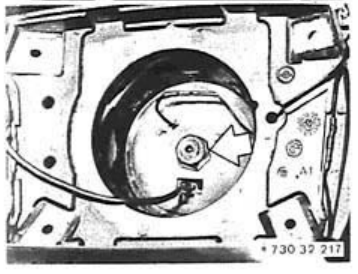
Installation:
Tightening torque*.
If the airbag unit is mounted with 2 bolts, tighten the "right" bolt first as seen looking forward.



Pull off plug and remove the airbag unit.

Caution!
The airbag unit must always be laid aside (in trunk of car) with the impact pad facing up.

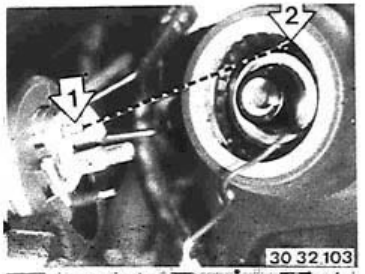
Installation:
Be careful not to clamp the leads.



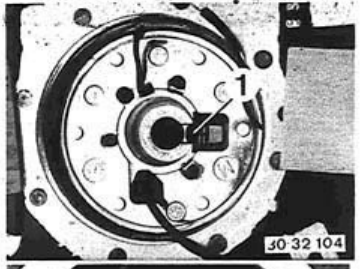
Turn the steering wheel to straight ahead position (marks on steering gear and steering spindle aligned).
Unscrew and remove nut with washer.

Important!
The steering wheel can only be pulled off after unlocking the steering lock.

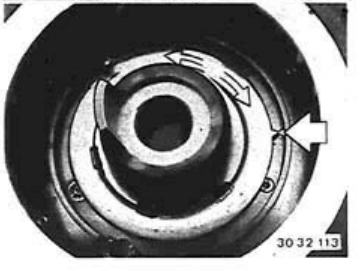
* See Specifications



Installation:
Lock pin (1) must engage in opening (2).
Replace self-locking nut.
Tightening torque*.



Note:
Loosening the nut will activate spring lock (1), which holds the contact ring in center position.

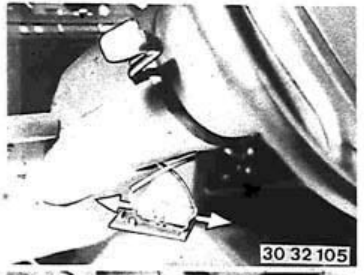


Adjusting Center Position if Necessary:
Press down spring (1), turn the contact ring against the left or right stop and then turn it back about 3 turns until the arrows for the center position are aligned.
Now release spring (1).

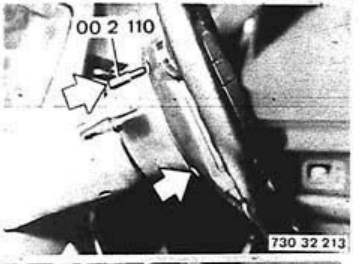
* See Specifications

32 34 020 REMOVING AND INSTALLING OR REPLACING AIRBAG UNIT

Caution!
Conform with the safety precautions! Disconnect the battery and cover the negative pole or terminal.

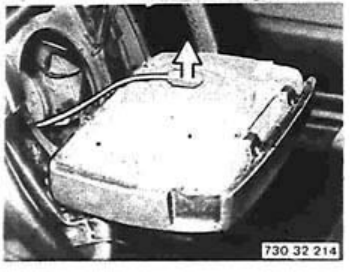


Lift cap out of the lower steering wheel casing section and disconnect the plug.



Unscrew four bolts with Special Tool 00 2 110.

Installation:
Tightening torque*.
If the airbag unit is mounted with 2 bolts, tighten the "right" bolt first as seen looking forward.



Pull off the plug and remove the airbag unit.

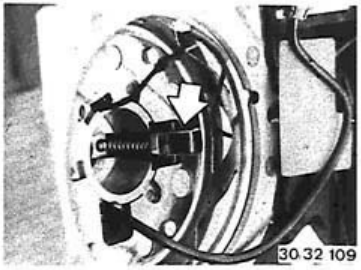
Caution!
The airbag unit must always be laid aside (in trunk of car) with the impact pad facing up.

Installation:
Be careful not to clamp the leads.

* See Specifications

32 34 510 REPLACING CONTACT RING (AIRBAG)

Caution!
Observe safety regulations!
Remove steering wheel 32 33 000.

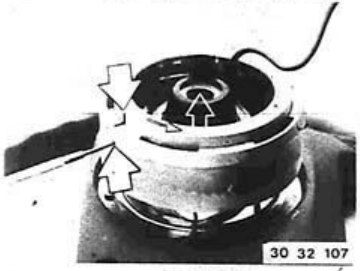


30 32 109

Lift out lock with a screwdriver.
Installation:
Place spring on lock and insert in bore
Press down lock until it engages.

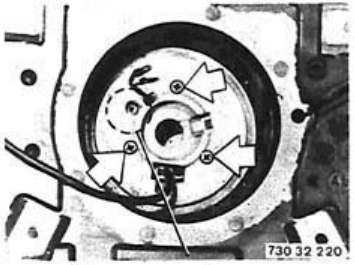
30 32 106

Pull off casing.
Installation:
Lubricate slip ring for horn with grease.



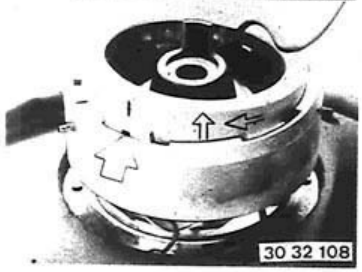
30 32 107

Mark position of circlip to hub.
Unscrew three studs, press down circlip, turn and remove.



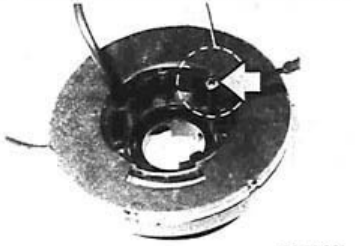
730 32 220

Disconnect plug.
Unscrew bolt and take off contact ring.



30 32 108

Installation:
Place circlip in hub, turn and pull up.
Studs must be located in openings of circlip.

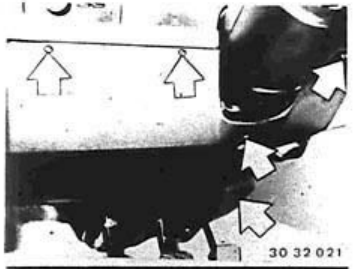


730 32 221

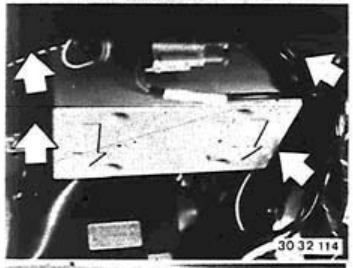
Important!
A new contact ring is locked in center position with a screw.
This screw must be removed after the contact ring has been bolted on the steering wheel.

65 77 010 REMOVING AND INSTALLING OR REPLACING AIRBAG DIAGNOSIS UNIT

Caution!
Conform with the safety precautions! Disconnect the battery and cover the negative pole or terminal.

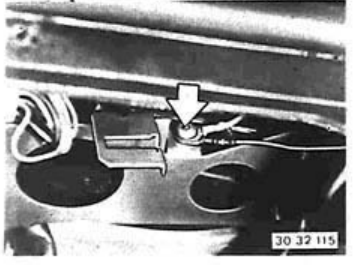


Remove dashboard trim panel.



If applicable, remove ABS control unit. Unscrew nuts and disconnect plug.

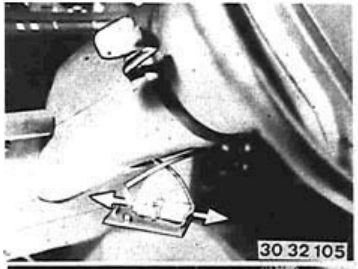
Installation:
Arrow on diagnosis unit faces forward.



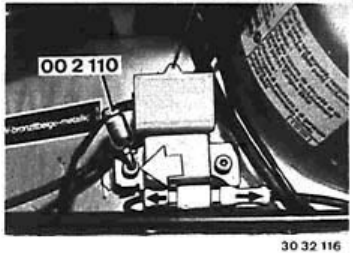
Disconnect ground lead on the central ground point.
Remove the diagnosis unit.

65 77 020 REMOVING AND INSTALLING OR REPLACING ONE AIRBAG CRASH SENSOR

Caution!
Conform with the safety precautions! Disconnect the battery and cover the negative pole or terminal.

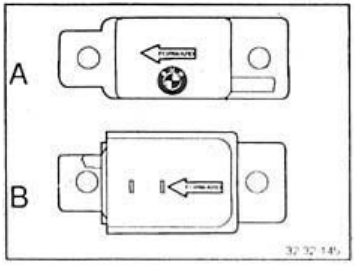


Lift the cap out of the lower steering wheel casing section and disconnect the plug.



Disconnect the plug and unscrew the bolts with Special Tool 00 2 110.

Installation:
The arrow faces forward.
Tightening torque*.

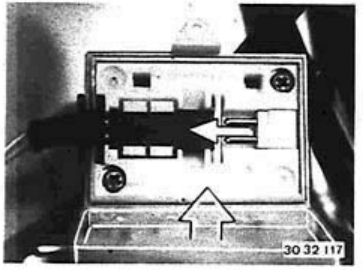


Crash sensors in shape "A" must always be replaced in pairs by sensors of shape "B".
Crash sensors in shape "B" can be replaced separately.

* **See Specifications**

65 77 040 REPLACING AIRBAG SAFETY SWITCH

Caution!
Observe safety regulations!
Disconnect battery and cover negative pole or terminal.
Open cover.
Take off plug.
Unscrew screws.
Note:
Opening the cover destroys the safety switch, which then has to be replaced.



Screw on safety switch.
Insert plug.
Push contact bridge to plug.
Close cover.

33 Rear Axle

	Rear axle – layout drawing	33- 0
	Visco rear axle lock – check in car (325iX)	33- 0/1

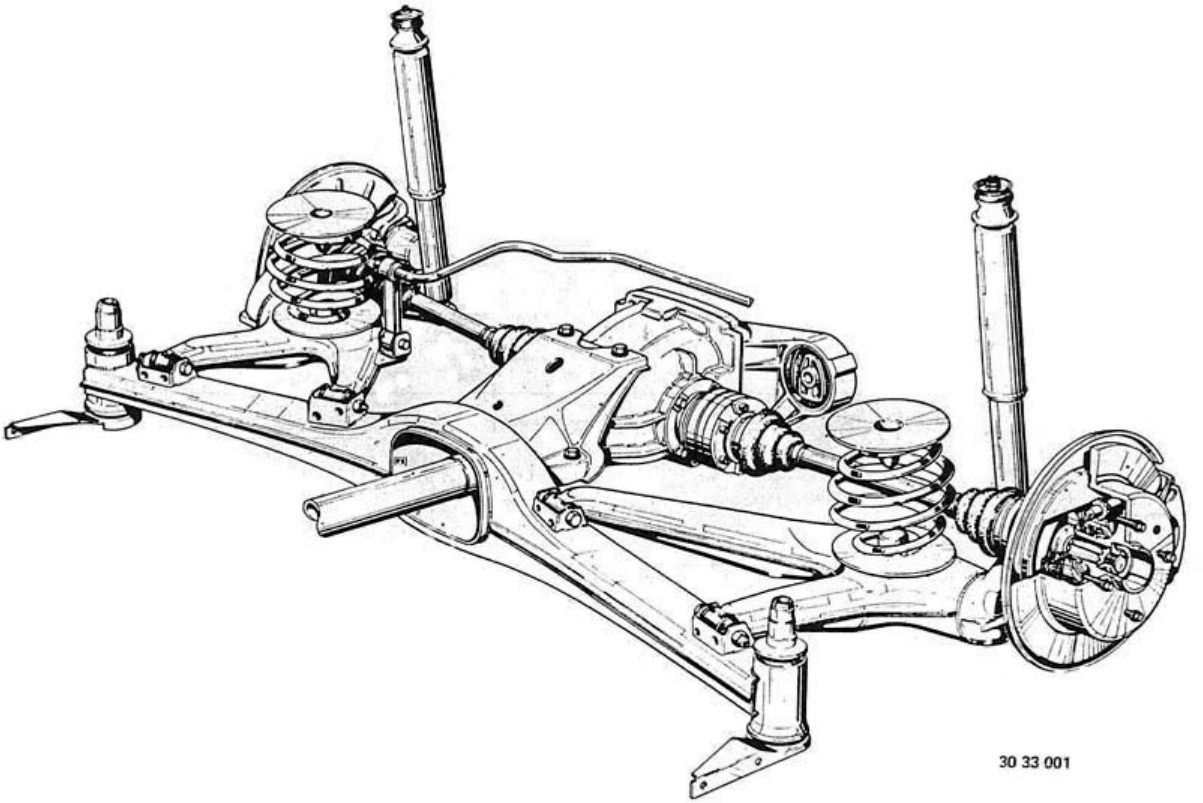
33 – 0

REAR AXLE LAYOUT DRAWING
15° AXLE



30 33 001

(325 IX): Checking Viscous Rear Axle Lock in Car:

Condition of viscous lock can be checked on brake test stand with BMW SERVICE TESTER.

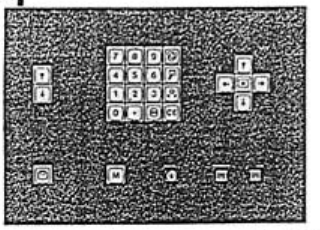
Caution!
If only one wheel turns during test on brake test stand, viscous lock is subjected to strong loads. This could lead to destruction due to excessive heat.

Total operation time = warming up time + test time = 40 seconds on brake test stand must not be exceeded.

Break of at least 30 minutes is required after each test. This time is applicable to both cold and warm-run cars.

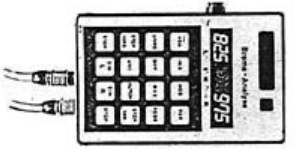
Cylinder speed of brake test stand must not exceed max. 7.5 km/h (4.5 mph).

If cylinder speed of brake test stand is not known, it can be determined with methods described in test for a 3 series car with ABS, but without for wheel drive. In so doing warm-up phase and braking force are omitted.



30 27 00

Select Test Program 03 ABS on BMW SERVICE TESTER.
Select ABS Test Step 03.

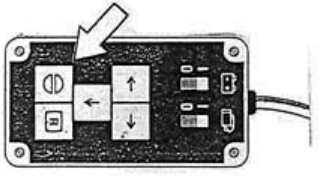


30 27 005

Switch on one brake test stand cylinder and let it run about 30 seconds (warm-up phase).

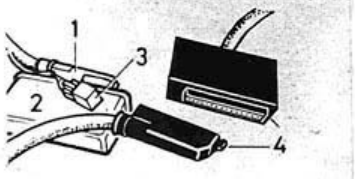
30 27 002

Check tire pressure and tire size.
Do not set brake test stand to automatic.
Drive car on test stand with its rear wheels on cylinders.
Switch off ignition.
Front wheels on floor.
Shift lever in 1st gear.



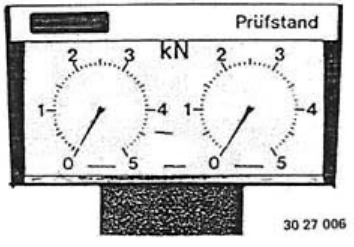
30 27 008

Press confirmation button on BMW SERVICE TESTER after warm-up time.
Value now displayed in ms is the cylinder speed for left or right rear.
See diagram.



30 27 003

Car must be connected on BMW SERVICE TESTER to determine test stand speed (wheel speed) under load.
Switch off electric equipment items and ignition.
Connect T-connector (4) between ABS control unit (2) and ABS wire harness (1).



30 27 006

Read braking force of left or right wheel on brake test stand.

Important!
Total operation time = max. 40 seconds.

33 – 0/2

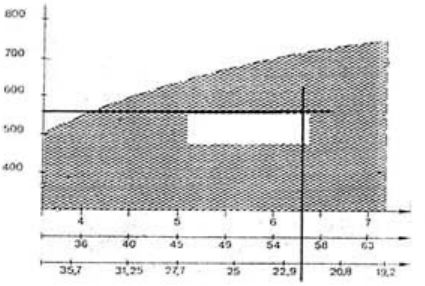
Enter period of time (ms) in diagram.
Enter braking force (on brake test stand) in diagram.

Condition of visco lock is seen at point of intersection of both lines.

Example:
Period of time for pulse wheel: 22 ms.

Braking force of left or right wheel:
550 N (121 lbs.).

Intersection point of both lines in shaded area:
visco lock faulty.



Tire size: 220/60 195/65 195/60
Final drive ratio: 3.64
No. of pulse wheel teeth: 48
Rear wheels in brake stand rollers
Front wheels on floor
Ignition off
1st gear
Only 1 rear wheel driven
Warm-up time approx. 30 sec.
Testing time max. 10 sec.
Total testing time 40 sec.
Tested immediately after warm-up time 30 minutes between two tests

Sum of test stand displays, left – right [N]

900
800
700

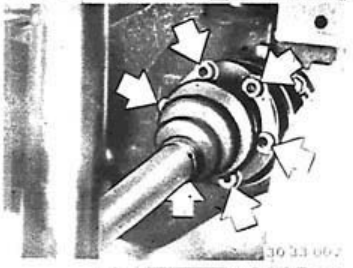
Pulse wheel cycle time [ms]

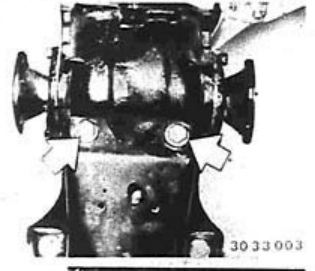
32 33 005

33 10 010 REMOVING AND INSTALLING FINAL DRIVE

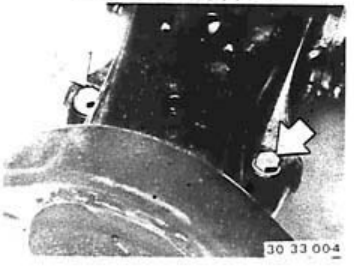
Unscrew propeller shaft bolts.
Installation:
Replace self-locking nuts.
Tightening torque*.



Unscrew output shafts and suspend from car on pieces of wire.
Installation:
Tightening torque*.

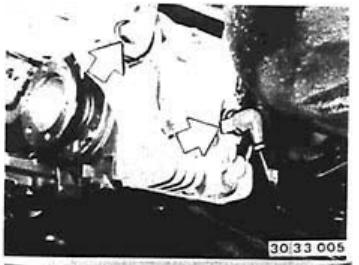


Unscrew bolts at top.
Installation:
First locate final drive on rear axle carrier with the top bolts.
Tightening torque*.

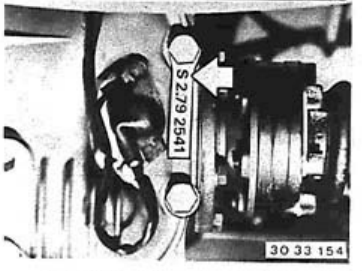


Support final drive with a garage jack.
Unscrew front bolts on left and right sides.
Installation:
Tightening torque*

* See Specifications



Pull off electric leads on speedometer pulse sender.
Unscrew rubber mount bolt and lower the final drive.
Installation:
Replace self-locking nut.
Tightening torque*.
Check oil level, correcting only with approved final drive gear lube - see Group 33 in Operating Fluids.
Amount of oil*.



Installation:
When replacing, check final drive ratio* and final drive version.
Ratio digits are stamped on data plate (1).

BREAKING-IN PROCEDURES AFTER REPLACING OR REPAIRING FINAL DRIVE

Strict conformance with these breaking-in procedures is required for preloading the tapered roller bearings.

During the first 1,000 km (600 miles) the car must be driven at different engine speeds and road speeds, but never faster than 2/3rds of the max. permissible speed in 4th gear (direct). For cars with a five speed manual transmission (with overdrive) 2/3rds of the max. permissible speed in 4th gear will be applicable to 5th gear.

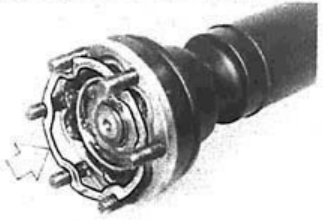
If there is no conformance with these breaking-in procedures, there could be seizure between the tapered rollers and inner race guide band, which in turn will cause a continuous noise, overheating and oil leakage.

Install tag or label for next oil change in view of the driver.

* See Specifications

Version with Constant Velocity Joint:

Unscrew propeller shaft on rear axle final drive.

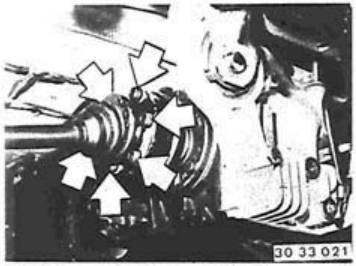


32 26 016

Installation:
Check gasket, replacing if necessary.
Replace stop nuts.
Tightening torque*.

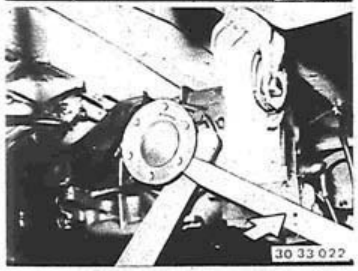
Important!
The constant velocity joint is not encapsulated. Protect the joint against dirt with a transporting cap or something similar.
Check grease filling*.

* See Specifications of Gr. 26

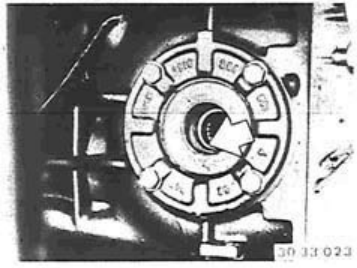


33 11 151 REPLACING SHAFT SEAL FOR DRIVE FLANGE

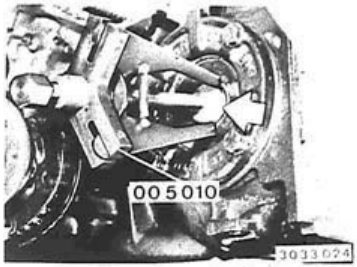
Unscrew output shaft on drive flange and suspend it on a piece of wire.
Installation:
Use washers.
Tightening torque*.



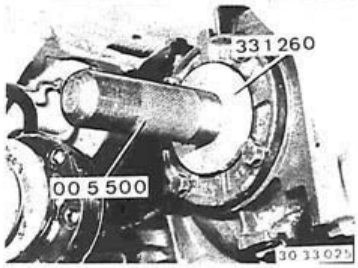
Press off drive flange with tire irons.



Installation:
Prior to installation of drive flange, place wire snap ring (1) in groove of differential case that both ends of wire snap ring are recessed in groove.
This will prevent lateral bending of ring.
Press in drive flange by hand and turn slightly until wire snap ring is heard to engage.
Replace stretched wire snap rings.

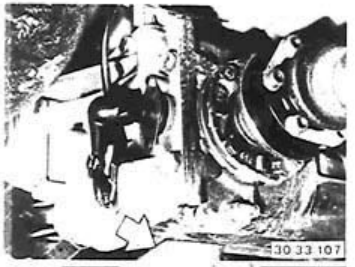


Pull out shaft seal with Special Tool 00 5 010 in conjunction with a pressure piece.



Installation:
Dip shaft seal in final drive oil.
Drive in shaft seal against stop with Special Tool 33 1 260 or 33 1 230.
Replace drive flange with a seriously scored bearing surface.

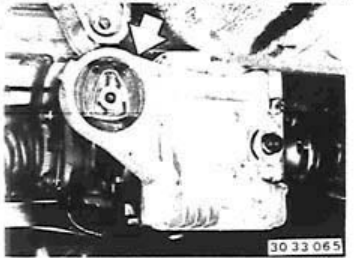
* See Specifications



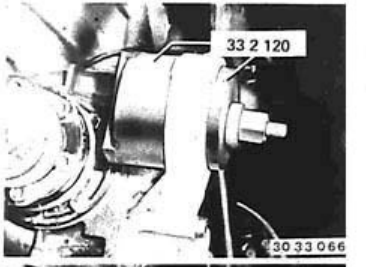
33 17 001 REPLACING RUBBER MOUNT FOR FINAL DRIVE

Loosen nuts on rear axle carrier.
Support final drive.
Installation:
Replace self-locking nuts.
Tightening torque*.

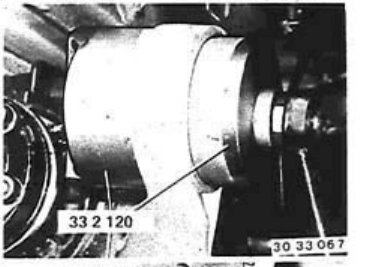
Pull off wires on speed pulse transmitter.
Remove rubber mount mounting bolt.
Installation:
Replace self-locking nut.
Tightening torque*.



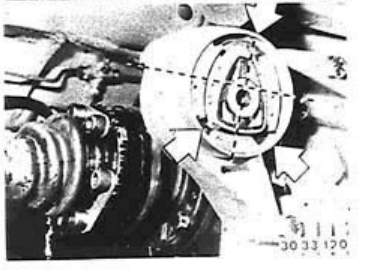
Lower final drive:



Press out rubber mount with Special Tool 33 2 120.
Note:
Rubber mount is eccentric.
Make sure special tool is applied correctly.

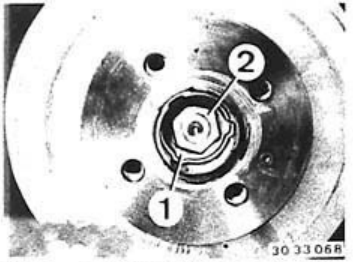


Pull in rubber mount with Special Tool 33 2 120.



Important!
Check installed position of rubber mount.

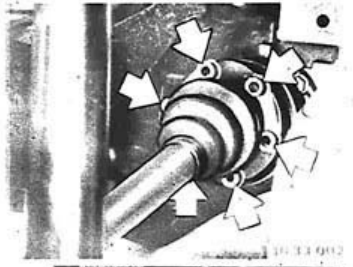
* See Specifications



33 21 000 REMOVING AND INSTALLING OUTPUT SHAFT

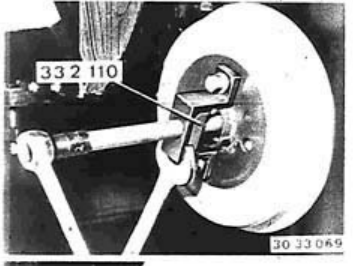
Remove wheel – see Group 36.
Lift out lockplate (1).
Unscrew nut (2).

Installation:
Lubricate bearing surface of nut with oil.
Tightening torque*.
Replace lockplate.

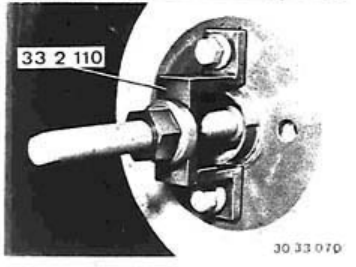


Unscrew output shaft on rear axle final drive.

Installation:
Tightening torque*.

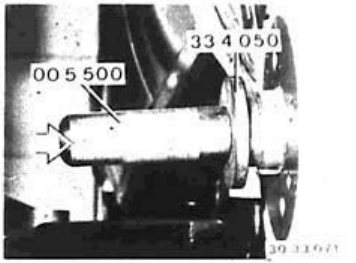


Press off output shaft with Special Tool 33 2 110.
(Spindle 33 2 111, bridge 33 2 112, is replaced by 33 2 116)
Special Tool 33 2 113 is replaced by 33 2 117 and use wheel bolts.

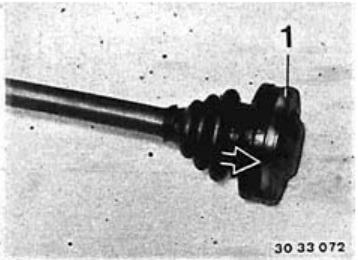


Pull in output shaft with Special Tool 33 2 110, by first screwing in spindle 33 2 114 completely.
Use bridge 33 2 116 and nut 33 2 115.

* See Specifications .

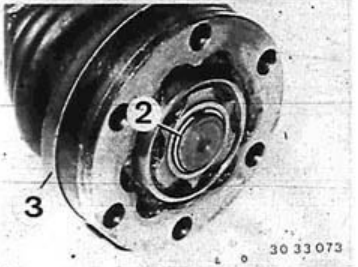


Drive in lockplate with Special Tools 33 4 050 and 00 5 000.

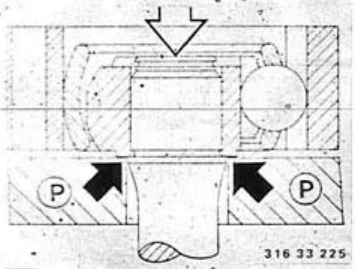


33 21 031 REPLACING DUST COVER

Remove output shaft 33 21 000.
Important!
Don't mix up the thicker output shafts and joints for the BMW 325 i.
Press off sealing cover (1).
Loosen straps.

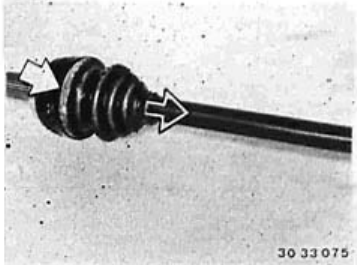


Remove circlip (2).
Press off cap (3) and dust cover.

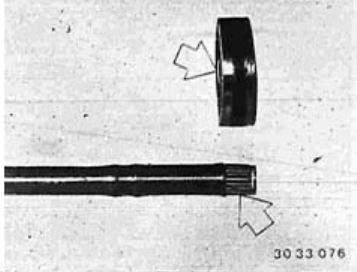


Press output shaft out of constant velocity joint.
Important!
Ball hub must rest on counterpressure plate (P).
Do not disassemble joint if not absolutely necessary.
Check joint for dirt or damage.

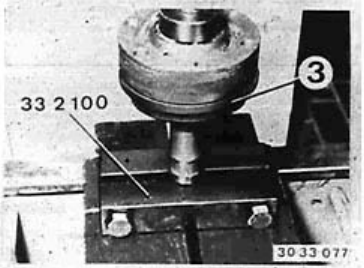
If the joint has to be disassembled (dirty), first electrically inscribe position of ball hub, ball cage and joint to each other on face.
Absolute cleanliness is important during assembly work.



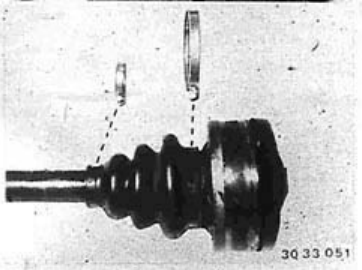
Pull wheel end dust cover off and on over the output shaft.
Slide transmission end dust cover over splined shaft.
Important!
Be careful not to damage new dust covers.
Protect it from the sharp edges on the splined shaft with a suitable sleeve.
Use repair kit.



Clean splines of joint to remove grease.
Coat splines with Loctite No. 270.
Caution!
Keep Loctite out of ball surfaces.

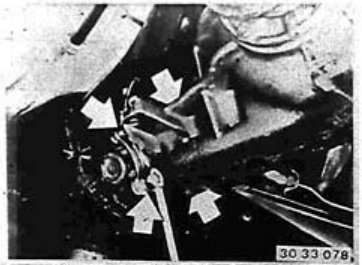


Press on joint and cap (3), while holding the output shaft with Special Tool 33 2 100.
Install circlip.



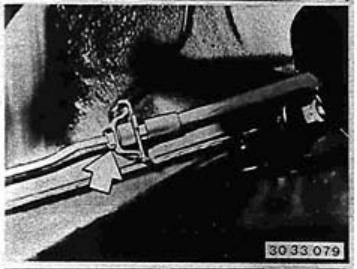
Pack joint and dust cover with grease*.
Clean sealing surfaces for dust cover to remove grease.
Coat large diameter end of dust cover with an adhesive* and mount with new clamps.
Seal and install sealing cover with Curil.

* See Specifications

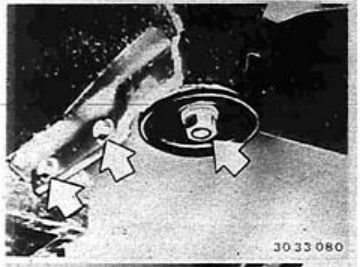


33 31 000 REMOVING AND INSTALLING REAR AXLE CARRIER ASSY.

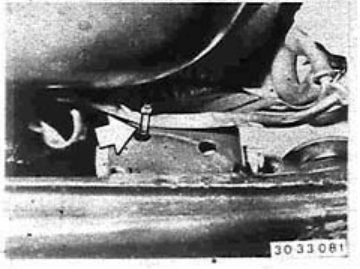
Remove primary and final muffler assembly – 18 12 000.
Remove heat shield.
Unscrew propeller shaft and center mount of propeller shaft – see 26 11 000.
Installation:
Replace self-locking nuts.
Tightening torque*.



Remove parking brake lever.
Draw off brake fluid with a syringe, reserved exclusively for use with brake fluids.
Disconnect brake lines on left and right sides.
Installation:
Tightening torque*.
Add brake fluid*.
Bleed brakes.

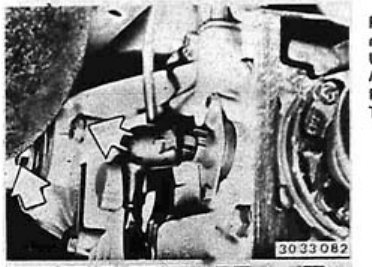


Support rear axle.
Unscrew left and right thrust struts.
Installation:
Replace self-locking nuts.
Tightening torque*.
Note:
Remove rear seat cushion (see 52 20 000) to replace the staybolts.
Remove rear side trim panel of convertible models – 51 43 000.

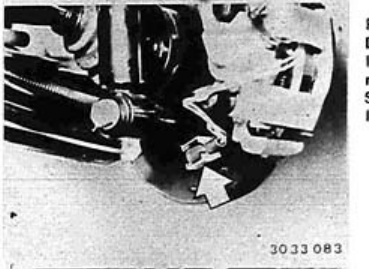


If applicable, unscrew wire clamp on rear axle carrier.

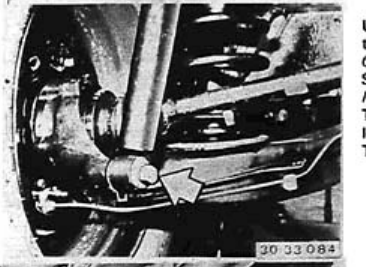
* See Specifications



Pull off wires on pulse transmitter - speedometer.
Unscrew rubber mount bolt.
Installation:
Replace self-locking nut.
Tightening torque*.



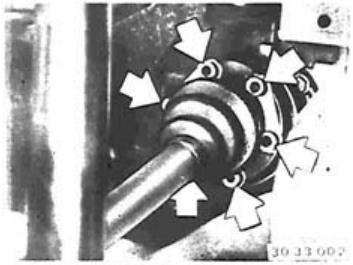
Rear Disc Brakes:
Disconnect brake pad wear indicator plug.
If applicable, unscrew stabilizer on left and right sides.
Support both trailing arms.
If applicable, let car rest on road wheels.



Unscrew left and right shock absorbers on trailing arms.
Caution!
Shock absorbers act as retaining straps.
Installation:
Tighten mounting bolts after car has been lowered and is resting on its wheels.
Tightening torque*.

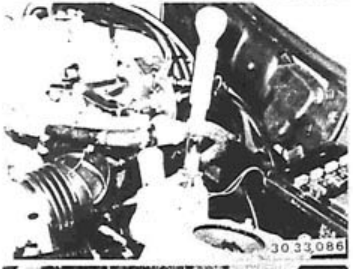
Lower rear axle carrier.
Pull parking brake cables out of protective tube.
Important!
Rear axle springs will be loose.

* See Specifications

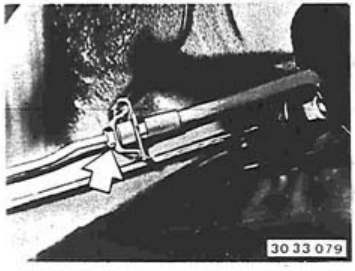


33 32 000 REMOVING AND INSTALLING TRAILING ARM ASSEMBLY

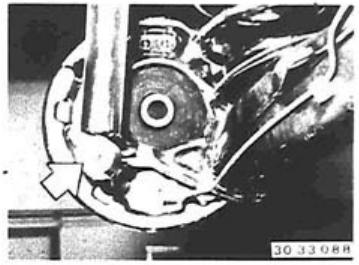
Remove rear wheel – 36 10 300.
Operate parking brake.
If necessary, remove output shaft 33 21 000.
Installation:
Tightening torque*.



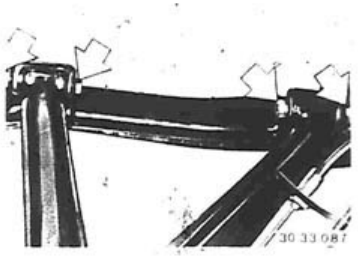
Remove parking brake lever – 34 41 000.
Draw off brake fluid in tank with a syringe reserved exclusively for brake fluids.
Remove filter screen sleeve.
Installation:
Add brake fluid* and bleed brakes.



Disconnect brake line.
Installation:
Tightening torque*.



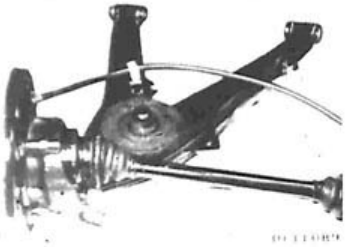
Support trailing arm.
Unscrew shock absorber and lower trailing arm.
Installation:
Tightening torque*.



Unscrew trailing arm on rear axle carrier.
Installation:
First guide in bolt for inner bracket.
Important!
Tighten bolts with car in normal position**.
Tightening torque*.

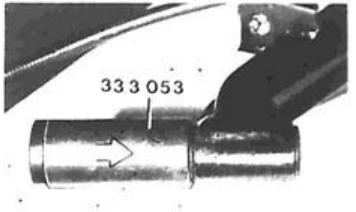
* See Specifications

* See Specifications
** See Specifications of Group 32



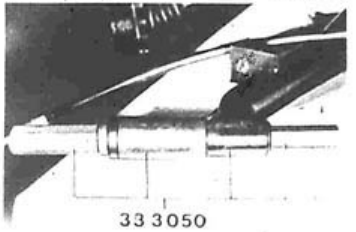
33 32 021 REPLACING TRAILING ARM

Remove trailing arm – see 33 32 000.
Replace wheel bearings and shaft seals – see 33 41 151.
Transfer guard.

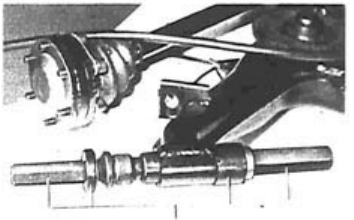


33 32 561 REPLACING BOTH SILENT BLOCKS – Trailing Arm Removed

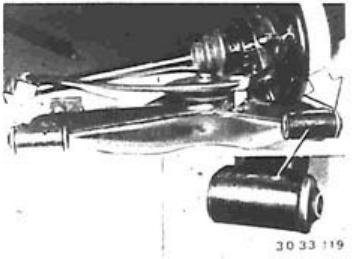
Coat collar in Special Tool 33 3 053 with water and push over bead of silent block.



Pull out silent block with Special Tool 33 3 050.

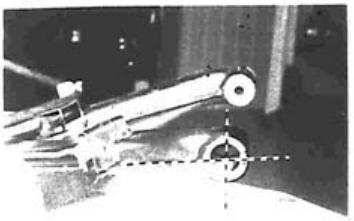


Coat new silent blocks with diluted Cresta, lubricating oil II or relaxed water.
Pull in silent blocks with Special Tool 33 3 050 using thrust disc (1) and sleeve (2) with 2 tabs.



Installation:
Collar end of each silent block faces out.

Eccentric silent blocks could be installed to correct the rear axle toe deviation caused by summation of unfavorable tolerances.
Important!
Changes in alignment geometry caused by damage in an accident may never be "eliminated" with this measure.

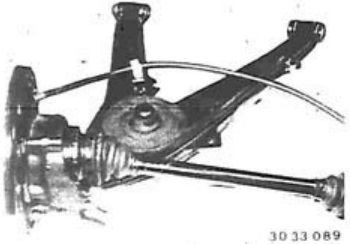


Mark horizontal position of trailing arm to trailing arm eye.

Check rear wheel alignment with optical tester 32 00 054.
Determine correction value.
Example:

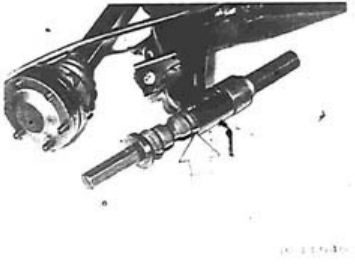
Actual value, left, rear	+ 2.5 mm (0.098")
Nominal value, left, rear	+ 2.0 mm (0.079")
Correction value	– 0.5 mm (0.019")

Use pertinent angle displacement from following diagram.
Connect numbers for toe correction on both sides of silent block with lines.

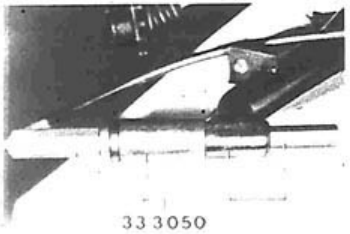


30 33 089

Remove rear wheel 36 10 300.
Remove and install semi-trailing arm 33 32 000.



Coat silent block with diluted Cresta, lubricating oil II or relaxed water.
Apply silent block on trailing arm that drawn line aligns with mark on trailing arm and pull in with Special Tool 33 3 050.
Mount trailing arm and check rear wheel toe.



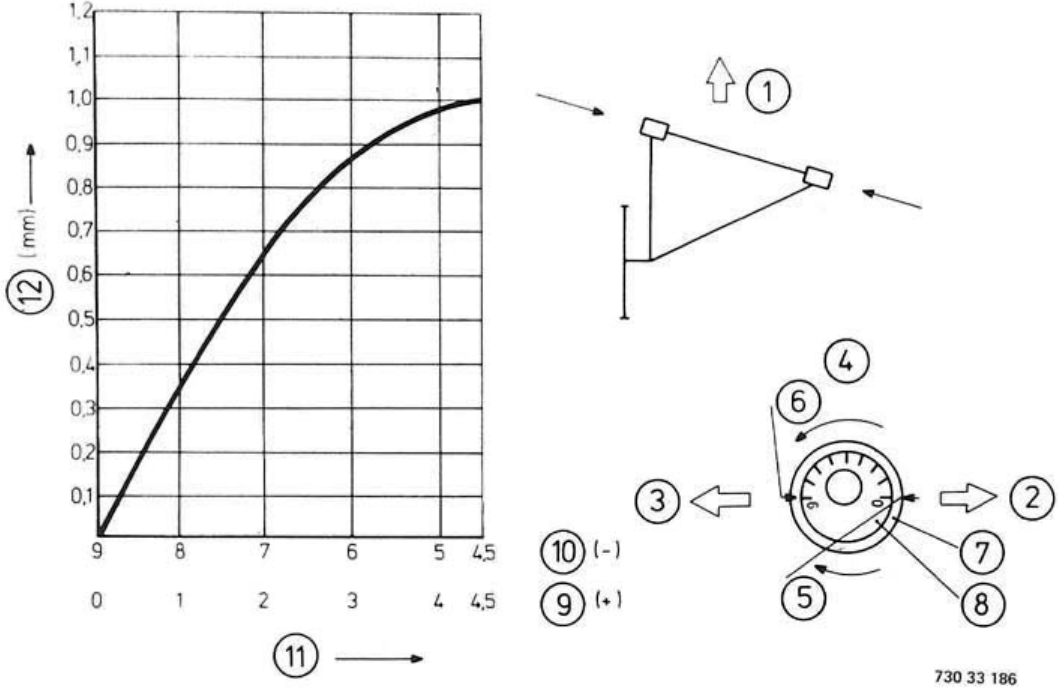
33 3050

Pull out silent block with Special Tool 33 3 050.

If the adjustment on the outer silent block is not sufficient, an eccentric silent block could also be installed on inside.

CHANGING TOE ON "LEFT" WHEEL

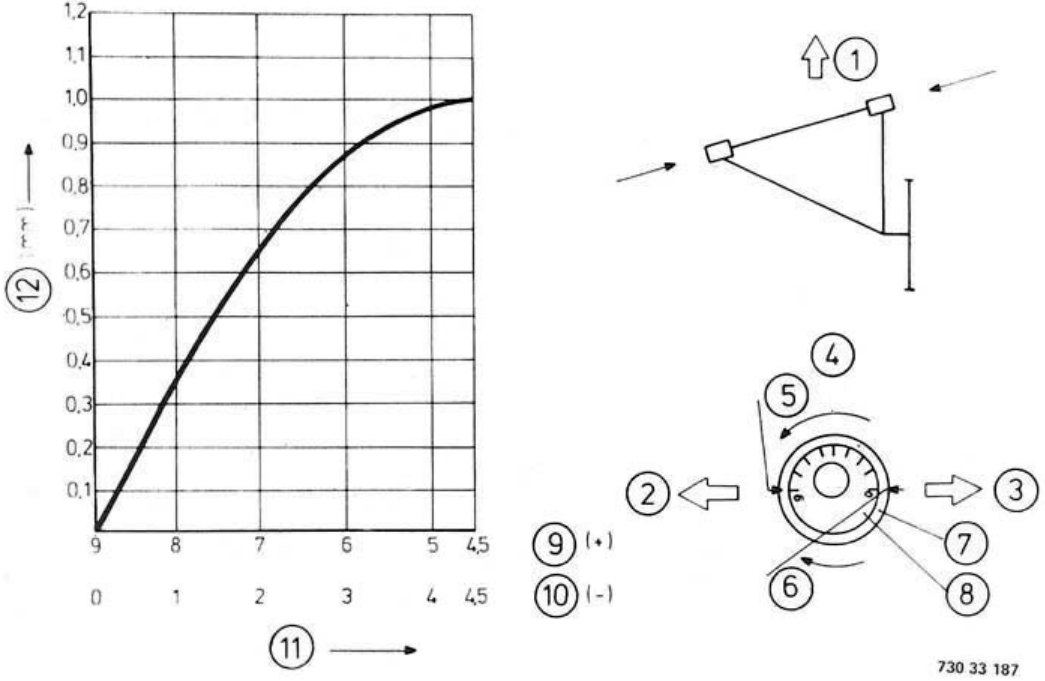
1 = Forward direction
2 = Forward direction, inner silent block
3 = Forward direction, outer silent block
4 = Pressing in note
5 = Reading point – toe increase
6 = Reading point – toe decrease
7 = Trailing arm eye
8 = Silent block
9 = Toe increase
10 = Toe decrease
11 = Displacement angle
12 = Toe change



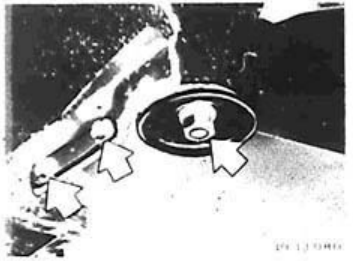
730 33 186

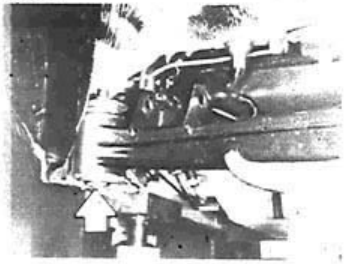
CHANGING TOE ON "RIGHT" WHEEL

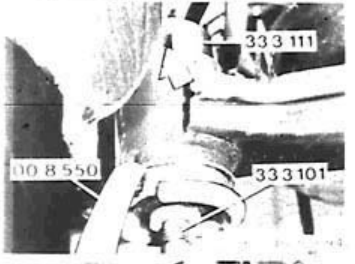
1 = Forward direction
2 = Forward direction, inner silent block
3 = Forward direction, outer silent block
4 = Pressing in note
5 = Reading point – toe increase
6 = Reading point – toe decrease
7 = Trailing arm eye
8 = Silent block
9 = Toe increase
10 = Toe decrease
11 = Displacement angle
12 = Toe change

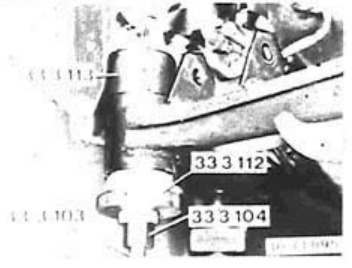


730 33 187









33 33 071 REPLACING RUBBER MOUNTS FOR REAR AXLE CARRIER

Remove rear seat cushion – 52 20 000.
Convertibles:
Remove side trim panel – 51 43 000.
Support trailing arm.
Unscrew strut.

Installation:
Use washers.
Replace self-locking nuts.
Tihtening torque*.

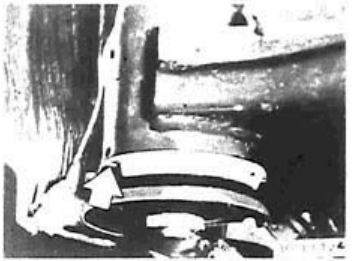
Knock out studs upwards.

Important!
Don't damage the threads.
If applicable, cut off protruding rubber at the openings.

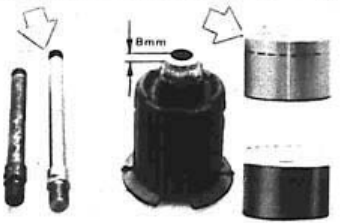
Place Special Tool 33 3 111 on the rubber mount between the body and rear axle carrier, and screw in Special Tool 33 3 101. Heat the rear axle carrier on the rubber mount take-up to make removal easier.
Important!
Flat sides of Special Tool 33 3 111 must face in direction of the openings. Apply Special Tool 00 8 550 with its claws in the openings, bolt down with Special Tool 33 3 101 and pull out the rubber mount.

Place Special Tool on edge of bushing between the body and rear axle carrier, and screw in Special Tool 33 3 103. Coat the rubber mount with Circolight** and apply on the rear axle carrier, pulling it in with Special Tool 33 3 104.

* See Specifications
** Source of Supply: HWB

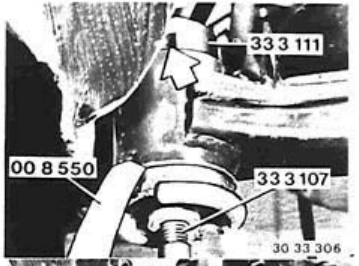


Installation:
Check installed position of rubber mount opening in the rear axle carrier.



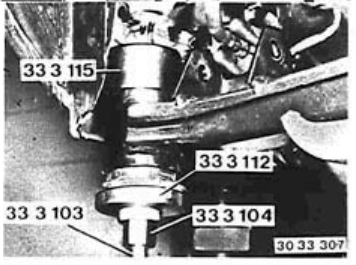
30 33 308

325 iX:
Rubber mount is 8 mm (0.315") higher.



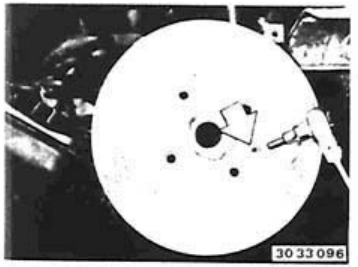
30 33 306

Longer Special Tool 33 3 107 is required for pulling out in conjunction with Special Tools 33 3 111 and 00 8 550.



30 33 307

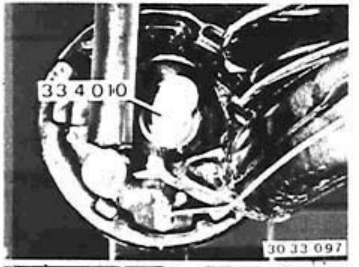
New Special Tool 33 3 115 is required for pulling in the rubber mount in conjunction with Special Tools 33 3 103, 33 3 112 and 33 3 104.



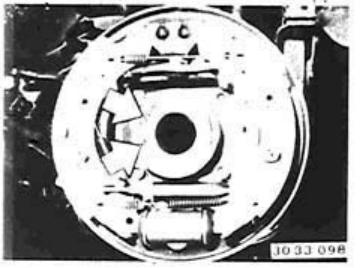
33 41 151 REPLACING WHEEL BEARINGS AND SHAFT SEAL

Remove output shaft assembly – 33 21 000.
Remove brake drum,

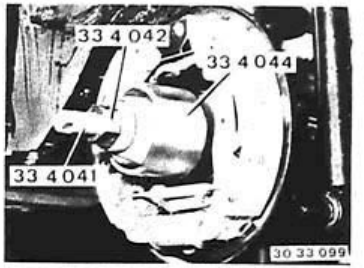
323 i, 325 e/i and ABS:
Remove brake disc.
Unscrew exhaust assembly.



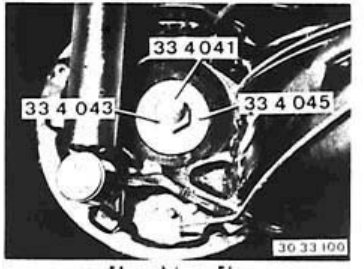
Drive out rear axle shaft with Special Tool 33 4 010.



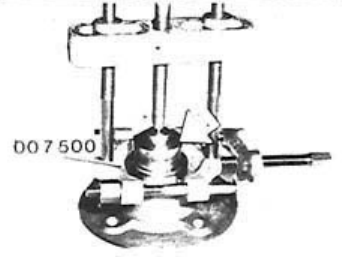
Lift out circlip,



Pull out wheel bearing with Special Tool 33 4 040.
323 i, 325 e/i and Cars with ABS from 1986 Models on:
Use Special Tool 33 4 031.

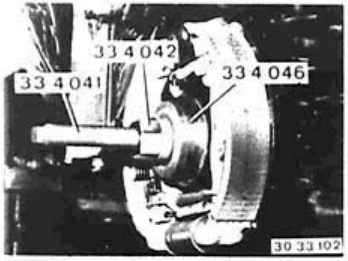


Use Special Tool 33 4 045.

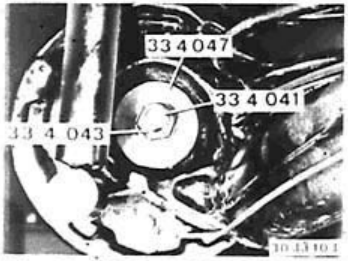


If applicable, pull inner bearing shell off of rear axle shaft with Special Tool 00 7 500 and a thrust piece.

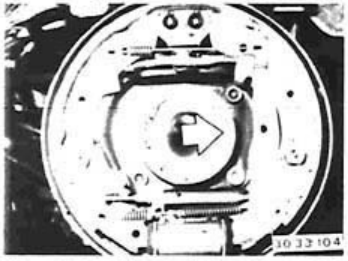
323 i, 325 e/i and Cars with ABS from 1986 Models on:
Use Special Tools 33 4 090 and 33 1 307.



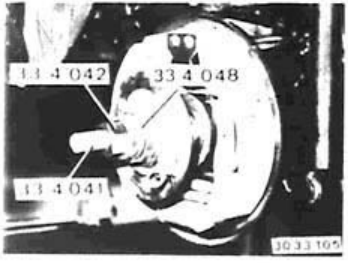
Pull in wheel bearing assembly with Special Tool 33 4 040.
Use Special Tool 33 4 049 for 323 i, 325 e/i and cars with ABS since 1986 models.



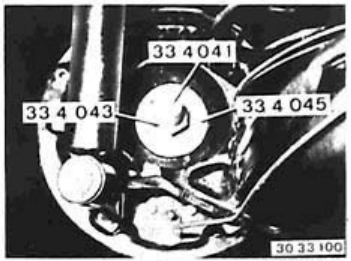
Use Special Tool 33 4 047.



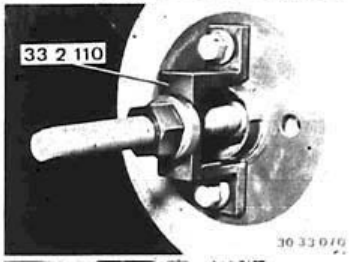
Insert circlip.



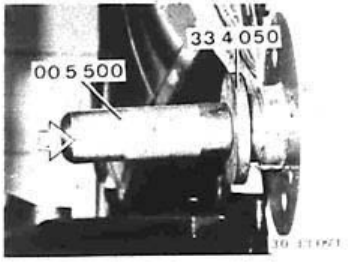
Pull in stub axle with Special Tools 33 4 040 and 33 4 048.



Use Special Tool 33 4 045.

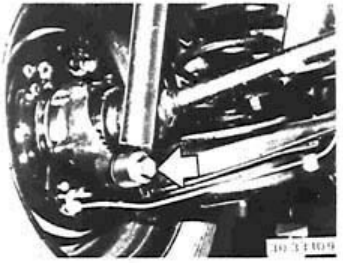


Install and pull in output shaft with Special Tool 33 2 110.
Tightening torque*.



Drive in lockplate with Special Tools 33 4 050 and 00 5 000.

See Specifications

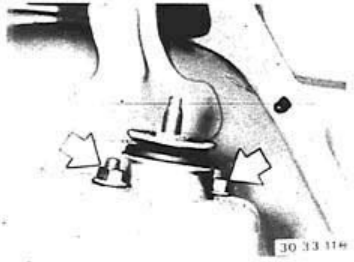


33 52 000 REMOVING AND INSTALLING REAR SHOCK ABSORBERS

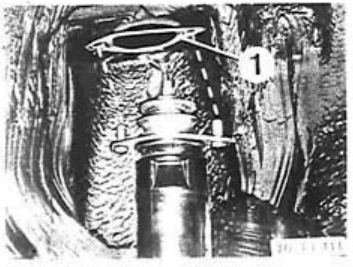
See Group 37 for cars with ride level control.
Support semi-trailing arm (or have road wheel rest on floor).
Unscrew shock absorber on semi-trailing arm.

Caution!
Shock absorber acts as a retaining strap. Do not remove the support or lift the car, to avoid damage on constant velocity joints.

Installation:
Tighten shock absorbers with car loaded down to normal position**.
Tightening torque*.



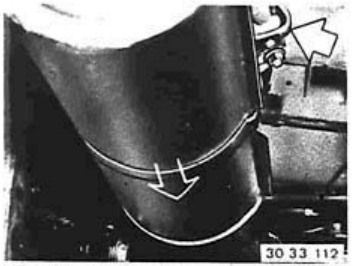
Remove trun trim panel partially - see Group 51.
Additional for Touring Models:
Remove side backrest - see Gr. 52.
Remove seat belt reels - see Gr. 72.
Unscrew centering shell on wheel house.
Installation:
Replace self-locking nut.
Tightening torque*.



Remove shock absorber.
Important!
Replace gasket (1).

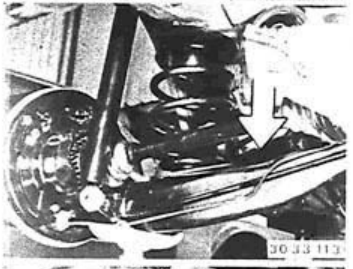
* See Specifications
** See Specifications of Gr. 32

Important!
Always store shock absorbers standing upright. If shock absorbers are stored laying down with their piston rods run in, they will cause knocking noise when used in car.
Remedy:
Store shock absorbers with run out piston rods standing upright at room temperature for at least 24 hours.

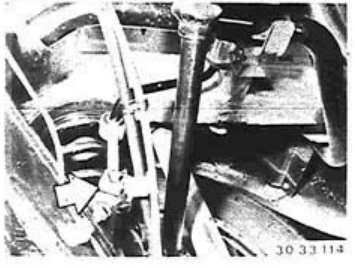


33 53 000 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT BARREL SPRING

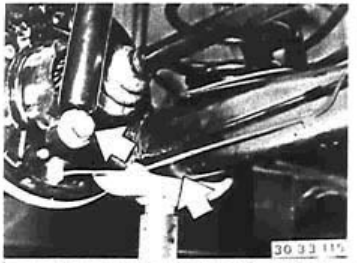
Disconnect exhaust assembly and suspend from car with a piece of wire.



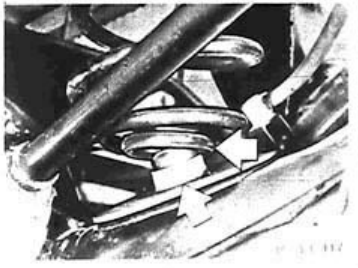
Unscrew final drive rubber mounts and push down, holding down with a wedge of wood or similar item.



Disconnect stabilizer, if applicable.



Support trailing arm.
Caution!
Don't damage the brake line.
Unscrew shock absorber on trailing arm.



Important!
Only lower trailing arm enough that spring can be removed.
Lowering too far could cause damage on output shaft joints.
Installation:
Check position of spring strut.
Important!
Check springs for surface damage.
Replace damaged springs.

Only install springs with same BMW number*, same color code* and correct rubber ring*.

* See Specifications

TROUBLESHOOTING REAR AXLE

Condition	Cause	Correction
Load change knock	Backlash excessive Output shaft faulty Play in propeller shaft slide	Adjust backlash – see 33 12 551 Replace output shaft – see 33 21 000 Install slide with Loctite No. 75
Traction or compression noise	Backlash excessive or insufficient	Adjust backlash – see 33 12 551
Drumming	Propeller shaft Rubber mounts on rear axle carrier faulty	See "Troubleshooting Propeller Shaft" Replace rubber mounts – see 33 33 071
Oil loss	Radial oil seals leak Vent clogged Wrong oil grade*	Replace radial oil seals Clean vent, see Service Information of Gr. 33 Replace final drive oil
Vibration	Imbalance of wheels Ouput shaft faulty Propeller shaft	Balance wheels or replace rims Replace output shaft – 33 21 000 See "Troubleshooting Propeller Shaft"
Rattling noise	Shock absorbers installed loose Upper shock absorber rubber ring faulty Lower shock absorber rubber ring faulty Rubber mounts on rear axle carrier faulty Shock absorbers faulty or worn	Tighten shock absorbers Replace rubber ring Replace shock absorber – see 33 52 100 Replace rubber mounts – see 33 33 071 Check shock absorbers, see Service Information of Group 37, or replace shock absorbers – see 33 52 000.
Grinding noise only when driving in curves	Wheel bearings faulty	Replace wheel bearings – see 33 41 141

* See Operating Fluids

34 Brakes

34 00 009	Brakes – test on dynamometer	34- 1
519	Brakes – check (high and low pressure tests)	34- 1
046	Brakes – bleed	34- 2

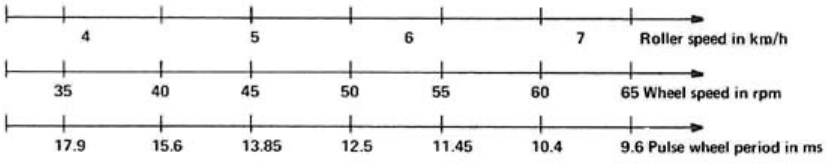
34 00 009 BRAKE TEST ON TEST STAND

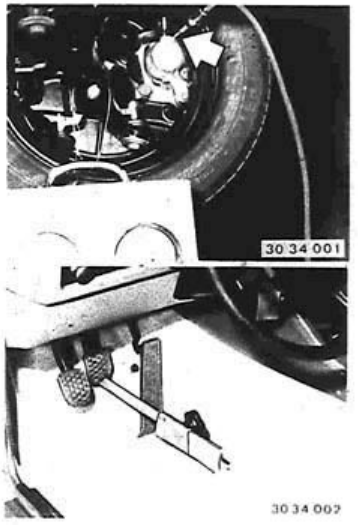
Inspect condition and treads of tires and also check/correct tire inflation pressure prior to testing the brakes.

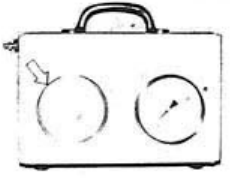
The brakes should have operating temperature, i.e. brake discs/drums should be warm and dry by way of braking the car several times.

Comply with operating instructions supplied with pertinent test stand in order to avoid damage on the car or system as well as injury of personnel.

Important!
Cars with four driven wheels (325 iX) must not be tested on a brake test dynamometer longer than 60 seconds or faster than 7.5 km/h (4.5 mph), in order to avoid damaging the central lock. In other words the total testing time for the front axle, rear axle and parking brake must not exceed 60 seconds. If testing has to be repeated, wait at least 30 minutes to have the central lock cool down.
If not specified and guaranteed by the manufacturers, the precise roller speed of a brake test dynamometer must be checked with a '3'-series car fitted with ABS, but without all wheel drive. Drive car on to dynamometer, connect BMW service tester and see ABS nominal value microfiche for connections. Select ABS test step 03 dynamic/speed sensor and switch on the dynamometer. Conversion of displayed ms:







730 34 013

34 00 519 CHECKING SERVICE BRAKES IN HIGH AND LOW PRESSURE TESTS

High Pressure Leak Test:
Perform test on both brake circuits.
1. Brake circuit front left and right
2. Brake circuit rear left and right
Unscrew bleeder screw.
Connect and bleed pressure tester.
Do not run engine.

Apply load* on brake pedal and hold brake pedal down with a pedal prop.
Max. pressure drop after 2 minutes is 8 %.
Important!
High pressure leak test must be performed with the engine stopped.

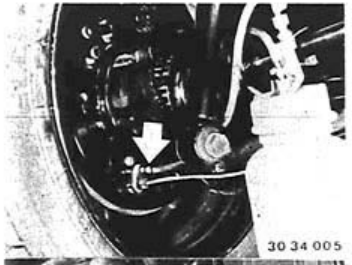
Low Pressure Test:
Perform test on both brake circuits.
Release pedal prop that test pressure in brake system is 2 to 5 bar (28 to 71 psi).
Car and tester must remain still, since movement would cause incorrect test results.
Pressure should remain constant during 5 minute test.
If pressure drops considerably, inspect all rubber parts.
Bleed brake calipers and wheel brake cylinders after finishing test.

* See Specifications

34 00 046 BLEEDING BRAKES

Brake fluid* must be replaced every 2 years.
Brake fluid is hygroscopic and consequently takes on moisture in air through vent hole in brake fluid tank. This could drop brake fluid boiling point from + 240° C (464° F) to + 160 ... 180° C (320 ... 356° F).
Check gasket (arrow).

Caution!
Keep brake fluid off of painted car parts.
Brake fluid damages paint finish.
Connect bleeder on brake fluid tank.
Conform with operating instructions supplied with bleeder.
Charging pressure must not exceed 2 bar (28 psi).



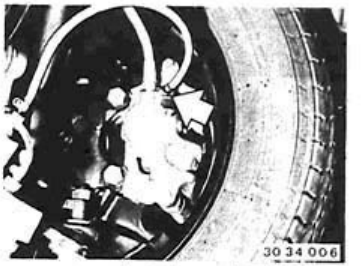
Rear Wheel Brakes (Drums):

Connect bleeder hose with bottle on bleeder screw.
Unscrew bleeder screw.
Tighten bleeder screw when escaping brake fluid is without air bubbles.

Rear Wheel Brakes (Discs):

Connect bleeder hose with bottle on bleeder screw.
Unscrew bleeder screw.
Tighten bleeder screw when escaping brake fluid is without air bubbles.

See Gr. 34 of Operating Fluids for approved brake fluids



Front Wheel Brakes:

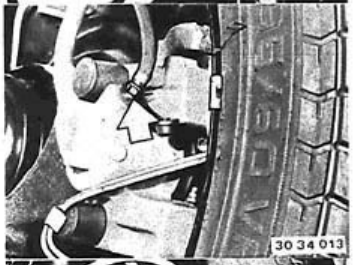
Connect bleeder hose with bottle on bleeder screw.
Unscrew bleeder screw.
Tighten bleeder screw when escaping brake fluid is without air bubbles.

34 00 047 BLEEDING BRAKES FOR ABS

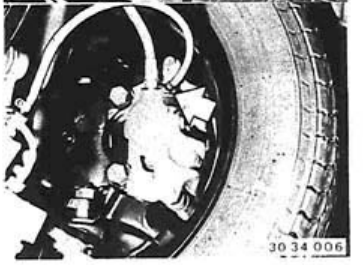
Connect bleeder on brake fluid tank.
Conform with operating instructions supplied with bleeder.

Important!
Do not use air flushing.

Press and hold brake pedal down.



Connect bleeder hose with bottle on bleeder screw and open bleeder valve on wheel brake, beginning at rear right.
Release brake pedal and operate 12 times as far as stop.

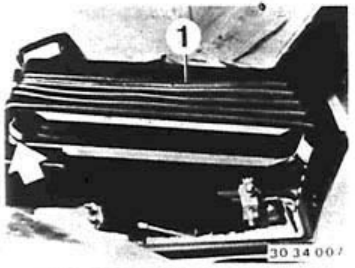


Hold brake pedal in down position.
Shut bleeder valve.
Release brake pedal.
Repeat bleeding on rear left, front right and front left.

34 10 014 ADJUSTING PARKING BRAKE

Requirements:
Both parking brake cables move easily and automatic slack control functions correctly.
Parking brake needs to be adjusted when the parking brake lever can be pulled up by more than 8 teeth.

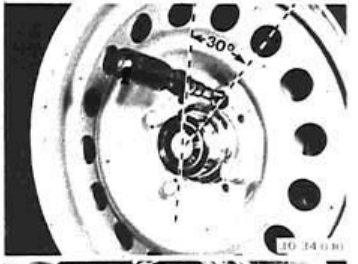
Discs:
Note:
The parking brake system, which is completely independent of the service brakes, is only subjected to limited wear since the parking brake will not be needed during normal car operation. This consequently reduces the friction torque, e.g. caused by corrosion of brake drums or contamination of liners.
The force required for operating will increase proportionally.
To acquire optimal parking brake efficiency, it will normally be sufficient to drive the car from the parking lot to the workplace max. 400 meters (1300 feet) with the parking brake applied (pull up lever until resistance is felt and then one further catch) before adjusting the parking brake.



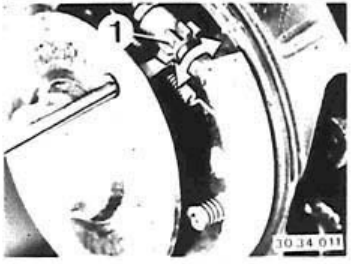
Lift out front clamp.
Pull off rubber cap (1).
Disconnect rear clamp.

Unscrew adjusting bolts (2).

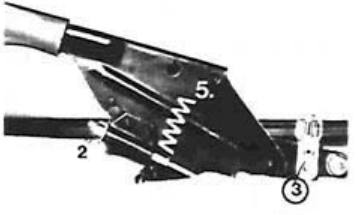
Drums:
Operate brake pedal several times.
Basic clearance will be adjusted automatically.
This is indicated by a clicking noise on the rear wheels.
Function of automatic slack control can be checked through a wheel bolt bore.



Unscrew one wheel bolt on each rear wheel and remove.
Turn wheels that each tapped bore is approx. 30° behind the perpendicular on top.
Installation:
Tightening torque*

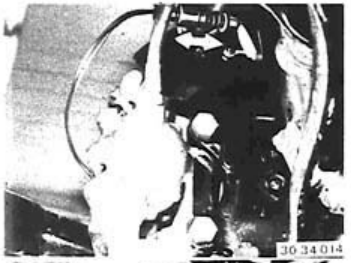


Turn adjusting nut (1) with a screwdriver to move out the parking brake shoes and prevent the brake disc from turning.
Then loosen adjusting nut by 3 or 4 threads.
Left adjusting nut turned up to tighten.
Right adjusting nut turned down to tighten.
Brake disc must turn easily.



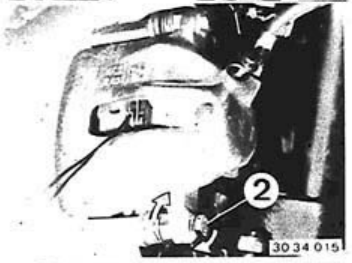
Brake Cable Adjustment:
Pull up parking brake lever by 5 teeth and adjust adjusting nuts (2) enough that left and right rear wheels can just be turned and both uniformly.
Release parking brake lever and check whether wheels can be turned easily.
The indicator lamp should go out when the parking brake is released with the ignition on.
Adjust switch (3), if necessary.

* See Specifications

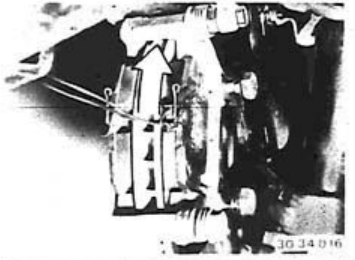


34 11 000 REMOVING AND INSTALLING FRONT BRAKE PADS

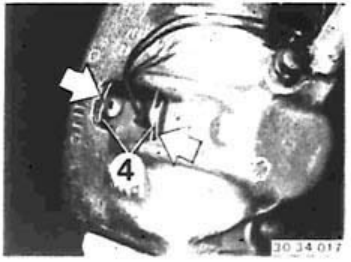
Remove front wheels – see 36 10 300.
Pull off brake pad wear indicator plug on left side.



Unscrew bolt (2).
Important!
Replace self-locking bolt.
Counterhold on guide pin.
Installation:
Tightening torque*.



Turn up brake caliper.
Remove brake pads.



Installation:
Check pads and pad thickness*.
Push back brake pistons completely.
Important!
Be careful not to damage dust cover on brake piston when assembling.
Check dust cover.
Check installed position of springs (4).

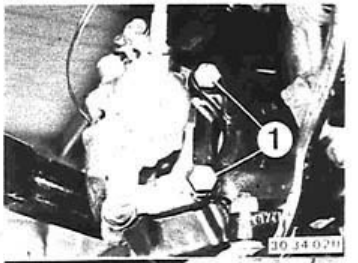
* See Specifications

30 34 018

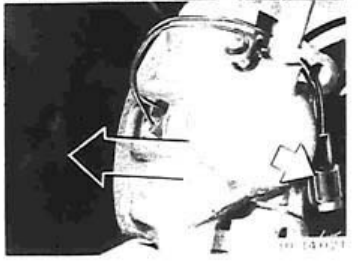
Drive out pin of brake pad wear indicator carefully.
Check circlip (5) when reusing.
Replace pad wear indicators with ground off plastic part.

34 11 520 REMOVING AND INSTALLING FRONT BRAKE CALIPERS

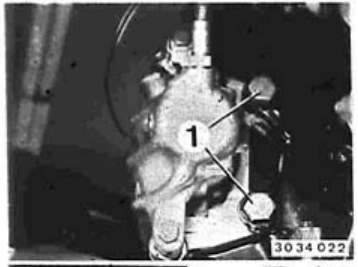
Remove front wheel – see 36 10 300.
Draw off brake fluid with a syringe which is used exclusively with brake fluid.
Disconnect brake line.
Installation:
Bleed brakes – see 34 00 046/047.



Unscrew caliper mounting bolts (1).
Installation:
Tightening torque*.

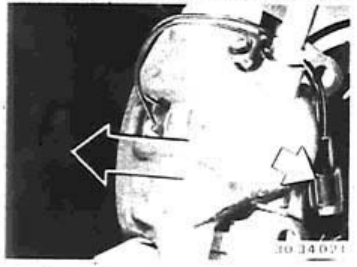


Pull off brake pad wear indicator plug on left side.
Pull off caliper toward rear.
Installation:
Make sure of-correct location of brake pad wear indicator wires with tab of dust cap – rubbing of the wires on the wheel rim must always be prevented.

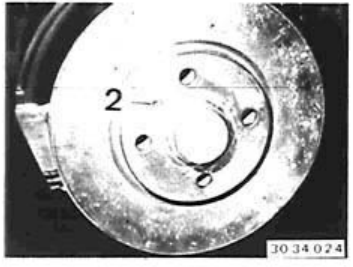


34 11 220 REMOVING AND INSTALLING FRONT BRAKE DISCS

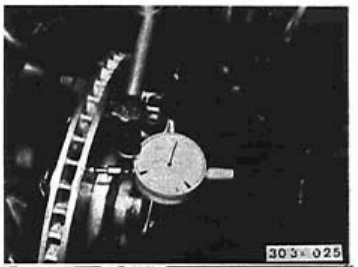
Remove front wheels 36 10 300.
Unscrew caliper mounting bolts (1).
Installation:
Tightening torque*.



Unplug brake pad wear indicator on left side.
Pull off caliper toward rear and suspend with a piece of wire.

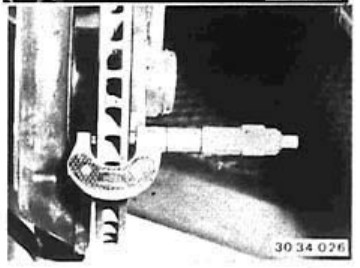


Unscrew bolt (2).
Take off brake disc.
Tool: wrench socket 34 1 020.

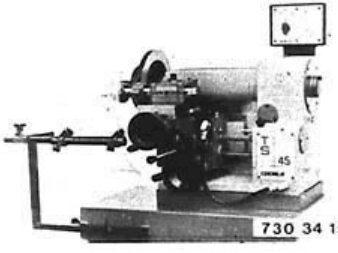


34 11 599 CHECKING FRONT BRAKE DISCS FOR RUNOUT AND DEVIATION IN THICKNESS – Front Wheels Removed

Requirement: wheel bearings okay
Mount dial gage holder and check lateral runout of brake disc with dial gage.
Note:
Mount brake disc with two M 12 x 1.5 bolts.



Measure deviation in thickness* within braking surface at about 8 points with a micrometer.

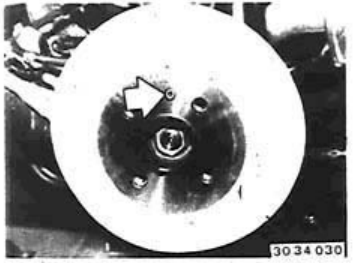


34 11 667 FINE GRINDING FRONT BRAKE DISCS – Brake Discs Removed –

Important!
Always fine grind both sides of both brake discs on one axle.
Check minimum thickness*.
After grinding to final size* one more brake pad set may be installed and worn to limits (see wear limit*).
Installation:
Even if only one brake disc has to be replaced, always replace both brake discs of one axle.

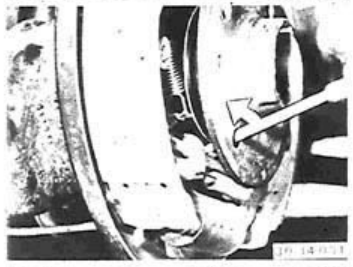
* See Specifications

* See Specifications

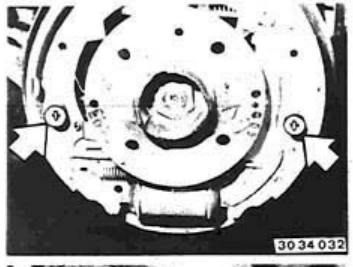


34 21 530 REMOVING AND INSTALLING BRAKES SHOES OF REAR WHEEL

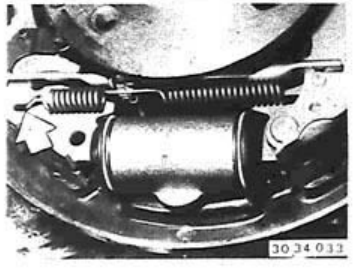
Remove rear wheel.
Unscrew bolt.



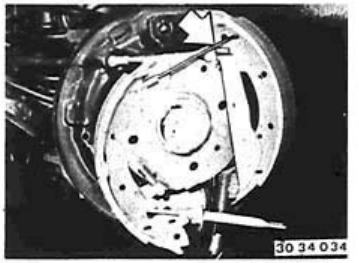
Remove brake drum by loosening parking brake cables and unscrewing automatic slack control enough that brake drum can be pulled off.



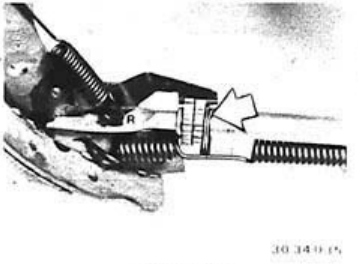
Push in return springs and turn 90°.



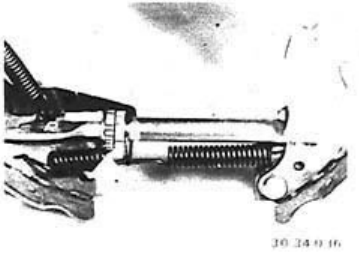
Disconnect bottom return spring at front.
Pull brake shoes out of wheel brake cylinder
Disconnect top return spring at front.
Remove front brake shoes with automatic slack control.



Disconnect parking brake cable.
Remove rear brake shoes.
Replace brake shoes by exchanging.
See Service Information of Group 34.
Installation:
Always replace all four brake shoes and use same make*.
Also replace return springs and thermo clip when replacing brake shoes.



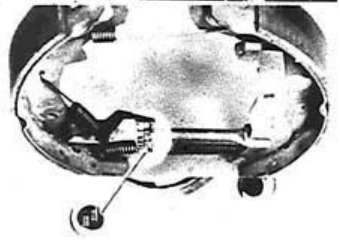
Arrangement of Automatic Slack Control:
Adjusting pinion on left side has right-hand threads (R) and left-hand threads (L) on right side.
Thermo clip must engage (arrow).
Note bends of return springs.



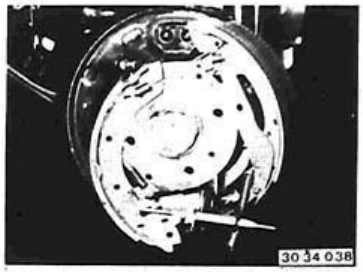
Unscrew adjusting pinion.
Check function and movement of automatic slack control.
If applicable, clean and give threads of push rod a light coat of grease.

* See Specifications

If brakes have to be bled, this must be done before adjusting the parking brake.

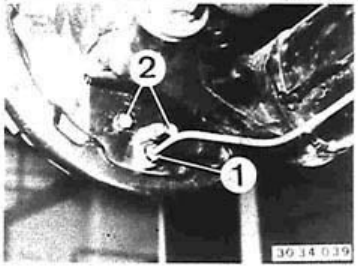


Adjust basic clearance by operating brake pedal.
A click will be heard on the rear wheel brakes until reaching the basic clearance.
Adjust parking brake 34 10 014.

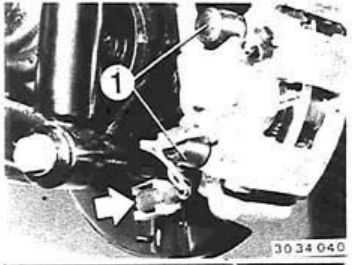


34 21 600 REMOVING AND INSTALLING WHEEL BRAKE CYLINDER

Remove and install brake shoes 34 21 530.
Draw off brake fluid with a syringe which is used exclusively with brake fluids.
Installation:
Bleed brakes 34 00 046.

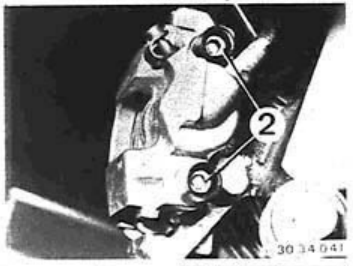


Unscrew brake line (1) and bolts (2) on wheel brake cylinder.

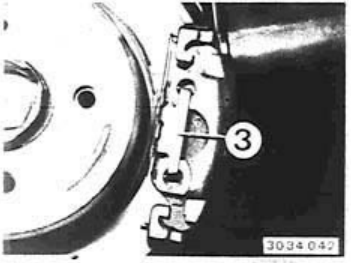


34 21 200 REMOVING AND INSTALLING REAR BRAKE PADS

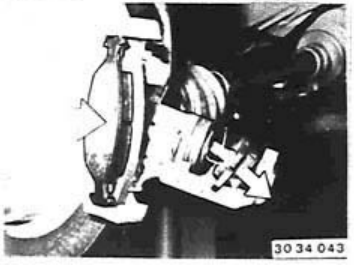
Remove rear wheels.
Press off plastic caps (1).
Right Side:
Pull off brake pad wear indicator plug.



Unscrew guide bolts (2).
Installation:
Check condition of guide bolts and threads, replacing guide bolts if necessary.
Tightening torque*.

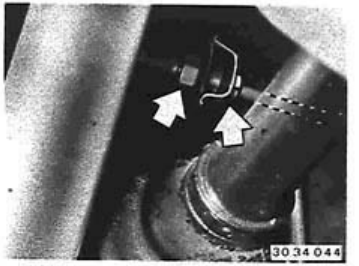


Press out clip (3).
Pull off caliper toward rear.



Remove outer brake pad.
Inner brake pad is located in piston (4) with a spring.
Installation:
Push back pistons completely.

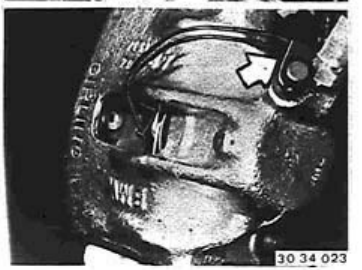
* See Specifications



34 21 745 REMOVING AND INSTALLING REAR BRAKE CALIPER

Remove rear wheel.
Draw off brake fluid with a syringe which is used exclusively with brake fluids.
Disconnect brake line.
Installation:
Bleed brakes – see 34 00 046/047.

Unscrew bolts (1).
Right Side:
Pull off brake pad wear indicator plug.
Pull off caliper toward rear.
Installation:
Tightening torque*.



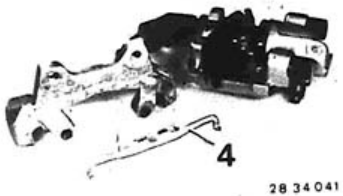
Important!
Check routing and securing of wire for brake pad wear indicator.
Check for secure holding with tab of dust cap.
Rubbing of wire on wheel rim must always be avoided.

* See Specifications

34 21 812 OVERHAULING REAR BRAKE CALIPER
– Use Repair Kit –

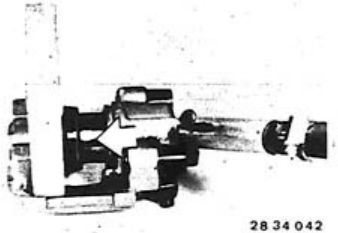
28 34 040

Remove rear brake caliper – 34 21 220.
Press off plastic caps (1).
Unscrew guide bolts (2).



28 34 041

Disassemble caliper.
Remove brake pads.
Installation:
Press brake pad toward outside fully prior to installing spring (4).



28 34 042

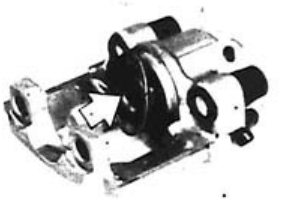
Press off rubber cap and clamping ring.
Place a liner (hard wood, hard felt or similar material) in caliper recess to protect piston.
Press out piston with compressed air applied through connection bore.
Caution!
10 bar (140 psi) air pressure is equal to a force of about 1250 N (275 lbs.).

28 34 043

Check guide sleeves (5), using guide sleeves in repair kit if necessary.

28 34 044

Remove seal carefully with a plastic needle.
Clean cylinder bores and parts with alcohol and dry with compressed air.
Inspect cylinder bore, piston and flange surfaces for damage thoroughly.
Machining of cylinder bores and pistons is not approved.
Installation:
Give all parts a light coat of ATE brake cylinder paste before installing.

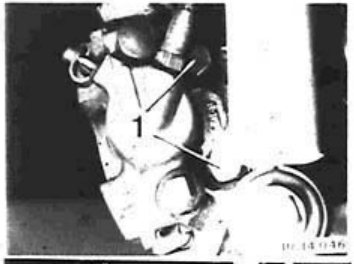


28 34 045

Pull rubber cap on to piston first.
Do not cant piston.
Press in piston with a piece of hard wood.

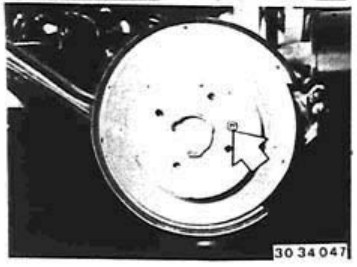
28 34 046

Pull rubber cap over edge of cylinder bore and secure with clamping ring.
Assemble caliper.



34 21 320 REMOVING AND INSTALLING REAR BRAKE DISC

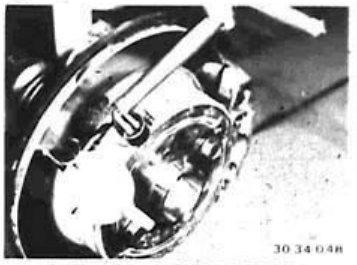
Remove rear wheel.
Unscrew bolts (1).
Installation:
Tightening torque*.



Pull off caliper toward rear and suspend on a piece of wire.
Brake line remains connected.
Unscrew bolt and take off brake disc.

Important!
Always replace both brake discs of one axle, even if only one disc has to be replaced.
Adjust parking brake – 34 10 014.
Breaking In Parking Brake After Replacing Brake Discs:
Car must be broken in in three phases.

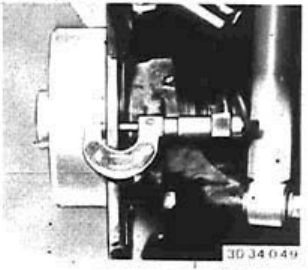
Phase 1:	5 full stop braking actions from 50 km/h (30 mph).
Phase 2:	Let brakes cool down.
Phase 3:	5 additional braking actions from 50 km/h (30 mph).



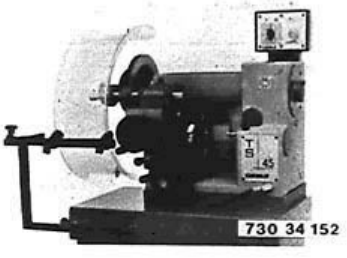
34 21 879 CHECKING REAR BRAKE DISC FOR RUNOUT AND DEVIATION IN THICKNESS

– Rear Wheel Removed –

If necessary, remove caliper 34 21 220.
Mount brake disc with two bolts.
Mount dial gage holder and check lateral runout* of brake disc with dial gage.



Measure deviation in thickness* within braking surface at about 8 points with a micrometer.
Installation:
Tightening torque*.



34 21 947 FINE GRINDING REAR BRAKE DISCS

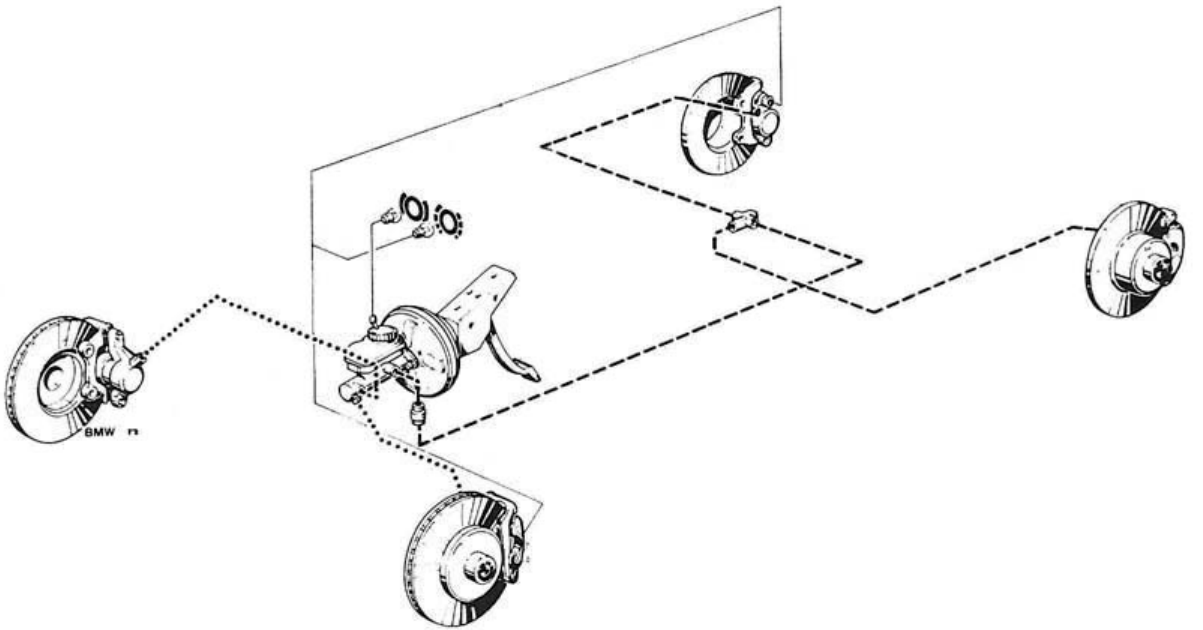
– Brake Discs Removed –

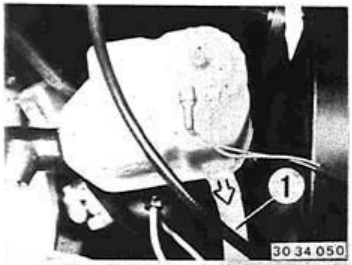
Important!
Always fine grind both sides of both brake discs on one axle.
Check minimum thickness*.
One more set of brake pads may be installed and used to wear limits* after machining discs to the final size*.
Installation:
Always replace both brake discs of one axle, even if only one brake disc has to be replaced.

* See Specifications

* See Specifications

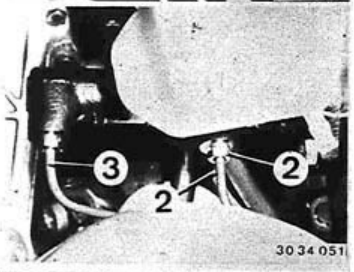
BRAKE LINE ROUTING LAYOUT – E 30



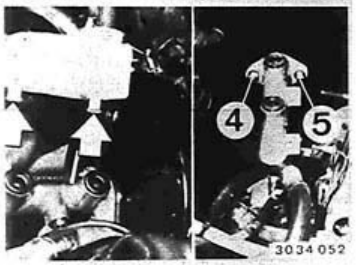


34 31 000 REMOVING AND INSTALLING BRAKE MASTER CYLINDER

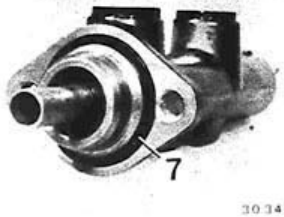
Draw off brake fluid in tank with a syringe reserved exclusively for brake fluids.
Pull off plug.
Pull off clutch hydraulic hose (1).
Installation:
Bleed brakes 34 00 046 / 047.



Unscrew brake lines (2 and 3).



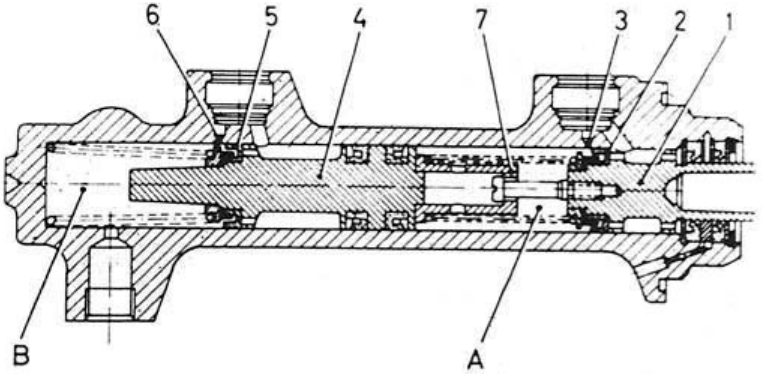
Pull off tank.
Unscrew mounting screws (4 and 5).
Installation:
Check rubber seal and connections.

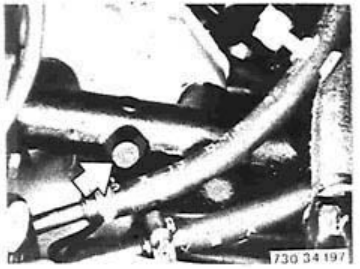


Installation:
Check rubber ring (7).
The building up of vacuum will be impaired, if sealing is not perfect.

Description of Tandem Brake Master Cylinder Operation:
Operating the brake pedal moves pistons (1 and 4) forward.
Primary cups (2 and 5) pass over compensating bores (3 and 6).
Now there is equal pressure in chambers A and B.

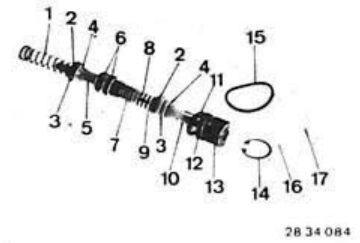
Dual Circuit System:
Chamber A is for front right and left.
Chamber B is for rear right and left.
The failure of a brake circuit will cause considerable increase in brake pedal travel.
If the second brake circuit fails, piston (1) uses the pressure building up in chamber A to move piston (4) in pressureless chamber B against the tandem brake master cylinder housing and to provide function of the first brake circuit.
If the first brake circuit fails, piston (1) in the pressureless chamber A is pressed against spring loaded cap (7) and the second brake circuit has full operation by way of chamber B.





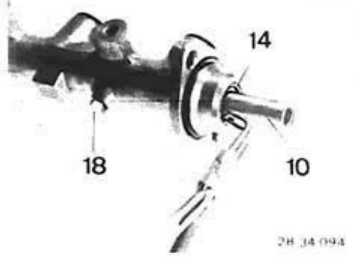
34 31 012 OVERHAULING BRAKE MASTER CYLINDER

Remove master cylinder 34 31 000.
No replacement parts are available for brake master cylinders with a recessed stop pin (ABS).



28 34 084

Important!
Use repair kit:
(1) spring, (2) support ring, (3) primary cup, (4) filler ring, (5) intermediate piston, (6) separating cup, (7) stop sleeve, (8) spring, (9) screw, (10) push rod piston, (11) stop washer, (12) secondary cup, (13) plastic sleeve, (14) circlip, (15) seal, (16) aluminum seal and (17) silicone grease.

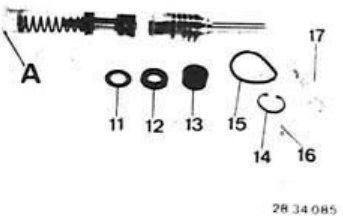


28 34 094

Apply light pressure on push rod piston (10), lift out circlip (14) and unscrew stop screw (18).
Release push rod piston (10) slowly and pull it out.

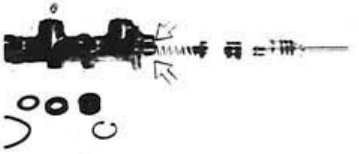
28 34 083

Remove intermediate piston by knocking housing lightly on a piece of wood.
Clean cylinder housing and other parts not included in the repair kit with alcohol and dry with compressed air.
Tandem brake master cylinders with surface damage in the cylinder bore may not be reused.
Check that all connecting, compensating and after-running bores are clean.



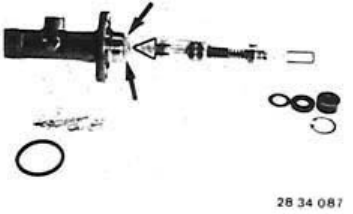
28 34 085

Give cylinder bore a very thin coat of ATE brake cylinder paste.
Remove large plug from assembly sleeve.
Slide short neck part on to long neck pipe far enough that stop washer (11), secondary cup (12), plastic sleeve (13), circlip (14), seal (15), aluminum seal (16) and silicone grease (17) can be removed.
Remove small plug.



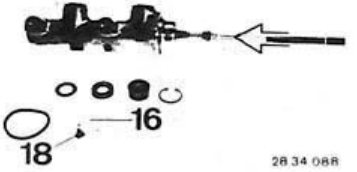
28 34 086

Clamp cylinder housing in a vise fitted with soft (aluminum) jaws.
Guide assembly sleeve with long neck pipe into cylinder bore.



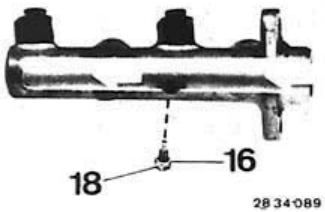
28 34 087

Slide stepped short neck pipe into cylinder bore against shoulder and hold in this position.



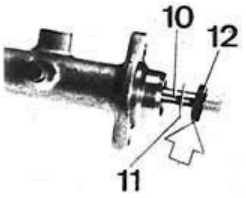
28 34 088

Press contents of assembly sleeve into cylinder bore carefully with a suitable mandrel, until the intermediate piston touches bottom of the cylinder.



28 34 089

Hold intermediate piston against stop and screw in bolt (18) with a new aluminum seal (16).
Tighten stop bolt (18) with a torque of 5 to 8 Nm (3.5 to 5.5 ft. lbs.).

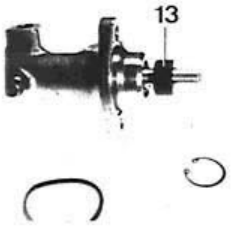


28 34 090

Release push rod piston (10) carefully.
Slide on stop washer (11).
Coat secondary cup (12) with silicone grease and install.
Let short stepped end of assembly sleeve protrude and slide over secondary cup (12).
Hold cup with two fingers.

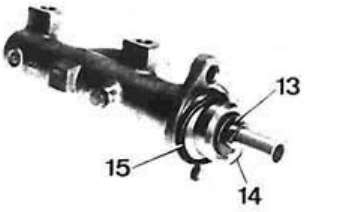
28 34 091

Adjust secondary cup flush with long neck pipe and slide complete assembly sleeve into cylinder bore.
Slide in long neck pipe carefully until resistance is felt.



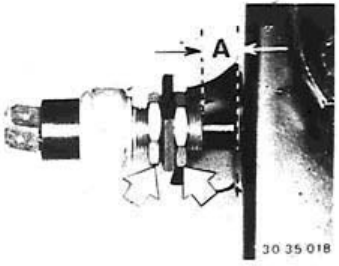
28 34 092

Hold long neck pipe and pull back short neck pipe.
Remove complete assembly sleeve.
Give plastic sleeve (13) a light coat of silicone grease and slide on to push rod piston in cylinder bore.



28 34 093

Press in push rod piston (10) and plastic sleeve (13).
Install circlip (14) with a special circlip pliers.
Circlip must have perfect fit in groove of cylinder bore.
Install new seal (15) before attaching on the vacuum brake booster.



30 35 018

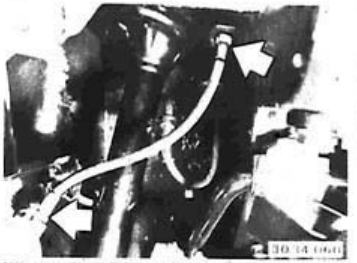
34 31 104 ADJUSTING BRAKE LIGHT SWITCH

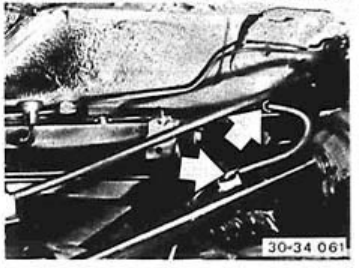
Adjust brake light switch with nut (1) and locknut (2) that distance (A) = 5 to 6 mm (0.197 to 0.236") of contact button is visible when the brake pedal is released.

34 32 361 REPLACING ALL BRAKE LINES

Brake lines are now only available in straight version and supplied in correct length with connecting nipples.

The removed brake pipe should be used as a template for bending.
Use bending tool**
Do not damage surface finish of pipes.
Do not bend pipes sharply or attempt to bend back an incorrectly bent brake pipe.
Also refer to Service Information of Gr. 34.





34 32 381 REPLACING FRONT BRAKE HOSE

Draw off brake fluid in tank with a syringe used exclusively with brake fluids.
Disconnect brake hose.
Installation:
Never twist brake hose while installing.
Bleed brakes – 34 00 046 / 047.
Tightening torque*.

34 32 451 REPLACING REAR BRAKE HOSE

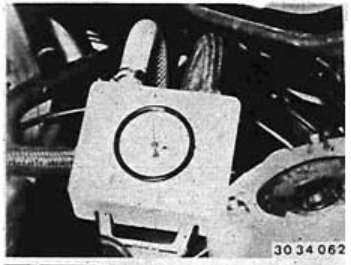
Draw off brake fluid in tank with a syringe used exclusively with brake fluids.
Disconnect brake hose.
Installation:
Never twist brake hose while installing.
Bleed brakes – 34 00 046 / 047.
Tightening torque*.

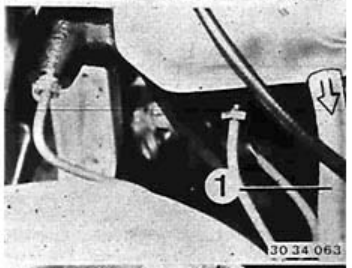
** Source: HWB

* See Specifications

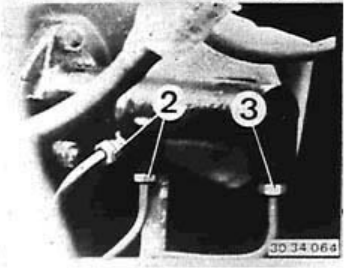
34 33 000 REMOVING AND INSTALLING BRAKE BOOSTER WITH TANDEM BRAKE MASTER CYL.

Checking Operation:
Operate brake pedal 10 times with engine stopped. Hold brake pedal down and start engine. System is okay if brake pedal gives.
If brake pedal does not give, the defect could be in check valve, vacuum hose or rubber ring between tandem brake master cylinder and brake booster. Engine's vacuum could be insufficient or filter screen of brake booster completely clogged with dirt.
Checking Engine Vacuum for Brake Booster:
Disconnect vacuum hose on brake booster
Install vacuum tester 34 3 100 between brake booster and check valve. Check available vacuum when releasing accelerator, going from an engine speed of 3000 rpm with engine at operating temperature.
Min. value = – 0.35 bar (5 psi).
Repeat test several times.
Minimum value with specified idle speed and engine at operating temperature:
– 0.50 bar (7 psi).

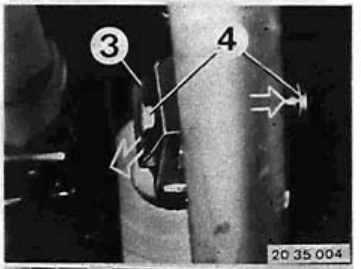




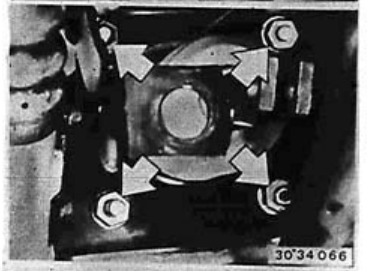
Draw off brake fluid in tank with a syringe used exclusively with brake fluids.
Pull off plugs.
Pull off hose (1) for clutch.



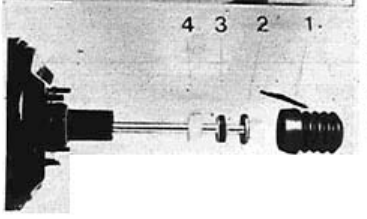
Disconnect brake lines (2 and 3).
Brake line 2:
front left
front right = 1st brake circuit
Brake line 3:
rear right
rear left = 2nd brake circuit



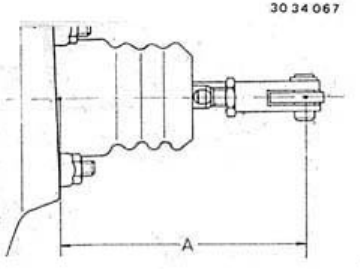
Remove instrument panel trim at bottom left 51 45 180.
Disconnect spring.
Press off clip (3) and pull out shaft (4).



Disconnect brake booster on pedal assembly base.
Take off brake booster with master cylinder toward front.
Installation:
Tightening torque*.
Adjust stop light switch 34 31 104.
Bleed brakes – 34 00 046 / 047.

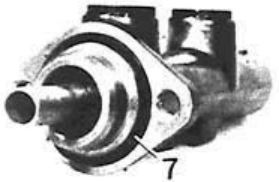


If filter screen in brake booster is clogged with dirt, remove cap (1), holder (2), damper (3) and filter (4).
Installation:
Clean damper (3) and filter screen (4).
Offset slots of damper (3) and filter screen (4) by 180° to each other.



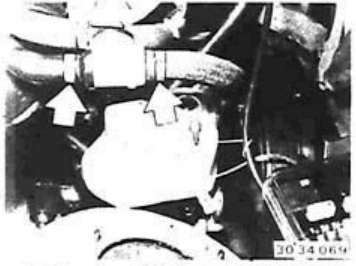
Basic adjustment distance A on piston rod = 125 mm (4.921").
Adjust brake pedal – see Group 35.

* See Specifications



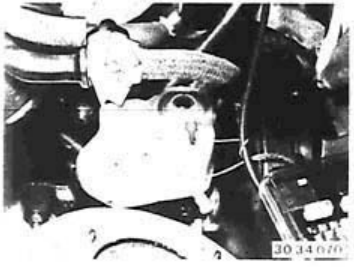
34 33 000 REPLACING BRAKE BOOSTER

Remove brake booster with tandem master cylinder 34 33 000.
Unscrew tandem master cylinder on brake booster.
Installation:
Tightening torque*.
Check rubber ring (7) between tandem master cylinder and brake booster, if necessary.

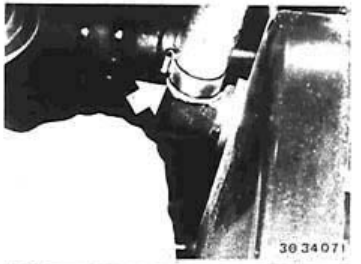


34 33 051 REPLACING CHECK VALVE FOR BRAKE BOOSTER

Disconnect vacuum hoses on check valve (1).
Installation:
Replace clamp if applicable.

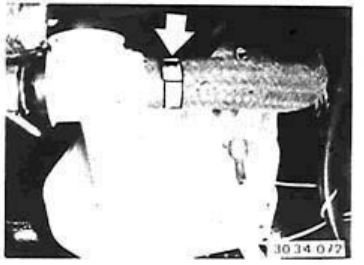


Loosen clamps and take off check valve.
Installation:
Arrow or black side faces intake manifold.
Replace clamps if applicable.



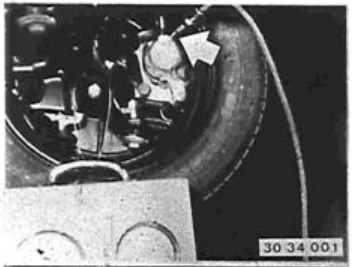
34 33 071 REPLACING VACUUM HOSE FOR BRAKE BOOSTER

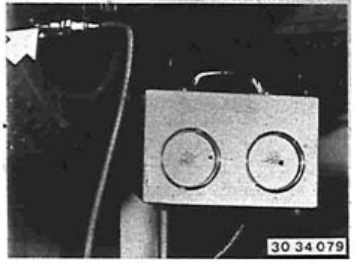
Disconnect vacuum hose on brake booster.
Installation:
Replace clamp if applicable.



Disconnect vacuum hose on check valve (1).
Installation:
Replace clamp if applicable.

* See Specifications

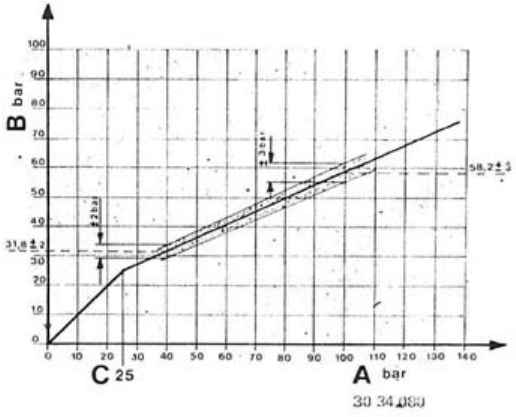




34 34 099 CHECKING FUNCTION OF BRAKE FORCE REGULATOR

Remove and install front wheel 36 10 300.
Remove and install rear wheel 36 10 320.
Connect one high pressure meter in front axle brake circuit.
Bleed high pressure meter.

Connect second high pressure meter on rear wheel brake bleeder screw.
Bleed high pressure meter.



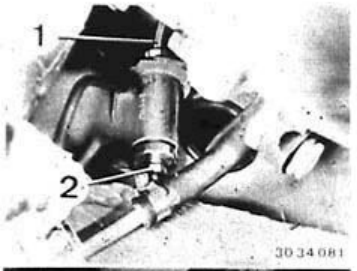
Operate brake pedal firmly at least 5 times.
Hold brake pedal pressed down with a pedal prop.
Up to a pressure of 25 bar (355 psi) both high pressure meters should display the same value.
As from a pressure of 25 bar (355 psi) the pressure of the rear wheel brake cylinder should drop according to the diagram.
A = Inlet pressure
B = Outlet pressure
C = Switching over pressure
Example:
Inlet pressure (= front axle pressure)

Pressure I	Pressure II
40 bar (569 psi)	100 bar (1422 psi)

Outlet pressure (= rear axle pressure)

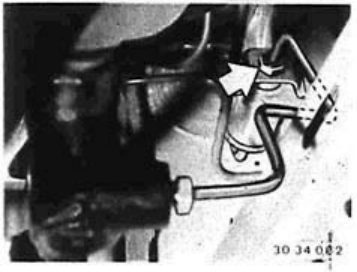
Pressure I	Pressure II
31.8 bar (452 psi)	58.2 bar (828 psi)

If necessary, take mean value from three measurements.
If measured values deviate from specified values, replace the brake force regulator.

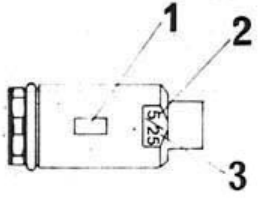


34 34 100 REMOVING AND INSTALLING BRAKE FORCE REGULATOR

Draw off brake fluid in tank with a syringe used exclusively with brake fluids.
Unscrew lines (1 and 2).
Installation:
Tightening torque*.
Bleed brakes 34 00 046 / 047.



Take off clamp and brake force regulator.

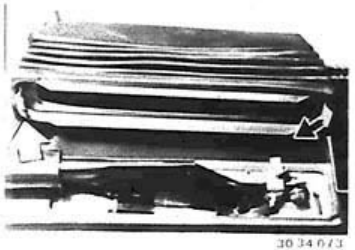


30 34 083

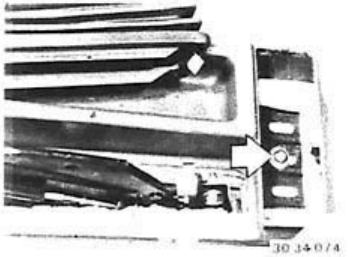
Check identification when replacing the brake force regulator.
(1) Calendar day / year number
(2) Reduction = (e.g. 0.45)
(3) Switching-over pressure

* See Specifications

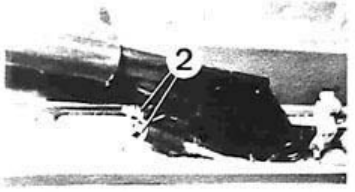
34 41 000 REMOVING AND INSTALLING PARKING BRAKE LEVER



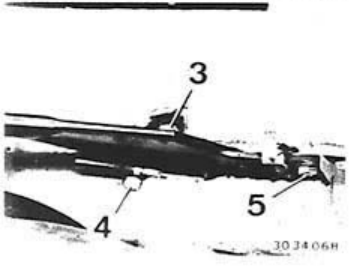
Take off rubber cap (1) by pulling up clamp at front and lifting out at rear.



Lift out rear ashtray.
Unscrew bolt.
Disconnect console by pushing back and remove.

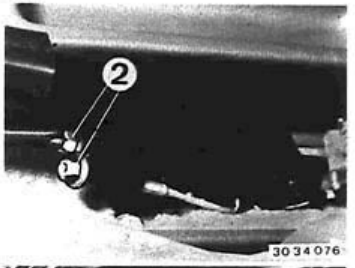


Unscrew nuts (2) on parking brake cables.



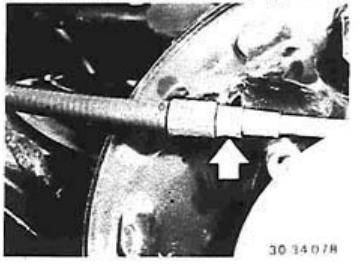
Unscrew bolts (3 ... 5).
Remove parking brake lever.

34 41 100 REMOVING AND INSTALLING PARKING BRAKE CABLE

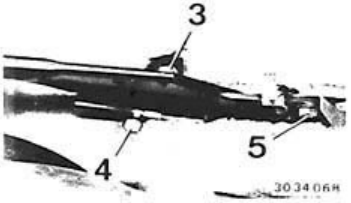


Remove and install brake shoes 34 21 530.
Take rubber cap off of parking brake lever by pulling up clamp at front and lifting out at rear.
Unscrew nuts (2) on parking brake cable.

Disconnect parking brake cable on semi-trailing arm.

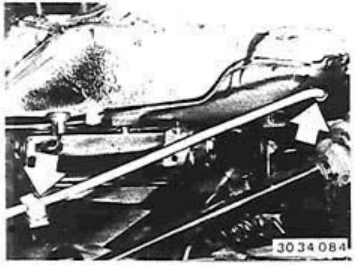


Compress locking clamp.
Disconnect parking brake cable on brake backplate and pull out.
Installation:
Make sure clamp fits correctly.

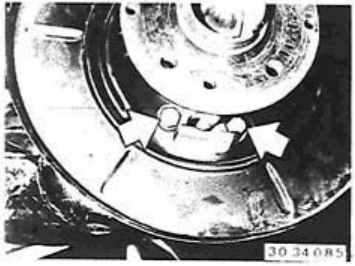


34 41 100 REMOVING AND INSTALLING PARKING BRAKE CABLE
– Rear Disc Brakes –

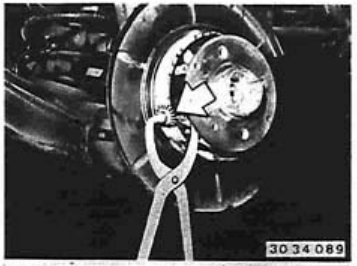
Remove expansion lock for parking brake shoes – see 34 41 250.
Remove parking brake lever – see 34 41 000.
Installation:
Adjust parking brake – see 34 10 014.



Disconnect parking brake cable on swing arm.
Pull parking brake cable out of protective pipe.
Installation:
Cable holder must bear on the protective pipe.



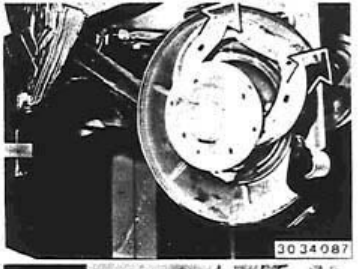
Unscrew support for parking brake cable.
Pull out parking brake cable.



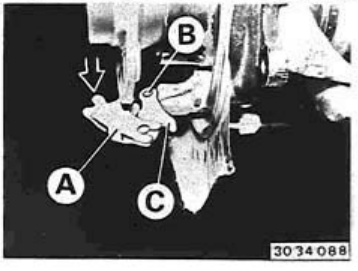
34 41 200 REMOVING AND INSTALLING PARKING BRAKE SHOES

Remove rear brake disc see 34 21 300.
Disconnect lower return spring with a brake spring pliers.
Installation:
Check return spring, replacing if necessary.
Adjust parking brake – see 34 10 014.

Turn spring retainers 90° with Special Tool 34 4 000 and disconnect.



Spread brake shoes apart at bottom and lift out from above.
Parking Brake Breaking-in Program After Replacing Liners:
Car must be broken in in three phases.
Phase 1: Car stopped 5 times from 50 km/h (30 mph) with max. deceleration.
Phase 2: Brakes cooled off.
Phase 3: Car stopped 5 more times from 50 km/h (30 mph).



34 41 250 CHECKING / REMOVING AND INSTALLING EXPANSION LOCK

Remove parking brake shoes see 34 41 200.
Pull off part A toward rear.
Press out pin B.
Pull out part C.
Installation:
Apply a thin coat of Molykote Paste G on sliding surfaces and pin.
Adjust parking brake - see 34 10 014.

Condition	Cause	Correction
Brakes pull to one side	a) Tire inflation pressure incorrect b) Uneven tire tread wear c) Oil on pads/liners d) Pad/liner type not as specified e) Caliper recesses dirty f) Guide bolts dirty or damaged g) Rear wheel alignment maladjusted h) Corrosion in calipers of wheel cylinders i) Shock absorbers without action k) Pad of one caliper worn l) Pad glazed	a) Correct tire inflation pressure b) Change or replace tires c) Replace brake pads/liners and eliminate cause d) Replace brake pads/liners e) Remove, clean and install calipers f) Replace guide bolts g) Check wheel alignment h) Remove and install, repair or replace calipers or wheel cylinders i) Check or replace shock absorbers k) Replace brake pads and check calipers l) Replace brake pads and check calipers
Brakes excessively hot while driving	a) Compensation bore in master cylinder clogged b) No play between push rod and master cylinder piston c) Rubber parts swollen from contact with wrong type of brake fluid d) Vent hole in brake fluid tank clogged e) Corroded calipers f) Cross spring broken g) Parking brake lever not released fully	a) Check or replace master cylinder b) Adjust push rod c) Overhaul or replace master cylinder d) Clean brake fluid tank e) Remove and install, repair or replace calipers f) Replace cross spring g) Check parking brake and parking brake cables, repairing if necessary
Braking effect insufficient inspite of great force on pedal Brake pedal travel normal short long	a) Brake pads oil splattered or burnt; wrong type of brake pads b) Brake booster malfunctions – engine vacuum insufficient c) One brake circuit failed due to leaks or damage	a) Replace brake pads b) Check power brake system – check engine (valves, cylinder head, gasket, etc.) c) Check brake system for leaks

TROUBLESHOOTING BRAKES

Condition	Cause	Correction
Brake pedal motion too soft and spongy	a) Air in brake system b) Insufficient brake fluid in brake fluid tank c) Overheated brake fluid – vapor lock due to excessive water content in brake fluid or excessive brake loads	a) Add or replace brake fluid and bleed brakes b) See a) c) See a)
Brake pedal travel excessive even though brakes have been bled and adjusted	a) Primary cup in master cylinder damaged b) Separating cups on floating piston of tandem brake master cylinder leak c) Leak in brake system	a) Overhaul or replace brake master cylinder b) See a) c) Check brake system for leaks
Uneven pad wear	a) Wrong type of brake pads b) Caliper recesses dirty, caps damaged c) Corrosion in calipers or wheel cylinders d) Rubber ring for piston control swollen	a) Replace brake pads b) Remove and install, repair or replace calipers or wheel cylinders c) See b) d) See b)
Brake pads worn at angle	a) Wheel bearing play excessive b) Brake disc not aligned with caliper c) Corrosion in calipers or wheel cylinders d) Brake disc wear angular e) Pads worn less than minimum thickness f) Spring force insufficient g) Guide bolts damaged	a) Replace wheel bearings b) Check caliper installation c) Remove and install, repair or replace calipers or wheel cylinders d) Grind or replace brake discs e) Replace brake pads f) Replace spring g) Replace guide bolts

Condition	Cause	Correction
Seized brake pads, pad does not move off of brake disc	a) Dirty caliper recesses, damaged protective caps b) Corrosion in calipers c) Compensation bore in master cylinder clogged	a) Remove and install, repair or replace calipers b) Remove and install, repair or replace calipers c) Overhaul or replace master cylinder
Brakes squeal or rattle	a) Wrong type of pads b) Dirty caliper recesses c) Spring force insufficient d) Brake disc not aligned with caliper e) Brake disc runout f) Excessive thickness difference within braking surface g) Brake drums out-of-true h) Knocking brake drums i) Dirt and dust in brake drums k) Liner wear excessive or one-sided l) Rust edges on brake discs m) Pad loose n) Wheel bearing play excessive	a) Replace brake pads b) Remove and install, clean calipers c) Replace springs d) Check caliper installation e) Check brake disc runout, replacing if necessary f) Measure brake disc thickness; grind or replace discs g) Grind or replace brake drums h) Grind or replace brake drums i) Clean and check brake drums k) Replace brake shoes l) Grind or replace brake discs m) Replace brake pads n) Replace wheel bearings
Brake pedal dead travel excessive	a) Wheel bearing play excessive b) Brake disc not aligned with caliper c) Brake disc runout d) Excessive thickness difference within braking surface e) Brake system leaks f) Air in brake system g) Pads/liners not specified type h) Automatic brake shoe slack control malfunctions	a) Replace wheel bearings b) Check caliper installation c) Check brake disc runout, replacing discs if necessary d) Measure brake disc thickness; grind or replace discs e) Check brake system for leaks f) Bleed brake system g) Replace brake pads and/or liners h) Remove and install brake shoes; repair slack control

Condition	Cause	Correction
Seized pistons in caliper	a) Caliper recesses dirty, caps damaged b) Brake disc not aligned with caliper c) Corrosion of pistons in calipers or wheel cylinders	a) Remove and install, repair or replace calipers b) Check caliper installation c) Remove and install, repair or replace calipers or wheel cylinders
Pulsating effect on brake pedal	a) Wheel bearing play excessive b) Brake disc not aligned with caliper c) Brake disc runout d) Excessive thickness difference within braking surface	a) Replace wheel bearings b) Check caliper installation c) Check brake discs for runout, replacing if necessary d) Measure brake disc thickness and grind or replace discs
Parking brake effect insufficient	a) Oil on brake shoes b) Excessive dead travel between brake shoes and brake drums c) Excessive dead travel in cables d) Cables maladjusted e) Corroded transmitting elements	a) Replace brake liners and eliminate cause b) Adjust parking brake c) See b) d) See b) e) Remove and install parking brake and spreader locks; check cables, replacing if necessary

1. ANTIBLOCK SYSTEM (ABS) – DESCRIPTION AND DESIGN

Description:

The basis of a braking action is the friction between the tires and road surfaces.
To brake a vehicle the tires have to transmit a frictional force to the road surface. In so doing there will be slip between the tires and road surface, i.e. the tire peripheral velocity will be slower than the road speed of the vehicle.

Figure 730 34 112 shows the relation between the frictional force and slip for a typical case on a dry road surface. The transmitted braking force reaches its maximum value in shaded area A. This is also the control range of ABS. When a wheel is locked, i.e. when there is 100% slip, the frictional force will normally be lower than when a wheel is rolling.

Consequently the ABS must control the brake pressure in the wheel brake cylinder in such a manner that the slip remains in the shaded area, because here the highest frictional force is available.

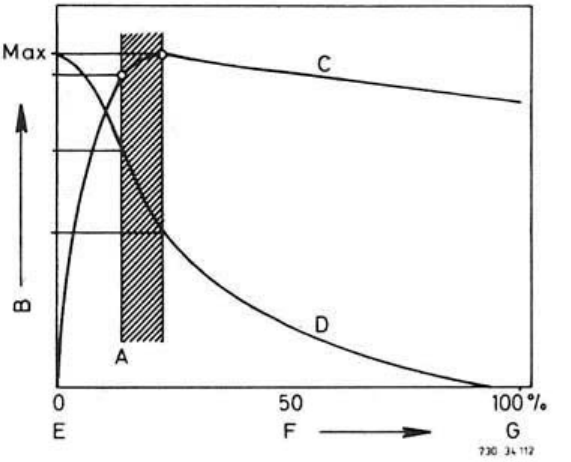
At the same time there will then be sufficient lateral cornering force to guarantee steering and directional stability.

The amount of slip, with which there is maximum frictional force, and the amount of frictional force itself depend chiefly on the tires (type, treads, rubber composition), the road surface (material, surface condition, wet, ice), the road speed and the slip angle of the wheels.

The ABS detects the frictional conditions between the tires and road surface prevailing at the moment. It automatically adjusts to each change in road surface/tire relation and makes use of the highest coefficient of friction, without that the vehicle slips or skids because of wheel locking.

Non-uniform friction conditions between the separate wheels will be held under control just as also instantaneous changes in the road surfaces, e.g. through patches of ice.

BRAKING AND LATERAL FORCES IN RELATION TO SLIP



A = ABS operating range
B = Braking and lateral force
C = Braking force
D = Lateral force
E = Rolling wheel
F = Slip
G = Locked wheel

DESIGN

The ABS consists of a control unit, hydraulic unit, speed sensors and a wire harness. Components are described separately below.

Speed Sensors:
Each speed sensor has a gear wheel, which runs past the permanently magnetized edge of the speed sensor and is installed in the wheel hubs.
The rotary motion of the wheels is recorded by inductive sensors and an electric signal is sent to the electronic control unit.

Electronic Control Unit:
The electronic control unit is located in the passenger compartment on left side underneath instrument panel. In a small multi-channel electronic computer accelration, decelration and slip factors are derived from the electric signals of the speed sensors, which are proportional to the wheel velocity. By logical connection of these factors there are control commands for the electromagnetically operated valves in the hydraulic unit.

The signal processing in the computer determines the control behavior of the system. The expected degree of dependability is based on digital engineering with highly integrated circuitry.

The control unit contains electronic monitoring circuits, which control the function prior to each trip and the ABS wire harness with equipment constantly during a trip. If the control unit detects a defect in the wire harness or electrical part of the equipment, the monitoring circuit will switch off the ABS and guarantee normal use of the brake system. An ABS indicator lamp reports this condition to the driver.

Hydraulic Unit:
The hydraulic unit is located in the engine compartment and was added to the conventional brake system.

To control the brake pressure in the wheel brake cylinders, the brake hydraulic unit has threeway valves which permit three brake pressure conditions.

Pressure build-up, pressure holding and pressure drop. These three pressure phases adapt themselves in the sequences and length to the requirements of the desired control characteristic and power flow between the road surface and tires. In principle the control procedures are as follows.
As soon as a wheel deceleration or slip indicates the locking of a wheel, the brake pressure is first held. If the wheel still tends to lock, the pressure will be dropped so long until the wheel accelerates or the slip limit is exceeded. Afterwards the pressure is raised again and the control phases begin from new.

An electrically driven return delivery pump returns the brake fluid taken from the wheel brake cylinder while dropping the pressure to the appropriate brake circuit.
The pump is designed as a two-piston pump so that the circuits of a dual brake circuit system remain fully separated.

Wire Harness:
The control unit is connected with the speed sensors and electric part of the hydraulic unit via a special wire harness for the sake of signal input and order output as well as electric power supply.

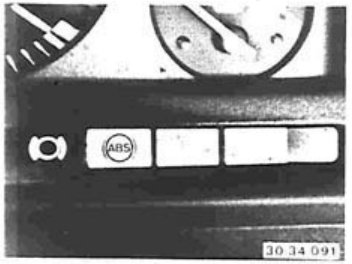
3 = Pulse sensor



DESCRIPTION OF AND CHECKING ABS INDICATOR LAMP

ABS indicator lamp lights up after switching on ignition.
Indicator lamp should go out when engine has started and ABS is okay.

Procedures are repated each time ignition is switched off and on.

Causes for faulty indication (indicator lamp doesn't light up, doesn't go out or comes on while driving – even occasionally – can be found with help of BMW SERVICE TESTER and brake test stand (dynamometer).

Important!
Each started step must be finished completely without a break!

Control unit will automatically switch to "normal braking" where there is electric or electronic faults in ABS.
This means car can still be braked, but without control (wheel could lock!).
Faulty system will be indicated by a continuously lighted ABS indicator lamp in instrument panel.

325 iX (Cars with Four Wheel Drive):
If ABS indicator lamp lights up while driving, first measure resistance in acceleration sensor and electric wire (see 34 52 000) before testing ABS.

Check throttle valve adjustment (see 13 54 130) in case of impaired comfort, e.g. hesitation or stalling of engine during ABS regulation.

ABS of 325 iX cars may not be tested on brake test stand (Test Steps 8, 9 and 10).

GENERAL INFORMATION ON REPAIRS AND BRAKE SYSTEM

Basically ABS does not require servicing, however, pay attention to the following points when working on cars with ABS.

a) Disconnect plug on electronic control unit (ignition switched off) when welding with electric welder.

b) When painting, electronic control unit can be subjected to max. 95° C (203° F) briefly or max. 85° C (185° F) for a longer period (about 2 hours).

c) Battery terminals must be tightened perfectly on end poles of battery after reinstallation of removed battery.

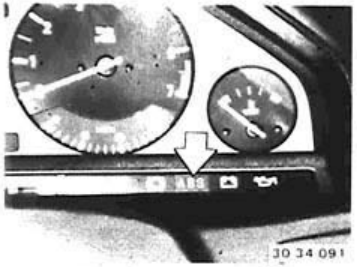
d) After replacement of hydraulic unit, control unit, pulse senders or wire hraness as well as after work which meant contact with ABS equipment (e.g. accident damage repairs), entire ABS must be checked with BMW SERVICE TESTER.
It is important that brake pipes and hoses are routed correctly.

e) After each job on brake system, brakes must be bled and high / low pressure tests performed.
Check all connections for leaks.

f) Brake cleaning solutions must always be kept out of brake system when cleaning brake components with brake cleaners.
Chlorinated hydrocarbons contained in many brake cleaning products of various manufacturers would lead to corrosion of brake components. Even most minute traces of brake cleaner residue must be avoided.

Note:
Only use cleaners* approved by BMW.

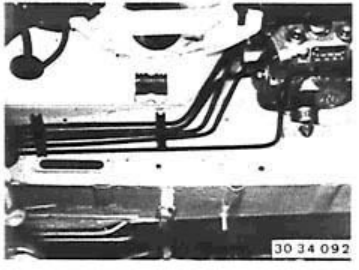
* Source of Supply: HWB



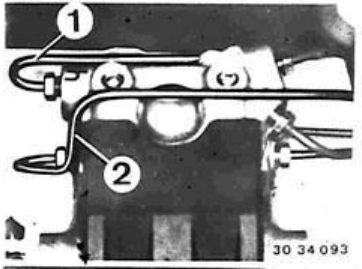
34 50 000 CHECKING OPERATION OF ABS

An electronic circuit in the control unit monitors ABS constantly.
Operation must be checked when ABS indicator lamp does not go out, comes on while driving or does not come on when turning on the ignition or after performing jobs on ABS.
See special note for 325 iX.

Operation is checked with the BMW service tester.
Connect tester on wire harness and control unit with a suitable plug.
See connection plan on ABS nominal value microfiche.
Important!
Each step of test must be finished completely, without taking a break.

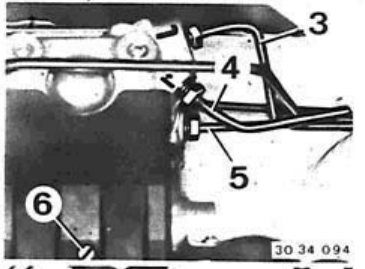


Servicing ABS.
Basically the ABS does not require servicing. Check brake lines to and from the hydraulic unit for correct routing and leaks together with the general brake system.

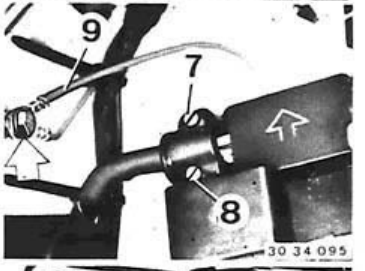


34 51 520 REMOVING AND INSTALLING/ REPLACING HYDRAULIC UNIT ASSEMBLY FOR ABS

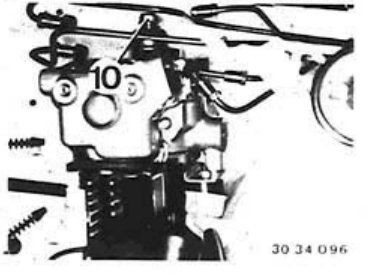
Disconnect battery ground lead.
Remove air cleaner 13 71 000.
Remove headlight cover.
Disconnect lines (1 and 2).
Installation:
Line (1) = to brake force regulator, rear.
Line (2) = to brake master cylinder, rear.
Caution!
Catch escaping brake fluid and keep it off of clothes and painted surfaces.



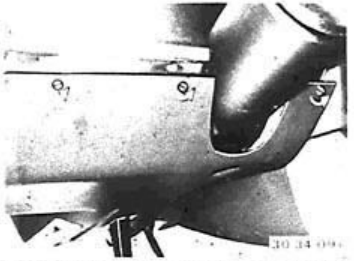
Disconnect lines (3 ... 5).
Unscrew bolt (6) and remove cover.
Installation:
Line (3) = to left front brake caliper.
Line (4) = to right front brake caliper.
Line (5) = to front brake master cylinder.
Don't mix up lines (mark if necessary).
Important!
Keep lines and connections clean (insert plugs).



Unscrew bolts (7 and 8).
Pull off multiple-pin plug.
Disconnect ground wire (9).

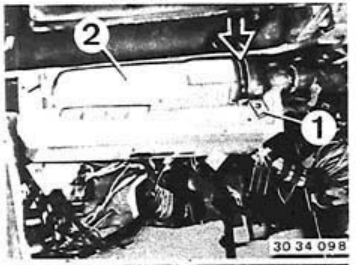


Loosen nut (10).
Pull up and remove hydraulic unit.
Installation:
Bleed brake system for ABS – 34 00 047
Check operation of ABS with BMW service tester – 34 50 000.

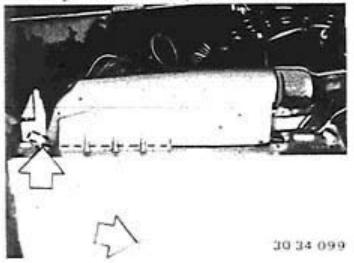


34 52 510 REPLACING CONTROL UNIT FOR ABS

Detach instrument panel trim at bottom left.
Caution!
Turn off ignition before removing or installing control unit.

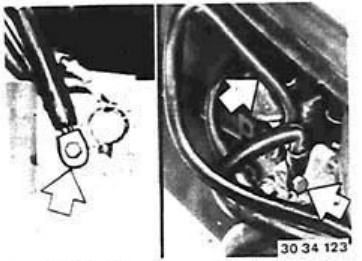


Push back clamp (1) and pull out multiple-pin plug (2) to the right, and then disconnect to the left.
Unscrew control unit on body.



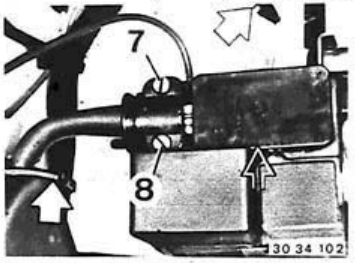
Check for correct connections when replacing a control unit.
Multiple-pin plug has a tab on its left side, for which the control unit must have an opening.
Important!
Only use a control unit with the specified code number*.
Installation:
First engage left side of plug and then press right side into clamp.
Check operation of ABS.

* See Specifications

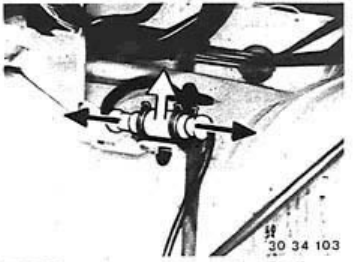


61 11 530 REPLACING WIRE HARNESS FOR ABS

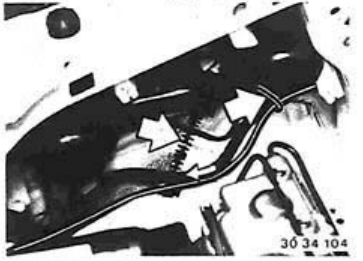
Disconnect battery ground lead.
Disconnect lead on battery positive terminal and lay back to left side in engine compartment.
BMW 325 e / 325 i:
Disconnect negative lead from battery support point on engine compartment firewall.



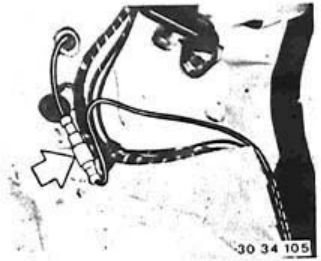
Take off cover on hydraulic unit.
Unscrew bolts (7 and 8).
Pull off multiple-pin plug on hydraulic unit carefully (plastic pins).
Loosen wire clip.



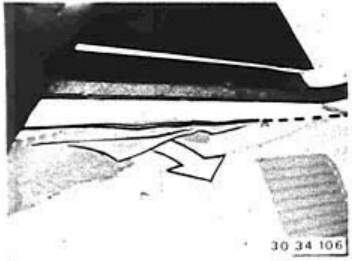
Remove covers for left and right headlights.
Disconnect both plugs for pulse sensors in engine compartment.
Loosen wire clips.



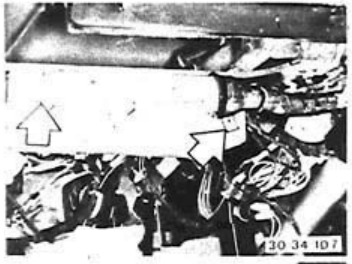
Pull in right wire to left side of engine compartment.



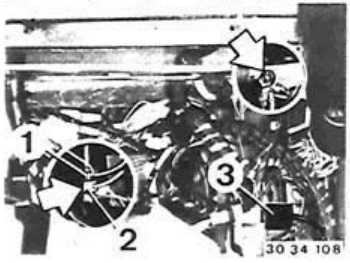
Remove both front seats 52 10 000.
Remove rear seat 52 20 010.
Disconnect both plugs for rear pulse sensors.



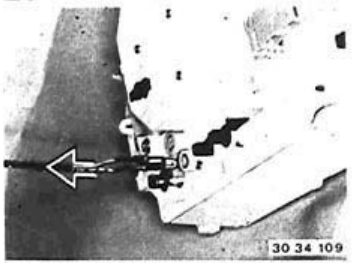
Detach carpets and trim panels as required.
Lay back left and right wires forward.



Detach instrument panel trim at bottom left.
Pull off multiple-pin plug on control unit.
Installation:
First engage left side of plug and then press right side into clamp.



Disconnect ground wire on body.
Pull off plugs (1 and 2).
Pull off electronic relay (3).



Pull indicator lamp with holder out of instrument cluster.

Remove fuse box.
Push wire harness into passenger compartment.

DESCRIPTION AND DUTY OF ACCELERATION PICK-UP (325 iX)

Description:

In the acceleration pick-up there are two mercury switches, one each for forward and reverse drive, which are installed in longitudinal direction of car at an angle to the horizontal.
The series connected mercury switches provide closed contact in horizontal position (resistance less than 1 k-ohm).

Negative acceleration (braking) of the car or inclination of the acceleration transmitter will displace the mercury filling and cause the contact to open (resistance greater than 2.5 M-ohms).

The glass tube is inclined in such a manner, that braking deceleration of 35 to 45 % is necessary to open the contact.
The braking deceleration value for forward drive can be simulated by inclining the acceleration pick-up from 19.5 to 24° (with Special Tool 34 5 150 this is equal to 26.5 to 33.0 mm (1.043 to 1.299")).
The switching point for reverse drive does not have to be adjusted.

Duty:

BMW 325 iX (all wheel drive) is the first standard production car to have permanent all wheel drive with constantly switched central and rear axle locks and also a continuously effective ABS.

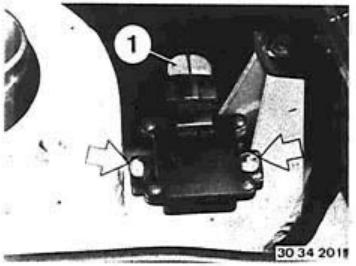
So that all three systems can be effective simultaneously, a sensor is required to provide information on the road condition (higher or lower traction).

The acceleration pick-up performs this duty in the BMW 325 iX (all wheel drive).

The ABS control unit will decide between various data fields depending on the switch condition (open or closed mercury switches), and consequently consider the traction condition of a street or road.

Defective Indicator:

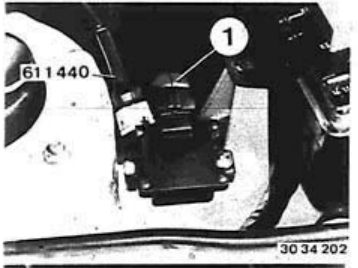
If an open switch condition (resistance greater than 2.5 M-ohms) is reported to the ABS control unit over a period of time longer than 20 seconds, the ABS switches off and reports this to the driver with a warning lamp in the instrument cluster.



34 52 520 REMOVING AND INSTALLING OR REPLACING ACCELERATION PICK-UP

Replacing:

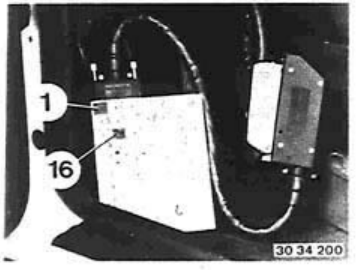
Pull off plug (1).
Remove shear-off screws (only drilling out is approved).
Installation:
Adjust acceleration pick-up.



34 52 000 CHECKING ACCELERATION PICK-UP FOR ABS

Checking (Switch):

Pull off plug (1).
Connect Jetronic test lead 61 1 440 on acceleration pick-up.
Connect ohmmeter (M 06) of BMW service tester.
Nominal value: less than 1 k-ohm.



If Necessary, Checking (Switch with Wire and Plug):

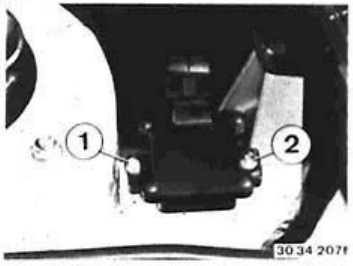
Connect universal adapter* on wire harness from ABS control unit.
Measure resistance between connections (1 and 16).
Nominal value: less than 1 k-ohm.
Ignition must be turned off while measuring.

* Source of Supply: HWB

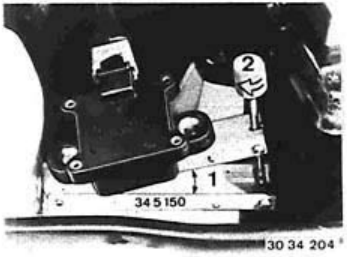
(cont. of 34 52 520)
Acceleration Pick-up for ABS:

Adjusting

Requirements:
Car parked on level ground (workshop floor).
Car including trunk empty.
Fuel tank full (or equal weight in trunk).
Tire inflation pressure correct.

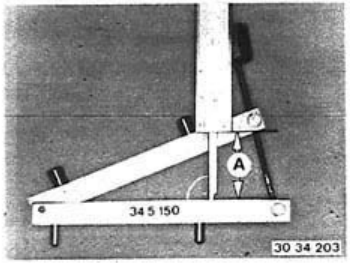


If the measured actual value is smaller than the nominal value, install the shim on mounting point (1).
If the measured actual value is larger than the nominal value, install the shim on mounting point (2).



Place Special Tool 34 5 150 with acceleration pick-up (in installed position) and test lead 61 1 440 on console in car.
Connect ohmmeter (M 06) of BMW service tester with test lead.
Nominal value: less than 1 k-ohm.
Increase angle (1) of special tool with screw (2) so long, until ohmmeter displays more than 2.5 M-ohms.

Install shim of determined thickness between the console and special tool.
Recheck switching point.
If switching point is now within tolerances, remove special tool and install acceleration pick-up with shim and shear-off screws.
Tighten shear-off screws and lock by shearing off the heads.
Tightening torque: 6 to 8 Nm (4.5 to 5.5 ft. lbs.)



Remove Special Tool 34 5 150 and measure distance (A).
Compare actual value with nominal value table.
If measured value is within tolerances, install acceleration pick-up without shim.
If measured value is not within tolerances, determine thickness of shim.
Examples:

Actual value	35.6 mm (1.401")
Maximum value	33.0 mm (1.299")
Min. shim thickness	2.6 mm (0.102")

or

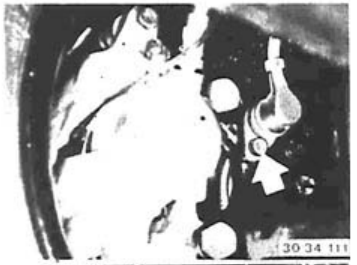
Actual value	35.6 mm (1.401")
Minimum value	26.5 mm (1.043")
Max. shim thickness	9.1 mm (0.358")

Nominal Value Table

For adjusting acceleration pick-up in car and checking acceleration pick-up.

	Distance "A" in mm
Permissible switching tolerance of acceleration pick-up in car	26.5 ... 33.0

A maximum of one wedge and three shims (a = 1 mm / 0.039") may be used on one mounting bolt to correct the switching point of the acceleration pick-up in the car.
If the switching point of an acceleration pick-up in the car is beyond the maximum shim range, the console must be corrected.
The wedge, Part No. 34 51 1 156 827, is equal to 4.9 ... 5.3 mm (0.193 to 0.209").

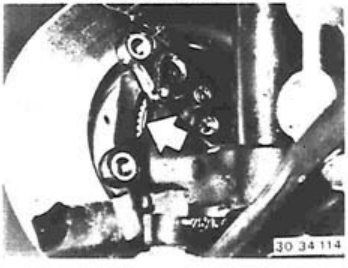


61 12 510 REMOVING AND INSTALLING/ REPLACING ONE FRONT PULSE (SPEED) SENSOR FOR ABS

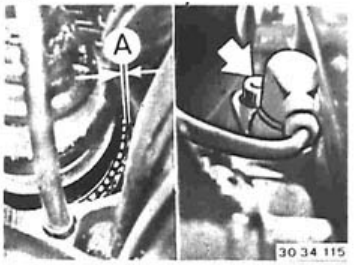
Turn off ignition.
Unscrew socket head screw.

Pull out pulse sensor.
Installation:
Check pulse sensor for damage, replacing if necessary.
Lubricate pulse sensor and housing with Molykote Longterm 2 before installing.
Spacing is given for pulse sensors by the take-up bores.

When replacing pulse sensor, disconnect plug in engine compartment and push wires through downward.
Lift wires out of holders.
Check operation of ABS – 34 50 000.

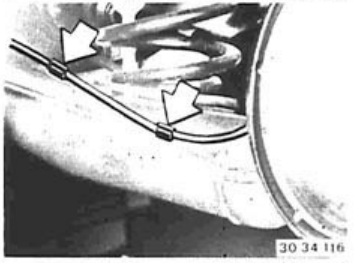


Removing and Installing/Replacing Front Pulse Wheel for ABS:
The front pulse wheel can only be replaced together with the bearing assembly.
See "Replacing Wheel Hub – 31 21 180".

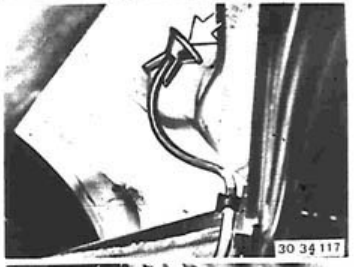


61 12 522 REMOVING AND INSTALLING/ REPLACING ONE REAR PULSE (SPEED) SENSOR FOR ABS

Turn off ignition.
Remove rear wheel 36 10 300
Unscrew socket head screw.
Installation:
The distance* between pulse sensor and pulse wheel (A) is given by design and cannot be adjusted.
However, it is necessary to visually inspect pulse wheel for dirt or damage.



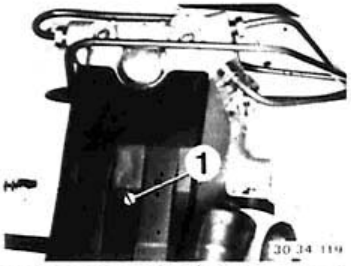
Lift wires out of holders.
Pull out pulse sensor.
Installation:
Check pulse sensor for damage, replacing if necessary.
Lubricate pulse sensor and housing with Molykote Longterm 2.



When replacing pulse sensor, remove rear seat 52 20 010.
Disconnect plug for pulse sensor.
Pull out rubber grommet and wires.
Disconnect pulse sensor.
Important!
Don't damage rubber grommet.

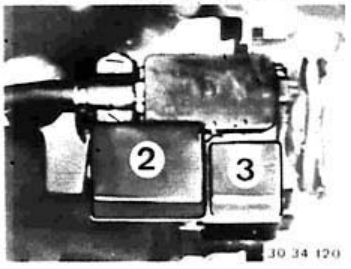
Removing and Installing/Replacing Rear Pulse Wheel for ABS:
The rear pulse wheel can only be replaced together with the rear output shaft.
See "Removing and Installing Output Shaft – 33 21 000".

* See Specifications

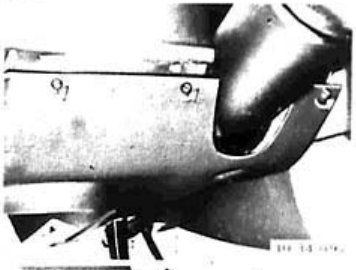


61 31 570 REPLACING RELAY ON ABS HYDRAULIC CONTROL UNIT

Unscrew screw (1).
Pull off cover.

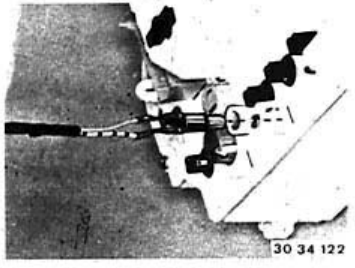


Pull out motor relay (2) or valve relay (3).



62 99 580 REPLACING INDICATOR LAMP FOR ABS

Remove instrument panel trim at bottom left.



Pull indicator lamp and holder out of instrument cluster.

Measured value reading < 34 ohms: short circuit in wire to motor relay (wires 1 and 28, wires in hydraulic unit).	 61 31 570 61 11 530 34 51 520
	Valve resistanc	Specifications not reached on all three valves: First check wire 32 for breaks or short circuit. Pull off plugs on hydraulic unit.	
	front left	Measure resistance direct on hydraulic unit between wires 1 and 4. Specification not reached: replace hydraulic unit. Check wire 2 from hydraulic unit plug to control unit plug for breaks or short circuit.	 34 51 520 61 11 530
	front right	Measure resistance direct on hydraulic unit between wires 3 and 4. Specifications not reached: replace hydraulic unit. Check wire 35 from hydraulic unit plug to control unit plug for breaks or short circuit.	 34 51 520 61 11 530
	rear	Measure resistance direct on hydraulic unit between wires 5 and 4. Specifications not reached: replace hydraulic unit. Check wire 18 from hydraulic unit plug to control unit plug for breaks or short circuit.	 34 51 520 61 11 530
	(rear right)	Measured resistance in wire harness adapter (4a), no measured value from car. Repeat test with connected diagnosis plug for "wrong connection" display (better ground connection with tester.)	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
03 Dynamic speed sensor test	Speed sensors (DF)	Wire harness and control unit connected.	Gr. 34
	front left front right rear left rear right	1. Cycle time Cycle time < specified value: gear turns too fast. Cycle time > specified value: gear turns too slow.	
		a) Visual Inspection: Excessive clearance between speed sensor and pulse gear. Speed sensor loose or dirty, check installation.	 61 12 510 61 12 520
		Check arrangement of gear with gauge. Hold opposite wheel on rear axle. Replace speed sensor.	 61 12 510 61 12 520
		2. Pulse Gear rotation not uniform enough. Check pulse gear teeth (condition, dirt). Check clearance between speed sensor and pulse gear. Replace pulse gear.	 61 12 510 61 12 520

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
04 Dynamic voltage		*Caution!* Turn off ignition before pulling off a plug and measuring resistance!	Group 34
	Voltage between leads 1 and 10.	Ignition turned on. Engine running. Battery charged, check. Voltage drop checked at: battery connections (+ and –), term. 15 and from ignition lock to electronic relay connection, from relay to control unit lead 1.	
	Stab. voltage betw. leads 12 and 10	Check function of electronic relay. 325 iX: check lead 10 ground connection. If applicable, connect universal adapter (available from HWB) between car wire harness and adapter (4a). Bridge terminals 10 and 19 only for this test step. Replace control unit. Also refer to test line 2 of Test Step 05.	34 52 510
	Valve relay home contact voltage drop	1. Replace valve relay. 2. Ground connection has excessive transition resistance or break. 3. Check flow in following leads: lead 8 from ground to hydraulic unit plug, from hydraulic unit lead 8 to lead 87a, flow from lead 4 to valve relay term. 30, from lead 4 to multiple pin plug (control unit) lead 32.	61 31 570
	Valve relay opening contact voltage drop	1. Replace valve relay. 2. Check flow in following leads: lead 6 from term. B + to hydraulic unit plug, from lead 6 to valve relay lead 2 to multiple pin plug (control unit) lead 27, from hydraulic unit lead 2 to valve relay lead 85, from lead 86 (valve relay) to lead 86 (motor relay) and lead 10, from hydraulic unit lead 10 to electronic relay term. 30a or 30 without overvoltage protection relay to DME master relay term. 87a.	61 31 570
	Motor relay operating contact voltage drop.	1. Replace motor relay. 2. Check ground terminals of pump motor for tight fit and transition resistance. 3. Check flow in following leads: from term. B + to hydraulic unit plug lead 12, from multiple pin plug (control unit) lead 14 to hydraulic unit plug lead 9 in hydraulic unit to motor relay term. 30 and positive terminal on pump motor. 4. Pump motor faulty: replace hydraulic unit.	34 51 520.
	Safety circuit lamp, diode	Check lead 29 from multiple pin plug (control unit) to hydraulic unit plug for breaks and voltage drop. Check plug connection on control lamp. Valve relay plugged in. Pull off hydraulic unit plug. Diode test between leads 7 and 4 (M 09) – replace hydraulic unit.	34 51 520.
		Diode now in the valve relay beginning with 1988 models / replace valve relay / test between pin 30 and lead 1.	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
05 Dyn./Ground/ Overvoltage/ Bits		Caution! Turn off ignition before pulling off a plug and measuring resistance.	Group 34
	Voltage between leads 1 and 10	Ignition turned on. Engine running. Battery charged, check.	
	Ground lead 10	Check ground connection below dashboard on left side. Check flow of multiple pin plug on wire harness (control unit) lead 10 to ground connection. Replace connections on electronic relay.	61 11 530
	Ground lead 20	Check ground connection below dashboard on left side. Check flow of multiple pin plug on wire harness (control unit) lead 20 to ground connection.	61 11 530
	Ground lead 34	Check ground connection below dashboard on left side. Check flow of multiple pin plug on wire harness (control unit) lead 34 to ground connection.	61 11 530
	Lead 14 / return delivery pump ground	Check ground connection on battery console. Check ground connection on return delivery pump. Check flow in ground lead. Check flow in multiple pin plug on wire harness (control unit) lead 14 to plug on hydraulic unit and lead 9 to term. 30 in hydraulic unit. If there is a power flow break: replace wire harness. Flow in leads okay: replace hydraulic unit, also refer to Test Step 08 - ABS Pump.	61 11 530 34 51 620
	Overvoltage protection	Replace electronic relay (check previous points!).	34 52 510
		Overvoltage protection is integrated in the ABS control unit beginning with 1989 models.	
	Test cycle	Replace control unit (check previous points!).	34 52 510
		If motor relay only switches (clicks) at intervals without that the pump motor runs, the voltage will briefly drop excessively due to the high switching on power at the power supply leads from the battery. Repeat test with the engine running. See Test Step 04 as well as Test Steps 06 and 07.	
	Fault simulation	Replace control unit (check previous points!).	34 52 510

Test Step	Tested		Troubleshoot, If Nominal Values Not Reached	Job Position
06 Control unit/ simulation – front wheels				Gr. 34
	Voltage between wires 1 and 10		Turn on ignition. Run engine. Battery charge, check.	
	(solenoid)		Due to high switching on power, possibly repeat test with engine running.	
	left pressure	build-up	Replace control unit and repeat test step.	34 52 510
		drop hold	If in test steps 08, 09 and 10 valves do not switch or pump does not run: replace hydraulic unit.	34 51 520
	right pressure	build-up	Due to high switching on power, possibly repeat test step with engine running.	
		drop	Replace control unit and repeat test step.	34 52 510
		hold	If in test steps 08, 09 and 10 valves do not switch or pump does not run: replace hydraulic unit.	34 51 520
			Only the pressure building-up and pressure holding phases (2 A) can be checked in 325 iX cars because of the changed activation times in the control unit. Irregular values will be displayed on adapter B in switch position (5 A).	
			It might be necessary to repeat this test step to reach the nominal values due to the high switching-on power and short switching phase.	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
07 Control unit/ simulation – rear wheels			Gr. 34
	Voltage between wires 1 and 10	Turn on ignition. Run engine. Battery charged, check.	
	(solenoid) pressure build-up drop hold	Due to high switching on power, possibly repeat test step with engine running. Replace control unit and repeat test step. If in test steps 08, 09 and 10 valves do not switch or pump does not run: replace hydraulic unit.	34 52 510 34 51 520
		Only the pressure building-up and pressure holding phases (2 A) can be checked in 325 iX cars because of the changed activation times in the control unit. Irregular values will be displayed on adapter B in switch position (5 A). It might be necessary to repeat this test step to reach the nominal values due to the high switching-on power and short switching phase.	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
08 ABS return delivery pump			Gr. 34
	Voltage between wires 1 and 10	Ignition turned on. Engine running. Battery charged, check.	
	Front left right left/right Rear left/right	Due to high switching on power, possibly repeat test step with engine running. Refer to test steps 05, 06 and 07. Testing the ABS requires the conventional brake system to be okay: bled properly, brake line connections tight, brake pads okay, master and wheel cylinders okay. Watch uniformity of wheels on one axle. Observe relation between wheel – reading.	
		Brake lines mixed up on hydraulic unit. Replace hydraulic unit.	34 51 520
		This test step may not be performed on a dynamometer for 325 iX cars, since the total loading time for the central lock in the transfer box must not exceed 60 seconds at a wheel speed of max. 7.5 km/h (4.5 mph). Refer to brake test dynamometer in 34 00 009.	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
09 Hydraulic unit pressure drop			Gr. 34
	Voltage between wires 1 and 10	Turn on ignition. Run engine. Battery charged, check.	
	Front left right left/right Rear left/right	Due to high switching on power, possibly repeat test step with engine running. Refer to test steps 05, 06 and 07. Testing the ABS requires the conventional brake system to be okay: bled properly, brake line connections tight, brake pads okay. Watch uniformity of wheels on one axle.	
		Replace hydraulic unit.	34 51 520
		This test step may not be performed on a dynamometer for 325 iX cars, since the total loading time for the central lock in the transfer box must not exceed 60 seconds at a wheel speed of max. 7.5 km/h (4.5 mph). Refer to brake test dynamometer in 34 00 009.	

Test Step	Tested	Troubleshoot, If Nominal Values Not Reached	Job Position
10 Hydraulic unit pressure build-up pressure hold			Gr. 34
	Voltage between wires 1 and 10	Turn on ignition. Run engine. Battery charged, check.	
	Front left right left/right Rear left/right	Due to high switching on power, possibly repeat test step with engine running. Refer to test steps 05, 06 and 07. Testing the ABS requires the conventional brake system to be okay: bled properly, brake line connections tight, brake pads okay. Watch uniformity of wheels on one axle.	
		Check lines to and from hydraulic unit for leaks. Replace hydraulic unit.	34 51 520
		This test step may not be performed on a dynamometer for 325 iX cars, since the total loading time for the central lock in the transfer box must not exceed 60 seconds at a wheel speed of max. 7.5 km/h (4.5 mph). Refer to brake test dynamometer in 34 00 009.	

ABS FAULT 325 IX (ABS Lamp Comes On After Repeated Cancellation By Restarting Engine)

CONDITION (Diagnosed After Engine Stopped)	CAUSE	CORRECTION
Lamp immediately after starting engine	Hydraulic unit, operating voltage, power supply. Acceleration sender has ground contact.	Service Tester Check PIN 16 of ABS wire harness plug for gound contact.
Lamp 15 to 20 seconds after starting engine (car stopped, engine running)	Break in "idle boost" current path.	Break in ground connection between ABS wire harness plug PIN 3 and solenoid valve.
Lamp at high engine speed in stopped car (or long afterrunning ABS control after stopping car) (> 1 second).	Dispersion in sensor leads.	Check electric lead routing of ABS sensors.
Lamp after exceeding speed of about 12 km/h ((7.5 mph).	Return delivery pump, electronics.	Service Tester
Lamp about 15 to 20 seconds after moving off (road speed > 3 km/h or 1.85 mph).	Break in acceleration sender current path.	Pin 16 to Pin 1 of ABS wire harness plug or connections 2 and 3 of acceleration sender - check plug connection in particular -.
Lamp after moving off frequently (road speed > 12 km/h or 7.5 mph).	Sensor fault (break in wire).	Service Tester
	Excessive voltage fluctuation in speed boost activation.	Difference in voltage between Pin 3 on ABS control unit and Pin 50 on Motronic control unit/nominal value: < 0.5 V. Check part number of Motronic control unit, see Service Information of Group 34.

35 Pedals

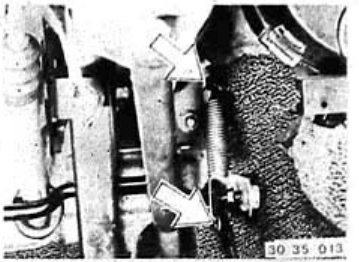
	Clutch, brake and accelerator pedals – layout drawings	35- 3
35 21 000	Brake pedal – remove and install	35- 4
35 31 000	Clutch pedal – remove and install	35- 5
35 21 011	Brake pedal bearing sleeve – replace	35- 6
35 31 011	Clutch pedal bearing sleeve – replace	35- 6
35 41 000	Accelerator pedal – replace	35- 6.1
030	Accelerator pedal shaft – remove and install	35- 7
421	Accelerator cable – replace / adjust	35- 8
	Accelerator cable adjusting procedures	35- 9
480	Kickdown switch – replace (EH transmission)	35- 9

RHD

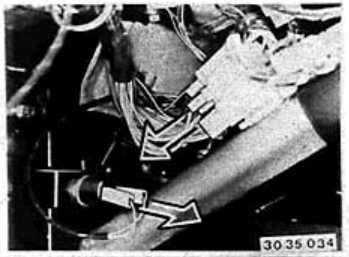
	See instructions of LHD for jobs not listed	
	Pedal layout drawings	35- 1R
	Clutch and brake pedal adjusting distances	35- 2R
	Pedal side spacing control distances	35- 3R
35 11 000	Console for pedals – remove and install	35- 4R
. . .	Console for brake booster – remove and install	35- 7R
35 21 . . .	Reversing lever, left – replace	35- 8R
. . .	Reversing lever, right – replace	35- 8R
. . .	Brake operation pull rod – replace	35- 9R

35 11 000 REMOVING AND INSTALLING CONSOLE FOR PEDALS

Disconnect battery ground lead.
Remove dashboard trim panel at bottom left – see Group 51.

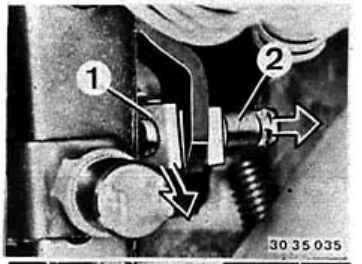


Disconnect accelerator pedal return spring on pedal.

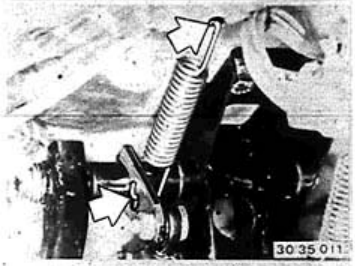


Pull off plug on stop light switch.
Pull off central electric plug on steering column.

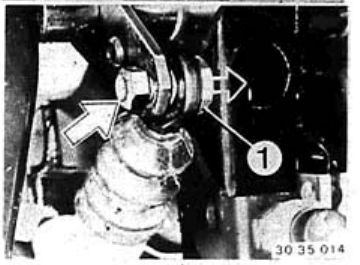
Note:
Since 1987 models: pull off plug of stop light switch – see Group 61.



Press off clamp (1) on brake linkage.
Pull out shaft (2).

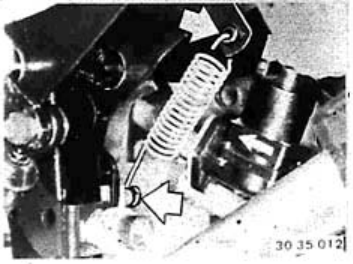


Version with Clutch Pedal Return Spring:
Disconnect clutch pedal return spring on body.

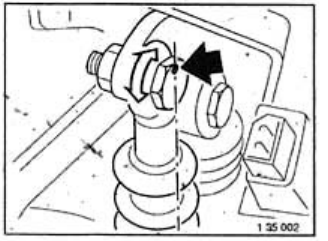


Unscrew nut and pull out eccentric (1).

Installation:
Install setscrew with Molykote Long-term 2.
Tightening torque*.

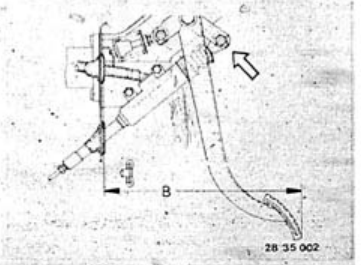


Disconnect brake pedal return spring on pedal.



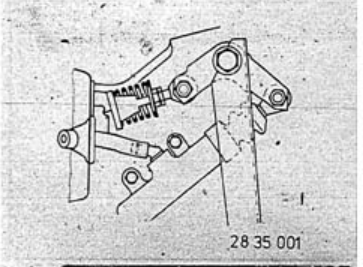
Installation:
Procedures for Adjusting Eccentric Bolt of Clutch Pedal:
Turn eccentric bolt until the dot on the eccentric bolt is opposite the clutch master cylinder.

* See Specifications

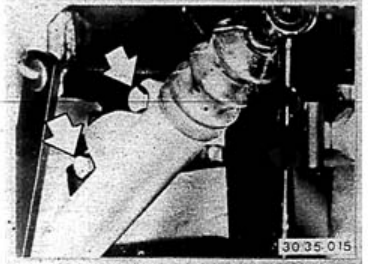


Installation:
Distance (B)* must be reached.
If distance (B)* cannot be reached with the described adjusting procedures, turn the eccentric bolt 180°.

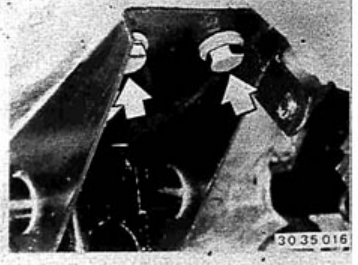
Important!
Intermediate positioning of the eccentric bolt is not approved!
Tightening torque*.



Installation:
Cars with over-center spring – check the installed position.



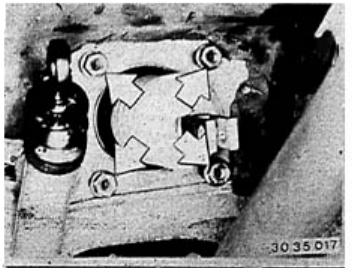
Unscrew master cylinder on the pedal console.



Unscrew bolts.

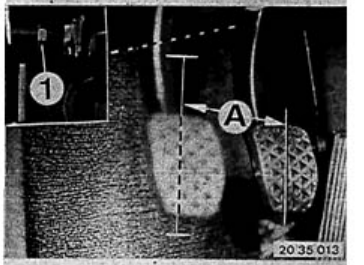
Installation:
Tightening torque*.

* **See Specifications**

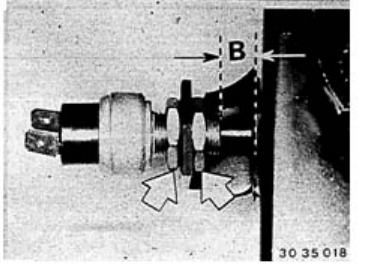


Unscrew console on the engine compartment wall.

Installation:
Tightening torque*.



Installation:
Adjust brake pedal height on brake linkage (1) (see brake pedal layout drawing).
Tightening torque*.



Installation:
Adjust stop light switch.

B = 5 to 6 mm (0.197 to 0.236").

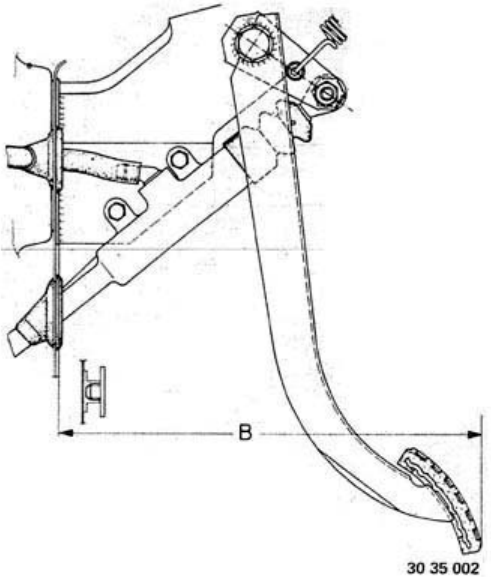
Stop Light Switch Since 1987 Models: See Group 61 for adjusting as well as removing and installing procedures.

Check function of stop lights.

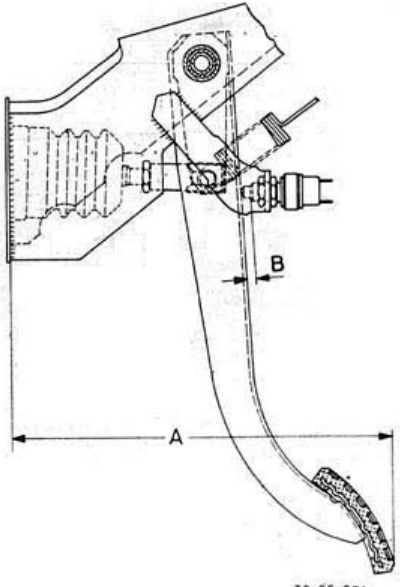
* **See Specifications**

Top Dead Center Spring

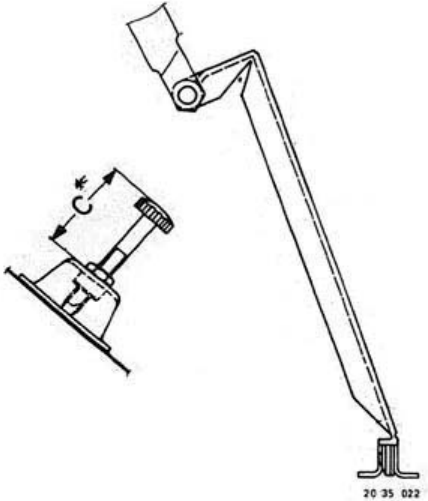
LAYOUT DRAWINGS OF CLUTCH, BRAKE AND ACCELERATOR PEDALS



30 35 002



30 35 001

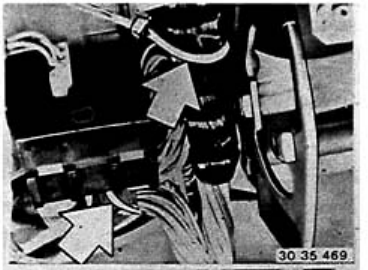


20 35 022

* See Specifications
** See Group 34

35 21 000 REMOVING AND INSTALLING BRAKE PEDAL

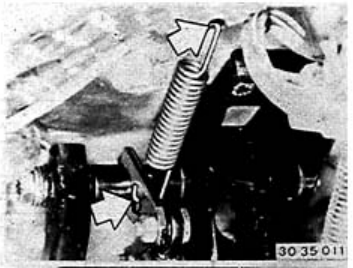
Remove dashboard trim panel at bottom left – see Group 51.



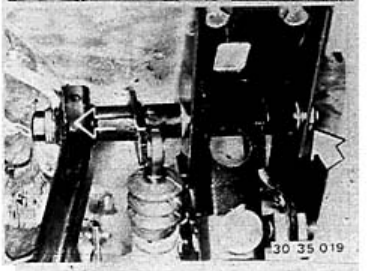
Cars with Pedal Value Sender:
Cut off straps and pull wire harness down.

Note:
Pedal value is shown removed for better understanding.

Installation:
Check for correct routing – wire harness must not rub on any parts of the car!

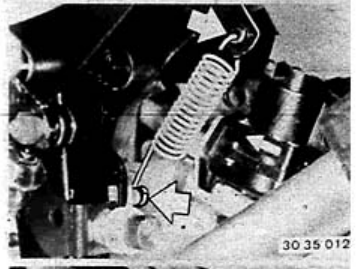


Version with Clutch Pedal Return Spring:
Disconnect clutch pedal return spring on body

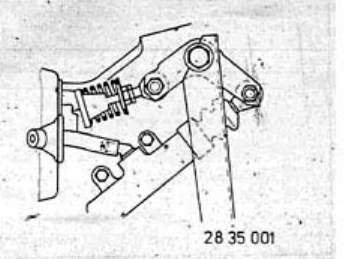


Unscrew nut.
Pull out shaft and take off pedal.

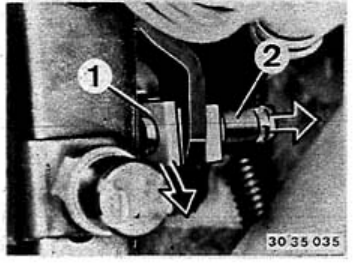
Installation:
Replace self-locking nut.
Tightening torque*.



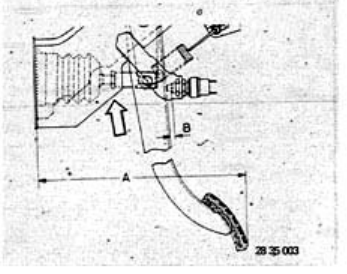
Disconnect brake pedal return spring on pedal.



Installation:
Cars with over-center spring – check for correct installed position.



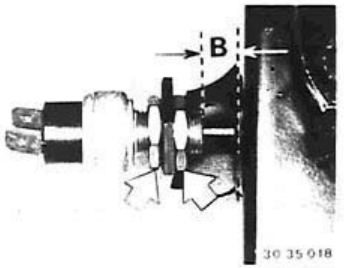
Press off clamp (1) on brake linkage (1)
Pull out shaft (2).



Installation:
Adjust brake pedal height to distance (A)* on the brake master cylinder push rod.

Important!
Travel must be limited in the brake master cylinder and must not be limited by, for example, the stop light switch (distance "B").

* See Specifications



Installation:
Adjust stop light switch.

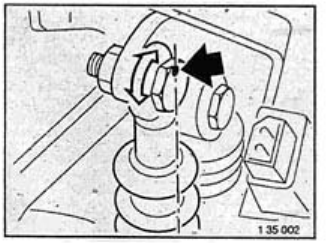
B = 5 to 6 mm (0.197 to 0.236").

Stop Light Switch Since 1987 Models:
See Group 61 for adjusting as well as removing and installing procedures.

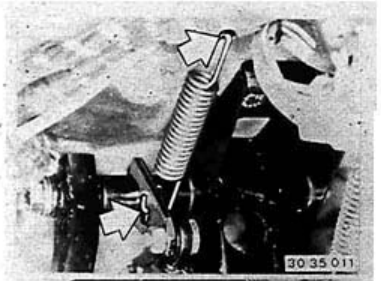
Check function of stop lights.

35 31 000 REMOVING AND INSTALLING CLUTCH PEDAL

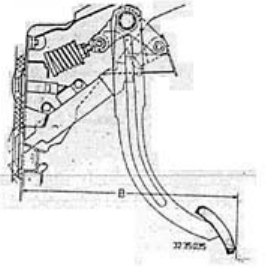
Remove dashboard trim panel at bottom left – see Group 51.



Installation:
Adjusting Procedures for Eccentric Bolt of Clutch Pedal:
Turn eccentric bolt until the dot on the eccentric bolt is opposite the clutch master cylinder.



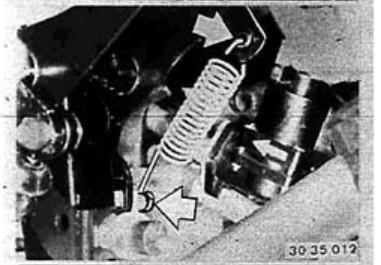
Version with Clutch Pedal Return Spring:
Disconnect clutch pedal return spring on body.



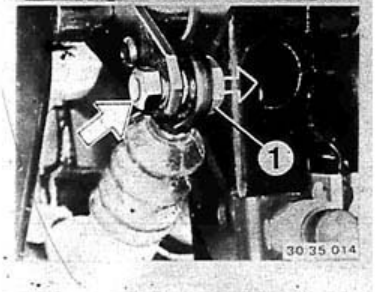
Installation:
Distance (B)* must be reached.
If distance (B)* cannot be reached with the described adjusting procedures, turn the eccentric bolt 180°.

Important!
Intermediate positioning of the eccentric bolt is not approved!

Tightening torque*.

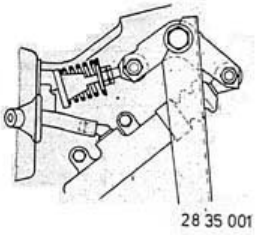


Disconnect brake pedal return spring on pedal.



Unscrew nut and pull out eccentric (1).

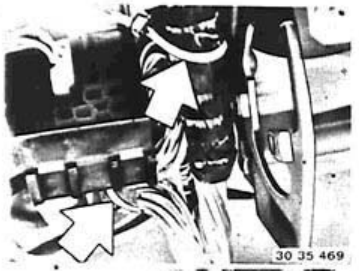
Installation:
Install eccentric bolt with Molykote Longterm 2.
Tightening torque*.



Installation:
Cars with over-center spring – check for correct installed position.

* See Specifications

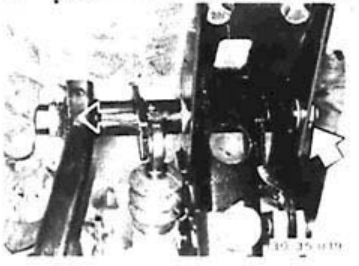
* See Specifications



Cars with Pedal Value Sender:
Cut off straps and pull wire harness down.

Note:
Pedal value sender is shown removed for better understanding.

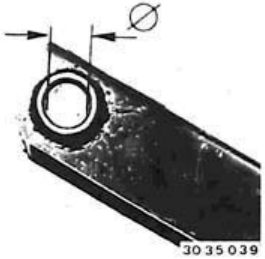
Installation:
Check for correct routing – wire harness must not rub on any car parts.



Unscrew nut.
Pull out shaft and take off pedal.

Installation:
Replace self-locking nut.
Tightening torque*.

* See Specifications



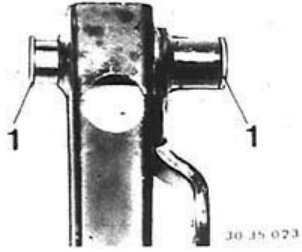
35 21 011 REPLACING BEARING SLEEVE FOR BRAKE PEDAL

35 31 011 REPLACING BEARING SLEEVE FOR CLUTCH PEDAL

Remove pedal 35 21 000 or 35 31 000.

Pedal with Injection Molded Bearing Sleeve:

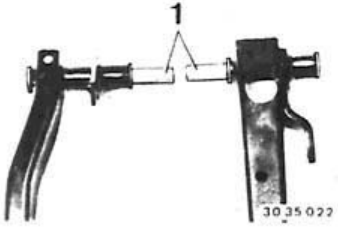
Replace pedal if worn.
If pedal movement is difficult, drill or ream out bearing sleeve to diameter of 14.2 + 0.1 mm (0.559 + 0.004").
Lubricate bearing surface with grease*.



Pedal with Press-fit Bearing Sleeves:

Identification:
Bearing sleeves on left and right sides protrude into guide tube by only about 17 mm (0.669").
Press out bearing sleeves (1) for brake and clutch pedals.

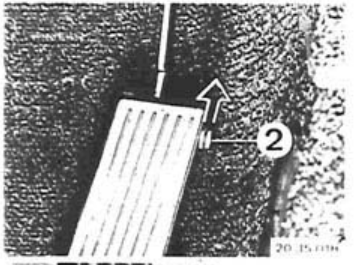
Installation:
Lubricate spacing sleeve with grease*.



* See Specifications.

35 41 000 REPLACING ACCELERATOR PEDAL

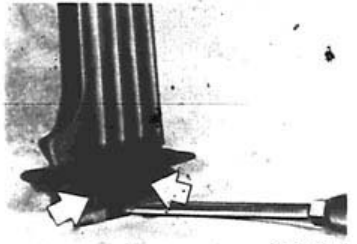
Important!
Always replace a removed accelerator pedal with a new part.
Clips of the old part could be damaged and lead to the accelerator pedal sliding out of the collar.
This in turn could lead to an accident!



Press off clamp (2).
Disconnect pedal.

Installation:
Lubricate sliding surface on the accelerator pedal shaft lightly with grease*.

Important!
Check for correct seating of clamp (2).



Press down on carpet, bend clips forward and lift out the accelerator pedal from above.

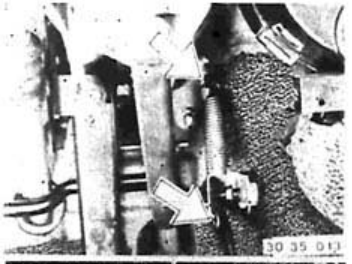
Installation:
Install accelerator pedal with the pocket inserted in the collar on the floor plate and have clips engage.

Important!
Recheck for correct engagment of the clips.

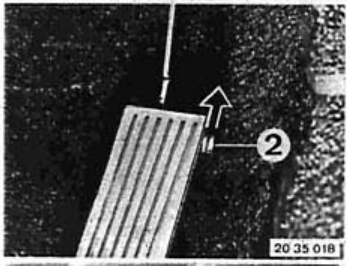
* See Specifications

35 41 030 REMOVING AND INSTALLING ACCELERATOR PEDAL SHAFT

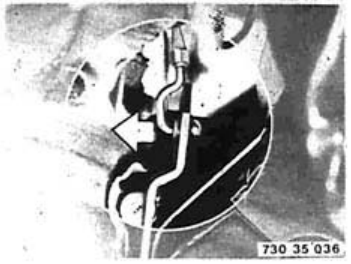
Remove dashboard trim panel at bottom left – see Group 51.



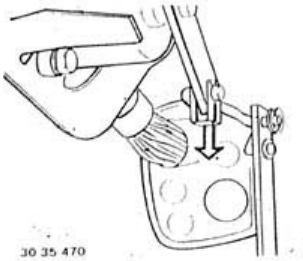
Disconnect accelerator return spring on pedal.



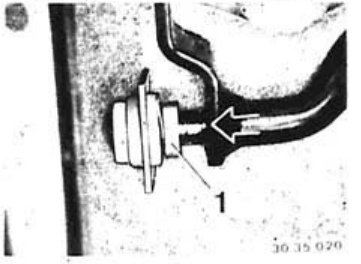
Press off clamp (2).
Disconnect pedal.



Disconnect cable on pedal.



Cars with Pedal Value Sender:
Pull retainer off of the push rod.
Disconnect push rod.



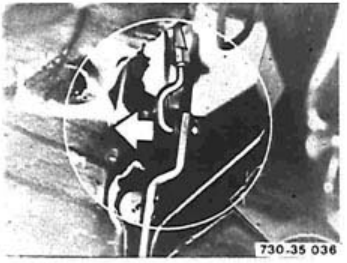
Pull off clamp (1).
Push shaft to the left and remove.

Installation:
Check bearing sleeves, replacing if necessary.
Lubricate all sliding surfaces lightly with grease*.

* See Specifications

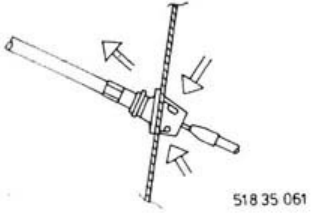
35 41 421 REPLACING / ADJUSTING ACCELERATOR CABLE

Remove dashboard trim panel at bottom left – see Group 51.

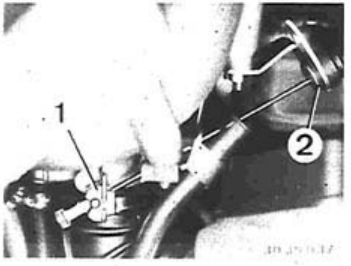


Disconnect cable on pedal.

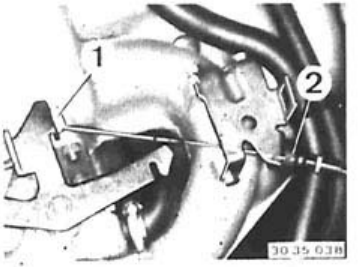
Installation:
Inspect rubber grommet, replacing if necessary.



Compress locking hooks and pull cable out of the engine compartment wall.

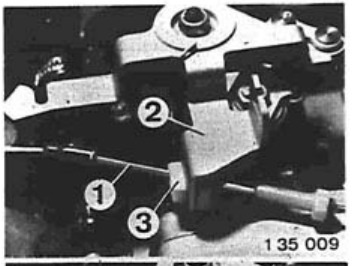


BMW 318 i (M 10):
Press operating nipple (1) out of the throttle valve lever and disconnect the adjusting screw with rubber pad on holder (2).

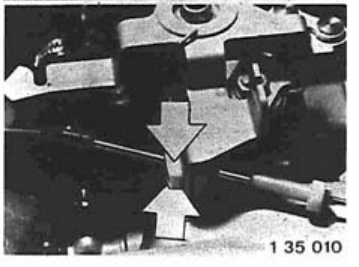


BMW 325 e:
Press operating lever (1) out of the throttle valve lever.
Disconnect rubber pad on holder (2).

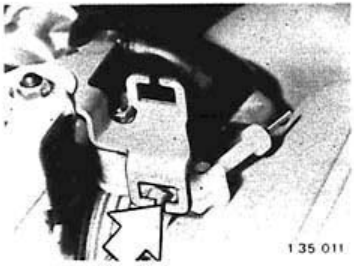
Take nipple off of the cable.



BMW 325 i:
1 Accelerator cable
2 Throttle valve lever
3 Holder

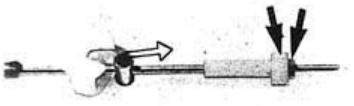


Unclip holder of accelerator cable in the throttle valve lever.

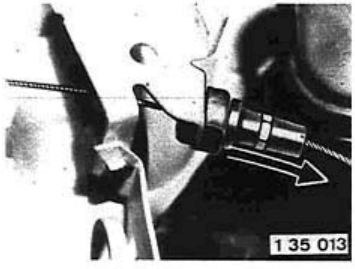


Remove accelerator cable downward through the slot in the throttle valve lever.

Take nipple of accelerator cable out of the holder.
Unscrew locknut and knurled nut.



1 35 012



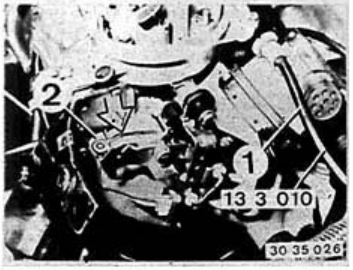
Take accelerator cable out of the holder.

ACCELERATOR CABLE ADJUSTING PROCEDURES

Manual Transmission:

1. Accelerator pedal on neutral stop.

2. Throttle valve in neutral position (automatic choke switched off).



316 Since 1984 Models:
Start engine and clamp vented hose (1) of the throttle valve drive with Special Tool 13 3 010.
Stop engine.

Important!
The throttle valve lever must bear on stop (2).

3. Adjust the cable to remove tension. Remove Special Tool 13 3 010.

4. Turn adjusting screw on full throttle stop of pedal console that there is still 0.5 mm (0.020") play on the full throttle stop of the throttle valve. Unscrewing the adjusting screw one and one half turns = 0.5 mm (0.020") play.

Automatic Transmission:

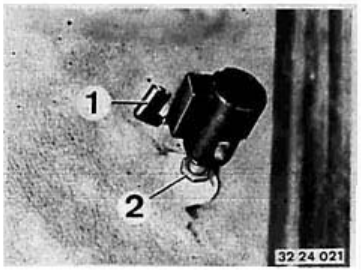
1.–3. same as for manual transmission.

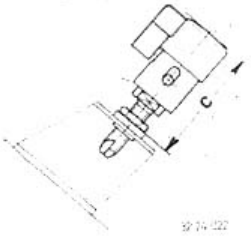
4. * Check control distance C* of the full throttle stop.

5. Adjust full throttle stop that there is still 0.5 mm (0.020") play on full throttle stop of the throttle valve in kickdown position (pedal pressed beyond full throttle stop). Unscrewing the full throttle stop one and one half turns = 0.5 mm (0.020") play.
Lock with the M 8 nut.

6. Check the pressure point for automatic transmission – see 24 00 004.

* See Specifications





Automatic Transmission with Overhaul Element:

1.–3. same as for manual transmission.
4. Operate accelerator pedal up to full throttle position.
5. Adjust full throttle stop to remove tension while accelerator pedal is operated.
6. Operate further than full throttle stop; overload stop on throttle valve assembly must not bear. If necessary reduce travel of full throttle stop and repeat the adjustment.

35 41 480 REPLACING KICKDOWN SWITCH (EH Transmission)

Test – see BMW Test Plan in Gr. 24.
Pull off flat plug (1).
Unscrew nut (2).
Unscrew switch.

Installation:
Adjust the nut to control distance C*.
Make final adjustment after installation.

* See Specifications

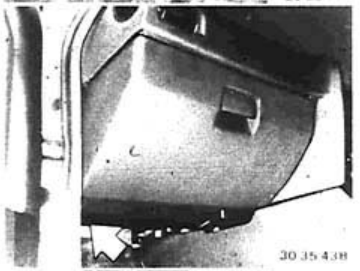
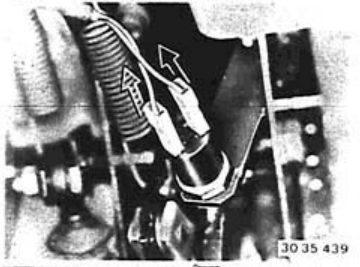
35 11 000 REMOVING AND INSTALLING CONSOLE FOR PEDALS – RHD –

Disconnect battery ground lead.
Remove dashboard trim panel at bottom right – see Group 51.

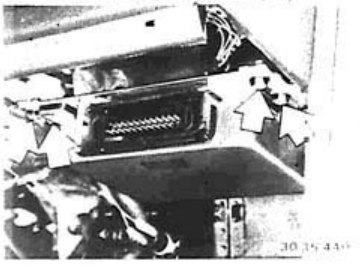


Remove left glove box.

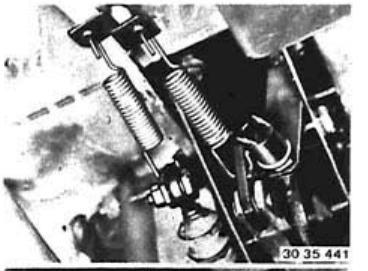


Pull off electric leads on stop light switch.

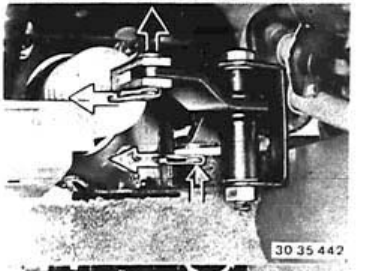
Note:
Pull off plug of stop light switch since 1987 models – see Group 61.



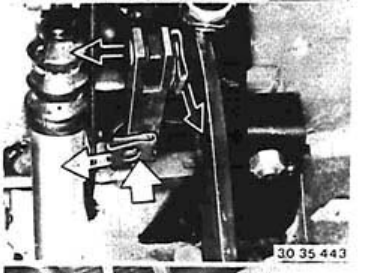
If applicable, unscrew control unit.



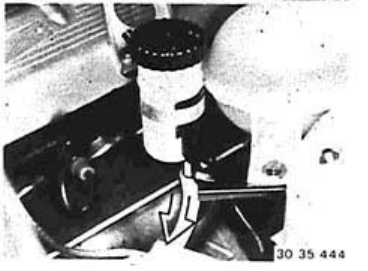
Disconnect return springs for brake and clutch pedals.



Unscrew left reversing lever on the pull rod and master cylinder.



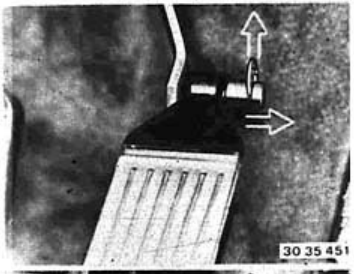
Remove pressure piece between the brake pedal and reversing lever.



Draw off brake fluid.
Pull hose off of the supply tank.

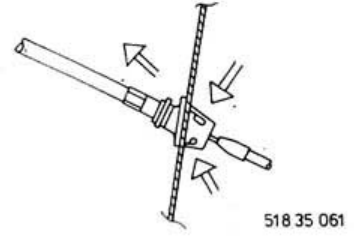
Note:
Plug the hose.

Unscrew line on clutch master cylinder.
Note:
Plug openings.

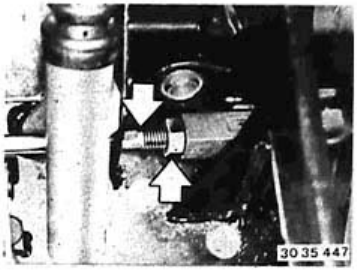


Disconnect shaft on accelerator pedal.

Disconnect accelerator cable.



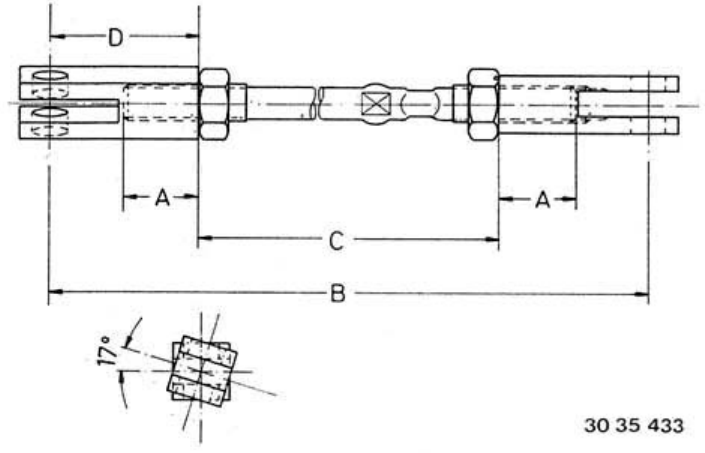
Compress locking hook and press cable out of pedal base.



Loosen locknut.
Turn pull rod out of pivot and push back to left.
Installation:
Tightening torque*

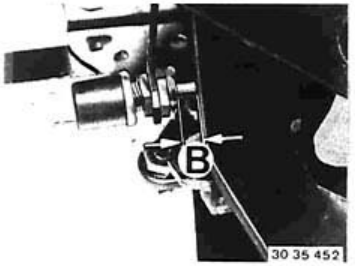
Installation:
Adjust position of brake pedal** with the pull rod.
Basic Pull Rod Adjustment:

A)	Important safety distance	
	Min. screwed-in depth	21 + 1 mm (0.872 + 0.039")
B)	Basic adjustment distance	722.5 ±1 mm (28.445 ±0.039")
C)	Helping distance	639.5 ±1 mm (25.177 ±0.039")
D)	Distance from bore to end of pivot	41.5 mm (1.634")



30 35 433

* See Specifications
** See Brake Pedal Adjusting Distance and Specifications



Installation:
Adjust the stop light switch.

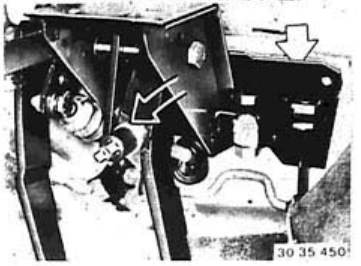
Distance B = 5 to 6 mm (0.197 to 0.236")

Stop Light Switch Since 1987 Models: See Group 61 for adjusting as well as removing and installing procedures.

Check function of stop lights.

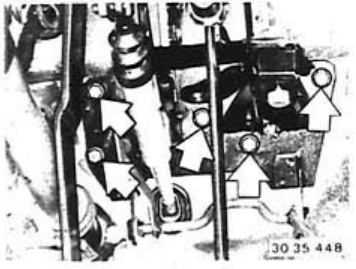
Unscrew bolts. *

Installation:
Tightening torque*.



* **Remove console.**

Installation:
Check gasket, replacing if necessary.

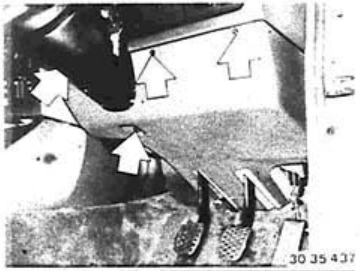


Unscrew bolts.

Installation:
Tightening torque*.

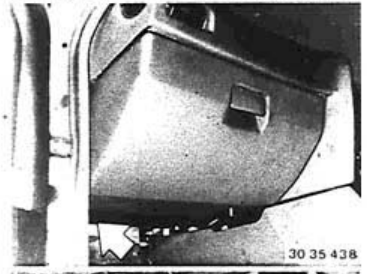
* **See Specifications.**

* **See Specifications**

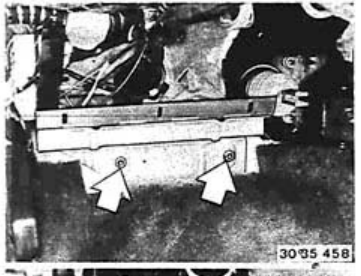


35 11 ... REMOVING AND INSTALLING BRAKE BOOSTER CONSOLE – RHD –

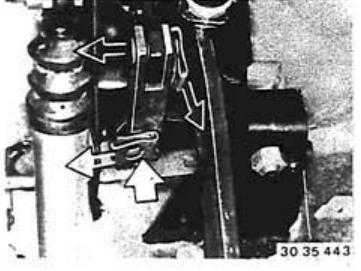
Disconnect battery ground lead.
Remove instrument panel trim at bottom right.



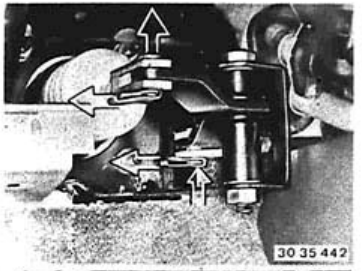
Remove left glove box.



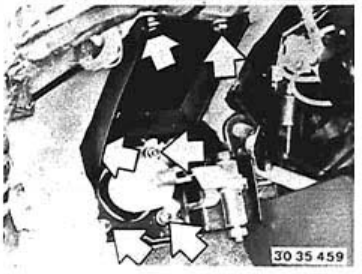
Remove console for glove box.



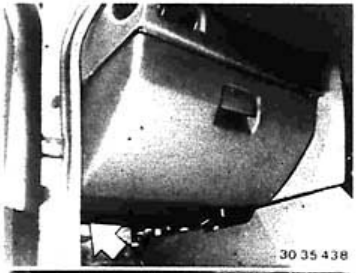
Remove thrust piece between brake pedal and operating lever.



Disconnect left operating lever on pull rod and master cylinder.
Push pull rod to the right as far as possible.

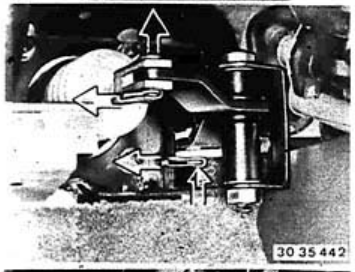


Unscrew bolts.
Remove console.
Installation:
Check brake pedal position, adjusting if necessary.

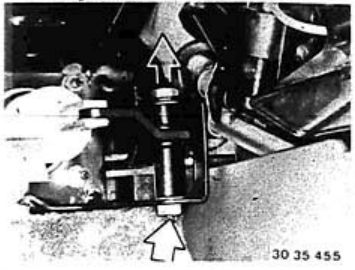


35 21 . . . REPLACING LEFT OPERATING LEVER – RHD –

Remove left glove box.



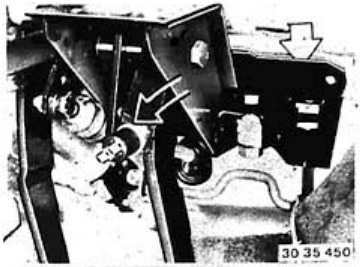
Disconnect left operating lever on pull rod and master cylinder.



Remove bolt.
Remove operating lever.
Installation:
Tightening torque*.

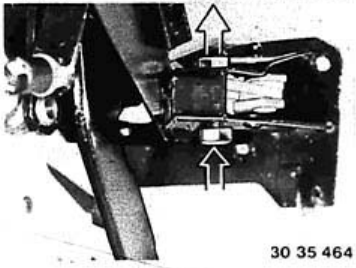
Press out spacing sleeve and bearing sleeves.
Installation:
Check bearing sleeves, replacing if necessary.
Lubricate all sliding surfaces with grease**.

* See Specifications
** Source: HWB

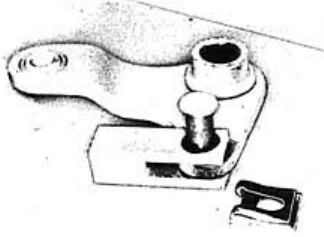


35 21 . . . REPLACING RIGHT OPERATING LEVER – RHD – (Pedal Assembly Removed)

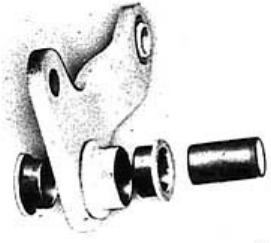
Remove pedal base assembly, see 35 11 000.



Remove bolt.
Remove operating lever.
Installation:
Tightening torque*.

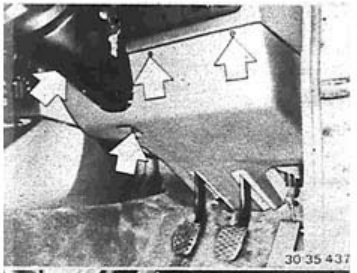


Remove pivot.
Installation:
Check installed direction of bearing pin.



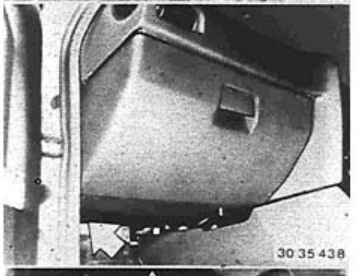
Press out spacing sleeve and bearing sleeves.
Installation:
Check bearing sleeves, replacing if necessary.
Lubricate all sliding surfaces with grease**.

* See Specifications
** Source: HWB

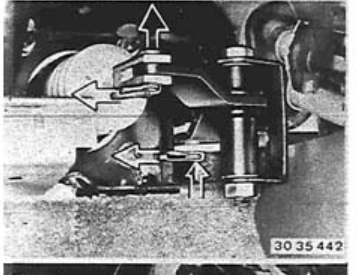


35 21 . . . REPLACING PULL ROD FOR BRAKE OPERATION – RHD –

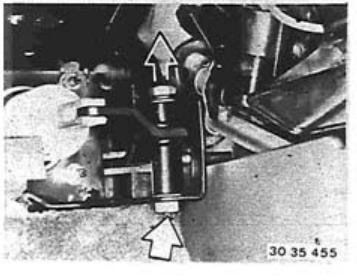
Disconnect battery ground lead.
Remove instrument panel trim at bottom right.



Remove left glove box.

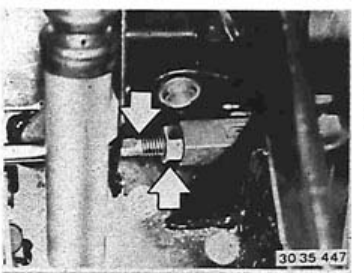


Disconnect left operating lever on pull rod and master cylinder.

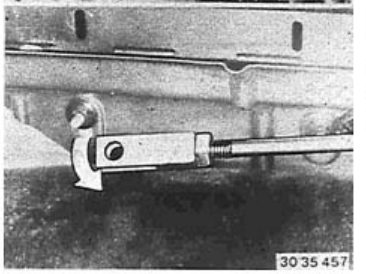


Remove bolt.
Remove operating lever.
Installation:
Tightening torque*.

* See Specifications



Loosen locknut.
Turn pull rod out of pivot.
Unscrew locknut.
Installation:
Adjust pull rod*.
Tightening torque*.

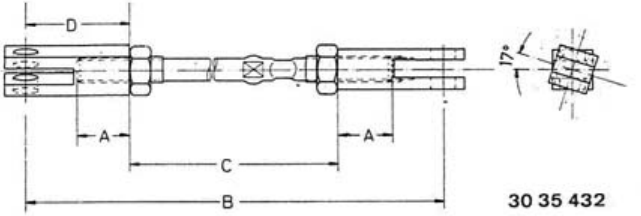


Unscrew left pivot.
Important!
Left-hand threads.
Installation:
Check min. screwed in depth* and tightening torque*.

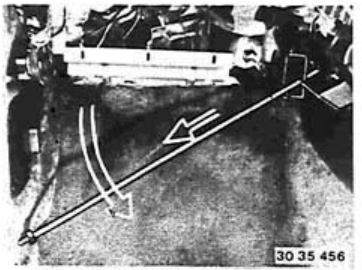
Installation:
Adjust position of brake pedal* with the pull rod.

Basic Pull Rod Adjustment:

A) Important safety distance
Min. screwed-in depth 21 ±1 mm (0.872 ±0.039")
B) Basic adjustment distance 722.5 ±1 mm (28.445 ±0.039")
C) Helping distance 639,5 ±1 mm (25.177 ±0.039")
D) Distance from bore to end of pivot 41.5 mm (1.634")

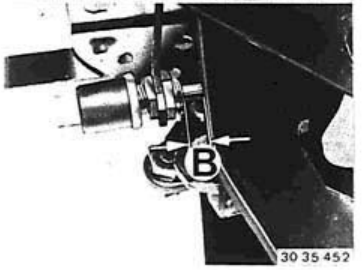


* See Brake Pedal Adjusting Distance or Specifications



Pull out the pull rod downward and to the left.

Installation:
Make sure that the pull rod can move without restriction.



Installation:
Adjust the stop light switch.

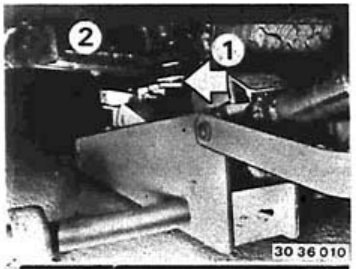
Distance B = 5 to 6 mm (0.197 to 0.236")

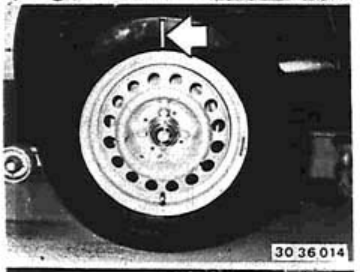
Stop Light Switch Since 1987 Models:
See Group 61 for adjusting as well as removing and installing procedures.

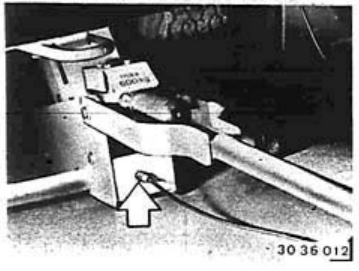
Check function of stop lights.

36 Wheels and Tires

36 10 030	Front wheels – balance dynamically and electronically on car	36- 1
080	Rear wheels- balance dynamically and electronically on car	36- 1
090	Front and rear wheels – balance dynamically and electronically (325iX)	36- 2
. . .	Front or rear wheel – check for lateral and radial runout (wheel removed)	36- 5
300	Front or rear wheel – remove and install	36- 6
508	Wheel – balance dynamically (wheel removed)	36- 7
715	Wheel rim – check for lateral and radial runout	36- 8
	Tire – replace	36- 9
	Tire – mount with a modern mounting machine	36- 10
36 13 . . .	Wheel bolt lock – install subsequently	36- 12







36 10 030 BALANCING BOTH FRONT WHEELS ON CAR DYNAMICALLY AND ELECTRONICALLY

Important!
Always first balance the wheels stationary precisely prior to electronic (finish) balancing.
Apply measuring support for balancing on control arm end (1) (up to 5" rims).
Use a suitable holding fork or additional fork (see Service Information or Workshop Equipment and Planning Documents)
From 5 1/2" rims on:
Apply the measuring support without an additional fork on control arm (2).
Lift car with the measuring support.

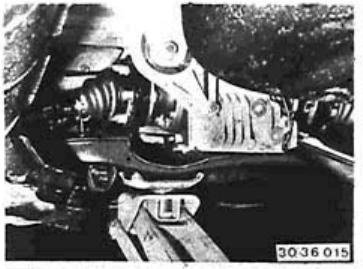
Paste adhesive tape or make a chalk mark, both 3 to 4 cm (1.181 to 1.575") long, on the outside of the tire being balanced, opposite the valve.

Connect leads for test sender
Important!
Balance wheels to operating instructions supplied with pertinent balancing machine.
Balancing must be carried out on firm under ground (concrete floor without basement).
Also refer to Service Information of Group 36.

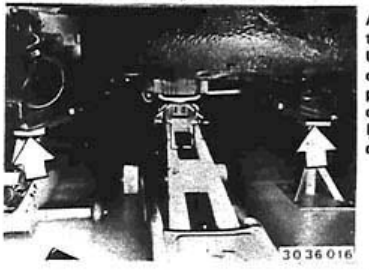
If a value of more than 15 grams is displayed for finish balancing of a wheel, the possible causes (e.g. inaccurate stationary balancing, centering, etc.), also refer to Service Information 36 0 483 (196), must be eliminated prior to finish balancing and before rechecking the finished wheel.

36 10 080 BALANCING BOTH REAR WHEELS ON CAR DYNAMICALLY AND ELECTRONICALLY

Important!
Always first balance the wheels stationary precisely prior to electronic (finish) balancing.
Paste a strip of adhesive tape or make a chalk mark, both 3 to 4 cm (1.181 to 1.575") long, on outside of the tire being balanced, opposite the valve.



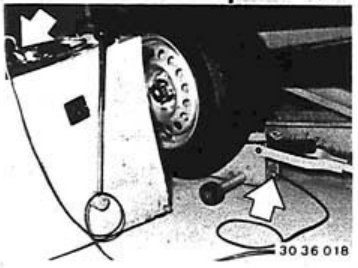
Use wedges on the front wheels.
Apply jack at middle of car on the rear axle carrier and lift the car.



Apply measuring support underneath the trailing arm of the wheel being balanced.
Use an unsprung support on the trailing arm of the running wheel (be careful of brake pipes and hoses), in order to suppress the oscillation from the final drive.
Lower the jack and place it underneath the differential with slight pressure.

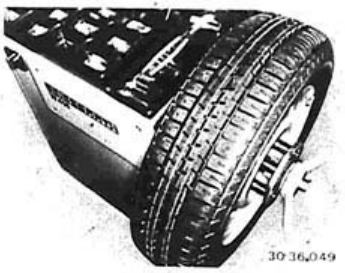
Check, whether it is possible to turn the wheels easily.

Balance with engine power in fourth gear at approx. 100 km/h (60 mph).
This requires a smooth running engine without misfiring, closed doors, engine hood and trunk lid and a driver sitting in car as calm as possible.
The exhaust extraction hose must not bear on the tail panel.



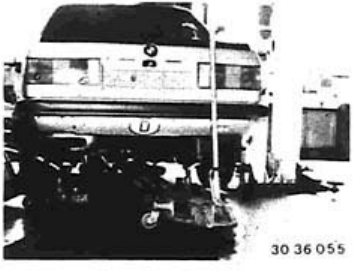
Connect leads for test sender.
Important!
Balance wheels to operating instructions supplied with pertinent balancing machine.
Balancing must be carried out on a firm underground (concrete floor with basement).
Also refer to Service Information of Group 36.

If a value of more than 15 grams is displayed for finish balancing of a wheel, the possible causes (e.g. inaccurate stationary balancing, centering, etc.), also refer to Service Information 36 0 483 (196), must be eliminated prior to finish balancing and before rechecking the finished wheel.



36 10 090 BALANCING FRONT AND REAR WHEELS DYNAMICALLY AND ELECTRONICALLY

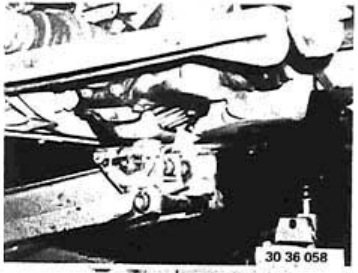
325 iX:
Important!
This car has four driven wheels.
Finish balancing requires that all four wheels can be turned freely and the car must be jacked up and supported safely.
Balance all wheels stationary precisely first prior to the electronic (finish) balancing – see 36 10 508.



Park car on four measuring supports for the finish balancing of 325 iX models.
When using only two measuring supports, two other identical and lateral moving supports must be used on the other axle.

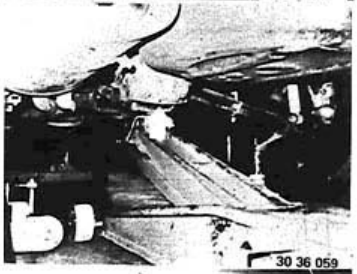
Important!
Check the deflection angle of the final drive end joint.

Balancing must be carried out on a firm underground (concrete floor without basement). Car must be level after jacking up and it must be possible to turn all wheels easily.
Also refer to Service Information of Group 36.

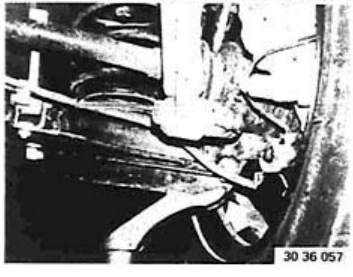


Apply a jack with light pressure underneath the middle of the front final drive, in order to suppress oscillation from the front final drive.

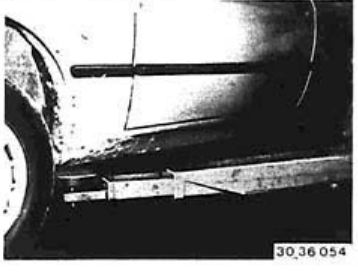
If applicable, lift car on a two-pillar hoist. Apply measuring supports underneath the front axle on each wheel carrier/control arm joint, using a suitable holding fork or additional fork (see Service Information or Workshop Equipment Planning Documents).



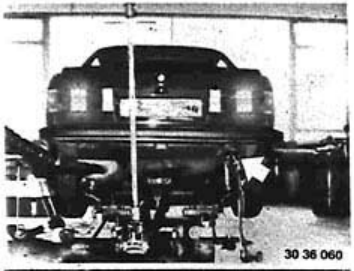
Apply a jack with light pressure underneath the middle of the rear final drive, in order to suppress oscillation from the rear final drive.



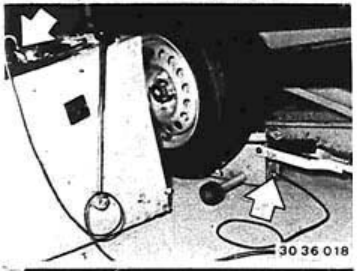
Apply measuring supports underneath the rear axle on each trailing arm as close as possible to the wheel, using a suitable holding fork or additional fork (see Service Information or Workshop Equipment Planning Documents).



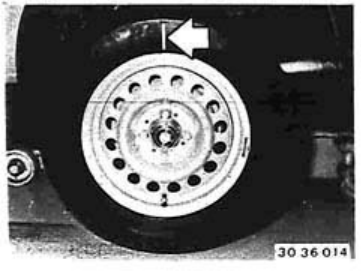
Lower arms of the lifting platform until they are still clear, however, they must never touch the body during balancing procedures (resonance oscillation).



Secure a steel cable on the rear towing eye to hold the car.
This cable must not be drawn tight because of possible wrong test readings.
Begin balancing on the front wheels.

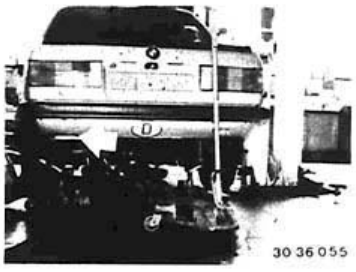


Connect leads for test sender.
Conform with operating instructions supplied with the equipment.



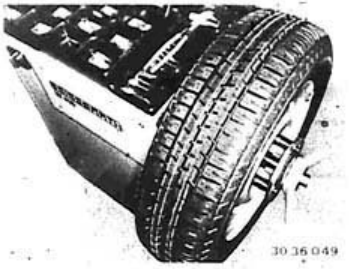
Paste a strip of adhesive tape or make a chalk mark, both 3 to 4 cm (1.181 to 1.575") long, on the outside of the tire being balanced, opposite the valve.

Adjust the finish balancer to correct sensitivity (to operating instructions) prior to balancing.
Since the degree of sensitivity for the balancing of a wheel cannot be transfered to a different wheel or even a different car, it must be determined separately for each wheel.



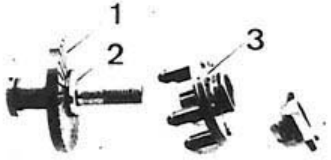
Balance with engine power in fourth gear at 100 km/h (60 mph).
This requires a smooth running engine without misfiring, closed doors, engine hood and trunk lid and a driver sitting as quietly as possible in the car.
The exhaust extraction hose must not touch the tail panel.

Stop the wheels carefully after testing.
Repeat test, after mounting balance weights at the displayed positions.
If a value of more than 15 grams is displayed for a finish balanced wheel, the possible causes (e.g. inaccurate stationary balancing) must be eliminated and the finished wheels rechecked.



36 10 ... CHECKING FRONT OR REAR WHEEL FOR LATERAL AND RADIAL RUNOUT
- Wheel Removed -

Remove wheel - see 36 10 300.
Mount wheel on balancing machine.
Wheel must be mounted on the balancing machine in the same manner as mounted on the car (valve facing down), to avoid tension.



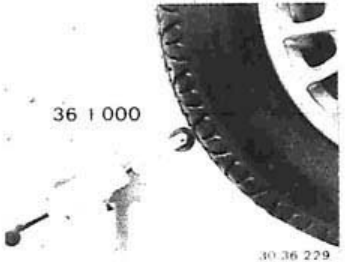
Use pertinent center supplied with the balancing machine.

1 =Basic flange

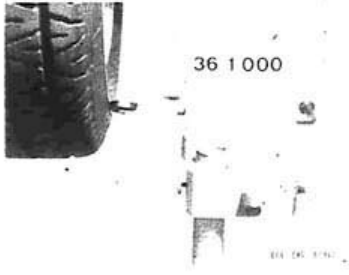
2 =Center

3 =Type flange

Also refer to Workshop Equipment Documents.



Set up Special Tool 36 1 000 on running surface of tire.
Turn wheel by hand and measure maximum radial runout* of tire.
Note:
Special tool must be perpendicular to the tire's running surface.



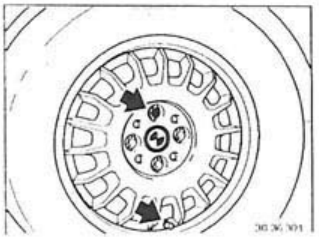
Set up Special Tool 36 1 000 on side of tire.
Turn wheel by hand and measure maximum lateral runout* of tire.
Note:
Special tool must be perpendicular to the side of the tire.
Don't measure on a lettered surface!

* See Specifications

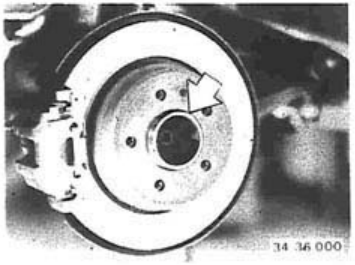
36 10 300 REMOVING AND INSTALLING FRONT OR REAR WHEEL

Important!
Wheel was balanced electronically – conform with the following procedures to avoid loading mistakes and imbalance.

- Loosen wheel bolts.
- Position wheel with valve facing down and mount in same position.
- If several wheels have to be removed at the same time, mark the mounting position of wheels on the tires (with chalk, for example).
- Mark wheel to wheel hub position (to avoid loading mistakes).
- Mark wheel lock to wheel (to avoid imbalance).
- Unscrew wheel bolts..

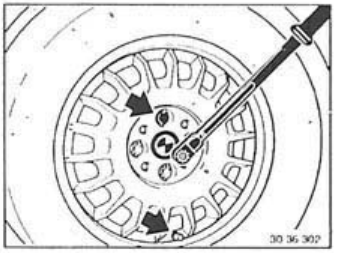


Installation:
Clean the wheel center collar and bearing surfaces of the wheel rim to remove dirt and old grease, and coat the center with Plastilube**, before mounting a wheel.
Inspect wheel bolt threads and tapers for wear, replacing the wheel bolts if necessary.
Lubricate wheel bolt threads lightly with grease, but keep grease off of the tapers for installation.

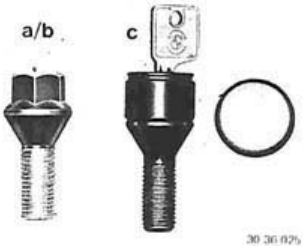


Important!
When mounting wheels on M 3 cars it is necessary to consider the clearance on the brake caliper (incorrect wheel installation could cause damage or displacement of the pad retainers in the brake calipers).

** See Operating Fluids



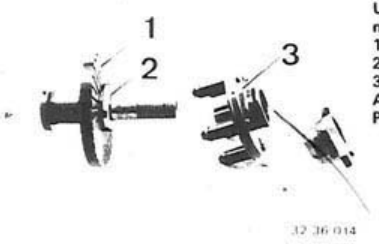
Tighten the wheel bolts crosswise.
Tightening torque*.
If new wheel rims are installed for the first time. recheck the tightening torque* after 1,000 km (600 miles).
Install a pertinent label to remind the driver of this.



a) Wheel bolt - galvanized
b) Wheel bolt - black chrome plated
c) Wheel bolt - black chrome plated and lockable (special equipment)

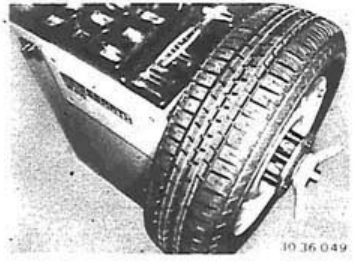
36 10 508 BALANCING WHEEL DYNAMICALLY – Wheel Removed –

Remove old balance weights, stones in treads and large pieces of dirt.
Check tire inflation pressure, condition of tire (damage, cuts, flat spots caused by not using car with hot tires for a long time).
If necessary, check wheel and tire for radial and lateral runout – see 36 10 209.



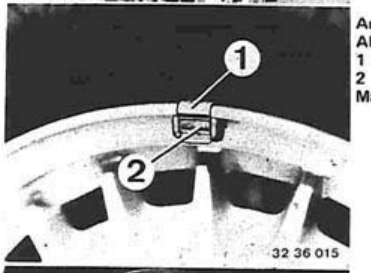
Use a suitable center of pertinent balancing machine.
1 Basic flange
2 Center
3 Type flange
Also refer to Workshop Equipment and Planning Documents.

Important!
To avoid clamping arrors, the wheel must be mounted on the balancing machine in the same manner (e.g. valve facing down) as mounted afterwards on the car.

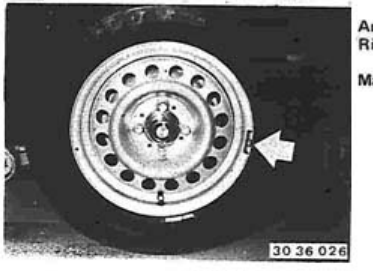


Balance wheel to operating instructions of pertinent balancing machine.

Aluminum Wheel Rims:
Press the side of the tire away from the rim flange slightly at an appropriate point with a tire clamp** and insert a holder.
Remove the tire clamp and push a balance weight underneath the holder until it engages.



Arrangement of Balance Weight for Cast Aluminum Rims:
1 Spring Holder
2 Balance Weight
Max. imbalance per wheel and side*.



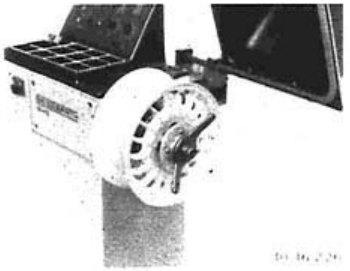
Arrangement of Balance Weights for Steel Rims:

Max. imbalance per wheel and side*.

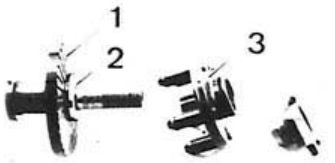
* See Specifications
** Source of Supply: Workshop Equipment and Planning Documents

36 10 715 CHECKING WHEEL RIM FOR RADIAL AND LATERAL

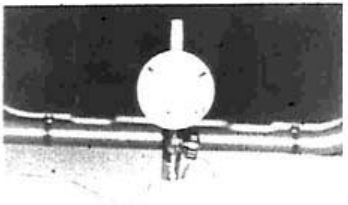
Remove wheel – see 36 10 300.
Take tire off of wheel rim.
Remove old balance weights.
Remove dirt on rim well and rim flange.



Mount wheel rim on balancing machine.

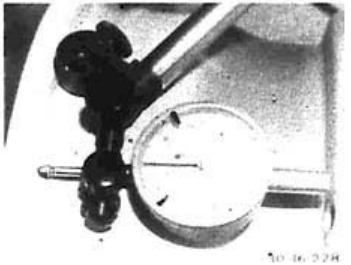


Use a suitable center of pertinent balancing machine.
1 Basic flange
2 Center
3 Type flange
Also refer to Workshop Equipment and Planning Documents.



Apply dial gage tip on rim well.
Turn wheel by hand and measure max. radial runout*.
Measure on both sides of rim well.
Note:
Dial gage must be perpendicular to the rim well.

* See Specifications

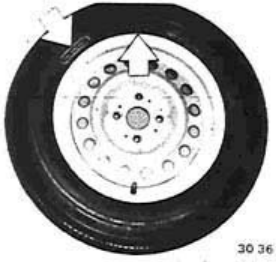


Apply dial gage tip on rim flange.
Turn wheel by hand and measure max. lateral runout*.
Measure on both rim flanges.
Note:
Dial gage must be perpendicular to the rim flange.

Important!
Avoid clamping errors when mounting wheel afterwards – see 36 10 508.

* See Specifications

28 36 023



30 36 029

30 36 030

REPLACING TIRES

Refer to operating instructions supplied with pertinent tire mounting machine for correct mounting of tires. However, also make sure that the machine is in perfect condition and that the wheel rim and tire are not damaged.

General Tire Removing / Mounting Instructions

Removing:
Begin removal of a tire at the valve.
After pressing the tire off of the rim flange, remove balance weights, press tire bead into well and coat thoroughly with tire mounting paste**. Clean wheel rim thoroughly and inspect rim for damage before mounting tire. The valve and valve insert must be replaced each time a tubeless tire is removed and installed.

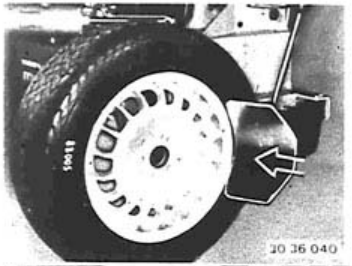
Important!
Loosen the tire on the inside and outside by applying the pressing-off horn on the bead periphery at several points before pressing off the tire. Should it be difficult to press off the tire, pry the tire away from the rim flange as far as poss-ible with the pressing-off horn and then apply tire mounting paste between the tire and rim flange. Repeat this step around the complete periphery of the tire.
Then press of the tire completely.

Greater pressing-off force is required for "TD tires" due to the bead toe seat. It is necessary to loosen tire on inside and outside at several points around the bead periphery with the pressing-off horn prior to pressing off.
Caution!
TD bead toe could jump out of Denloc groove suddenly and cause pressing-off horn to knock in!

Mounting:
Coat tire bead with tire mounting paste**.
Make sure tire is mounted on correct side, especially in case of asymmetric tires. The "outside" of these tires is marked.
Mount tire with as little as possible stress on the beads, since otherwise there would be danger of damaging the tire or TD bead toe of TD tires.
First of all let the tire bead – coming from the well – jump over the hump of the rim shoulder.
Inflate the tire in steps while observing continuously.
Maximum "jump-over pressure" = 3.3 bar (47 psi).
If the tire is not seated on the rim correctly, increasing the inflation pressure will not improve the tire seating!
Instead it will be necessary to press off both tire beads, apply another coat of tire mounting paste and to inflate the tire again.
Increase the inflation pressure slowly until the tire "settles" only when the beads bear on the rim shoulders correctly.
Maximum "settling pressure" = 4.0 bar (57 psi).
Refer to Service Information of Group 36 for approved tires, tire sizes and wheel rims as well as special equipment.

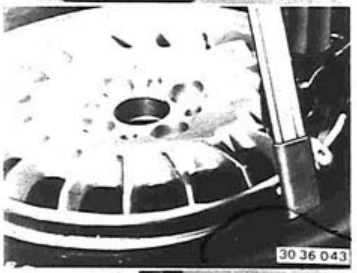
We must point out that TD tires may be mounted only on TD rims!
Incorrect mounting of TD tires on rims of other design (even TR!) could cause tire damage, which in turn could lead to tire blowout while driving car.
Such tires may never be reused, not even on TD rims!

** Source of Supply: HWB

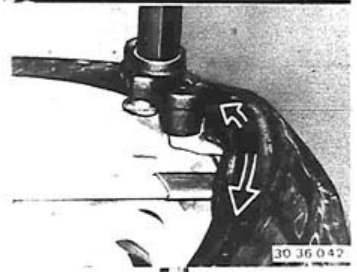


Mounting Tires with a Modern Mounting Machine

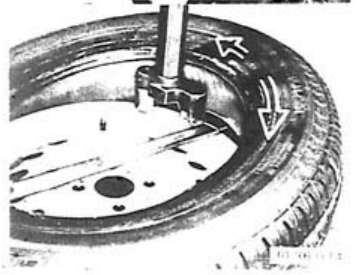
Unscrew valve and deflate the tire.
Press off tire bead from rim flange all around on outside and inside with pressing-off horn of the machine.
If tire beads fit too tight, first only loosen tire from flange at several points with the pressing-off horn prior to the actual pressing-off.
Push both tire beads into rim well completely until they are loose.
Pull off balance weights on rim and clean rim to remove large pieces of dirt.
Coat tire beads with mounting paste.
Clamp wheel on mounting machine.
Narrow rim shoulder always faces up.



Swing mounting pillar into position or fold and let it engage.
Adjust mounting head, whereby it must be pressed on the rim edge fully and turn down the lever for the clamp; normally the distance of the mounting head will set in automatically.
Valve should be about 10 cm (4") to the right of the mounting head.
Lift tire bead over mounting finger with tire irons.
Use coated or shrink-fit hose covered tire irons for aluminum rims.

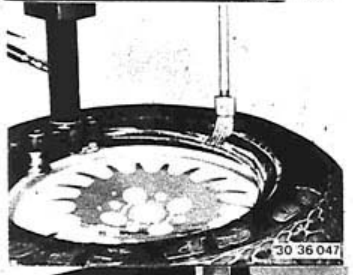


Let mounting machine run back a short distance (counterclockwise) so that the tire bead can slide fully on to the mounting finger.
Then let mounting machine run forward (clockwise) a short distance.
In so doing always check, whether the bottom bead is fully in the well and the tire is given enough time to move.
Stop the machine and let it run back slightly, if the bead clamps.



Now also lift the bottom bead over the mounting finger with the tire iron, if the upper bead is pulled off of the rim.
Let machine run back a short distance again and then forward (clockwise) briefly, until there is complete separation of the tire from the rim.

Release lock and tilt back or swing away the mounting pillar.
Unclamp and clean the rim.
Replace the valve.
Coat the rim flange and tire beads with mounting paste.
Clamp the rim on the mounting machine.
Slide on the tire with the lower bead over the rim flange partially.
Valve is 10 cm (4") to the right of the mounting head.

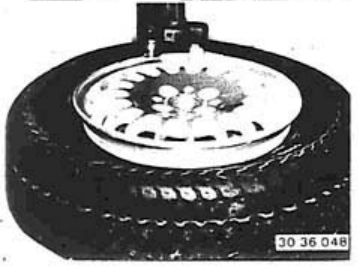


Swing or tilt the mounting pillar into position and lock.
Check adjustment of the mounting finger, readjusting if necessary and clamp.
Press the tire underneath the mounting finger by hand.
Tire bead should seat in the roller next to the mounting finger.
Let the mounting machine run forward (clockwise) a short distance.
The lower tire bead will drop into the well.

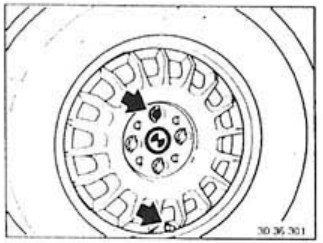
Press the upper tire bead underneath the mounting finger.
Tire bead should seat in rollers next to the mounting finger.

Important!
Don't pinch or damage the bead.

Run the mounting machine forward (clockwise) a short distance, while checking that the lower tire bead remains in the well.

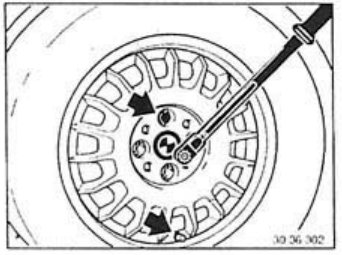


After mounting, first release the clamps and then inflate the tire (without valve insert).
Increase the pressure in steps to 3.3 bar (47 psi) (spring pressure).
If the tire bead does not slide on to the rim edge all around, do not increase the pressure.
Instead the tire must be deflated and the tire bead pressed off, then coat the tire bead and rim flange with mounting paste again and inflate again to 3.3 bar (47 psi) pressure.
If tire beads seat on rim flange correctly, increase the inflation pressure to max. 4.0 bar (57 psi) to have the tire "settle".
Screw in the valve insert and correct the tire inflation pressure.



36 13 . . . SERVICE INSTALLING WHEEL BOLT LOCK

Loosen wheel bolts.
Lift car that wheel has cleared ground.
Loosen wheel bolts until wheel can be turned on the wheel hub.
Turn wheel to have the valve face down.
Remove top wheel bolt and install the wheel bolt lock.



Imbalance could be produced by play in the center and the wheel's own weight.
This imbalance is reduced to a minimum through installation of the somewhat heavier wheel bolt lock, in the top wheel bolt position.

Tighten the wheel bolts crosswise finger tight in this position (wheel bolt lock at top, valve at bottom.
Lower car and tighten the wheel bolts crosswise.
Tightening torque*.

Wheels must be finish balanced, if a customer complains about wheel imbalance after installation of a wheel bolt lock.

* See Specifications

	Ride level control – troubleshoot	37- 24

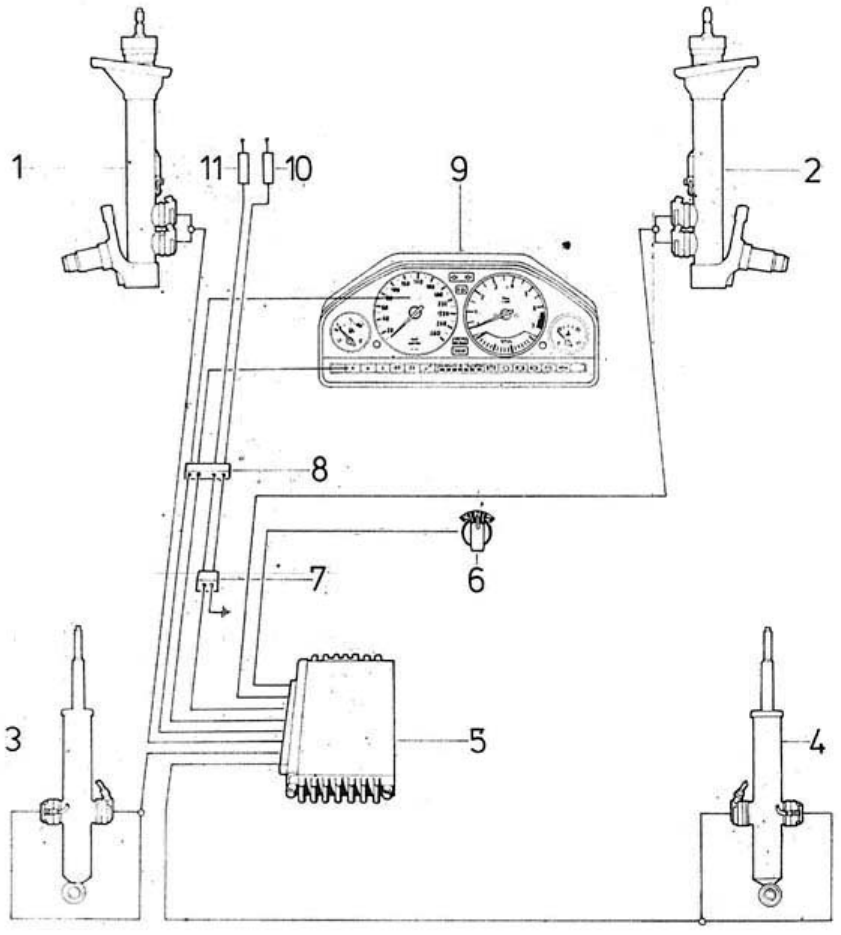
DESCRIPTION OF ELECTRONIC ABSORBER CONTROL (EDC)

Three different shock absorber settings (comfort, normal and sport) can be selected with a switch in the middle console. The shock absorber selection is indicated with control lamps in the instrument cluster. An additional control lamp (absorber symbol) indicates faults in the electrical system. The system monitor control lamp goes out about 1.5 seconds after turning on the ignition. Fault reports can be cancelled after elimination of the cause by turning the ignition off and on.

Shock absorber settings (bump and rebound stages) are controlled by solenoids on the double-pipe gas pressure shock absorbers. The control unit monitors the same setting of all shock absorbers. In case of a fault in the electrical system there is automatic switchover to sport for safety's sake (all solenoids are without current). There is also switchover to sport, if a speedometer signal is missing (car stopped; Vo limit, time delay approx. 1.5 sec.). The system switches back to the selected shock absorber setting as soon as there is a signal again (moving off) within approximately 0.05 seconds.

There is speed-dependent regulation in the comfort position. There is automatic switchover from comfort to normal setting at a road speed of about 110 km/h (68 mph). It switches back to comfort when the road speed drops below about 100 km/h (62 mph).

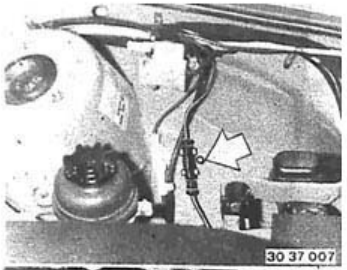
Automatic switchovers are not displayed by the control lamps, since the control lamps only show the position of the selector switch.



30 37 016

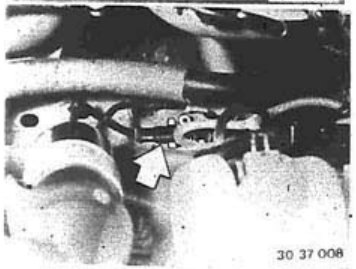
EDC LAYOUT DRAWING

1 Shock absorber front left
2 Shock absorber front right
3 Shock absorber rear left
4 Shock absorber rear right
5 EDC control unit (left in trunk)
6 Selector switch (center console)
7 Power saving relay (left underneath instrument panel)
8 Main/center wire harness plug connection (left underneath instrument panel)
9 Instrument cluster
10 Fuse no. 21 (fuse box)
11 Fuse no. 26 (fuse box)

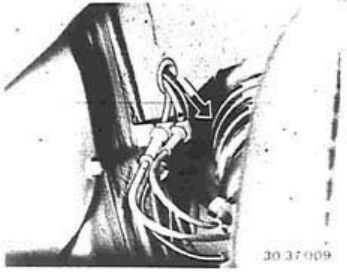


37 . . . . REPLACING FRONT SHOCK ABSORBERS WITH EDC

Disconnect plug (remove left spring strut shock absorber).

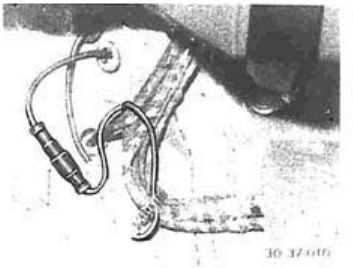


Disconnect plug (remove right spring strut shock absorber).



Guide electric wire through hole.
See Group 31 for other removal procedures.

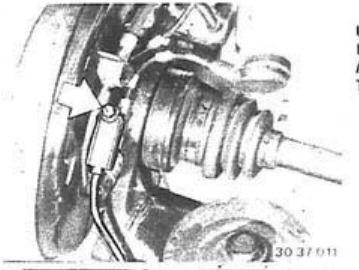
Important!
Covers on solenoids must not be opened.
Shock absorbers cannot be disassembled.
Don't place absorbers on valves or their connections.
Recommendation:
Replace both shock absorbers of one axle.



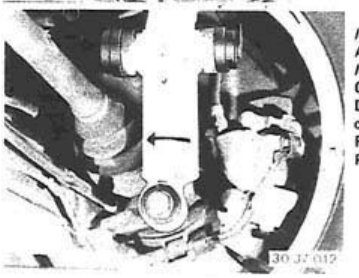
37 . . . . REPLACING REAR SHOCK ABSORBERS WITH EDC

Remove rear seat cushion – see Group 52.
Disconnect left or right plug underneath the insulation sheet and guide electric wire through hole in floor plate.

Remove left or right wheel – see Group 36.



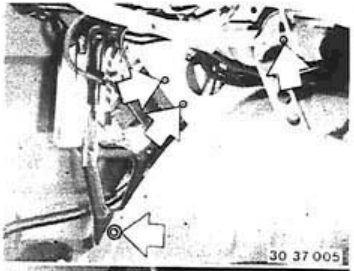
Unscrew wire connector (Y-piece).
Loosen electric wire clips.
Installation:
Tightening torque: 3.5 Nm (2.5 ft. lbs.).



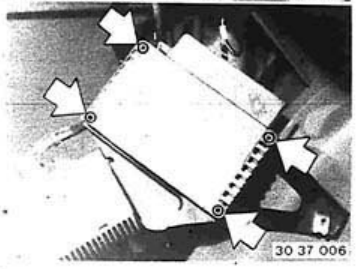
Installation:
Arrow on absorber faces forward.
Important!
Covers on solenoids must not be opened.
Don't place absorbers on valves or their connections.
Recommendation:
Replace both shock absorbers of one axle.

37 . . . . . REPLACING EDC CONTROL UNIT

Turn off ignition.
Remove left trunk trim panel.
Pull off plug on control unit.



Unscrew screws for equipment carrier.
Pull out and turn equipment carrier.



Unscrew screws for control unit.

Important!
Ignition may only be turned on again after control unit has been screwed firmly on the car's ground point.

37 . . . . . REPLACING EDC SELECTOR SWITCH

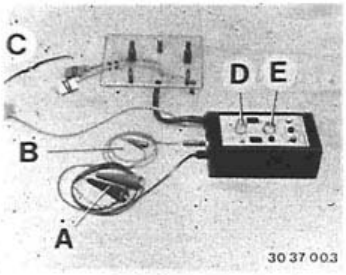
Procedures are identical with those for replacing program switch of EH transmission – see 61 31 265.

37 . . . . . REPLACING POWER SAVING RELAY

Turn off ignition.
Remove instrument panel trim at bottom left – see 51 45 180.

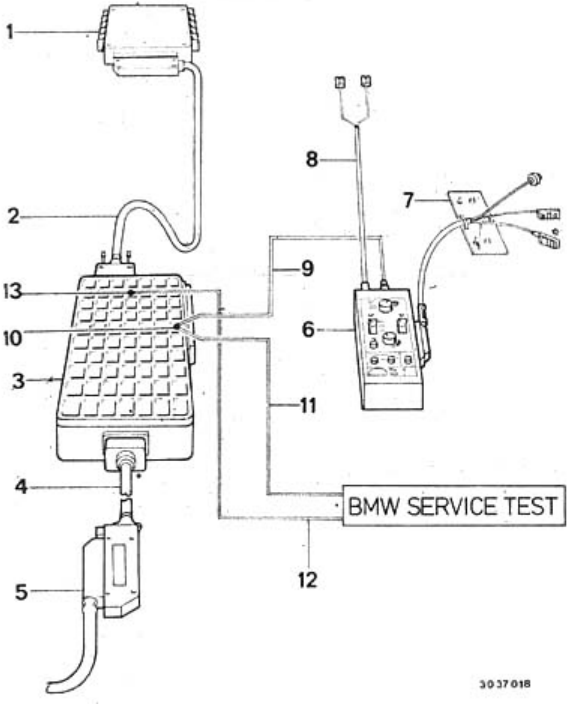
Pull out power saving relay.

37 . . . . CHECKING EDC SHOCK ABSORBERS WITH SHOCK TESTER



Connect 35-pin connecting lead on universal adapter*.
Connect connecting lead on simulator*.

A Power supply 12 V
B Frequency output
C Instrument cluster connection (model 3 wire harness)
D Knob
E Regulator



Turn off ignition.
Remove left trunk trim panel.
Connect universal adapter, simulator and BMW Service Tester as shown.

1 Control unit
2 35-pin connecting lead (plug) for universal adapter
3 Universal adapter
4 35-pin connecting lead (jack) for universal adapter
5 Car wire harness for EDC control unit
6 Simulator
7 Wire harness for model 3 (not used)
8 12 V power supply for simulator
9 Simulator frequency output (yellow jack)
10 PIN 35 on universal adapter
11 BMW Service Tester (yellow) terminal
12 BMW Service Tester (black) terminal
13 PIN 11 on universal adapter

Install universal adapter with 35-pin connecting leads between wire harness and EDC control unit.
Connect simulator power supply on 12 V source.
Connect simulator frequency output (yellow jack) on PIN 35 of universal adapter (model 3 wire harness remains unused).
Connect BMW Service Tester with frequency measuring multimeter function on universal adapter.
(yellow conn. term. on PIN 35)
(black conn. term. on PIN 11)

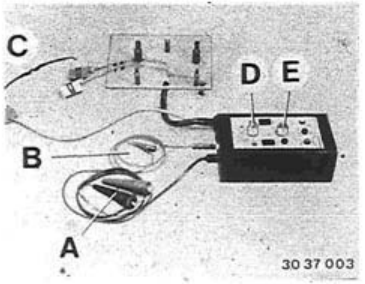
Set simulator knob (D) to km/h.
Turn back simulator regulator (E) to stop.
Set EDC selector switch to K.
Turn on ignition (display control lamp K on).
(control unit operating volatge > 11.5 V)
(measured between PIN 2 and PIN 11)
Switch on simulator.
Adjust frequency to about 15 Hz with regulator (D).
Do not change this setting and disconnect BMW Service Tester.
Switch through shock absorber settings with the selector switch (loud click heard when switching from K to N and N to S).
Check shock absorbers with Shock Tester (to operating instructions supplied with tester).
Nominal values*.

* Source of Supply: HWB

* See Service Information of Gr. 37

37 . . . . . CHECKING ROAD SPEED DEPENDENT ABSORBER SWITCHOVER

Connect 35-pin universal adapter, simulator and BMW Service Tester (see "Checking EDC Shock Absorbers with Shock Tester").



Set simulator knob (D) to km/h.
Turn back simulator regulator (E) to point shortly before stop.
Set EDC selector switch to K.
Turn on ignition (display control lamp K comes on).
Control unit operating voltage > 11.5 V. (measured between PIN 2 and PIN 11)
Turn up simulator regulator (E) until solenoids switch (loud click).
Nominal value: approx. 150 Hz (≙ approx. 110 km/h or 68 mph).

Turn down simulator regulator (E) again until solenoids switch again.
Nominal value: approx. 135 Hz (≙ approx. 110 km/h or 68 mph).
Requirement: no fault report (absorber symbol control lamp off).
Also refer to M 3 EDC Troubleshooting.

Note:
Control lamps do not also switchover.

TROUBLESHOOTING EDC M 3

Testing Requirements:
Battery charged (> 12 V), fuses 16 and 26 okay (fuse box),
power saving relay okay (behind instrument panel trim bottom left)

Perform tests with BMW Service Tester, universal adapter with 35-pin plugs and simulator (Source of Supply: HWB).

A. Fault Lamp On (Absorber Symbol)

– Turn off ignition.
– Remove left trunk trim panel.

Important!
Always turn off ignition before disconnecting wire harness plug on control unit.

– Connect universal adapter on EDC wire harness (control unit remains disconnected).

Do pins 11 and 12 have ground? —— no ——→ Repair wire.

yes

Measure resistance between

Pins	Shock Absorber
3 and 19 3 and 23	front left
4 and 20 4 and 24	front right
5 and 21 5 and 25	rear left
6 and 22 6 and 26	rear right

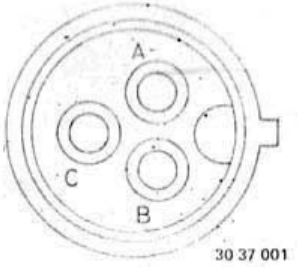
Is nominal resistance of 1.8 to 2.5 ohms measured? —— yes ——▶ Check wire harness, see B, C pin and receptacle connections/replace control unit if necessary.

no

Disconnect pertinent wire plug connection in engine compartment or underneath rear seat cushion.
Measure resistance between plug pins

C and A

C and B



30 37 001

Top View of Disconnected Plug

Is nominal resistance of 2 ohms ± 10 % measured with 20° C (68° F) coil temperature? —— no ——▶ Replace absorber – see Replacing EDC Shock Absorbers in Group 37.

yes

Repair connecting wires for control unit; see control unit plug pin connections.

B. Control Lamps Do Not Switch Over; No Fault Report

– Connect universal adapter on EDC wire harness, see A.

Do pins 1 and 2 have operating voltage of > 11.5 V? — no → Repair wire, see pin and receptacle connections.

yes

12 V voltage on

30 37 002

Top View of Disconnected Wire Plug

Does power flow through wires. — no → Repair wires.

yes

Replace selector switch.

C. Shock Absorbers Do Not Switch Over, Control Lamps Switch Over (K / N / S)

Check EDC shock absorbers with Shock Tester.
If necessary, check road speed dependent shock absorber switchover.

Can shock absorbers be switched over? —— no → Single absorber does not switch over. → Replace shock absorber.

All shock absorbers do not switch over. → Check operating power supply of > 11.5 V on pins 1 and 2, repairing if necessary or replace control unit.

yes

Connecting wire between instrument cluster and control unit, see pin and receptacle connections, check/repair (road speed signal pin 35).

Do absorbers fulfill nominal values*? —— no → Replace absorbers.

* See Specifications

RIDE LEVEL CONTROL / CIRCULATING SYSTEM

Description

Ride control has the task of keeping the rear end of the car at a certain level regardless of the payload (up to maximum axle load). A piston-type pump bolted on the power steering pump provides the system with necessary pressure. The flow of oil produced permanently by the pump is distributed to the line leading to the pressure reservoirs and a return line by a mechanically operated regulating valve depending on payload and ride level. Ride level information for the regulating valve is taken from the rear axle stabilizer. Loading the car causes the suspension to bottom and in turn the stabilizer to turn. A control valve in the regulating valve is turned to lift position with help of a lever with regulating rod. The turning of the stabilizer is reduced as the rear end of the car lifts, which in turn means that the control valve in the regulating valve is also turned back to normal position continuously. After reaching the nominal ride level the control valve will be back in normal position and the oil flows direct into return (circulation).

After reaching the maximum permissible rear axle load, a pressure safety valve in the regulating valve prevents a further increase of pressure in spring struts and pressure reservoirs, so that the rear end of an overloaded car will drop.

The stabilizer is turned in opposite direction when unloading the car. The control valve in the regulating valve is turned to lower position, so that the oil under pressure in spring struts and pressure reservoirs can flow into return. The control valve will be back in normal position after reaching the nominal ride level.

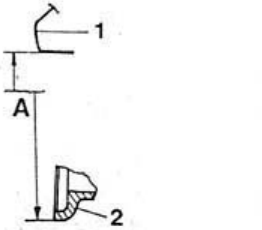
A low pressure valve in the regulating valve prevents dropping the pressure in spring struts and pressure reservoirs below the minimum pressure while lifting the car.

The oil forced out by piston rods of single-pipe shock absorbers is pushed back and forth between the spring struts and pressure reservoirs while driving each time the suspension of rear wheels bottoms and rebounds. The gas cushion of the pressure reservoirs is then compressed and released alternately, producing the effect of gas pressure struts, which is applied parallel to the coil springs of the spring struts.

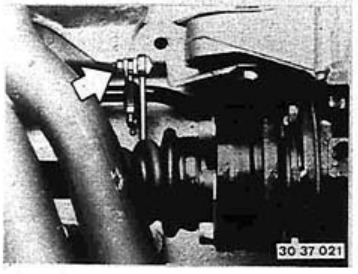
37 .. ... FILLING AND BLEEDING PROCEDURES

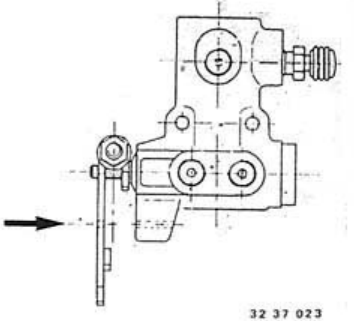
Pour in hydraulic oil* until the level is approx. 25 mm (1") below the upper edge of the tank.
Start engine.
Load down car with 200 kg (440 lbs.) in trunk close to the tail panel (middle).
Turn steering wheel three time from lock to lock.
Stop engine.
Lift rear axle until the wheel clear ground.
Check oil level in tank after about two minutes and, if necessary, correct (specification: approx. 25 mm (12) below upper edge of tank).
Check line connections for leaks.

* See Operating Fluids of Gr. 37



28 32 091





32 37 023

37 12 010 ADJUSTING CAR RIDE LEVEL HEIGHT

Load down car with at least 200 kg (440 lbs.) in middle of trunk (close to wall). Place rear wheels on rotating plates of the wheel alignment tester. Block front wheels. Move shift lever into neutral and release the parking brake lever. Start engine. Measure the "actual car ride level height" (A) between wheel house lower edge (1) and rim flange (2) at wheel middle height after regulation of height control has been concluded.
Specifications*.

Deviation from Specifications:
Unscrew the regulating rod on the regulating lever (stabilizer).
Tightening torque*.
Adjust specified height* on the regulating lever with the engine running.

Higher = lever moved forward
Lower = lever moved back

Stop the engine after reaching the specified height and hold in middle position with a shortened 3 mm (0.118") dia. drill bit (arrow).
In so doing do not move the lever beyond the neutral position in the "lowering" direction.
Tighten regulating rod joint in the slot of the lever.
Tightening torque = 9 Nm (6.5 ft. lbs.).
Check for correct seating of the ball pin on the lever.

Remove the drill bit.

Important!
The lever must not be disconnected on the regulating valve.

* See Specifications

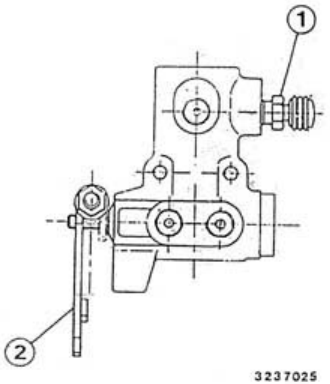
37 12 110 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT REAR SHOCK ABSORBER

Remove trunk trim panel and radio speaker – see Group 51.
Remove backrest – see Group 52.
Remove seat belt reel – see Group 72.
Remove wheel – see Group 36.

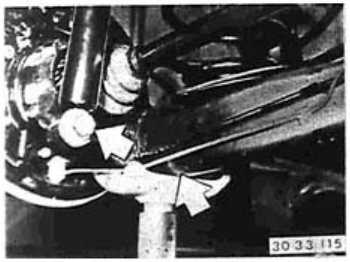
Installation:
Conform with filling and bleeding procedures and check pipe/hose connections for leaks.

Unscrew pressure discharging screw (1) on the regulating valve and discharge the pressure.

Note:
Place a tray underneath.
The bolt on lever (2) must never be loosened!



3237025



30 33 115

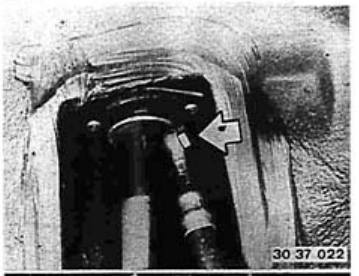
Support the trailing arm.

Important!
Don't damage the brake pipe.

Unscrew mounting bolt.

Installation:
Tightening torque*.
Check for correct seating of pipe in holder on the shock absorber.

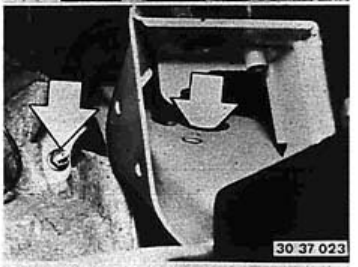
See Specifications of Gr. 33.



30 37 022

Clean the pipe connection (absolute cleanliness is mandatory).
Unscrew connecting pipe on the shock absorber.

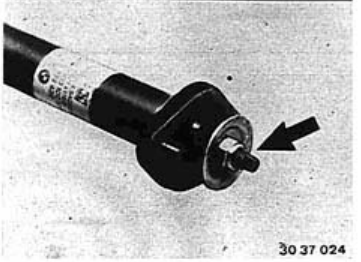
Installation:
Replace seals.
Tightening torque*.



30 37 023

Unscrew the mount bolts.

Installation:
Replace self-locking nuts.
Tightening torque*.

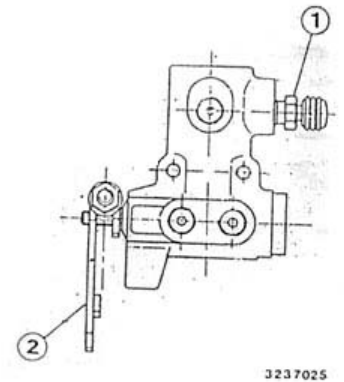


30 37 024

Pull off rubber cap.
Unscrew bolt and take off mount.

Installation:
Replace self-locking nut and gasket.
Tightening torque*.

* See Specifications of Gr. 33 and 37



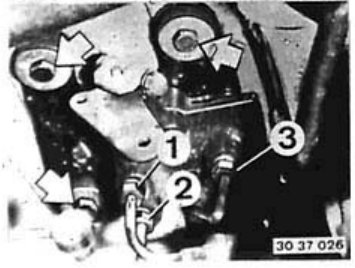
37 12 210 REMOVING AND INSTALLING OR REPLACING RIDE LEVEL REGULATING VALVE

Unscrew pressure discharging plug (1) on regulating valve and discharge pressure.

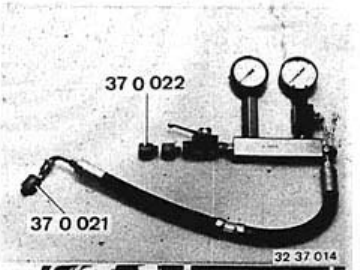
Note:
Place a pan underneath to catch oil.
Never loosen the clamping bolt on lever (2).

Installation:
Conform with filling and bleeding procedures and check pipe connections for leaks.
Adjust ride level height - see 37 12 010.

Unscrew regulating rod on valve lever.
Installation:
Tightening torque: 8.8 Nm (6.4 ft. lbs.).

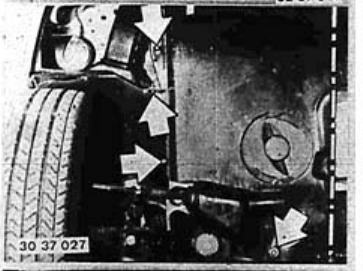


Unscrew pipes (1 ... 3).
Unscrew mounting bolts and take off ride level regulating valve with holder.
Installation:
Tightening torque: 14.3 Nm (10.3 ft. lbs.).

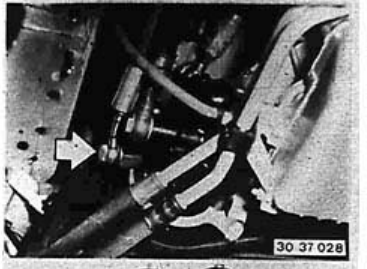


37 21 005 CHECKING FUNCTION OF RIDE LEVEL CONTROL PUMP

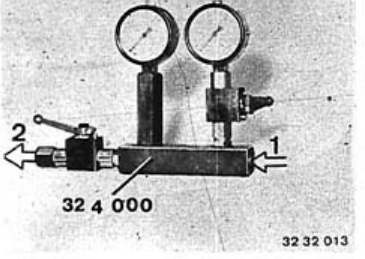
Assemble tester, Special Tool 32 4 000.
Connect adapter on tester.



Unscrew bolts and take off splash guard.



Unscrew bolt.
Installation:
Replace seals.
Tightening torque: 31.2 Nm (22.5 ft. lbs.).
Check pipe connections for leaks and correct the hydraulic fluid level**.

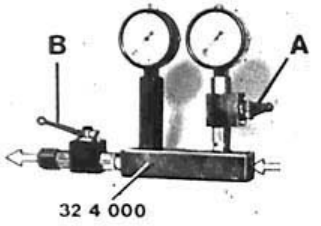


Connect tester.

1 = Pump connection

2 = Pipe connection to regulating valve

** See Gr. 37 In Operating Fluids



32 32 014

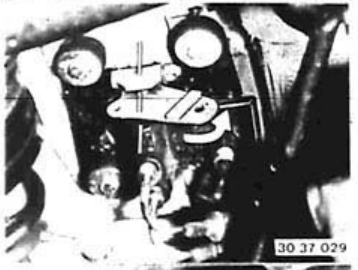
A =Shutoff valve (low pressure - 0 to 15 bar / 0 to 213 psi)

Caution!
Shutoff valve (A) must always be closed for high pressure tests - tester could be damaged.

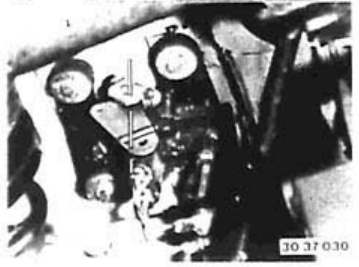
B =Shutoff valve (high pressure - 0 to 150 bar / 0 to 2130 psi)

Open valve (B).
Close valve (A).

Unscrew nut and disconnect regulating rod on stabilizer.
Start the engine.

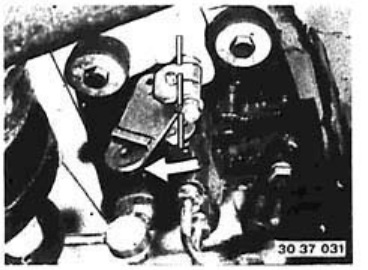


Regulating up position = lever moved forward.
Maximum pressure*.
(rear end of car lifted)



Normal position = lever in middle position.
Circulating pressure*.

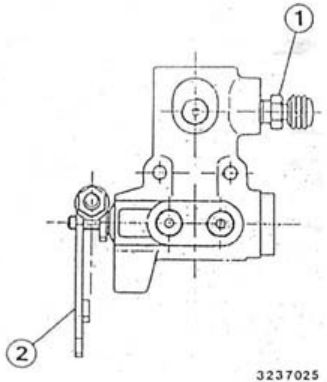
* See Specifications



Regulating down position = lever moved back.
Circulating pressure*.
(rear end of car lowered)

Remove pressure tester.

* See Specifications



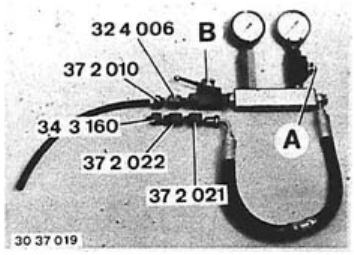
37 21 030 REPLACING LEFT OR RIGHT PRESSURE RESERVOIR

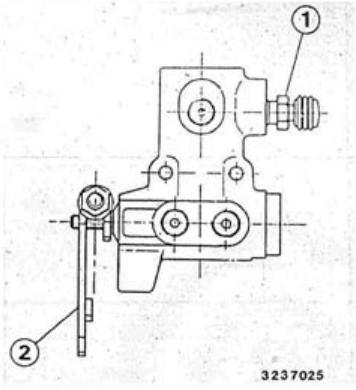
Loosen pressure discharging plug (1) on regulating valve and discharge the pressure.

Note:
Place a pan underneath to catch oil. Never unscrew clamping screw on lever (2).

Installation:
Conform with filling and bleeding procedures and check pipe connections for leaks.

Remove spare wheel and pressure reservoir cover.





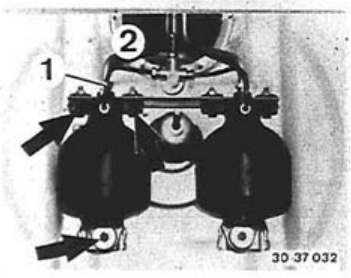
37 21 500/ 37 21 501 CHECKING CHARGING PRESSURE IN LEFT OR RIGHT PRESSURE RESERVOIR

Assemble tester, Special Tool 32 4 000. Connect adapter on tester. Close shutoff valves (A and B).

Loosen pressure discharging plug (1) on regulating valve and discharge the pressure.

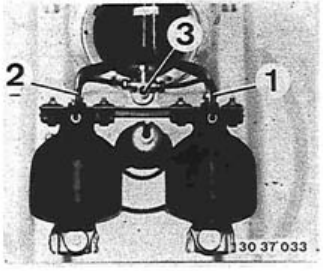
Note:
Place a pan underneath to catch oil. Never unscrew the clamping screw on lever (2).

Installation:
Conform with the filling and bleeding procedures.



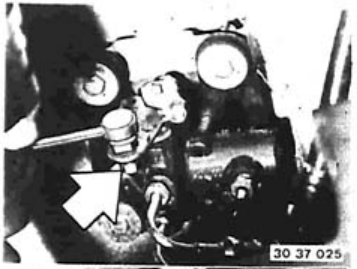
Unscrew pipes (1 and 2).
Unscrew mounting bolts.
Take off pressure reservoir.
Installation:
Replace rubber mounts, if necessary.
Tightening torque*.

*** See Specifications**



To check the left pressure reservoir, unscrew bolt (3) and pipe (1) completely and connect the tester, pushing the adapter aside for this purpose.
Installation:
Tightening torque*.

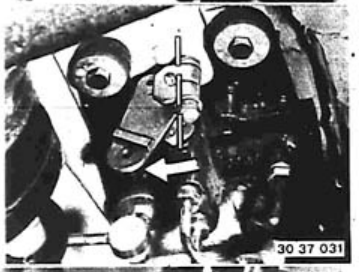
*** See Specifications**



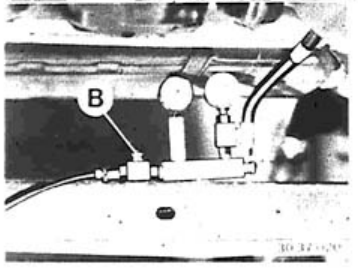
Unscrew nut and disconnect regulating rod on the regulating lever.
Installation:
Tightening torque*.

Start engine and regulate the system in lift direction (lever on regulating valve moved forward).
Maximum pressure*.
(ride level regulating valve)

Stop the engine.



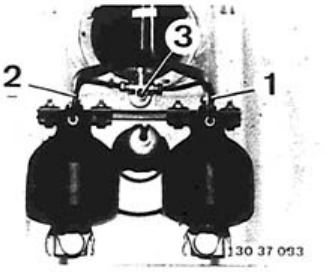
Regulate the system back to lowering position.
Minimum pressure*.
(ride level regulating valve)



Open shutoff valve (B) slowly and let hydraulic oil run into a pan.
The pressure, at which the pressure gage drops suddenly to 0, is the gas charging pressure* of the pressure reservoir.
Repeat the test.

* See Specifications

Remove the tester.
Connect pipe (1) again.
Installation:
Tightening torque*.



Checking Right Pressure Reservoir:
Discharge the pressure.
Unscrew pipe (2) and connect the tester, pushing the adapter aside for this purpose.
Now perform test in the same manner as for the left pressure reservoir.
Installation:
Tightening torque*.

* See Specifications

TROUBLESHOOTING RIDE LEVEL CONTROL

CONDITION	CAUSE	CORRECTION
Measured car ride level height too high or too low	a) Level height adjustment incorrect b) Regulating linkage mounted incorrectly	a) Adjust level height - see 37 12 010 b) Check/repair regulating linkage installation and adjust level height - see 37 12 010
Rear end of car drops below nominal level height when loaded and with engine running.	a) Car overloaded b) Hydraulic fluid level too low c) Regulating linkage mounted incorrectly d) Delivery line damaged e) Insufficient pump pressure f) Ride level regulating valve faulty g) Spring strut shock absorbers faulty	a) Check payload, reducing it to max. axle load if applicable b) Check/correct hydraulic fluid level c) Check/repair regulating linkage installation and adjust level height - see 37 12 010 d) Check and repair/replace delivery line e) Check pump - see 37 21 005, repair or replace - see Group 32 f) Check ride level regulating valve - see 37 21 500/501 (reservoir pressure test) or replace - see 37 12 210 g) Check absorbers (shock tester) or replace - see 37 12 100
Rear end of car does not rise/drop to nominal level after removing payload	a) Regulating linkage mounted incorrectly b) Delivery/return line damaged c) Ride level regulating valve faulty d) Spring strut shock absorbers faulty e) Insufficient pump pressure	a) Check/repair regulating linkage installation and adjust level height - see 37 12 010 b) Check and repair/replace delivery/return line c) Check ride level regulating valve - see 37 21 500/501 (reservoir pressure test) or replace - see 37 12 210 d) Check absorbers (shock tester) or replace - see 37 12 100 e) Check pump - see 37 21 005, repair or replace - see Group 32

TROUBLESHOOTING RIDE LEVEL CONTROL (Continued)

CONDITION	CAUSE	CORRECTION
Line between pressure reservoir and shock absorber damaged	a) Ride level regulating valve faulty b) Gas charging pressure loss in pressure reservoir	a) Check ride level regulating valve - see 37 21 500/501 (reservoir pressure test) or replace - see 37 12 210. b) Check pressure reservoir - see 37 21 500/501 or replace - see 37 21 030.
Car's suspension harder than normally	a) Gas charging pressure loss in pressure reservoir	a) Check pressure reservoir - see 37 21 500/501 or replace - see 37 21 030.
Insufficient shock absorber performance, rattling in rear axle	a) Spring strut shock absorbers faulty	a) Check absorbers (shock tester) or replace - see 37 12 100.

41 - 001

INTRODUCTION

This repair manual for body jobs is supplied for skilled workers and consequently it is assumed, that persons referring to this manual will be well qualified, conscientious workers with the necessary amount of responsibility.

Instructions are therefore limited to information on factory approved repair methods as well as related tips and working aids.

The described body repair jobs refer to the complete or partial replacement of parts with original BMW replacement parts or sections of replacement parts. Straightening and dent removal must be adapted to a pertinent damage scope. Concerned welding and spot welding seams must be inspected and, if necessary, repaired.

Refer to the cut out parts for the quantity and location of welding spots, inert gas welded seams and brazed connections. Use inert gas plug welding instead of spot welding in non-accessible areas.

Most pictures show a rough, unpainted bodyshell. Remove or cover all car parts, which are in the repair zone and are in danger of being subjected to heat, sparks or dust.

Disconnect the ground lead on the battery or body connection point. Protect electric leads against dangers of mechanical or thermal influence.

Conform with safety precautions for cars with an airbag system (SRS).

Conform with fire and accident prevention regulations.

Welding can be performed after removal of control units, if
- there is guarantee of about 1 meter (3 feet) distance between welding and ground connections and
- there is guarantee of good electric connection between welding and ground points (no rubber mounts or anything similar).

If not, thermal development must be considered especially in case of autogen welding (decisions must be made for each individual case).

In spite of continuous quality control in welding by the factory, it is still possible that some welded points could be faulty. They will be repaired in the factory subsequently, either with inert gas spot welding or, when not accessible, with 15 mm (0.590") long inert gas welded seams on the flange end. Consequently repaired welded seams on the body do not always indicate repairs by a third party.

For example: left engine carrier member resistance spot welded - right engine carrier member welding repaired with inert gas welding.

Important!
The steering gear must be inspected and maybe replaced after an accident or accident-similar driving conditions - see Service Information 32 01 88 (828).

Seal off all sealing seams, sealed in original state, with a body sealing compound. Replace damaged anti-drumming insulation.
Seal new sheet metal parts or the cavities, seams, creases and folds produced by new sheet metal parts with a body sealing compound immediately.

Source of supply for workshop equipment, aids, sealing materials, cements and similar products: HWB (a Business Division of BMW AG).

REMOVING PVC MATERIAL IN REPAIR ZONE

Corrosion inhibition after repairing begins already with the professional removal of PVC undercoating, anti-drumming compound and seam sealing compound in the repair zone.

Remove PVC material with a rotating steel brush, or heat PVC to maximum 180° C (355° F) with a hot air blower and scrape off with a spatula.
Burning off the PVC material or heating it above 180° C (355° F) with a gas flame torch or similar tool would produce strong corrosion-promoting hydrochloric acid.
Health impairing vapors would also be set free.
New undercoating would not have sufficient adhesion on burnt PVC material and consequently undersurface rusting would be possible.

WELDING GALVANIZED SHEET METAL

Hot galvanized and galvanized sheet metal is used to a greater extent for components of the body, which are especially subject to corrosion.

Conformance with the following points is necessary when working with these parts.
The welding smoke contains poisonous zinc oxide, so that especially good extraction is necessary in the welding bay.
Do not grind off zinc coat for resistance spot welding and inert gas welding.
The zinc coat, however, must be ground off for brazing jobs.

If at all possible welded connections should be made with resistance spot welding.
Welding current is boosted by at least 10 % as compared with blank sheet metal.
Apply as high as possible electrode contact force (make break out test on sample sheet metal).
A coat of spot welding paste can be applied for better sealing.

Inert gas welding should be preferred to autogen welding in areas not accessible for resistance spot welding, because of the lower heat dispersion.
Machining or forming of galvanized sheet metal in warm state is normal.
Make sure of thorough extraction of poisonous vapors.
Remove burnt residual zinc completely.
Align, grind down and tin out visible joints as normally.
Coat ground off zink coat ed surfaces with zinc dust paint.

RECOMMENDED WORKING METHODS AND TOOLS

1. Cutting Out Damaged Parts:

Determine the location of mating surfaces with help of the replacement part before beginning with the work. Cut out damaged part roughly within the mating surfaces.

Caution!
Don't damage sheet metal located underneath.

Remove sealing compound, anti-drumming compound and, if applicable, paint to neutralize the connection points. Drill out spot welding. Make sure holes are drilled in the cut out part while drilling. Don't drill in the connection flanges remaining for installation of the new part.

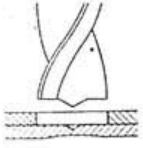
Grind off welded seams with a disc grinder carefully. Heat brazed connections with an autogen gas torch (don't heat excessively!). Lift off scrap metal. Remove residual brazing solder with a steel brush. Straighten and grind all connection points thoroughly.

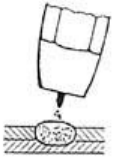
2. Installing New Parts:

Prepare connection points to pertinent repairing instructions.

Always perform repairs, which concern the suspension points of the engine, transmission, axles or running gear, on a straightening bench with the attachments belonging to the car type. There are also attachments for different body parts. Check curvature and dimensions of windshield and rear window by installing an original window. Refer to pertinent drawings for the gaps of doors, engine hood and trunk lid.

Coat mating surfaces intended for resistance spot welding with zinc dust paint. Only remove the protective paint from galvanized replacement parts. Drill 8 mm (0.315") dia. holes with same spacing as the drilled out welded spots in connections not accessible for the spot welding tongs and insert gas plug weld.





Produce inert gas welded seams according to the part cut out.

Produce brazed connections with as little as possible heat dispersion and without excessive heat. Procedures deviating from standard connections will be described in the repair manual. Grind down welded seams visible on outside surfaces.

Caution!
Don't grind down the sheet metal too thin.

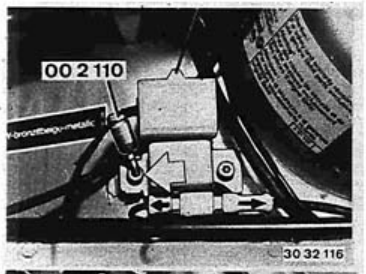
Straighten and tin out irregularities. Tinning out is supposed to prepare the surface to such an extent, that only a coat of fine filler has to be applied prior to spraying on paint.

Seal off all welding seams, which had been sealed in original state, with a body sealing compound. Replace damaged anti-drumming compound. Seal new sheet metal parts or the cavities, seams, creases and folds produced by new sheet metal parts with a body cavity sealing compound immediately.

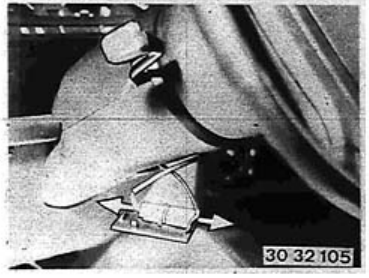
Source of supply for workshop equipment, aids, sealing materials, cements and similar products: HWB (a Business Division of BMW AG).

SAFETY PRECAUTIONS FOR CARS WITH AN AIRBAG WHEN WORKING ON BODY

Disconnect both poles of car's battery before working with an electric welder.
Cover battery poles.



Disconnect plugs of both front sensors (C).



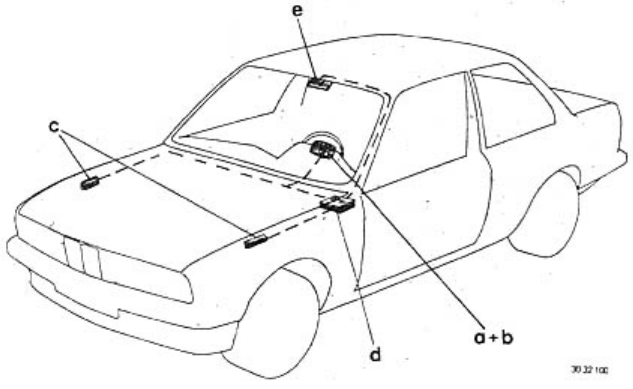
Lift cap off of steering wheel casing lower section and disconnect plug.

Parts of the airbag system may not be heated above 100° C (212° F), not even briefly.

If there is danger that working on the body could subject parts of the airbag system to strong vibrations, they should be removed as a precautionary measure.

In case of deformations or when installing the holders for both crash sensors on the front wheel houses on left and right sides, make sure that the holders are aligned parallel to the car's longitudinal axis precisely.

Also refer to the repairing and safety regulations concerning the airbag system in Group 32.



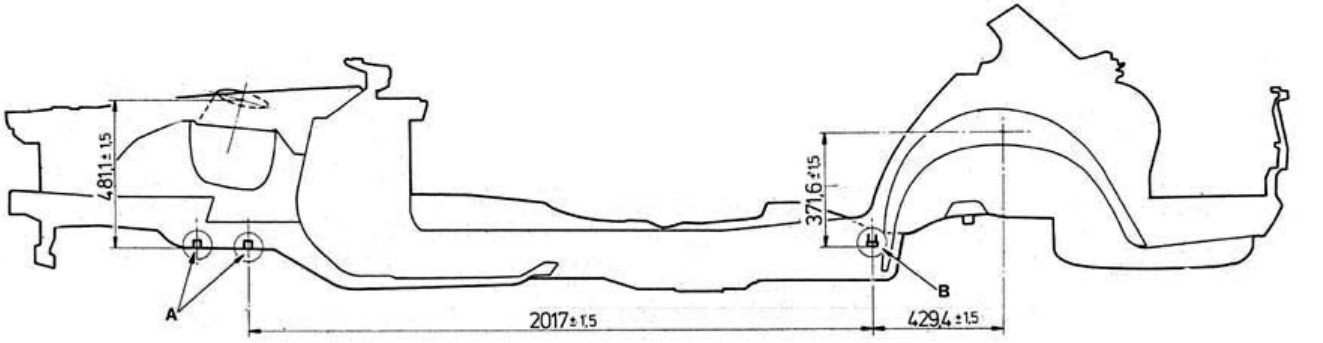
Components:

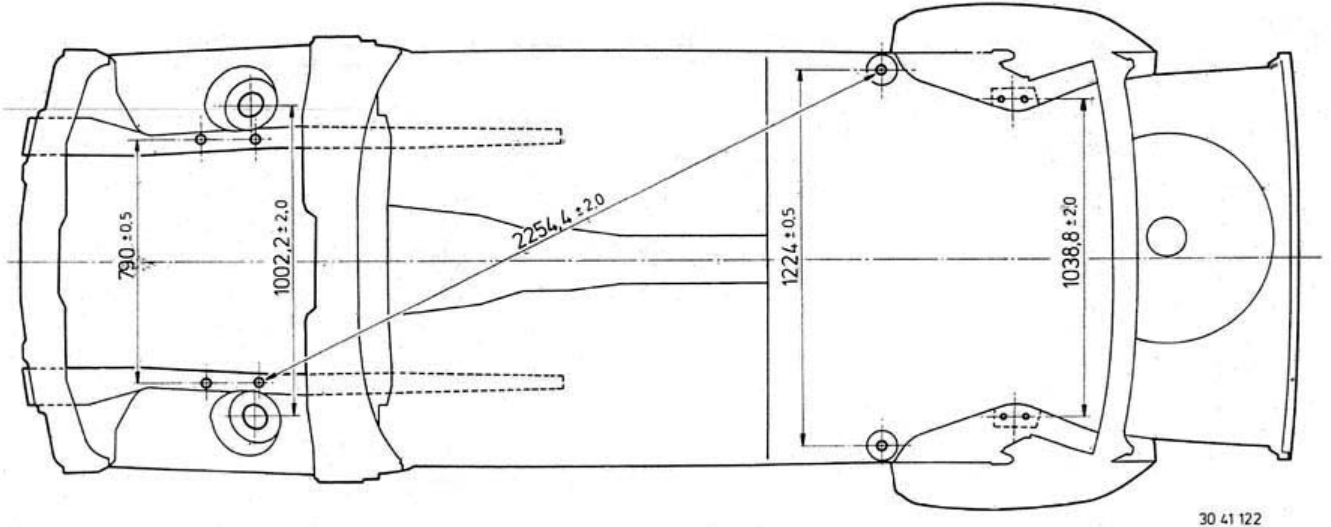
a) Airbag steering wheel with impact shell and impact pad, in which airbag, gas generator and ignition pill are integrated.
b) Contact ring – guarantees power supply to ignition pill.
c) Two crash sensors (left and right front on wheel house) and safety switch left.
d) Electronic diagnosis unit (instrument panel trim left) with integrated safing sensor (prevents unwanted activation).
e) Airbag indicator lamp integrated in check control unit.

41–004

FRAME ALIGNMENT CONTROL DIMENSIONS – BMW '3' Series / E 30
– Sedans and Convertibles –
A Front axle take-up
B Rear axle take-up
All dimensions in mm

Note:
Only use the following values for a rough inspection, Repairs can only be carried out correctly with the approved set of attachments and a straightening bench.

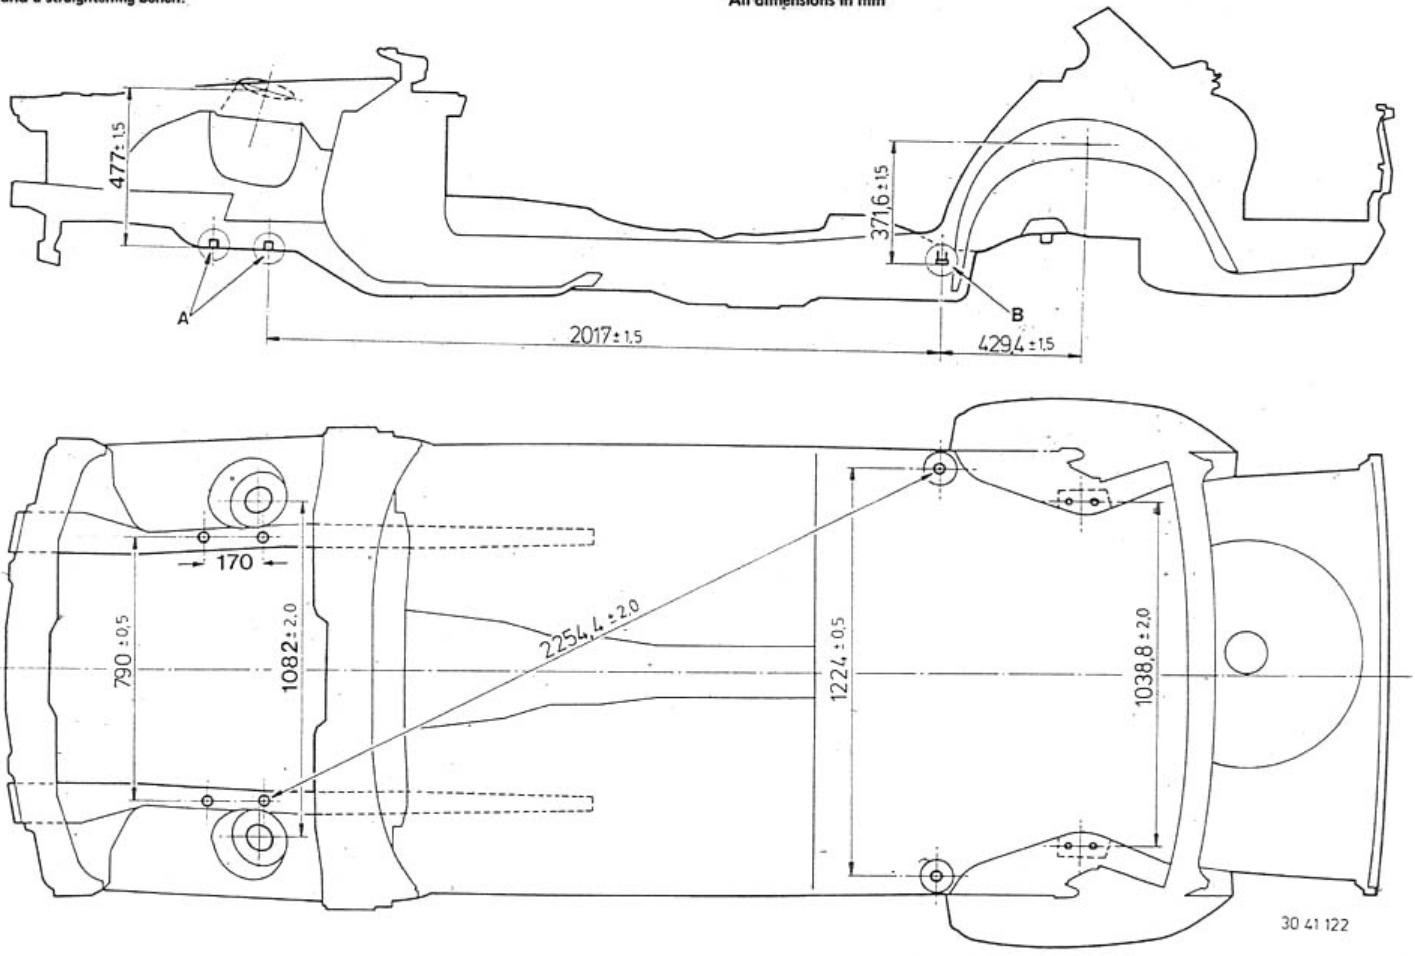


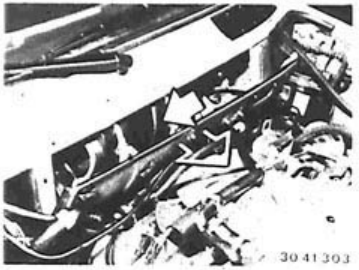


30 41 122

Note:
Only use the following values for a rough inspection. Repairs can only be carried out correctly with the approved set of attachments and a straightening bench.

FRAME ALIGNMENT CONTROL DIMENSIONS – BMW '3' Series / E 30
– All Wheel Drive Cars –
A Front axle take-up
B Rear axle take-up
All dimensions in mm



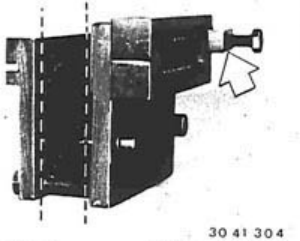


DIE-STAMPING CHASSIS NUMBER

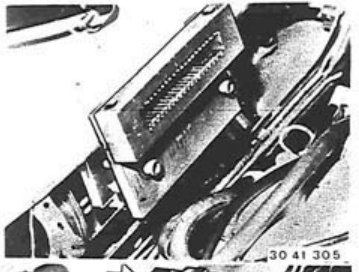
If the die-stamped chassis number has to be removed while repairing the car body, it must be die stamped again.

Note:

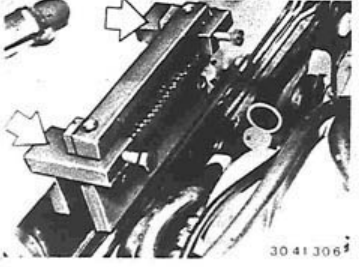
Die stamping of chassis number is also possible after car has been assembled, but then cover on wall and cover for blower motor have to be removed.



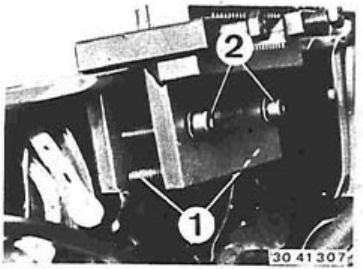
Assemble Special Tool 41 1 001 that smooth side of baseplate faces stamp guide.
Screw in bolts only so far, that Special Tools 41 1 003 can still be inserted later.



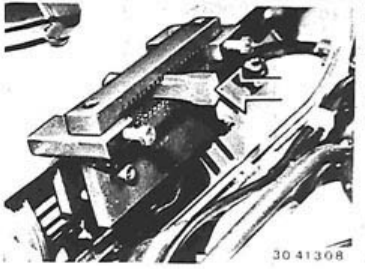
Apply special tool fixture and place baseplate on surface for chassis number.



Insert Special Tools 41 1 003 on left and right sides and clamp down.



Align baseplate to be parallel to stamp guide with bolts (1).
Push up special tool fixture completely.
Tighten bolts (2).



Stamp Digits 41 1 002:
Insert digits in special tool separately and die stamp chassis number.
When replacing parts of body or complete body in a workshop, die stamp "+" in front of and behind chassis number instead of BMW emblem for clear identification.

REPAIRING BODY PARTS MADE OF GLASS FIBER REINFORCED PLASTICS

Limited damage on parts made of glass fiber reinforced plastics, e.g. trunk lid of M 3 cars, can be repaired with the described repairing method.

There is chiefly application of two methods for the production of glass fiber reinforced plastic parts in standard car production.

SMC = Sheet Moulding Compound = processing method with polyester resin saturated sheets (prepegs), which are then hardened with application of pressure and heat. Prepegs are a sheetlike, free-flowing base compound consisting of glass fibers, fillers and unsaturated polyester resin.

BMC = Bulk Moulding Compound = injection moulding method with application of heat and high pressure producing a sauerkraut-similar compound, in other words a compound which is not sheetlike.

Identification:

Strong solid parts, insensitive to solvents. Flame test: crispy charcoaled, yellowish red, strongly sooting flame. Consequently only damage, which has no influence on the stiffness and strength of mounting points, may be repaired.

POSSIBLE REPAIRING

Possible Repairing Limitations:

In extreme driving conditions body parts will be subjected to strong vibrations and wind pressure or suction. Consequently only damage, which has no influence on the stiffness and strength of mounting points, may be repaired.

Example – Trunk Lid for E 30 / M 3 Cars:

Broken off or torn corners and damage on the outer panel may be repaired. Repairs may not be carried out on the supporting inner panel elements and threaded inserts of mounting points. Replace a part when in doubt.

Repairing glass fiber reinforced plastic parts will considerably depend on the type of damage, preparation of the damaged zones and qualification as well as perfection of the work. It is recommended to practice repairs on parts no longer required in order to have sufficient experience.

The company approved ultraviolet hardening repair system* is distinguished by the following advantages in application as compared with conventional two-component resins.

1. Single component system, no mixing or mixing errors.
2. No waste, since excessive material will not hardened when not subjected to light and can be reused.
3. Very long application time in closed rooms (only slight influence from light entering the room through closed windows); fast hardening after ultraviolet radiation (direct sunshine, ultraviolet lamp*).
4. Glass sheets pre-impregnated, no air inclusions.
5. Easy moulding of impregnated glass sheets without dirtying hands.
6. Uniform handling of entire repair system from resin to finish filler.
7. Brushes and other tools can be stored until needed again without washing them when light is kept off of them (covered with aluminum foil, placed in boxes, or in a similar manner).

Tool Requirements:

Hand tools and equipment already used for working with sheet metal can be applied as material removing tools. It is only necessary to purchase an ultraviolet lamp* required for hardening of the resin.
Cutting and grinding tools must be sharp and must not smear. The use of unsuitable tools will subject the material surface to excessive heat and cause "polished" spots. Only repair plastic parts at room temperature.

SAFETY PRECAUTIONS WHEN REPAIRING GLASS FIBER REINFORCED PLASTIC PARTS

Grinding dust must be removed on site with suitable extraction and a vacuum cleaner or machines with integrated extraction.
Protective goggles and a mask must be worn during grinding operations.

Conform with the following points when working with and storing polyester resins.

Personal Protective Equipment:

Gloves, goggles.

Working Hygiene:

Good ventilation and regular washing of hands; no contact with food.

First Aid:

Take off dirty clothes immediately. If dust has gotten in eyes, rinse out thoroughly with water and go to a physician. Dab coated skin and wash thoroughly with water and soap. If great amount of vapors are inhaled, go outdoors in the fresh air and, if necessary, visit a physician.

Information on Toxicology:

Systems containing styrol will irritate eyes, skin and the respiratory track. No damaging effects are known from decades of use as long as handling is correct.

Measures in Case of Fire:

Fire extinguishing agents: water mist (no water stream), powders, foam, CO_2 and halon.

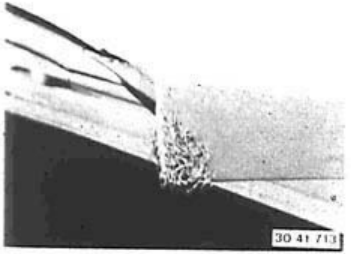
Scrapping:

Never let it get into drink water systems.
It can be brought to a normal refuse station after hardening.

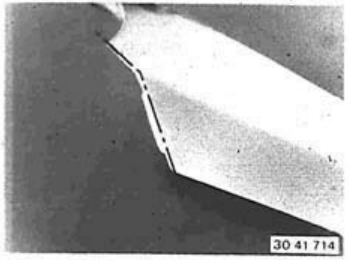
REPAIRING GLASS FIBER REINFORCED PLASTIC PARTS

Assumed Damage:
Damaged Corner on Trunk Lid;

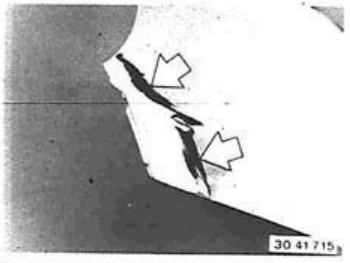
Note:
The following repairing instructions can only describe general procedures.
Procedures must be adapted to the pertinent type of damage.
See the introduction for additional information.



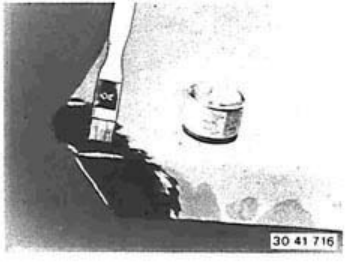
Grind off damaged corner until firm, non-fibrous laminate is visible.
Note:
Grind off that much further, if gasoline, oil or something similar has penetrated into the damaged area.

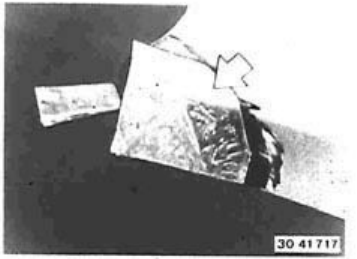


Grind mating surfaces in flat-flowing transition.
Note:
The plastic surface has a graphite coat to make it conductive for the painting method used in standard production.
Grind off the graphite coat outside of the damaged area.
Clean ambient area with atcetone.

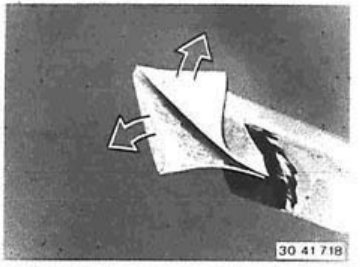


Coat mating surfaces with an adhesion agent.

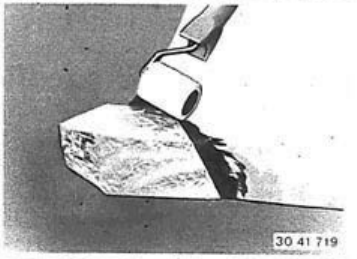




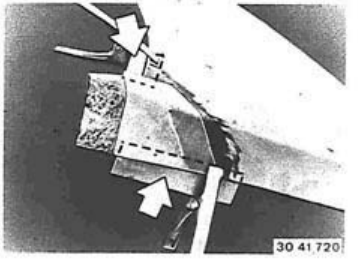
Remove repair bandage from aluminum foil and cut off to size.
Important!
Material hardens in sunshine.
Close aluminum bag immediatly to keep out light.



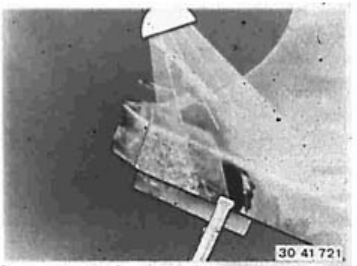
Pull off transparent plastic sheet on one side.



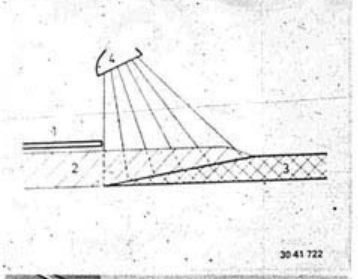
Place repair bandage on damaged surface and mold.
Press out air bubbles.
Use a rubber roller, if necessary.



If applicable, cover inside of damaged surface with the pulled off sheet and keep it stretched by applying strips of metal or plastic until hardening is finished.

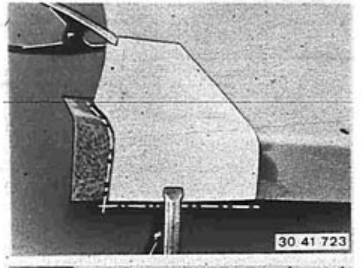


Aim an ultraviolet lamp on damaged surface.
The hardening time will depend on the lamp version, scope and strength of laminate.
Gain experience by making tests, if necessary.
Hardening time for 1 mm (0.039") coat = approx. 2 minutes.
Important!
Chemical reaction produces heat, which could lead to self-destruction of the laminate.
If necessary, interrupt the ultraviolet lamp treatment occassionally.

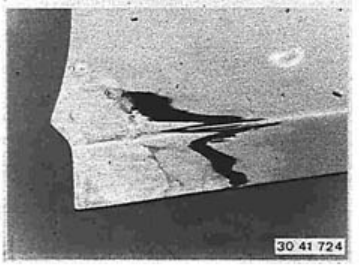


Note:
Ultraviolet radiation is only effective when applied direct. There is no hardening in zones of shade or on covered laminate. This can be exploited, in that some sections are covered and only certain surfaces are hardened, or are cemented. The remaining sections can then be molded and hardened separately.

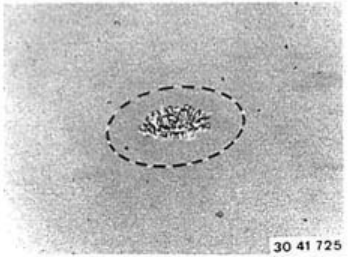
1 Cover
2 Repair material
3 GFP part
4 Ultraviolet lamp



Pull off foil.
Build up laminate to final thickness by cutting repair bandages to size, hardening and grinding inbetween as necessary.
Important!
Remove foil between layers. Harden the laminate with an ultraviolet lamp. Transfer the edge shape with a paper template from the other side.



Grind inside and outside of repaired area.
Remove irregularities with a glass fiber putty.

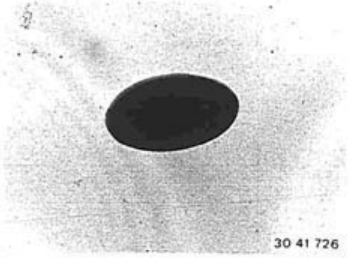


30 41 725

REPAIRING GLASS FIBER REINFORCED PLASTIC PARTS

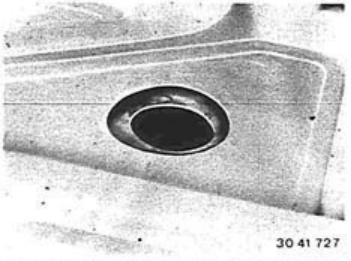
Assumed Damage:
Hole or Damaged Laminate in Outer Trunk Lid Panel Between Reinforcement Ribs:

Note:
The following repairing instructions can only describe general procedures.
Procedures must be adapted to the pertinent type of damage.
See introduction for additional information.



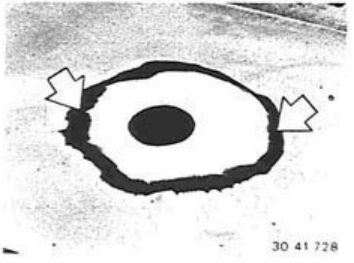
30 41 726

Cut out damaged area until firm, non-fibrous laminate is visible.
Note:
Grind off that much further, if gasoline, oil or something similar has penetrated into the damaged area.



30 41 727

Note:
The trunk lid consists of inside and outside panels.
If both panels are damaged, cut out the damaged area on the inside a little larger.

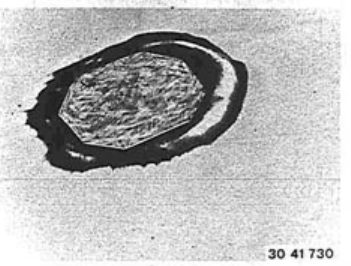


30 41 728

Grind mating surfaces in flat-flowing transition.
Note:
The plastic surface has a graphite coat to make in conductive for the painting method used in standard production.
Grind off the graphite coat outside of the damaged area.
Clean ambient area with atcetone.

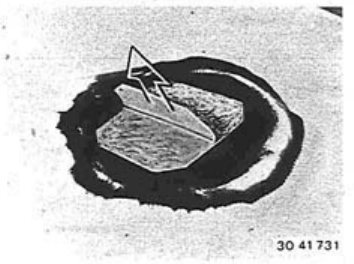
30 41 729

Coat mating surfaces with an adhesion agent.



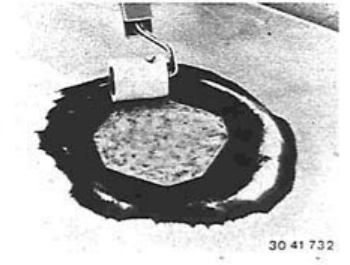
30 41 730

Remove repair damage from aluminum foil and cut off to size.
Important!
Material hardens in sunshine.
Close aluminum bag immediately to keep out light.



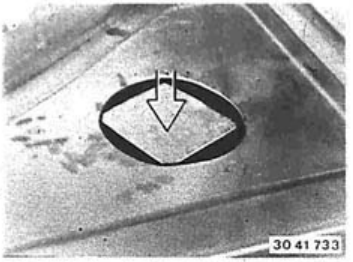
30 41 731

Pull off transparent plastic sheet on one side.

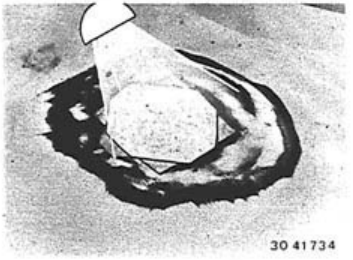


30 41 732

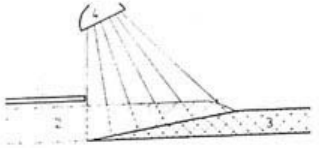
Place repair bandage on the damaged surface and press on all around.
Press out air bubbles.
Use a rubber roller, if necessary.



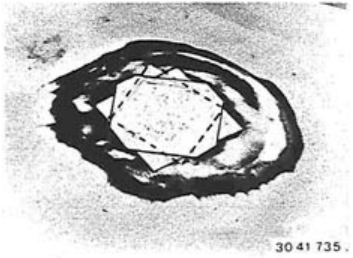
Note:
In case of large damage, cover the inside of the hole with the pulled off sheet and hold it with a piece of metal or something similar until hardening is finished.



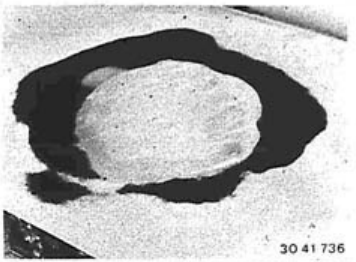
Aim an ultraviolet lamp on the damaged surface.
The hardening time will depend on the lamp version, scope and strength of laminate.
Gain experience by making tests, if necessary.
Hardening time for 1 mm (0.039") coat = approx. 2 minutes.
Important!
Chemical reaction produces heat, which could lead to self-destruction of the laminate.
If necessary, interrupt the ultraviolet lamp treatment occassionally.



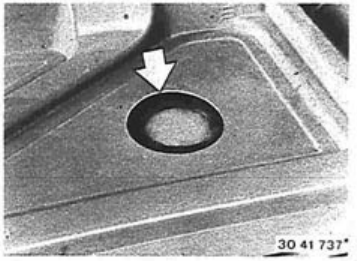
Note:
Ultraviolet radiation is only effective when applied direct. There is no hardening in zones of shade or on covered laminate. This can be exploited, in that some sections are covered and only certain surfaces are hardened, or are cemented. The remaining sections can then be molded and hardened separately.
1 Cover
2 Repair material
3 GFP part
4 Ultraviolet lamp



Pull off foil.
Build up laminate to final thickness by cutting repair bandages to size, hardening and grinding inbetween as necessary.
Important!
Remove foils between layers.
Harden the laminate with an ultraviolet lamp.



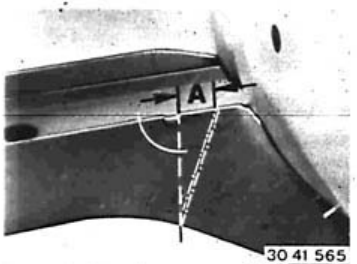
Grind the repaired area.
Remove irregularities with a glass fiber putty.



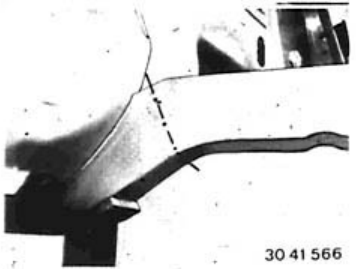
Repair the inside panel to the instructions for the outside.

41 11 011/ 001 REPLACING RIGHT / LEFT FRONT ENGINE CARRIER (PARTIAL REPLACEMENT) WITH WHEEL HOUSE – All Wheel Drive –

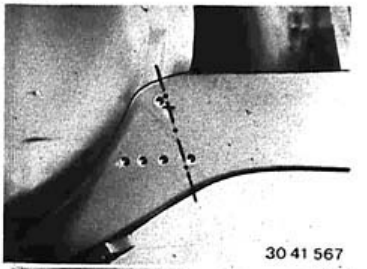
Refer to information on page 41 - 001.
Remove or disconnect following parts:
ground lead on battery, bumper, wheel house trim top and bottom, all radiator grill sections, engine hood lock, engine hood release, front spoiler, all headlights, front fog lamps if applicable, both bumper brackets, horns, heater wall seal, entrance cover strips, front seat, instrument panel trim, carpet on A pillar, passenger compartment carpets partially, footwell insulation sheet partially, brake booster with brake master cylinder if applicable, fuel filter, ignition coil, brake lines partially, engine, front axle with transmission, engine compartment wires partially, radiator trim, data plate.
Check and adjust front wheel alignment.
Remove both side panels.
Remove front panel with front wall – see 41 33 001.
Remove wheel house – see 41 14 021.
Note:
If the console holding the ABS acceleration pick-up is straightened or welded on the left wheel house, the acceleration pick-up must be adjusted afterwards.
See Group 34 (ABS – All Wheel Drive) for adjusting procedures.



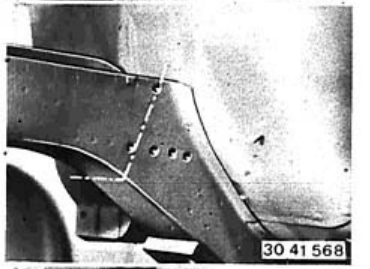
Mark cut according to sketch.
A = 30 mm (1.181")



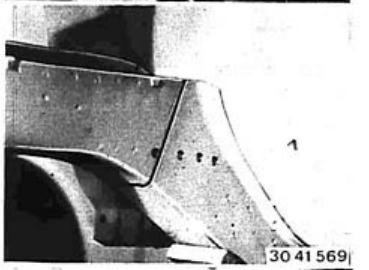
Transfer determined cut to outside.



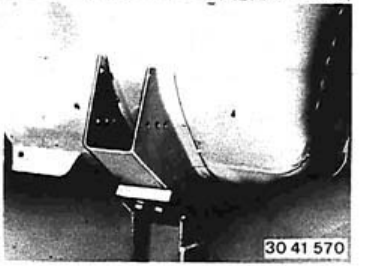
Drill out spot welds.



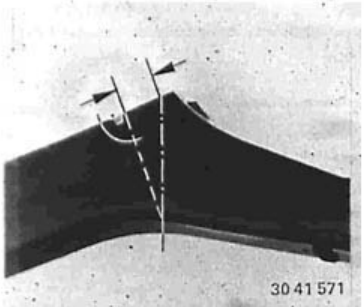
Drill out spot welds.



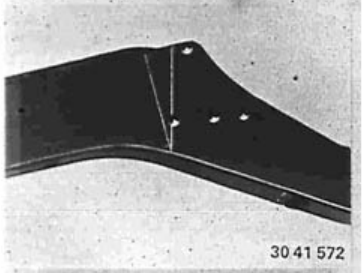
Cut through engine carrier on side and bottom.
Important!
Be careful not to damage metal sheet on inside.



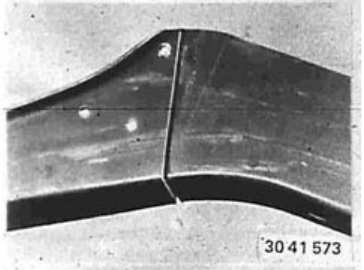
Lift off engine carrier front section.
Straighten and grind mating surfaces.



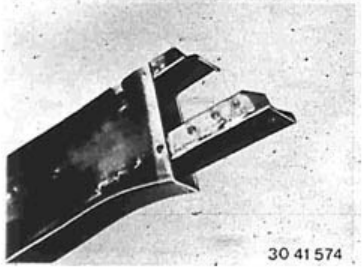
Transfer cut to new engine carrier.
Note:
Consider width of joint.



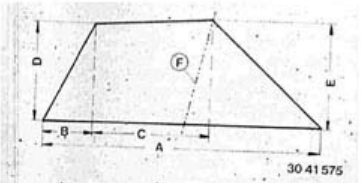
Drill out spot welds on inside and outside.



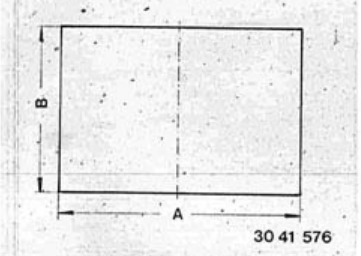
Cut through engine carrier on side and bottom.
Important!
Be careful not to damage sheet metal on inside.



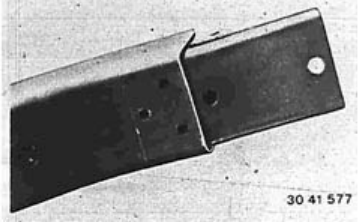
Straighten and grind mating surfaces.



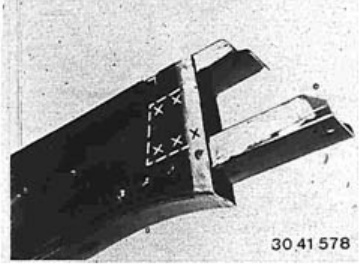
Prepare two sheet metal reinforcements for sides to sketch.
Sheet metal thickness = 1.8 mm (0.071").
A = 120 mm (4.724")
B = 21 mm (0.827")
C = 50 mm (1.968")
D = 44 mm (1.732")
E = 47 mm (1.850")
F = Cutting line on engine carrier



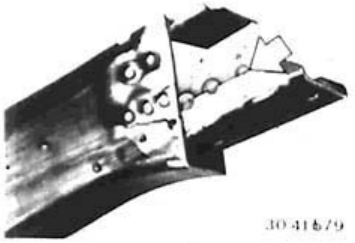
Prepare sheet metal reinforcement for bottom to sketch.
Adapt to curvature of carrier.
Sheet metal thickness = 1.8 mm (0.071").
A = 55 mm (2.165")
B = 80 mm (3.150")



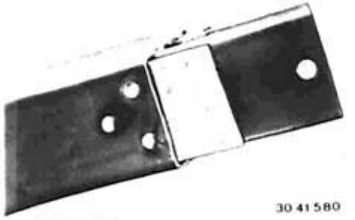
Mark location of and drill holes for plug spot welding in new engine carrier.



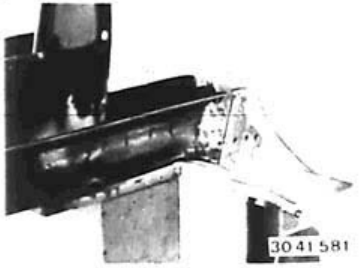
Match shape of reinforcement plates on inside and outside of new engine carrier.
Drill holes for plug spot welding.



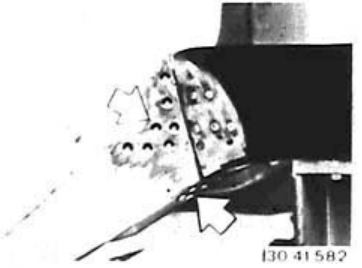
Slide in reinforcement plates half their distance and plug spot weld.
Tack weld ends on available reinforcement slightly.



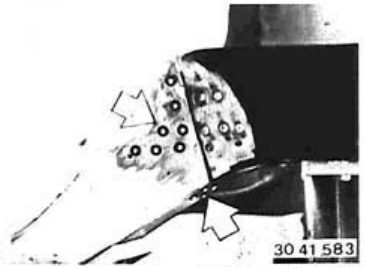
Slide in bottom reinforcement plate half its distance and plug spot weld.



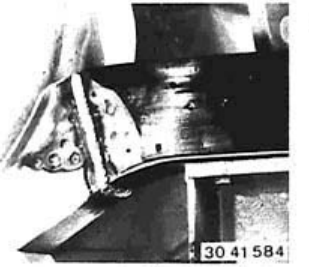
Set up car on straightening bench.
Fit in engine carrier.



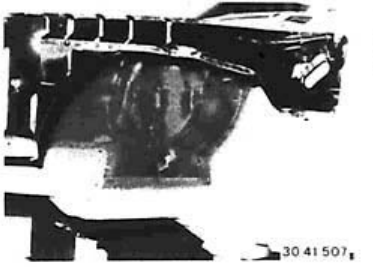
Drill holes for plug spot welding in area of reinforcements.
Note:
Reinforcement plates must bear on engine carrier.



Plug spot weld all reinforcements through provided holes.



Inert gas weld the joint.



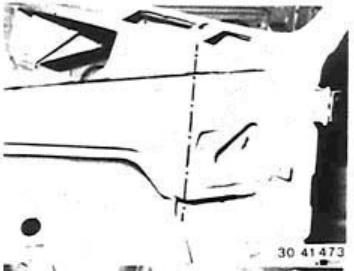
Install wheel house and front wall.
Coat all joints with body sealing compound*
Spray out wheel house with anti-drumming compound*

* See Specifications

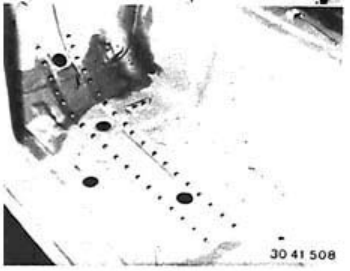
41 11 015 REPLACING LEFT FRONT ENGINE CARRIER (WITH WHEEL HOUSE)

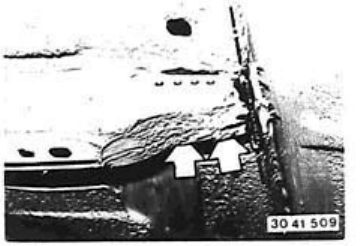
Refer to information on page 41 - 001.
Remove or disconnect following parts. Battery on ground pole, bumper, upper and lower wheel house trim panels, all radiator grill sections, engine hood lock and catch, front spoiler, all headlights, front fog lamps when applicable, both bumper brackets, two-tone horns, heater wall seal, entrance cover, front seat, dashboard trim panel; carpet on A pillar, carpet in passenger compartment partially, footwell insulation sheet partially, brake booster with master cylinder, fuel filter, ignition coil, brake pipes partially, engine, front axle with transmission, engine wire harness partially, radiator trim panel and data plate.
Remove both side panels.
Remove front panel with front wall – see 41 33 001.
Installation:
Check and adjust front wheel alignment.

Remove wheel house – see 41 14 021.

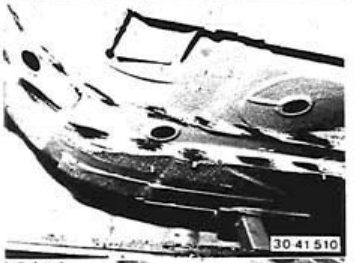


Uncover spot welding seams on inside of car.
Drill off welding spots.

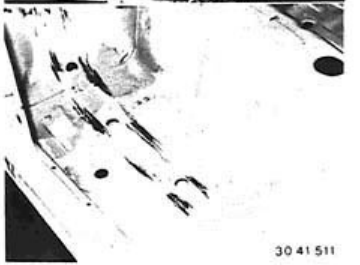




Uncover points of connection on end of engine carrier.
Drill off welding spots.
Grind off welding seam.
Remove engine carrier.



Straighten and grind points of connection.

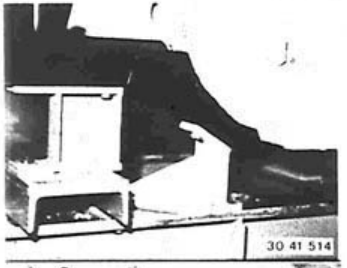


Straighten and grind points of connection.

Grind points of connection on new engine carrier.

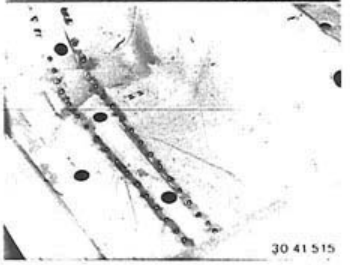
30 41 513

Drill holes for plug spot welding in engine carrier at rear.



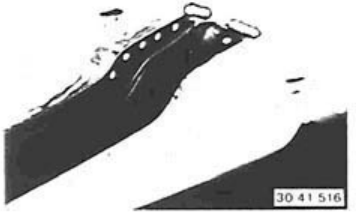
30 41 514

Set up car on straightening bench.
Install engine carrier.



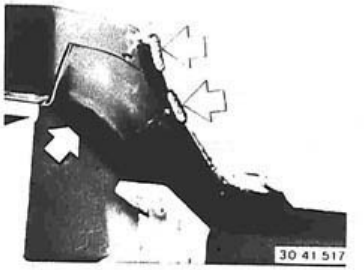
30 41 515

Plug spot weld engine carrier from the passenger compartment.



30 41 516

Plug spot weld engine carrier at rear on sides.
Weld rear with two inert gas welding seams.



30 41 517

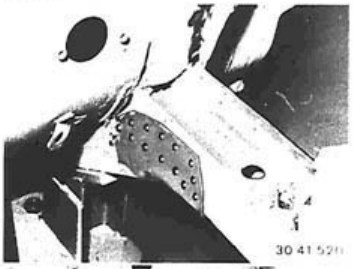
Seal engine carrier on inside and outside of separating wall with short inert gas welding seams.

Install wheel house – see 41 14 021.
Seal all welding seams with joint sealing compound*.
Replace damaged anti-drumming compound*.

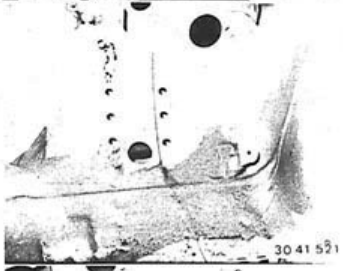
* Source: HWB

41 11 026 REPLACING ENGINE CARRIER FRONT SECTION AND LEFT FRONT CENTER SECTION (WITH WHEEL HOUSE)

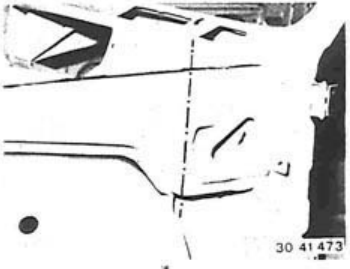
Refer to information on page 41 - 001.
Remove or disconnect following parts:
ground lead on battery, bumper, upper and lower wheel house trim, all radiator grill sections, engine hood lock, engine hood release, front spoiler, all headlights, front fog lamps if applicable, both bumper brackets, horns, heater wall seal, entrance cover strip, front seat, instrument panel trim, carpet on A pillar, passenger compartment carpets partially, footwell insulation sheet partially, brake booster with brake master cylinder, fuel filter, ignition coil, brake lines partially, engine, front axle and transmission, engine compartment wire harness partially, radiator trim and data plate.
Check and adjust front wheel alignment.
Remove both side panels.
Remove front panel with front wall – see 41 33 001.



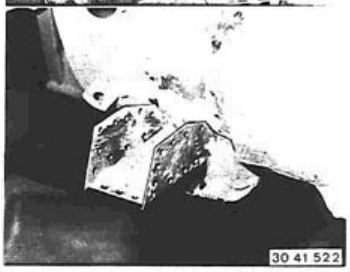
Make joint accessible.
Drill out spot welds.



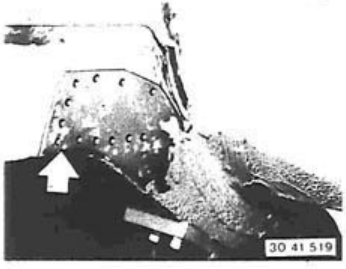
Drill out spot welds.
Lift off engine carrier.



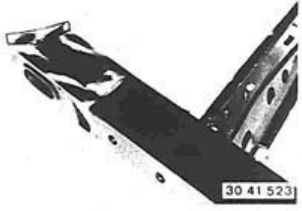
Remove wheel house – see 41 14 021.



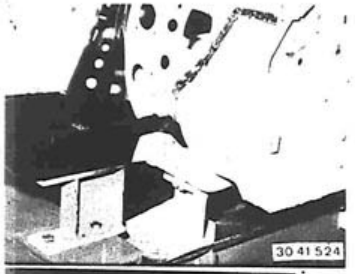
Straighten and grind mating surfaces.



Make joints accessible.
Drill out spot welds.

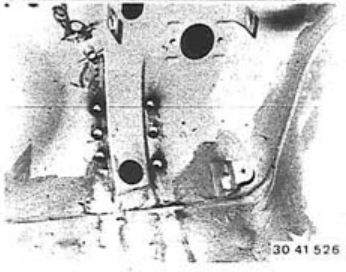


Grind mating surfaces on new engine carrier.



Set up car on straightening bench.
Set up engine carrier.

Plug spot weld engine carrier through provided holes.



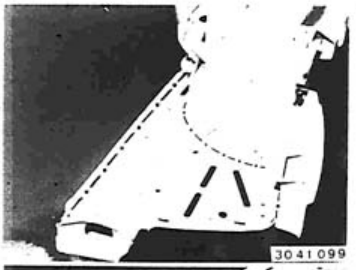
Plug spot weld engine carrier through provided holes.

Install wheel house – see 41 14 021.
Seal all welding seams with joint sealing compound*.
Replace damaged anti-drumming compound*.

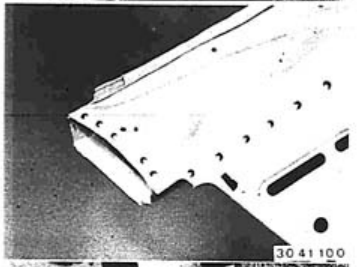
* Source: HWB

41 11 043/044 REPLACING LEFT/RIGHT ENGINE CARRIER FRONT SECTION WITHOUT WHEEL HOUSE

Refer to information on page 41 - 001.
Remove or detach following parts.
Disconnect battery ground lead.
Remove grill, headlights, front fog lights, two-tone horns, engine hood lock, data plate and radiator.
Disconnect wire harness partially.
Remove engine hood complete with hinges, see 41 61 000 / 41 61 050.
Remove front bumper, see 51 11 000.
Remove both front side panels, see 41 35 000.
Remove front panel complete with front wall, see 41 35 000.

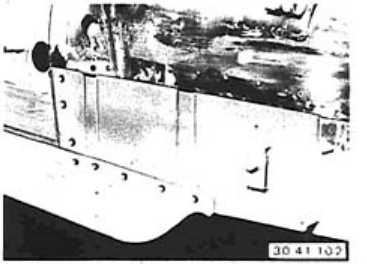


Cut out cover along line.

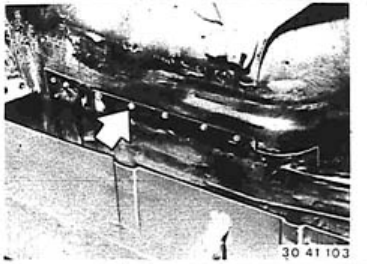


Drill off welded spots.

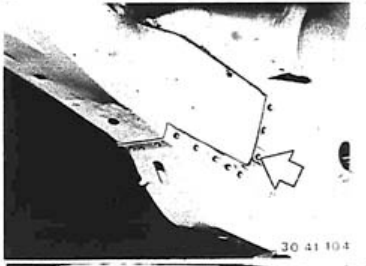
Cut off holder.



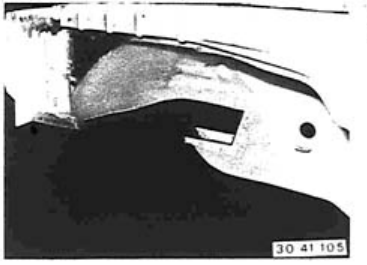
Drill off welded spots.



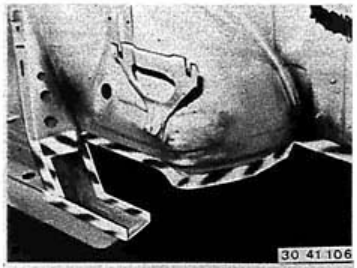
Drill off welded spots.



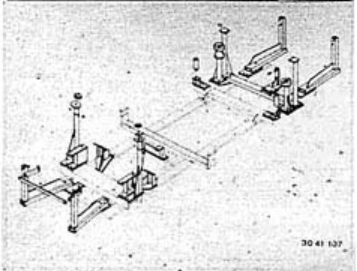
Drill off welded spots.
Remove engine carrier front section.



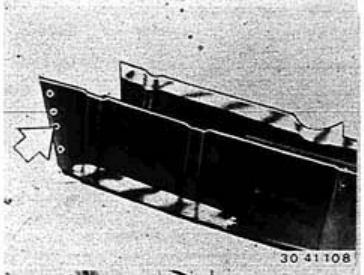
Remove scrap metal.
Straighten and grind mating surfaces.



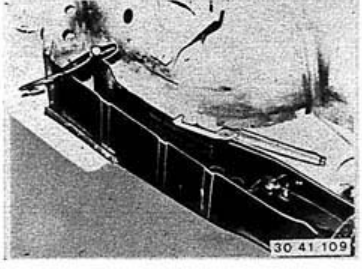
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.



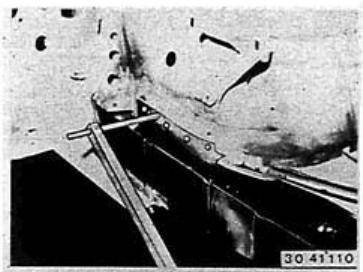
Set up car on straightening bench.



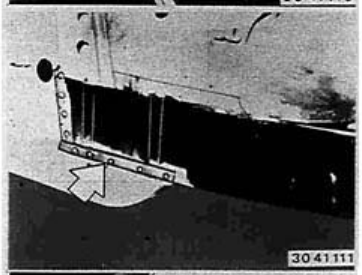
Grind and coat mating edges on new engine carrier front section with zinc dust paint.
Drill holes for plug spot welding in area of wheel house support.



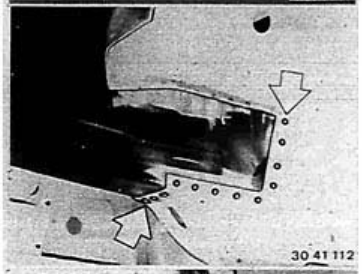
Install and clamp new engine carrier front section.



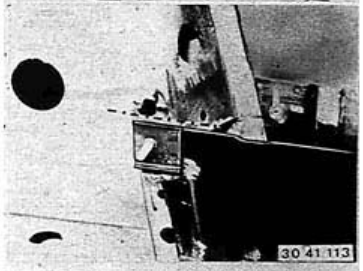
Spot weld engine carrier front section on wheel house.



Inert gas plug weld engine carrier front section on wheel house support and engine carrier.

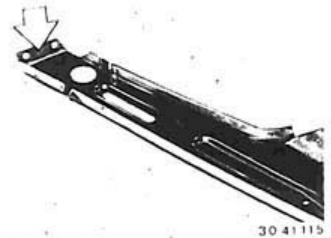


Inert gas plug weld engine carrier and wheel house from outside.

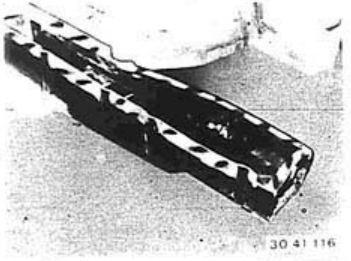


Weld on holder.
Check position.

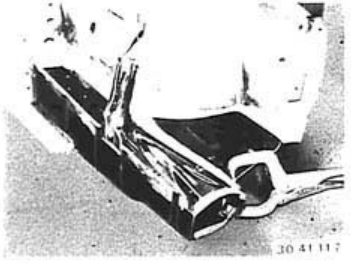
Grind and coat mating surfaces on cover plate with zinc dust paint.



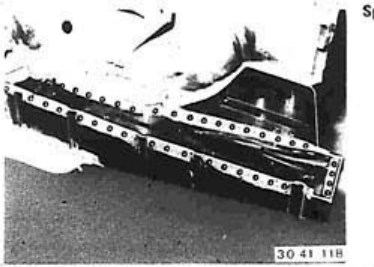
Drill holes for inert gas plug welding in wheel house/support joint.



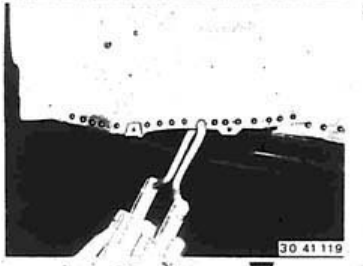
Grind and coat mating surfaces with zinc dust paint.



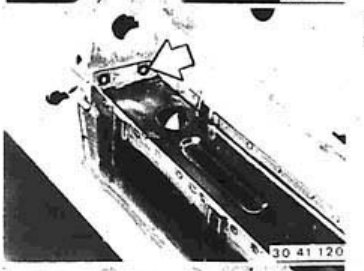
Install and clamp end plate.



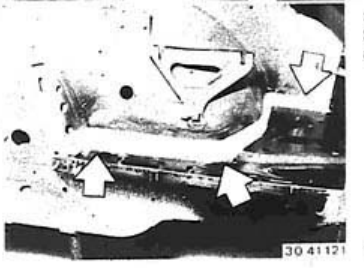
Spot weld end plate.



Spot weld end plate on wheel house.



Inert gas plug weld end plate on wheel house support.

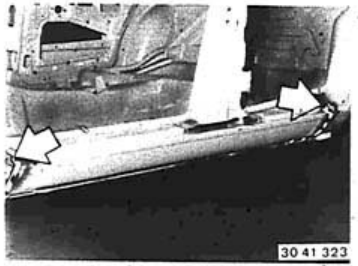


Seal joints with body sealing compound*. Spray out wheel house in engine acrrier with anti-drumming compound*.

* Source: HWB

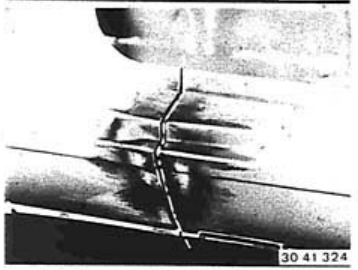
41 11 101 REPLACING LEFT OR RIGHT SIDE MEMBER COVER – Four Door Model –

Refer to information on page 41 - 001.
Remove or disconnect following parts: rear door, front seat, B pillar plate, seat belt, entrance cover strip, front and rear cover plates, front and rear door edge guards partially, carpet partially, rear seat cushion, mounting parts, strut and fuel tank.



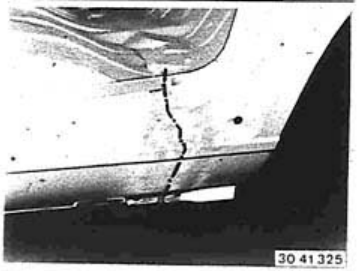
30 41 323

Uncover connections.
Remove brazing solder.



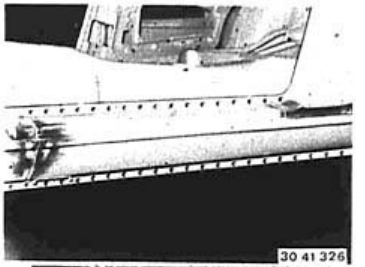
30 41 324

Cut through cover at front.



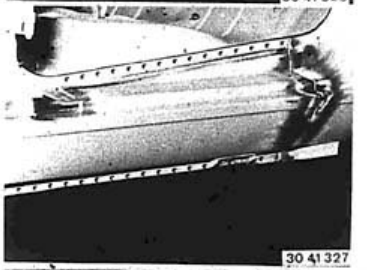
30 41 325

Cut through cover at rear.



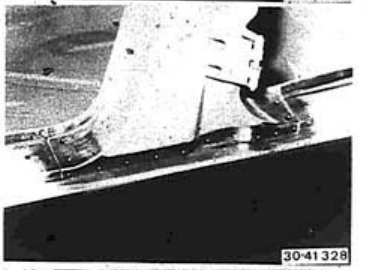
30 41 326

Drill out spot welds.



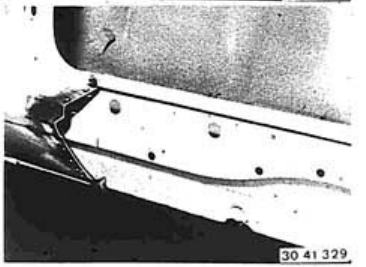
30 41 327

Drill out spot welds.



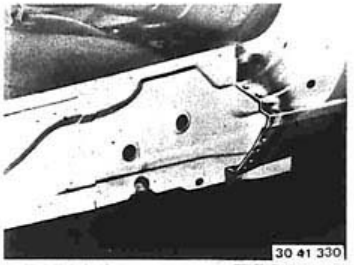
30 41 328

Drill out spot welds on B pillar.
Lift off cover.

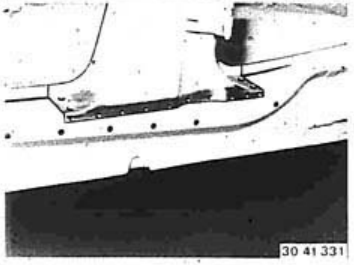


30 41 329

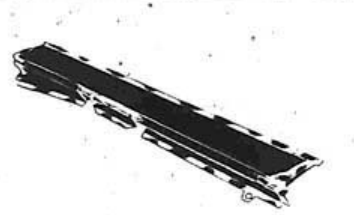
Drill off scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



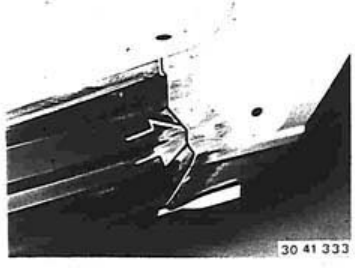
Drill off scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



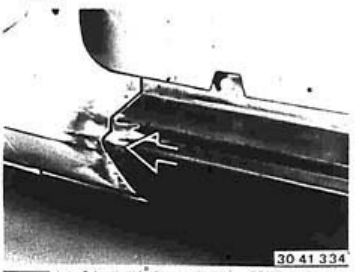
Straighten and grind mating surfaces on B pillar.



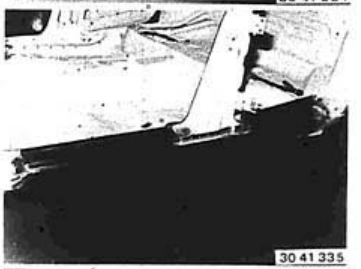
Grind mating surfaces on new cover.
Coat mating surfaces required for spot welding with zinc dust paint.



Slide rear end of new cover underneath side panel approx. 25 mm (1") further than necessary.
If necessary, drill out several spot welds on side panel.

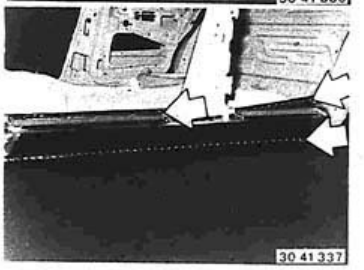


Push up cover at front and slide it underneath the A pillar connection.

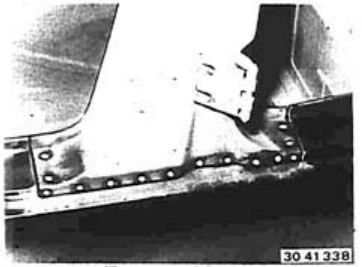


Straighten and tack weld cover.

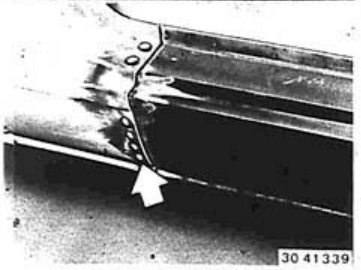
Install front and rear doors, and check gaps.



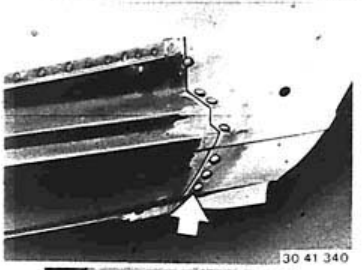
Spot weld cover at top and bottom.



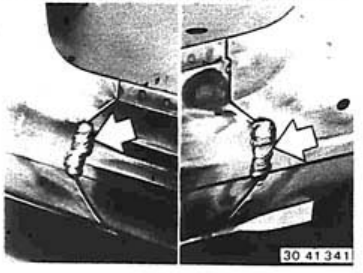
Plug spot weld B pillar connection.



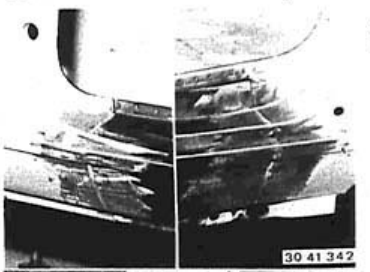
Plug spot weld A pillar connection.



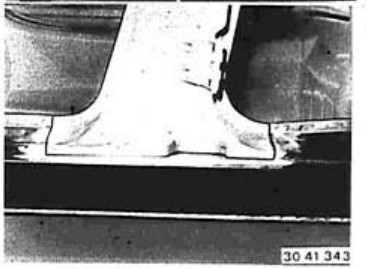
Plug spot weld C pillar connection.



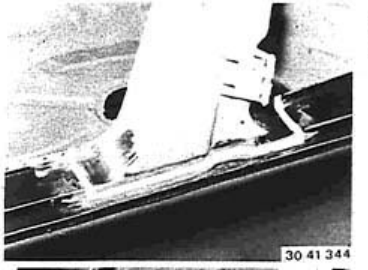
Braze edge for A pillar connection and C pillar butt joint.



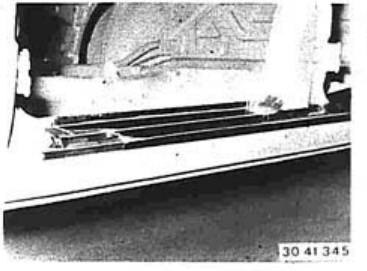
Grind down joints.
Tin out joints, if necessary.



Grind down joint.



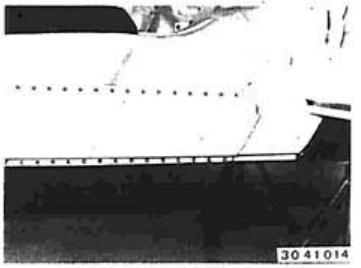
Coat joints on B pillar connection with joint sealing compound.



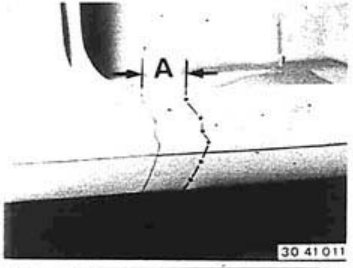
Spray anti-drumming compound on bottom of cover.

41 11 121 REPLACING COVER FOR LEFT OR RIGHT SIDE MEMBER (PARTIAL REPLACEMENT WITHOUT REMOVAL OF DOOR)

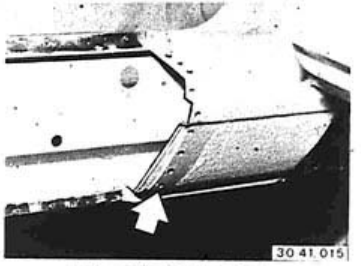
Refer to information on page 41 - 0.
Remove front seat 52 10 000.
Remove inner and outer entrance rail plates, edge guard of front door opening, and seat belt on entrance rail.
Fold back carpet partially.



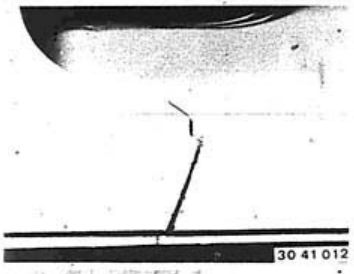
Drill out spot welds.
Lift off cover.



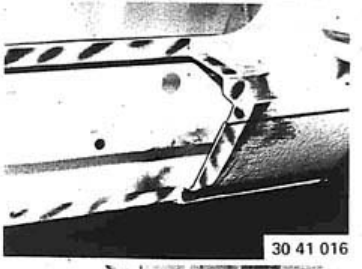
Mark cutting lines.
Cutting line must be at least distance A = 30 mm (1.181") away from B pillar connection.



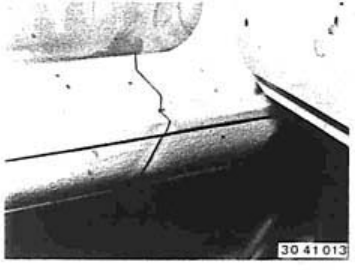
Drill out spot welds.
Remove scrap metal.
Note:
Cover is brazed along edge.



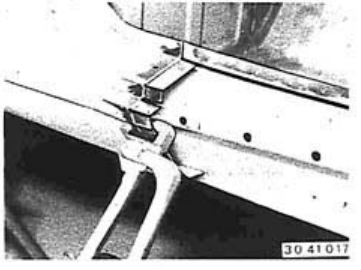
Cut-through cover.



Straighten and grind mating surfaces.
Coat surfaces for spot welding with zinc dust paint.

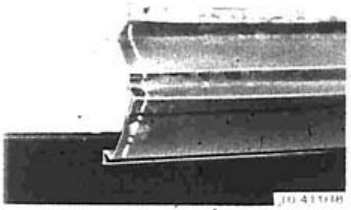


Cut through cover on connection of A pillar.

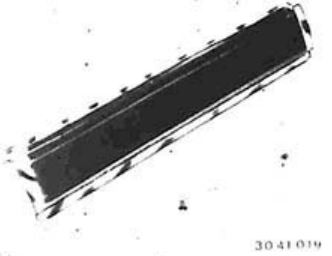


Make cut in rear of connecting surfaces and shoulder with a shouldering pliers.

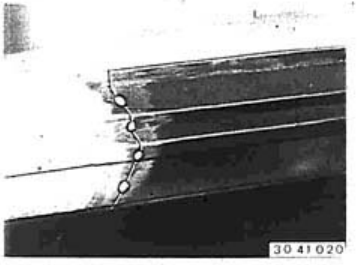
Cut new cover to size to match mating surfaces and fit in.



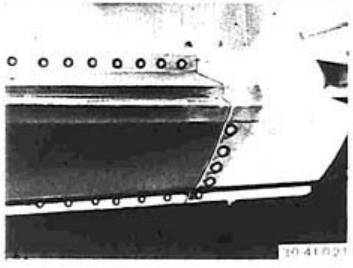
Grind mating surfaces.
Coat surfaces for spot welding with zinc dust paint.



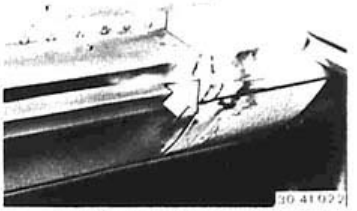
Insert and tack weld cover.



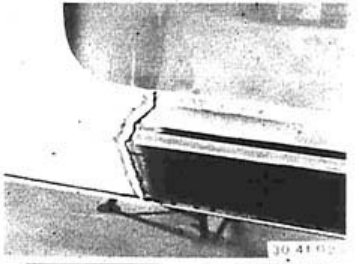
Spot weld cover at top and bottom.
Plug spot weld front through standard bores.



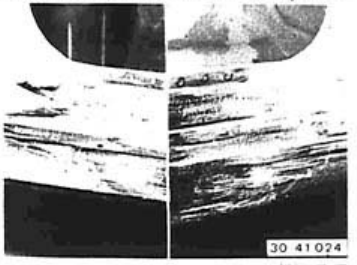
Braze gap on edge.



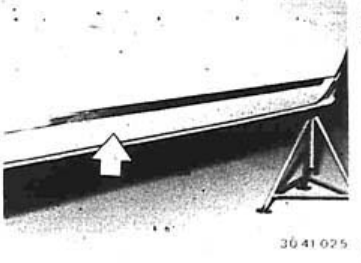
Inert gas weld rear of mating surface.



Grind and tin mating surfaces.



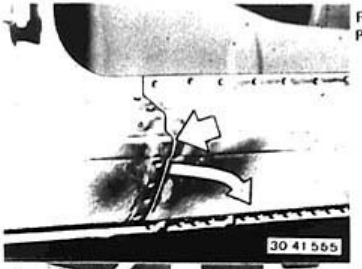
Spray an anti-drumming compound* on bottom of cover.



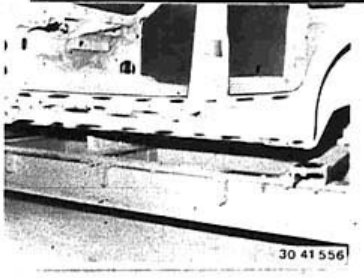
* Source: HWB

41 11 510 REPLACING COVER FOR LEFT OR RIGHT SIDE MEMBER (REAR SIDE PANEL REMOVED) – TWO DOOR MODEL –

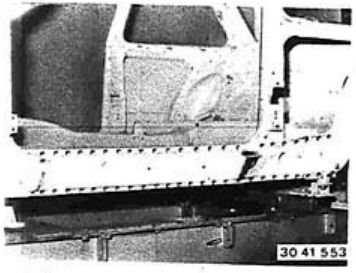
Refer to information on page 41 - 001.
Remove or disconnect following parts:
ground lead on battery, rear bumper, left tail light assembly, trunk mats, wall trim, left wheel house trim, tail panel trim, trunk lid seal, rear window complete with rubber frame, side window, rear seat cushion and backrest, front seat, side trim panel, hatrack, entrance cover strip, front door pillar carpet, passenger compartment carpets partially, roof liner partially, seat belt, door pillar trim, front door seals, door striker, C pillar air extraction mask, rear side panel rubbing strip, left wheel house cover, fuel tank complete, brace on floor assembly and wire harness in trunk partially.



Remove brazing solder.
Pull out cover underneath front door pillar.

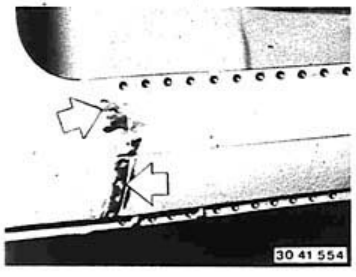


Straighten and grind mating surfaces.
Coat mating surfaces needed for spot welding with zinc dust paint.



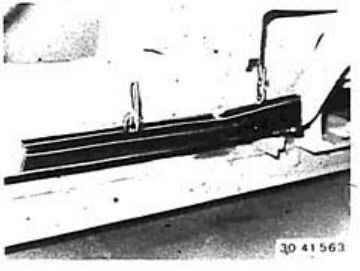
Remove side panel – see 41 35 101.
Make joints accessible.
Drill out spot welds.

Grind mating surfaces on new cover.
Coat mating surfaces needed for spot welding with zinc dust paint.

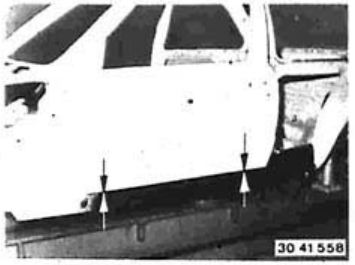


Drill out spot welds.

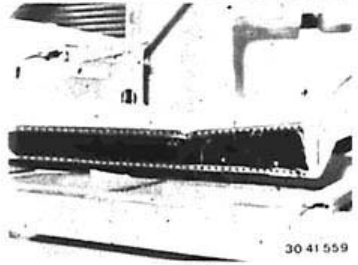
30 41 557



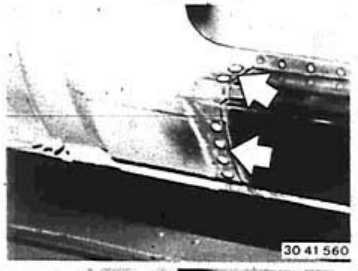
Set up and clamp cover.



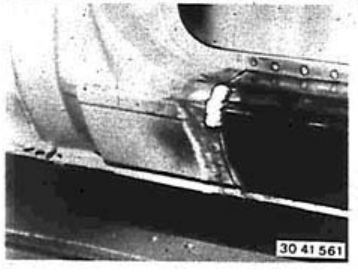
Install door and check gap.
Also clamp on rear side panel if necessary.



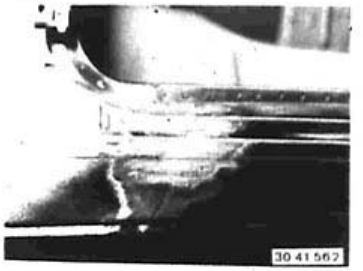
Spot weld cover.



Plug spot weld joint with door pillar.



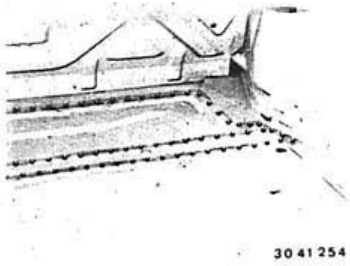
Braze joint along edge.



Grind down joints, tinning if necessary
Spray anti drumming compound on cover after installation of rear side panel

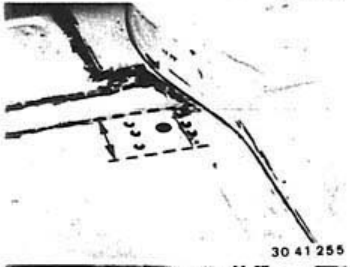
41 12 535 REPLACING TRUNK FLOOR PLATE ASSEMBLY –TAIL PANEL REMOVED

Refer to information on page 41 - 001.
Remove or disconnect following parts: final drive, right wheel house cover, fuel filler neck, complete fuel tank and, if applicable, heavy layer mat.



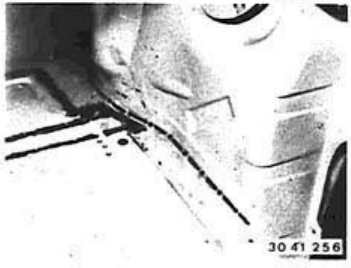
30 41 254

Clear mating surfaces.
Drill off welded spots.



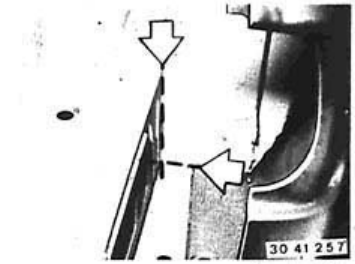
30 41 255

Drill off welded spots along side members toward rear by approx. 80 mm (3.150").



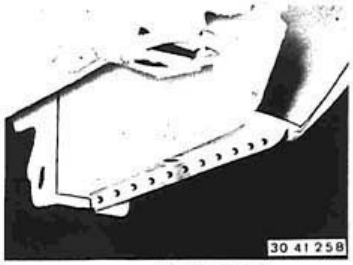
30 41 256

Cut off trunk floor plate on left and right wheel houses.



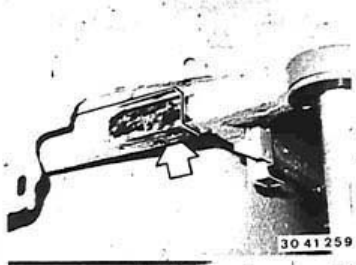
30 41 257

Cut off trunk floor plate on left and right wheel houses.



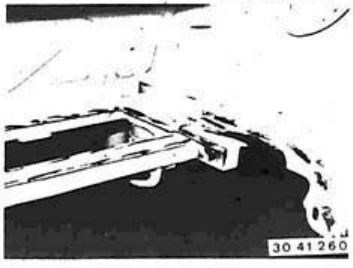
30 41 258

Clear and drill off welded spots.



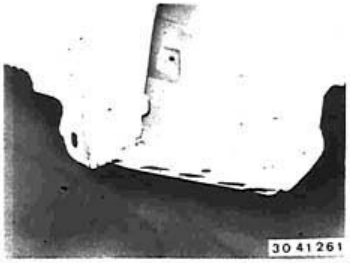
30 41 259

Clear mating surfaces of left and right side members.
Drill off welded spots.
Lift off trunk floor plate complete with side members.

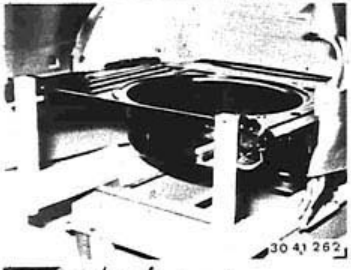


30 41 260

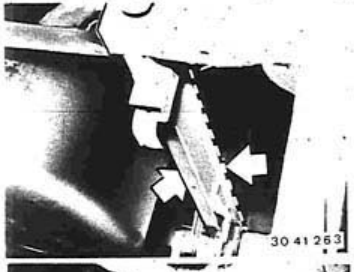
Remove scrap metal.
Straighten and grind mating surfaces.



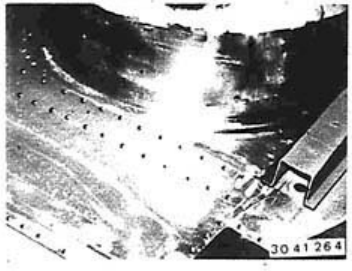
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.



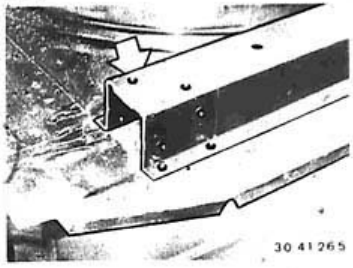
Set up car on straightening bench.
Fit in trunk floor plate.



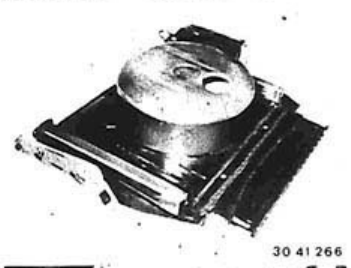
Mark location of cross member on trunk floor plate.



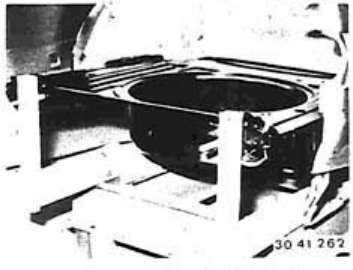
Lift off trunk floor plate.
Drill holes for plug spot welding in mating surfaces not accessible for spot welding.
Spacing of holes = 40 mm (1.575").



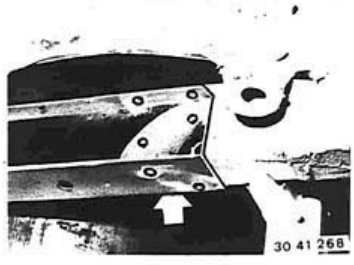
Drill holes for plug welding in mating surfaces of side members.
Note:
Drill holes on flange of side members through trunk floor plate as well.



Grind down all mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.

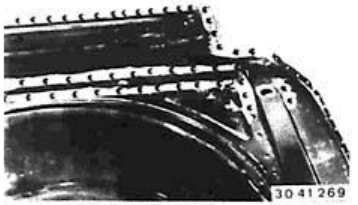


Install trunk floor plate and straighten according to straightening bench.

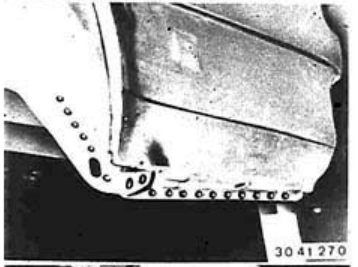


Plug spot weld both side members.

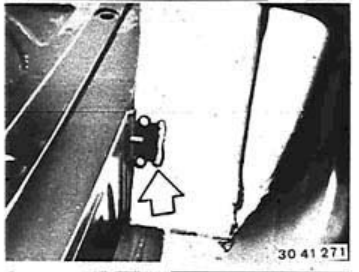
Plug spot weld front of trunk floor plate, on cross member, side members and wheel houses.



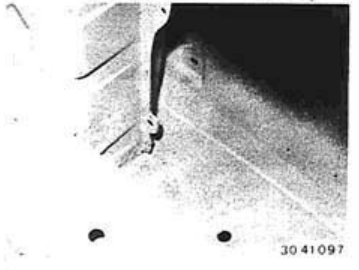
Spot weld cross panel on wheel houses.
Spot weld side panels.



Weld on reinforcement bracket.



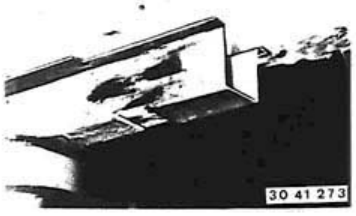
Install tail panel.
Seal off all joints at top and bottom with a body sealing compound*
Spray an anti-drumming compound* on underside of car, wheel houses and bottom of tail panel.



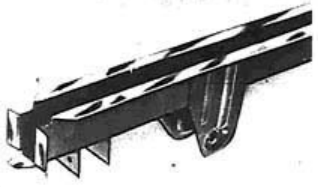
* Source: HWB

41 12 545 REPLACING CROSS MEMBER ON TRUNK FLOOR PLATE – TRUNK FLOOR PLATE REMOVED –

Refer to information on page 41 - 001.
Cut off cross member along line.

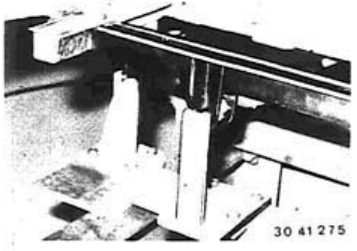


Remove scrap metal.
Straighten, grind and coat mating surfaces with zinc dust paint.

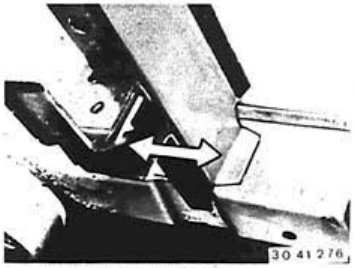


30 41 274

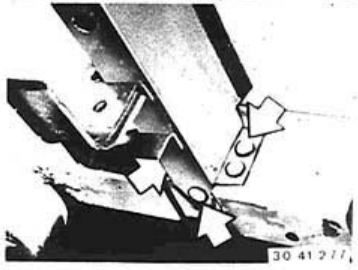
Grind mating surfaces on new cross member and coat with zinc dust paint.



Install cross member with straightening bench attachment and clamp.



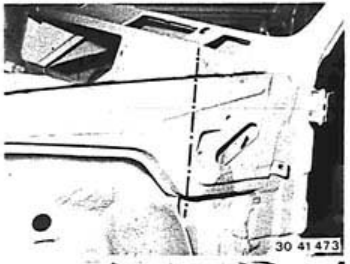
Align cross member in height, toward front and rear, according to seams in side members.



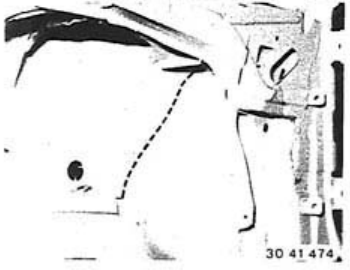
Spot weld cross member on left and right sides.

41 14 021 REPLACING LEFT FRONT WHEEL HOUSE

Refer to information on page 41 - 001.
Remove or disconnect following parts. Battery ground lead, bumper, upper and lower wheel house trim, all radiator grill sections, engine hood lock and catch, front spoiler, all headlights, if applicable front fog lamps, both bumper brackets, two-tone horns, heater wall seal, entrance cover strip, front seat, dashboard trim panel, carpet on A pillar, passenger compartment carpet partially, footwell insulation sheet partially, brake booster with master cylinder, fuel filter, ignition coil, brake pipes partially, engine, front axle with transmission, wire harness in engine compartment partially, radiator trim and data plate.
Unscrew both side panels.
Remove front trim panel with front wall – see 41 33 001.
Installation:
Check and adjust front wheel alignment.

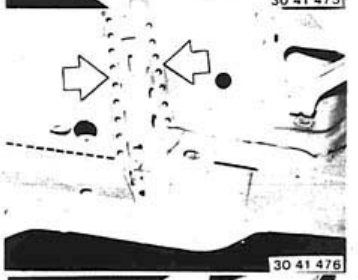


Cut off wheel house along line.

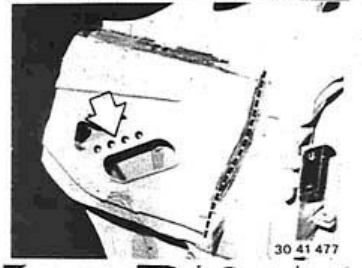


Cut off wheel house on engine compartment wall.

Cut off wheel house on end plate.

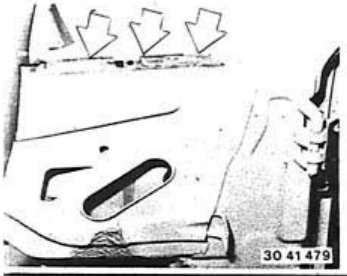


Cut off wheel house on engine carrier.
Drill off wheel house support.
Lift off wheel house.



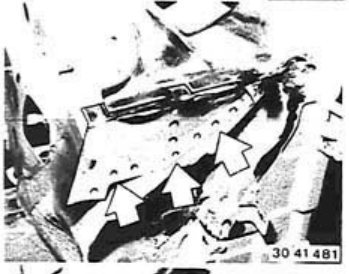
Drill off welding spots.
Grind off welding seams.

Remove joint sealing compound.
Drill off welding spots.



Remove brazing solder.
Lift off end plate.

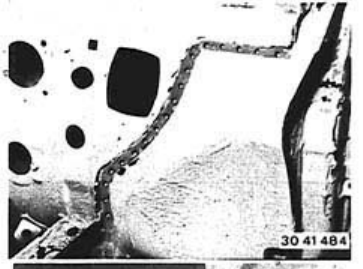
Cut off holder for end plate.



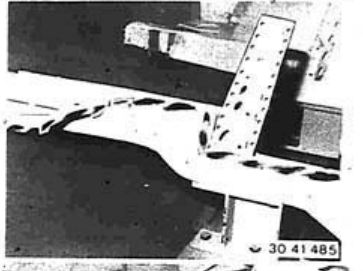
Drill out spot welds.
Remove scrap metal.

Remove scrap metal.
Straighten and grind mating surfaces.

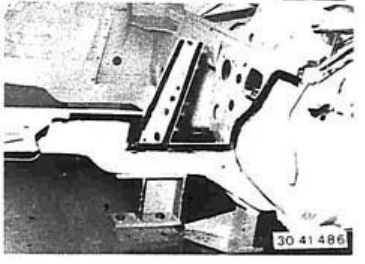
Remove scrap metal.
Straighten and grind mating surfaces.



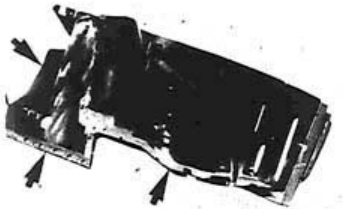
Drill holes for plug spot welding in area of engine compartment wall.



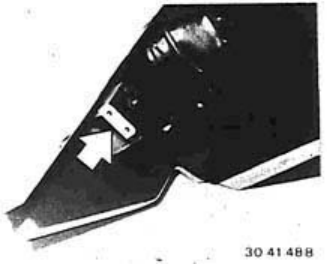
Remove scrap metal.
Straighten and grind mating surfaces.



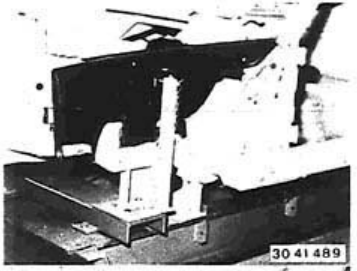
Coat all mating surfaces with zinc dust paint.



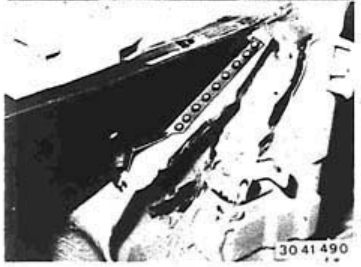
Grind and coat mating surfaces with zinc dust paint.
Drill holes for plug spot welding in area of engine carrier.



Drill holes for plug spot welding in holder for engine hood lock.



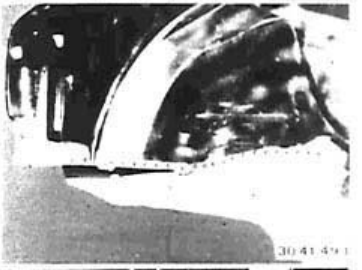
Set up car on straightening bench.
Install, align and tack weld new wheel house.



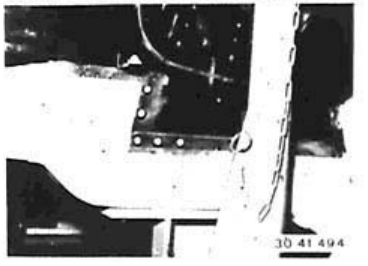
Spot weld wheel house on heater separating wall.

Plug spot weld areas not accessible for spot welding tongs.

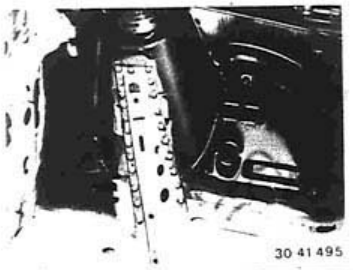
Spot weld wheel house on engine carrier.



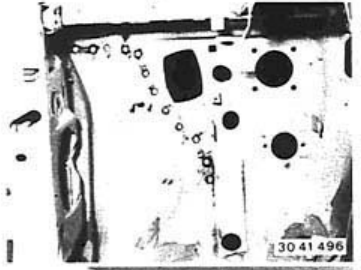
Spot weld wheel house on end plate



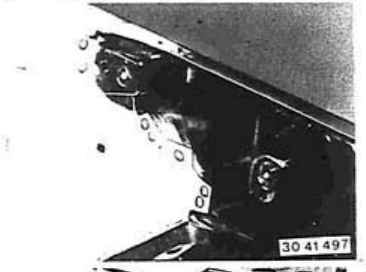
Plug spot weld wheel house through provided holes.



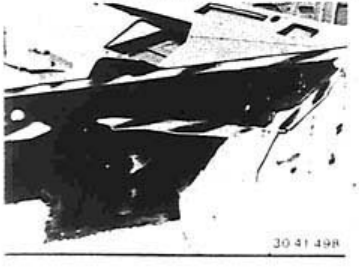
Plug spot weld support on wheel house.



Plug spot weld in area of engine compartment wall from the passenger compartment.

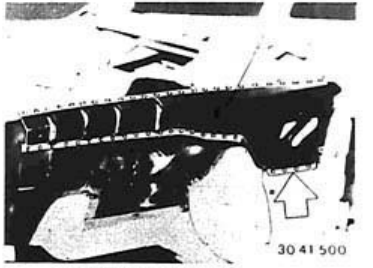


Plug spot weld engine hood lock holder and heater separating wall on wheel house.

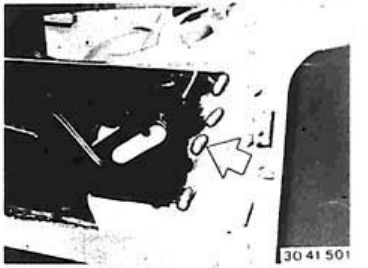


Grind mating surfaces for end plate.
Coat mating surfaces needed for spot welding with zinc dust paint.

Grind mating surfaces on end plate.
Coat mating surfaces needed for spot welding with zinc dust paint.

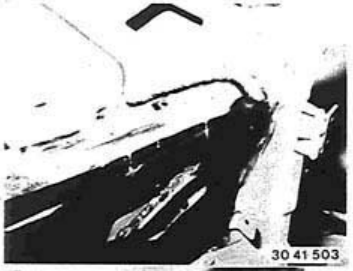


Install and spot weld end plate.

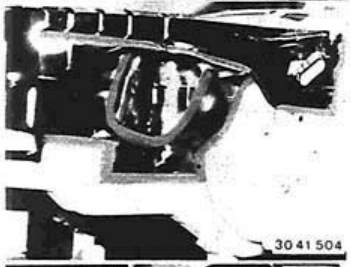


Inert gas weld end plate in A pillar area.

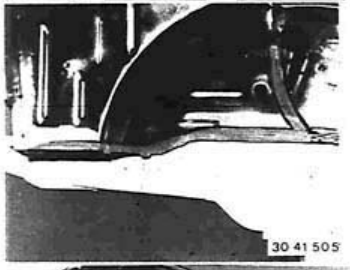
Plug spot weld the heater separating wall joint.



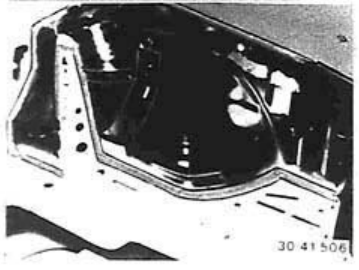
Braze wheel house and end plate on cowl panel.



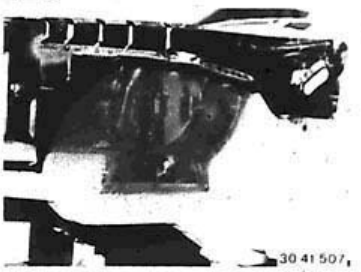
After Installation of Front Panel:
Seal mating surfaces with a body sealing compound.



Seal mating surfaces with a body sealing compound.



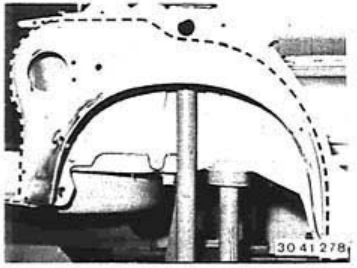
Seal mating surfaces with a body sealing compound.



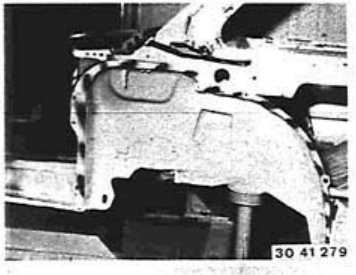
Spray out wheel house with an anti drumming compound.

41 14 132 REPLACING RIGHT REAR WHEEL HOUSE OUTER SECTION AND SIDE PANEL (PARTIAL REPLACEMENT UP TO WINDOW LINE)

Refer to information on page 41 - 001.
Replace right rear side panel (partial replacement up to window line) 41 35 291.

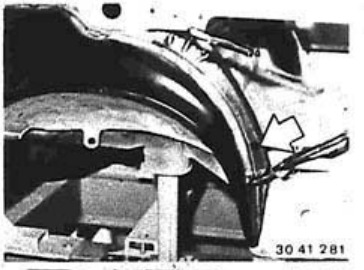


Drill off welded spots.
Lift off wheel house outer section.

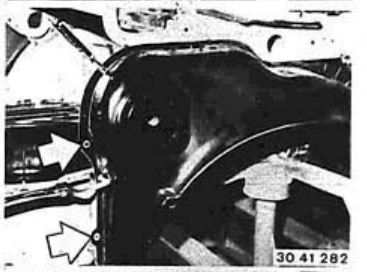


Straighten and grind mating surfaces.
Coat surfaces intended for spot welding with zinc dust paint.

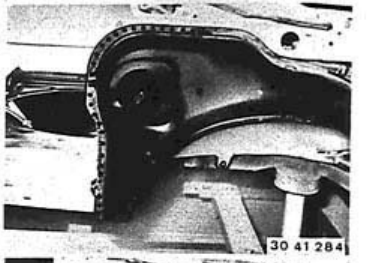
Grind and coat mating surfaces on new wheel house outer section with zinc dust paint.



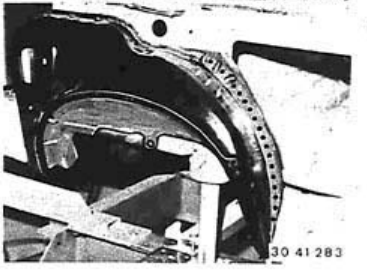
Clamp on wheel house outer section and align with dowel pin bores.



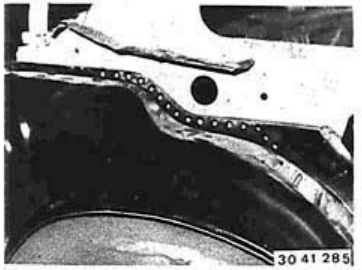
Clamp on wheel house outer section and align with dowel pin bores.
If applicable, tack weld wheel house outer section and install side panel to check.



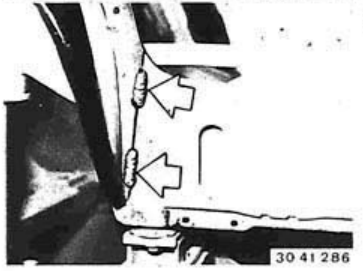
Spot weld wheel house outer section on inside.



Spot weld wheel house outer section on inside.



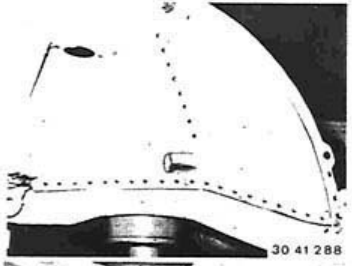
Plug spot weld mating surfaces not accessible for normal spot welding.



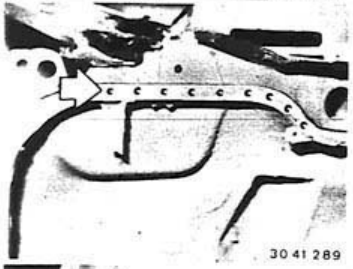
Inert gas weld wheel house outer section on cover for side member,

41 14 181 REPLACING RIGHT REAR WHEEL HOUSE ASSEMBLY AND SIDE PANEL

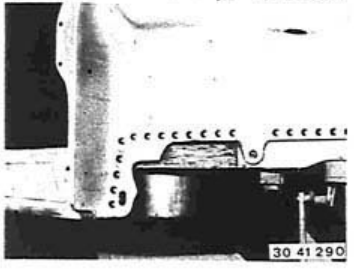
Refer to information on page 41 - 001.
Replace right rear wheel house outer section and side panel (partial replacement up to window line) 41 14 132.
Also remove rear axle carrier assembly or, if applicable, trailing arm assembly.



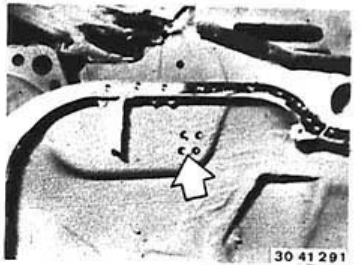
Clear and drill off welded spots.



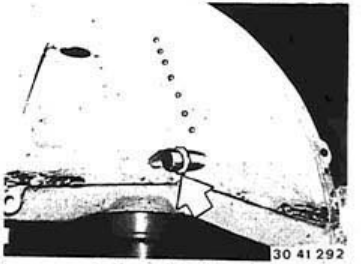
Clear and drill off welded spots.



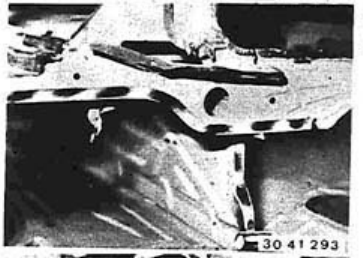
Clear and drill off welded spots.



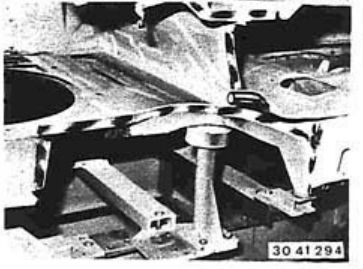
Drill off welded spots for hinge support



Remove brazing solder from tube for vent line.
Take off wheel house.



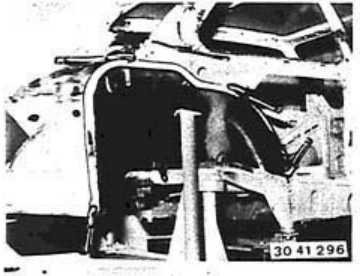
Straighten and grind mating surfaces.
Coat surfaces intended for spot welding with zinc dust paint.



Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.

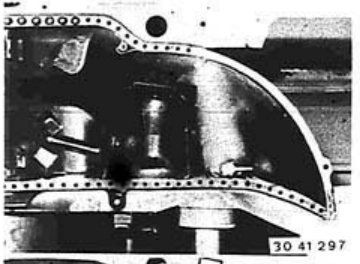
30 41 295

Grind mating surfaces on new wheel house inner section.
Coat mating surfaces intended for spot welding with zinc dust paint.



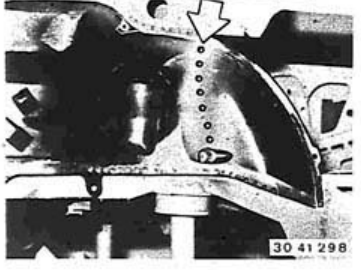
30 41 296

Set up car on straightening bench.
Fit in wheel house.



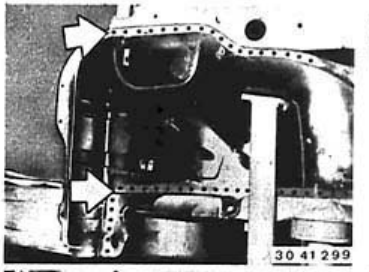
30 41 297

Spot weld wheel house.



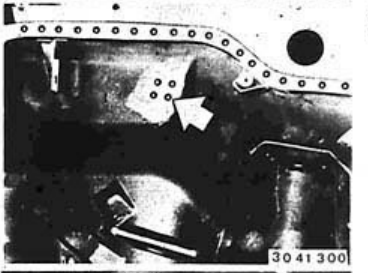
30 41 298

Spot weld wheel house.



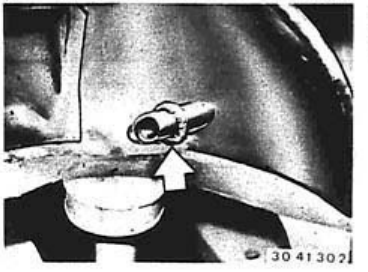
30 41 299

Spot weld wheel house.
Inert gas plug weld mating surfaces which are not accessible forspot welding.



30 41 300

Spot weld trunk lid hinge support or use plug spot welding when necessary.

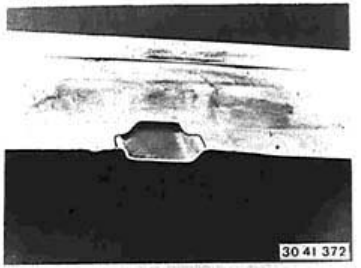


30 41 302

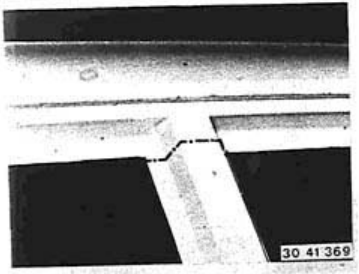
Braze tube for tank vent.
Grind and prepare mating surfaces for wheel house outer section.

41 21 051 REPLACING LEFT OR RIGHT CENTER DOOR PILLAR
— Four Door Model —

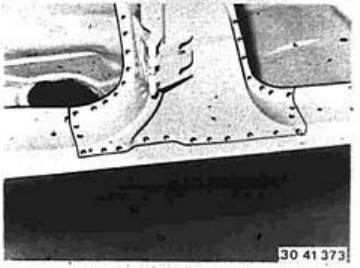
Refer to information on page 41 - 001.
Remove or disconnect following parts:
rear door, front seat, B pillar plate, seat belt, front and rear entrance cover strips and plates, front and rear door edge guards partially, carpet on entrance, roof liner partially, rear seat cushion and backrest.



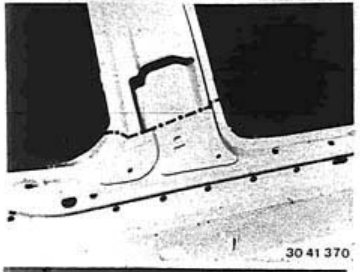
Remove scrap metal.
Straighten and grind mating surfaces.



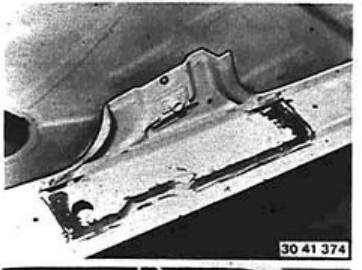
Saw through B pillar along line.



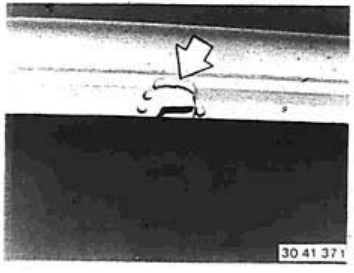
Drill out spot welds.
Lift off rest of B pillar metal on outside.



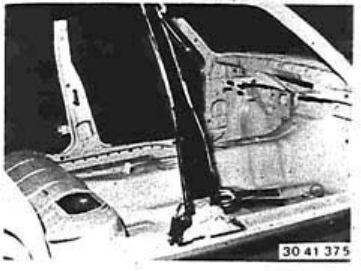
Saw through B pillar on cutting point in opening of end plate.



Remove scrap metal on end plate.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



Drill out spot welds.
Heat brazing solder.
Remove scrap metal.
Note:
Apply a coat of heat protecting paste on the roof and rain molding, to avoid any damage to the roof panel paint finish.



Grind and coat mating surfaces on end plate required for spot welding with zinc dust paint.
Install, align and tack weld end plate.

30 41 351

Grind mating surfaces on new B pillar.
Coat mating surfaces required for spot welding with zinc dust paint.

30 41 352

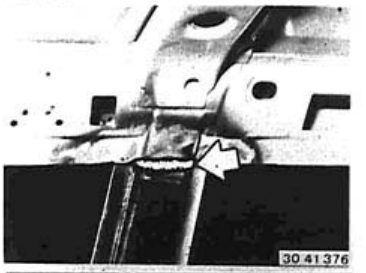
Drill holes for plug spot welding in mating surfaces required for plug spot welding.

30 41 353

Install and tack weld B pillar.

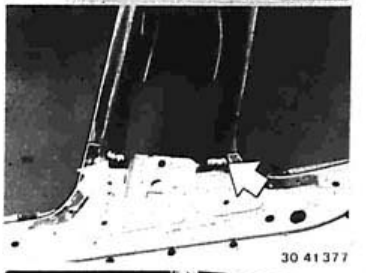
30 41 354

Install rear door and check gaps.



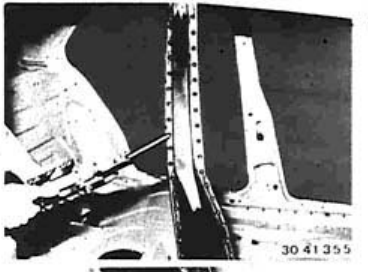
30 41 376

Inert gas weld end plate on roof frame.



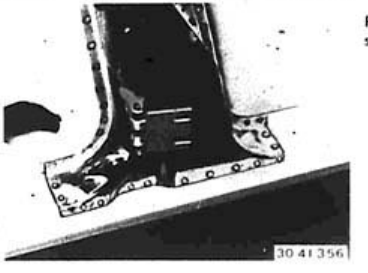
30 41 377

Inert gas weld end plate on connection at bottom.



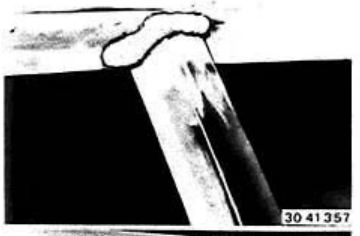
30 41 355

Spot weld B pillar on end plate.

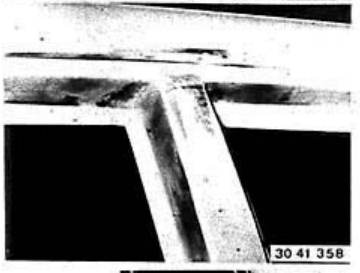


30 41 356

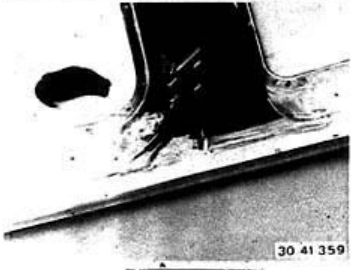
Plug spot weld connection on cover for side member.



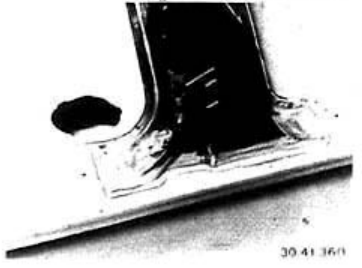
Braze connection on roof frame.
Note:
Apply a coat of heat protection paste on roof and rain molding, to avoid any damage to the roof panel paint finish.



Grind down joints.



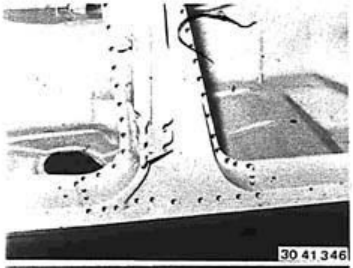
Grind down joints.



Coat joints on side member cover with a joint sealing compound.

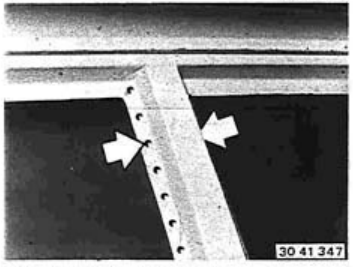
41 21 . . . REPLACING LEFT OR RIGHT CENTER DOOR PILLAR OUTSIDE SECTION
– Four Door Model –

Refer to information on page 41 - 001.
Remove or disconnect following parts: rear door, front seat, B pillar plate, seat belt, entrance cover strips and plates front and rear, front and rear door opening edge guards partially, carpet on entrance, roof liner partially, rear seat cushion and backrest.



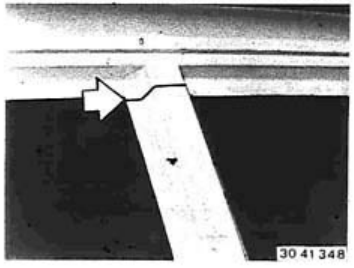
30 41 346

Drill out spot welds.



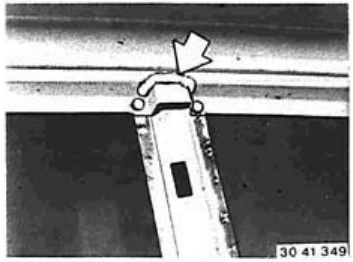
30 41 347

Drill out spot welds.



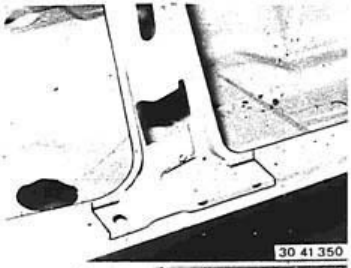
30 41 348

Saw through B pillar along line.
Caution!
Don't damage the end plate.
Lift off B pillar.



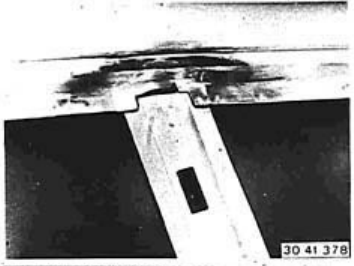
30 41 349

Heat brazing solder.
Remove scrap metal.
Note:
Apply a coat of heat protection paste on roof and rain molding, to avoid any damage to the roof panel paint finish.



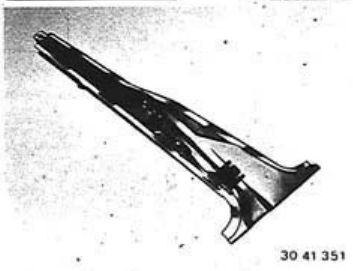
30 41 350

Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



30 41 378

Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



30 41 351

Grind mating surfaces on new B pillar.
Coat mating surfaces required for spot welding with zinc dust paint.

30 41 352

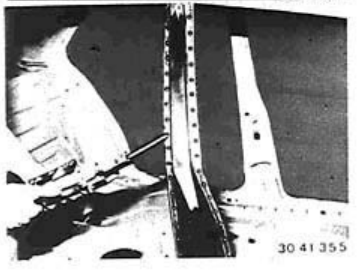
Drill holes for plug spot welding in mating surfaces required for plug spot welding.

30 41 353

Install and tack weld B pillar.

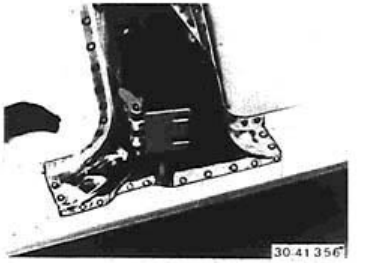
30 41 354

Install rear door and check gaps.



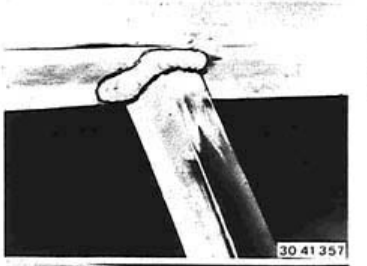
30 41 355

Spot weld B pillar on end plate.



30 41 356

Plug spot weld connection on side member cover.

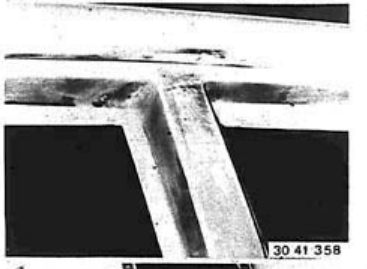


30 41 357

Braze connection on roof frame.

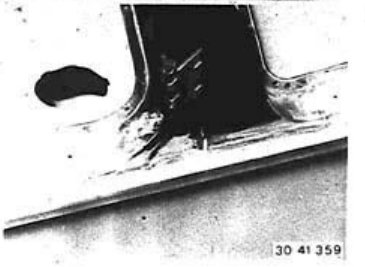
Note:

Apply a coat of heat protection paste on roof and rain molding, to avoid any damage to the roof panel paint finish.



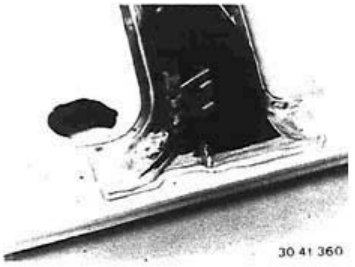
30 41 358

Grind down joints.



30 41 359

Grind down joints.

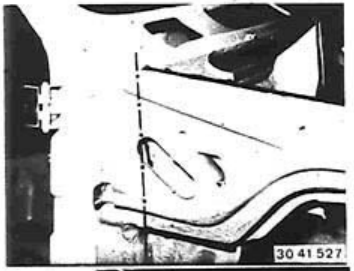


Coat joints on side member cover with a joint sealing compound.

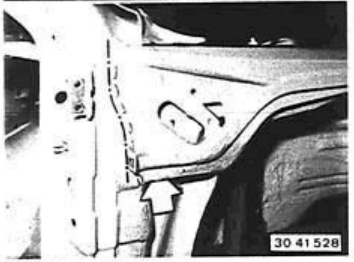
41 21 501 REPLACING LEFT OR RIGHT FRONT DOOR PILLAR
– Front Side Panel Removed –

Refer to information on page 41 - 001.

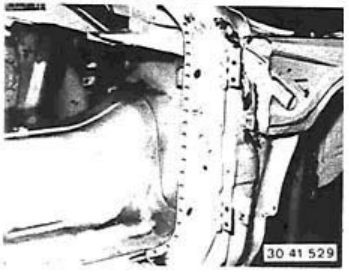
Remove or disconnect following parts:
ground lead on battery, roof ornamental strip, front seat, entrance cover strip, entrance cover plate, instrument panel trim, engine hood release lever partially, door pillar carpet, passenger compartment carpets partially, air inlet grill on cowl panel and windshield with rubber frame



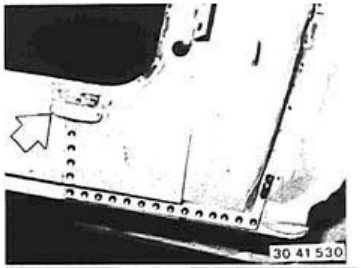
Cut through end plate along line.



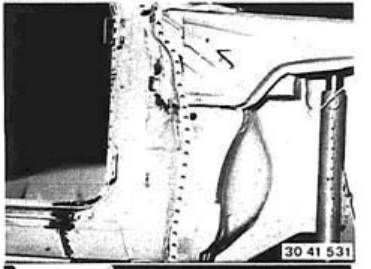
Grind off welding seams.
Drill out spot welds from underneath.
Remove end plate section.



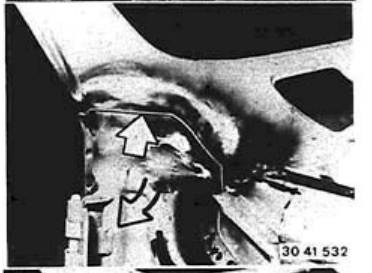
Make joints accessible.
Drill off spot welding seam.



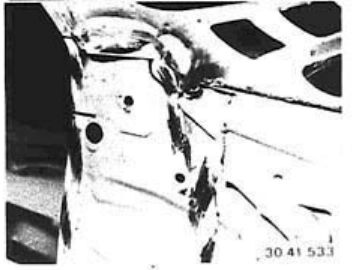
Drill out spot welds.
Remove brazing solder.



Drill out spot welds.

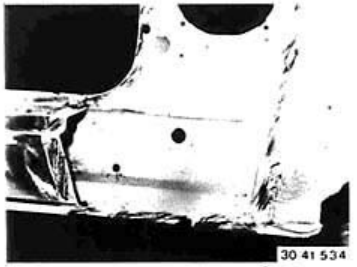


Remove brazing solder.
Lift off door pillar.

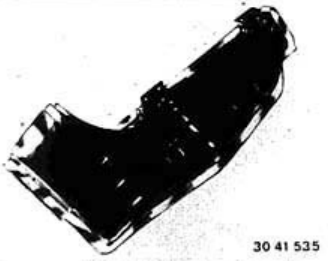


Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces needed for spot welding with zinc dust paint*.

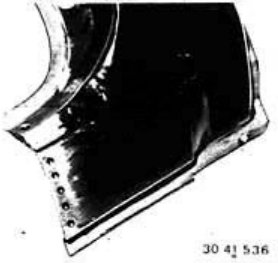
* Source: HWB



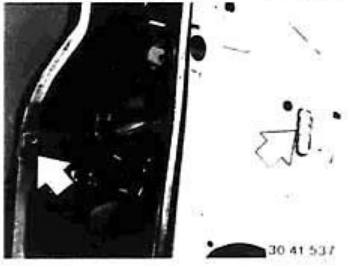
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces needed for spot welding with zinc dust paint.



Grind mating surfaces on new door pillar.
Coat mating surfaces needed for spot welding with zinc dust paint.

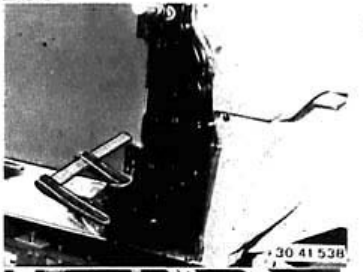


Drill holes for plug spot welding at joint with entrance.

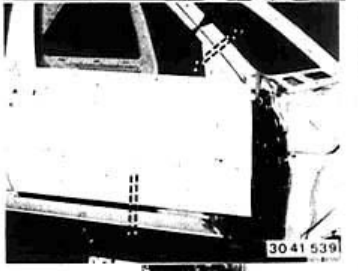


Use insulating tape* on bearing surface for reinforcement.

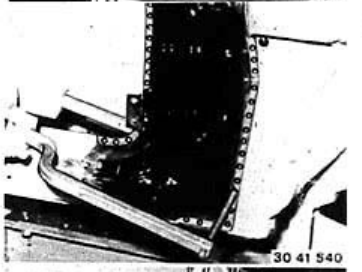
* Source: HWB



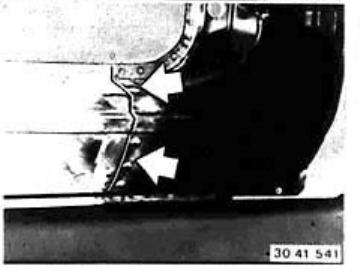
Clamp and align door pillar.
Tack weld at several points.



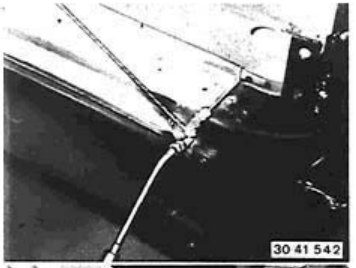
Install door and check gap and plane to entrance and cowl panel.
Note:
Use washers if door is too low.



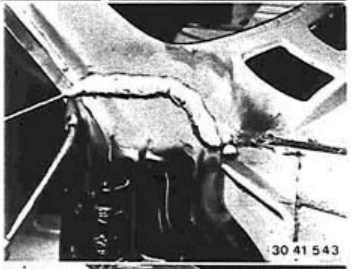
Spot weld door pillar.



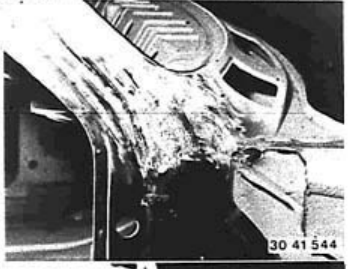
Plug spot weld joint with entrance.



Braze outside edge on entrance.

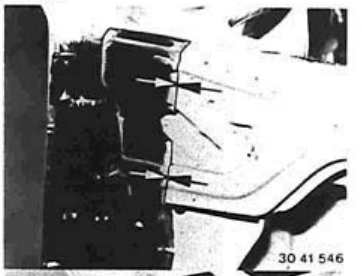


Braze joint with cowl panel.

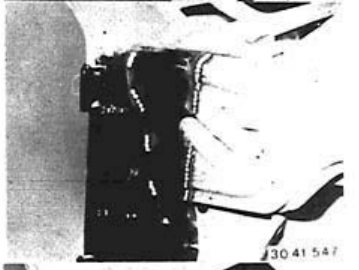


Grind mating surface.

Install new end plate.
Determine location of cut for partial replacement.



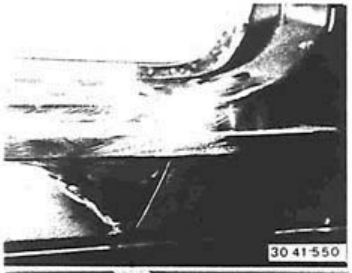
Grind mating surfaces on partial replacement section and fit in.



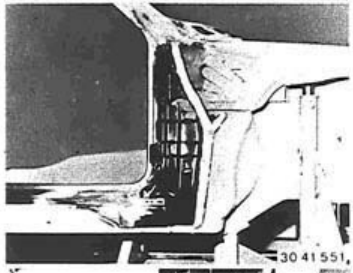
Inert gas weld partial replacement section.

Braze in cowl panel area.

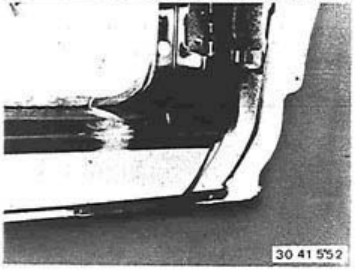
Grind mating surface, tinning if necessary.



Grind mating surface, tinning if necessary.



Seal all joints with a joint sealing compound*.

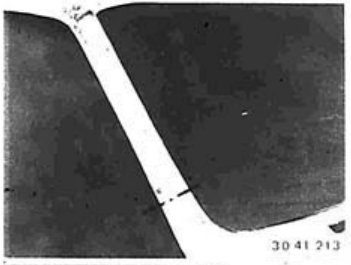


Replace anti-drumming coat on entrance and in wheel house.

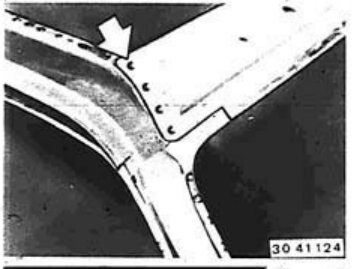
* Source: HWB

41 22 501 REPLACING LEFT OR RIGHT ROOF FRAME
– ROOF PANEL REMOVED –

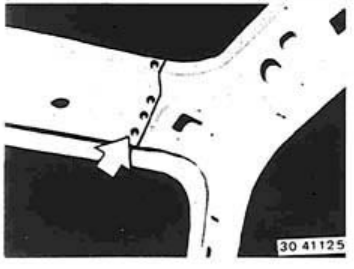
Refer to information on page 41 -001.
Remove or disconnect following parts: instrument panel trim, grill on bottom of cowl, front door, front bumper, front side panel.
Important!
Support car from underneath that roof frame is without pressure.



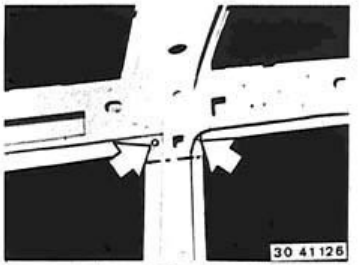
Cut off roof frame along line.



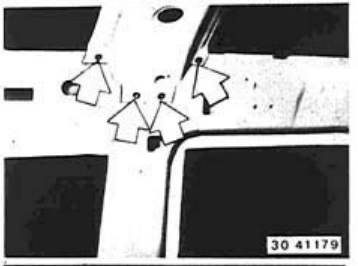
Drill off welded spots on roof frame at front.



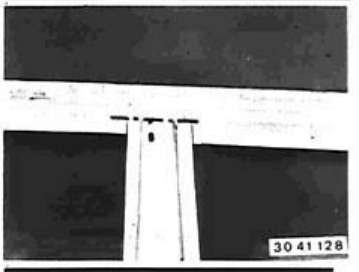
Drill off welded spots on inside.



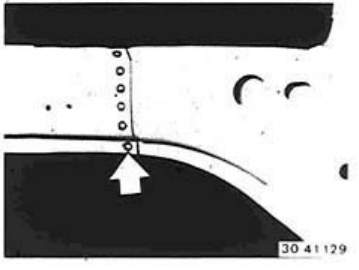
Cut off B pillar end plate on roof frame.
Drill off welded spots.



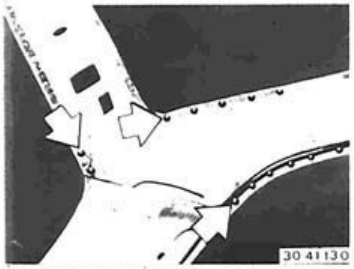
Drill off left and right roof braces.
Note:
Roof braces are installed after installation of roof panel.



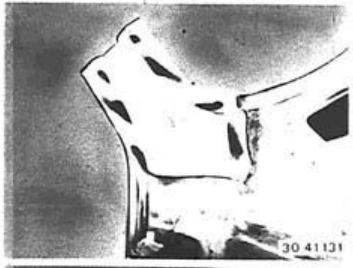
Cut off brazed connection between roof frame and B pillar.



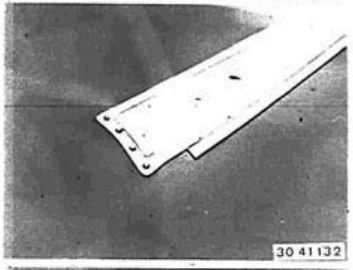
Drill off roof frame on C pillar.



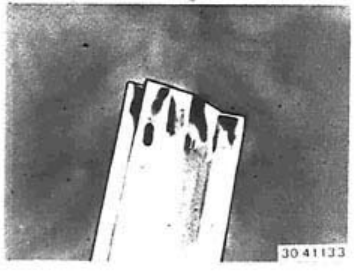
Drill off welded spots.



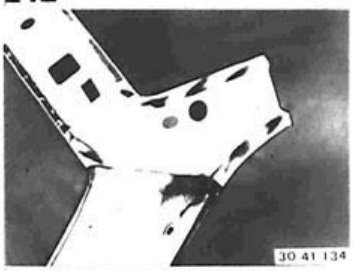
Remove scrap metal.
Straighten and grind mating surfaces.



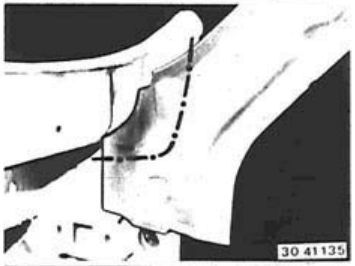
Remove scrap metal.
Straighten and grind mating surfaces.



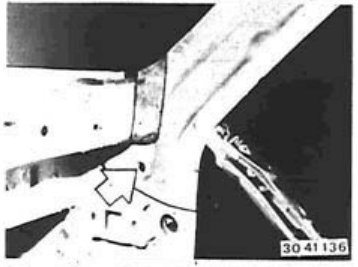
Remove scrap metal.
Straighten and grind mating surfaces.



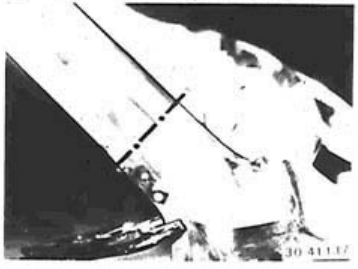
Remove scrap metal.
Straighten and grind mating surfaces.



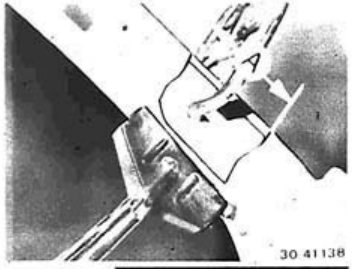
Cut new panel for cowl to size, that hole in new part can be aligned with old hole.



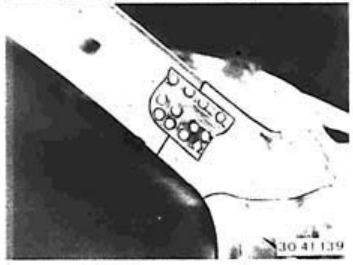
Clamp on panel and align according to hole and seams.



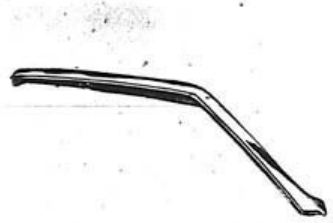
Mark cutting point on panel.
Take off and cut panel to size.
Grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.



Make up reinforcement A = approx. 40 mm (1.575") from remaining panel and fit in.

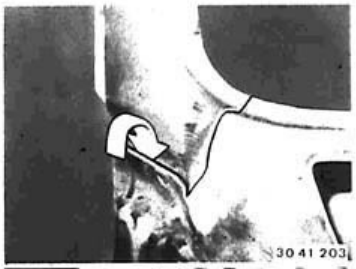


Grind down reinforcement.
Coat mating surfaces with zinc dust paint.
Spot weld panel on reinforcement.

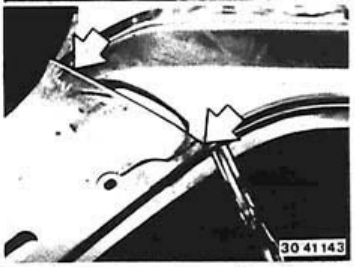


Grind mating surfaces on new roof frame.
Coat mating surfaces intended for spot welding with zinc dust paint.

Install and clamp down roof frame complete with cowl, tack welding if necessary.

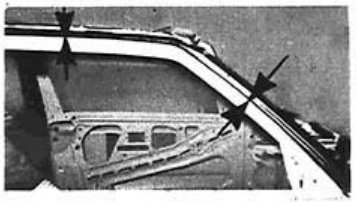


Note:
Make sure cowl panel grabs behind connection for A pillar.



Note:
Roof frame grabs underneath rear side panel.

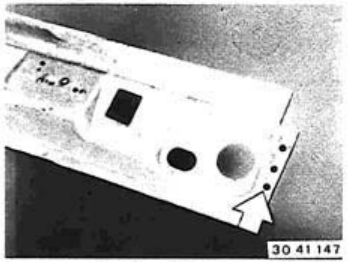
Install windshield with several pieces of rubber frame.
Make sure of uniform clearance and same curvature between glass and body opening.



Install door and check door gap.

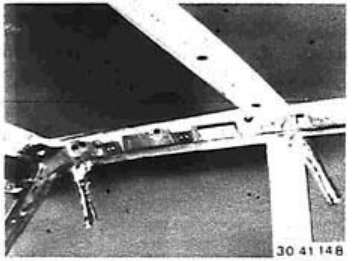
30 41 146

Grind mating surfaces on cover plate.
Coat mating surfaces intended for spot welding with zinc dust paint.



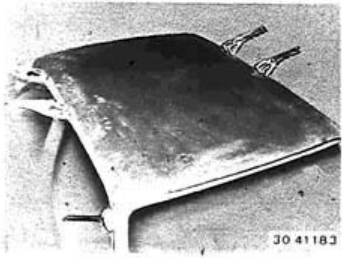
30 41 147

Drill holes for plug spot welding in rear mating surface.



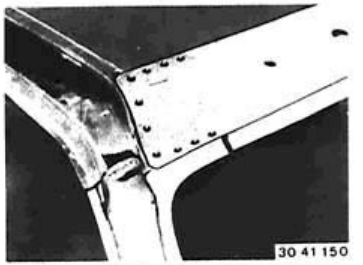
30 41 148

Install and clamp cover plate.
If necessary, install roof brace to check roof frame.



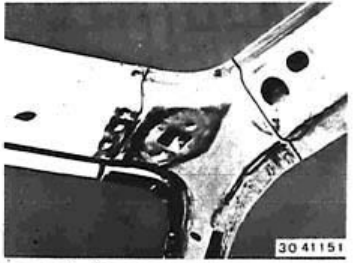
30 41 183

Install and clamp outside roof panel.
Check seat of outside roof panel.
Lift off outside roof panel again.



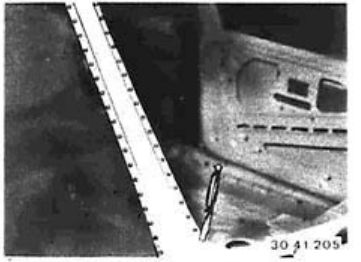
30 41 150

Plug spot weld or spot weld front roof frame with roof frame on sides.



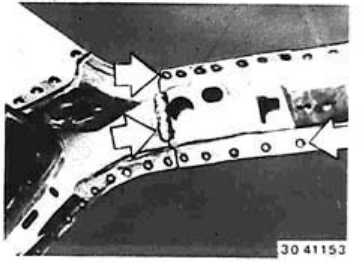
30 41 151

Plug spot weld or spot weld front roof frame with cowl panel and roof frame on sides.



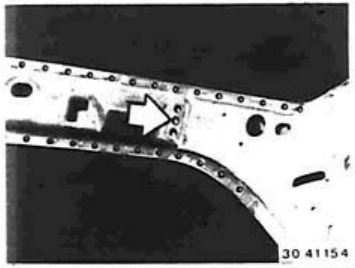
30 41 205

Spot weld cowl panel on cowl.

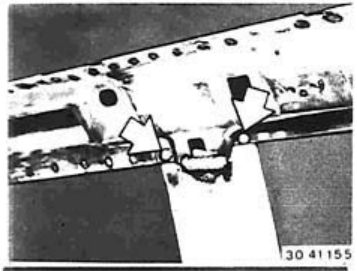


30 41 153

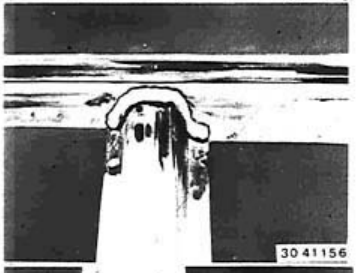
Spot weld end plate.
Inert gas weld mating surface to cowl panel.



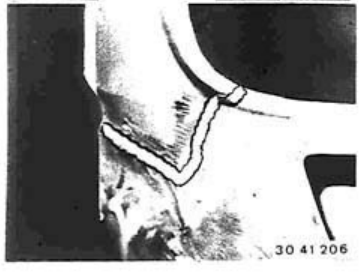
Spot weld end plate and C pillar on side frame.
Plug spot weld mating surface for C pillar.



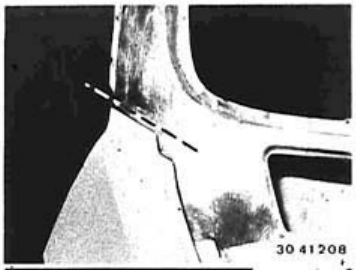
Spot weld or inert gas weld B pillar.



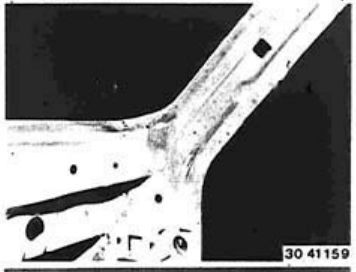
Braze B pillar on outside.



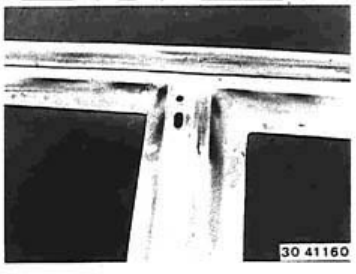
Braze joint on A pillar.



If necessary, tin out joint on A pillar.
Match contour on front side panel.



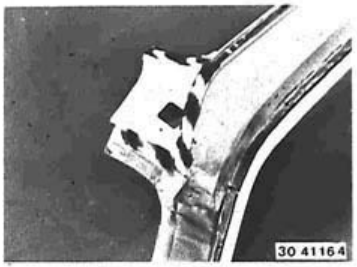
Grind mating surface.



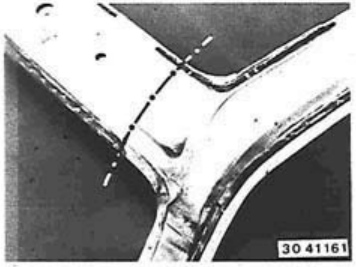
Grind mating surface.
Note:
Coat blank metal parts with zinc dust paint before installing outside roof panel.

41 22 541 REPLACING FRONT ROOF FRAME
– ROOF PANEL REMOVED –

Refer to information on page 41 - 001.

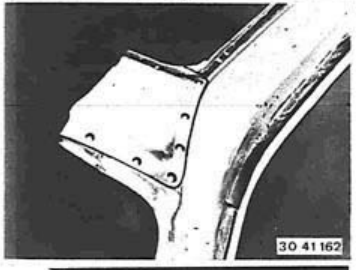


Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.

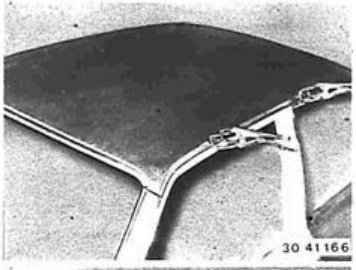


Cut through roof frame on left and right sides.

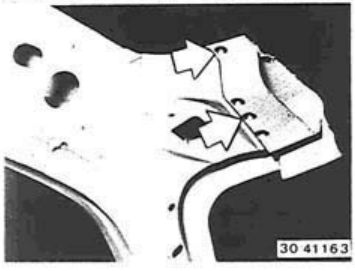
Grind mating surfaces on new parts.
Coat mating surfaces intended for spot welding with zinc dust paint.



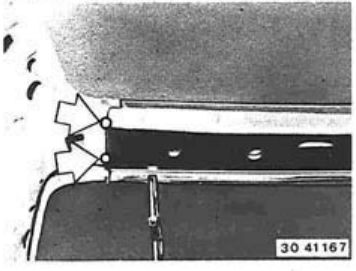
Drill out welded spots on left and right sides.



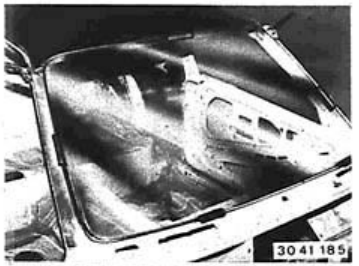
Install and clamp roof panel.



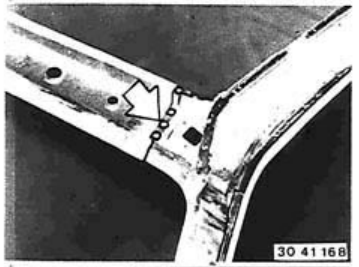
Drill off welded spots.



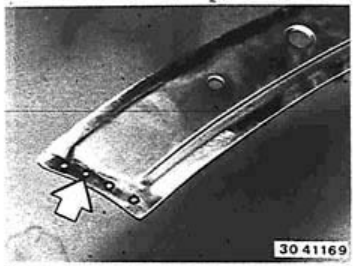
Install and tack weld roof frame inside section.



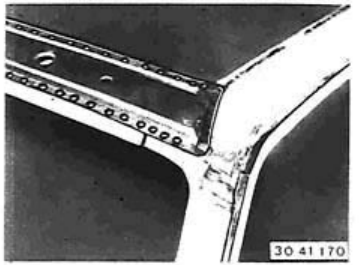
If necessary, install windshield with several pieces of rubber frame.
Check for uniform clearance and same curvature between glass and body opening edge.



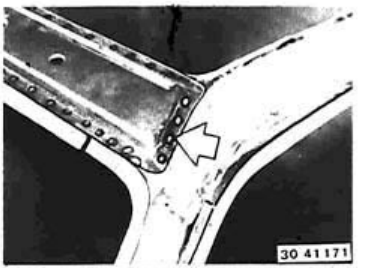
Lift off roof panel.
Spot weld roof frame inside section.



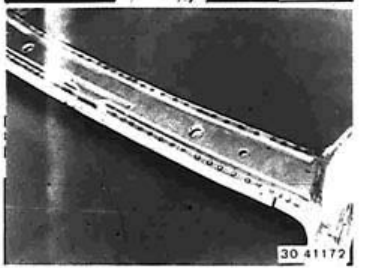
Drill holes in roof frame outside section for inert gas plug welding.



Clamp on and spot weld roof frame outside section.



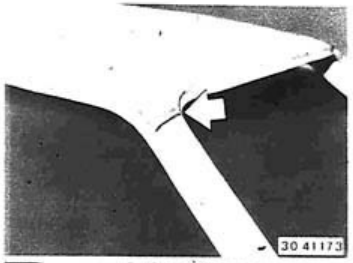
Plug spot weld at provided holes.



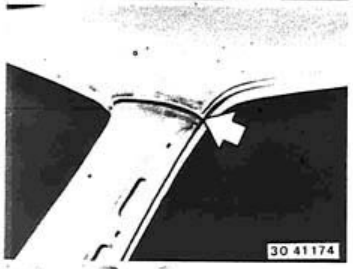
Straighten and grind mating surfaces.
Coat blank metal parts with zinc dust paint before installing roof panel.

41 31 001 REPLACING ROOF PANEL (WITHOUT SUN ROOF)

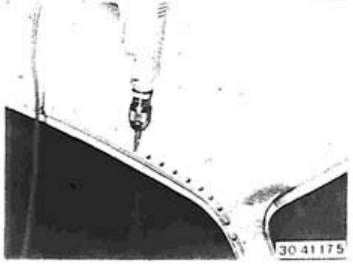
Refer to information on page 41 - 001.
Remove or disconnect following parts: battery ground lead, windshield and rear window with rubber frames, rear seat cushion and backrest, rear side trim panels, rear side windows, hatrack, both sun visors, A and B pillar plates, edge guards as req., roof liner with braces, inside lights, inside mirror, grab handles, seat belts as req., check control, front top trim, both roof ornamental strips.



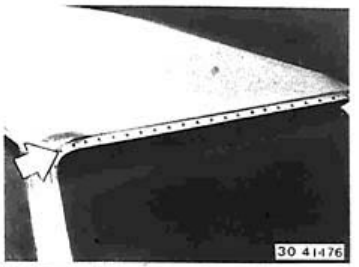
Clear front joints.
Remove brazing solder.



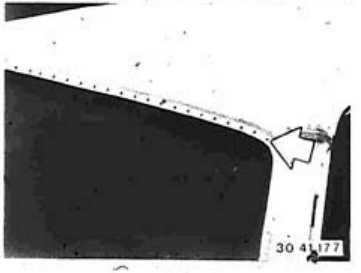
Clear rear joints.
Remove brazing solder.



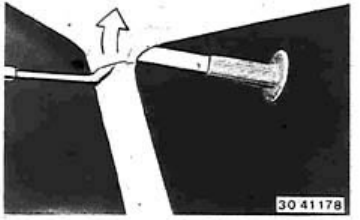
Drill off welded spots on rain molding.
Note:
The spot welded seam is gradually replaced by a roll welded seam.
If applicable, cut off roof panel.
Grind off scrap metal after lifting off the roof panel.



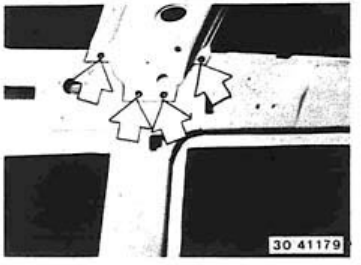
Drill off welded spots in window opening.



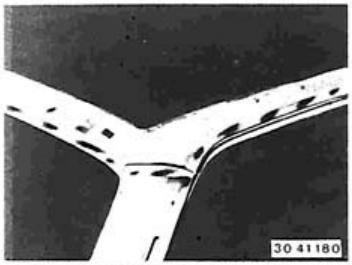
Drill off welded spots on rear window frame.



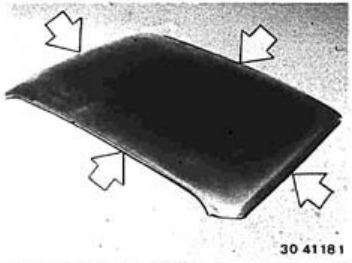
Lift off roof panel.



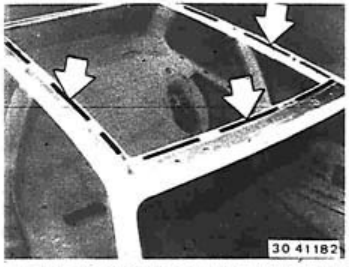
Cut out roof brace on left and right sides.



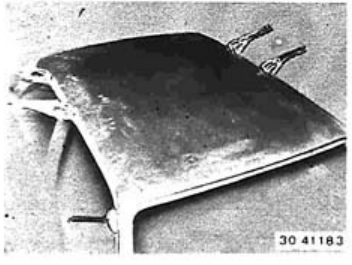
Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.



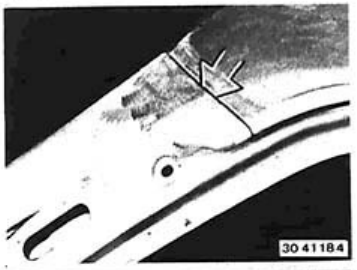
Grind mating surfaces on new roof panel.
Coat mating surfaces intended for spot welding with zinc dust paint.



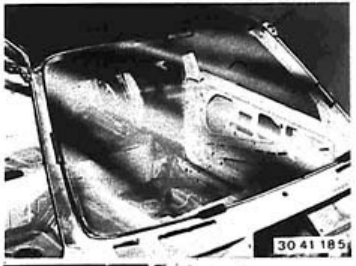
Paste Terostat tape on roof frame.



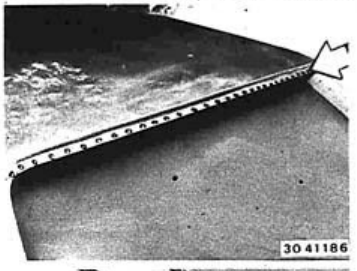
Install and clamp roof panel.



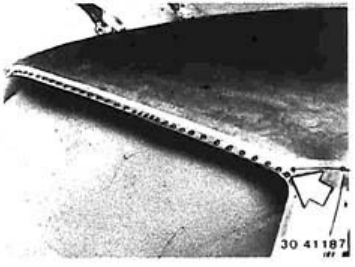
Note:
Roof panel grabs underneath C pillar.
Check clearance and transition to C pillar, correcting if necessary.



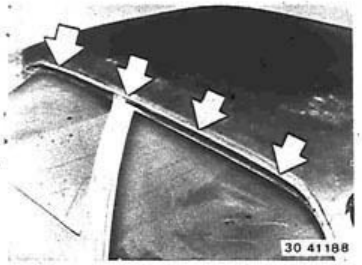
Install windshield and rear window with several pieces of rubber frame.
Check for uniform clearance and same curvature between window panes and body opening edges.



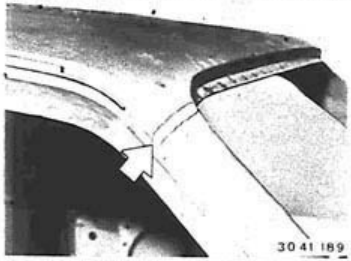
Spot weld roof panel in windshield opening.



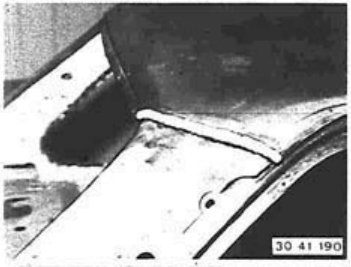
Spot weld roof panel in rear window opening.



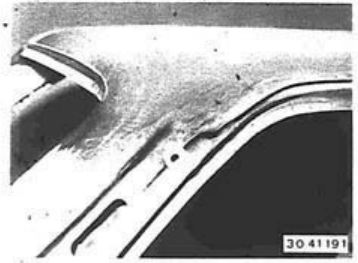
Spot weld roof panel on left and right rain moldings.



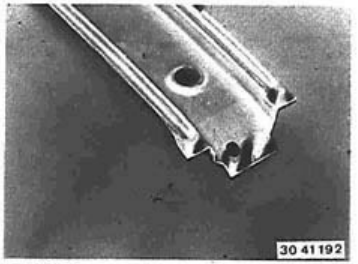
Braze cowl joints on left and right sides.



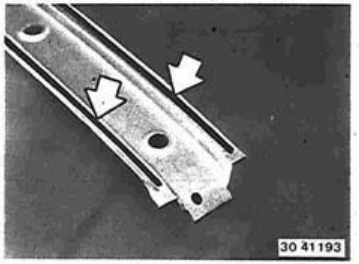
Braze C pillar joints on left and right sides.



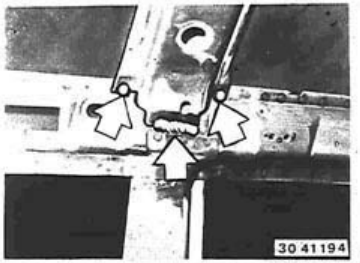
Grind front and rear joints, tinning out if necessary.



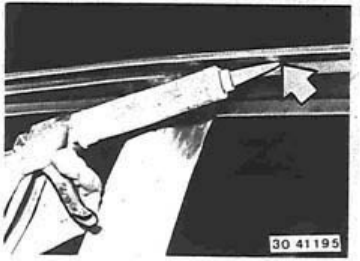
Grind mating surfaces on roof brace.



Paste Terostat tape on bearing surfaces of roof panel.



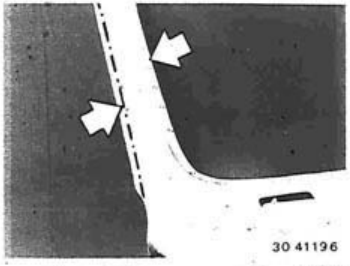
Install roof brace and press against roof panel lightly.
Weld on roof brace on left and right sides.
Use inert gas welder.



Seal joint between roof frame and roof panel with a body sealing compound.

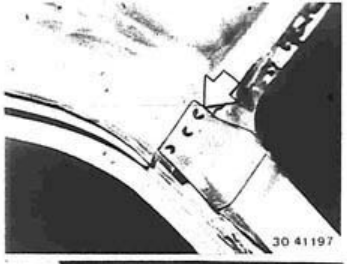
41 32 515 REPLACING LEFT OR RIGHT COWL PANEL
– ROOF PANEL REMOVED –

Refer to information on page 41 - 001.
Remove or disconnect following parts: instrument panel trim, grill on bottom of cowl, front door, front bumper, front side panel.



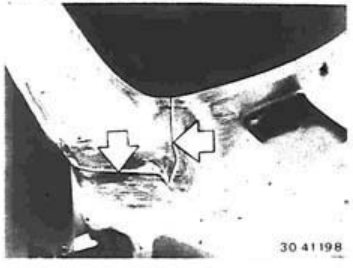
30 41196

Drill off welded spots on window opening.
Cut off panel on outside.



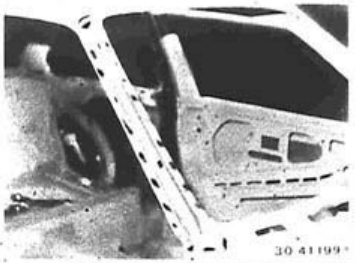
30 41197

Drill off welded spots on roof.frame joint.



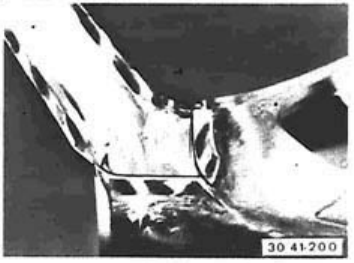
30 41198

Clear joint surface.
Remove brazing solder.
Take off cowl panel.



30 41199

Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces intended for spot welding with zinc dust paint.

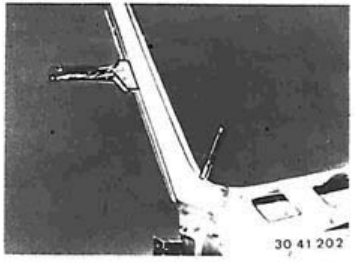


30 41200

Straighten and grind mating surfaces.

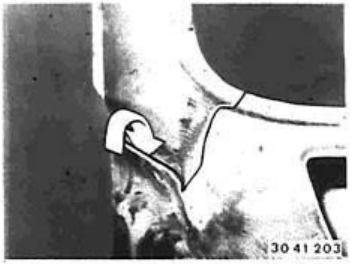
30 41 201

Grind mating surfaces on new cowl.
Coat mating surfaces intended for spot welding with zinc dust paint.

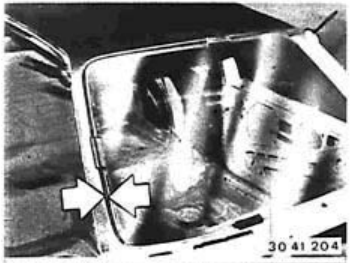


30 41 202

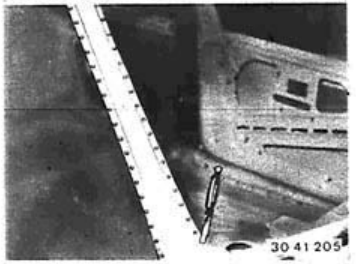
Install and clamp cowl panel, tack welding lightly in window opening.



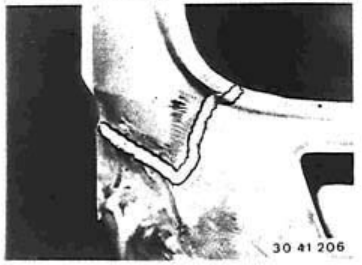
Note:
Make sure cowl panel grabs underneath connection for A pillar.



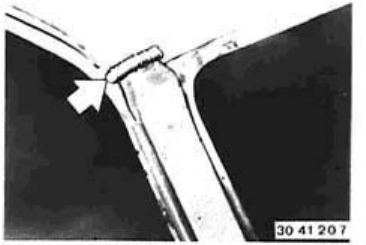
Install roof panel.
Install windshield with several pieces of rubber frame.
Check for uniform clearance and same curvature between glass pane and body opening.



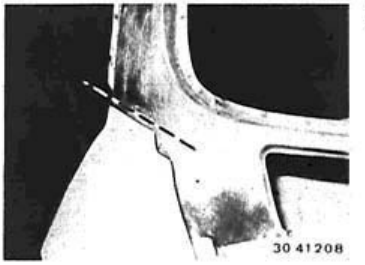
Spot weld cowl panel.



Braze connection on A pillar.



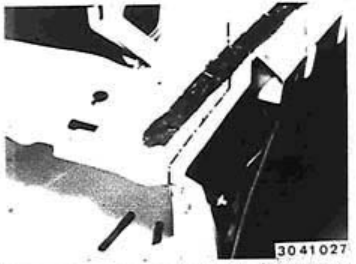
Inert gas weld top joint



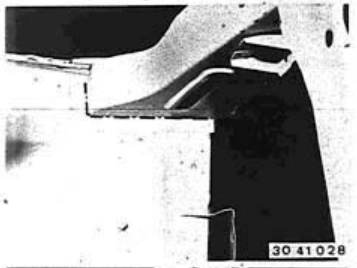
If necessary, tin out connection on A pillar. Match contour on front side panel.

41 33 001 REPLACING FRONT PANEL COMPLETE WITH FRONT WALL

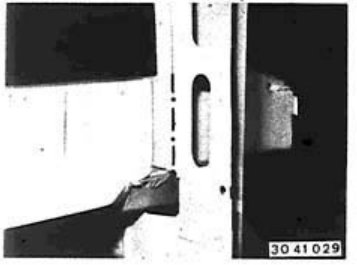
Refer to information on page 41 - 001.
Remove or disconnect following parts.
Disconnect battery ground lead.
Remove radiator grill, headlights, front fog lamps, two-tone horns, engine hood lock, data plate and radiator.
Disconnect wire harness partially.
Remove engine hood complete with hinges, see 41 61 000 / 41 61 050.
Remove front bumper, see 51 11 000.
Remove both front side panels, see 41 35 000.



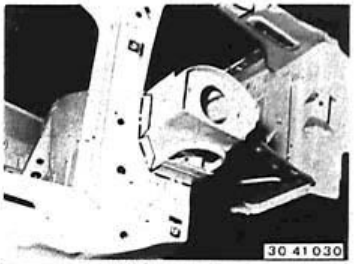
Cut off front wall on wheel house.



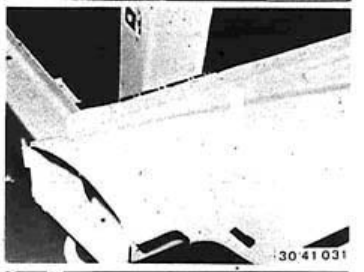
Cut off front wall on wheel house.



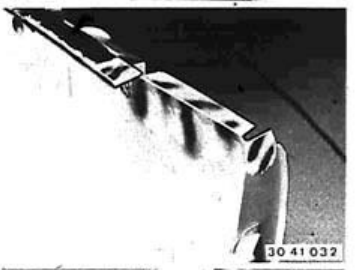
Cut off front wall on engine carrier.



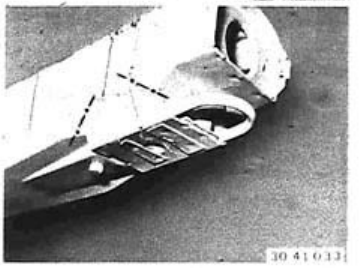
Cut off front wall on engine carrier.



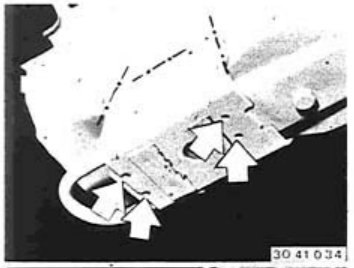
Grind off welded seams.
Take off front wall.



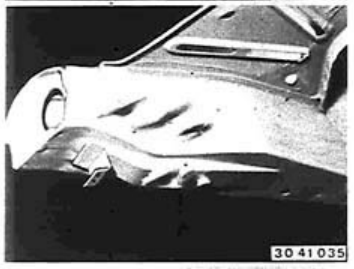
Remove scrap metal.
Straighten and grind mating surfaces.
Coat with zinc dust paint.



Grind off welded seams on eyelet.

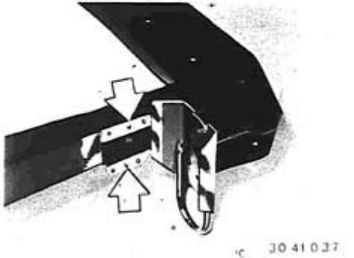


Grind off welding seams on towline eye.
Drill off welding spots.
Remove towline eye.

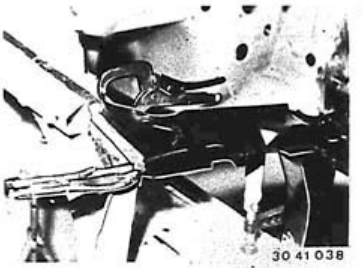


Remove scrap metal.
Straighten and grind mating surfaces.

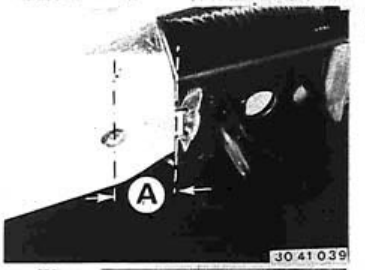
Grind mating surfaces on left and right sides of new front wall and coat with zinc dust paint.



Grind mating surfaces on left and right sides of new front panel wall.
Drill holes for inert gas plug welding.



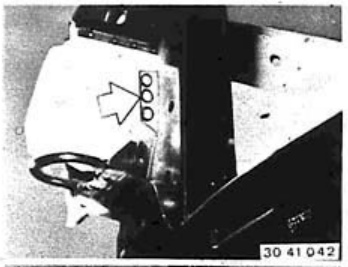
Fit in and clamp front wall.



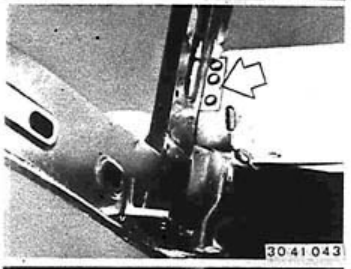
Note:
Distance A = 33.5 mm (1.319").

Spot weld front wall on wheel house.

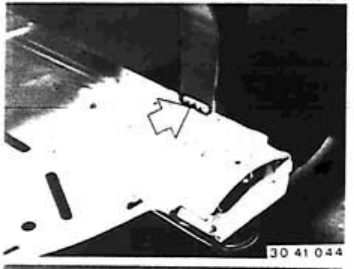
Inert gas weld towline eye on engine carrier inside and outside.
Spot weld and/or inert gas weld bracket.



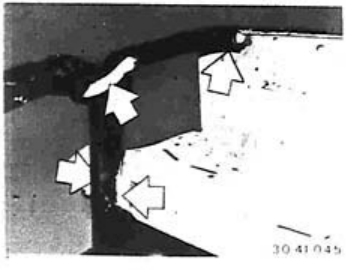
Inert gas plug weld front wall on engine carrier.



Inert gas plug weld front wall on engine carrier.



Inert gas weld front wall on end plate.

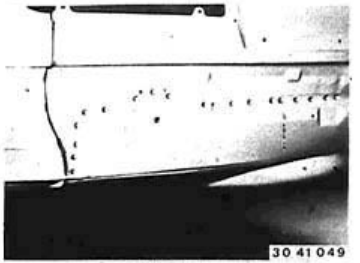


Coat all mating surfaces and joints with a body sealing compound*.

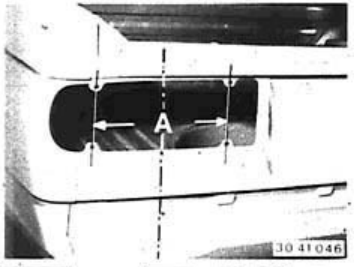
* Source: HWB

41 34 041 REPLACING TAIL PANEL

Refer to information on page 41 - 001.
Remove rear bumper.
Unscrew tail lights and license plate lights.
Disconnect wire harness partially.
Unscrew lock base with lock cylinder and license plate.
Unscrew final muffler holder.
Take off trunk lid seal partially.
Remove trunk mat and spare wheel.

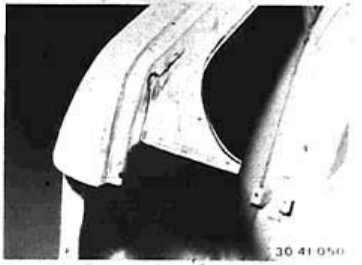


Drill off welding spots.
Take off tail panel.

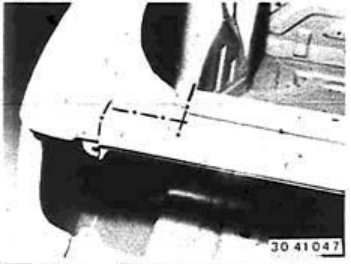


Note:
In order to limit paint spraying work to the tail panel, the cutting line can also be located in the tail light opening.

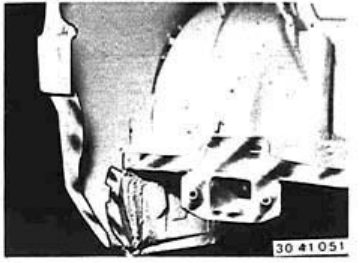
Distance A = 265 mm (10.433").



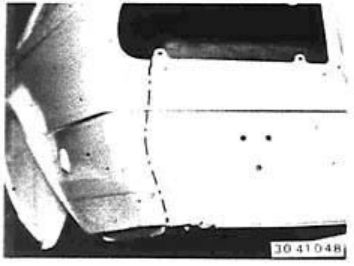
Remove scrap metal.



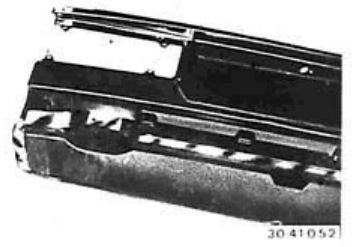
Cut off tail panel along lines on left and right sides.



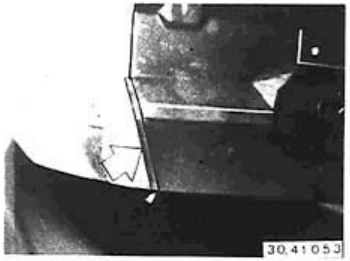
Remove scrap metal.
Coat surfaces required for spot welding with a zinc dust paint.



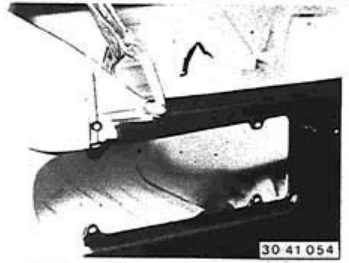
Cut off tail panel along lines on left and right sides.



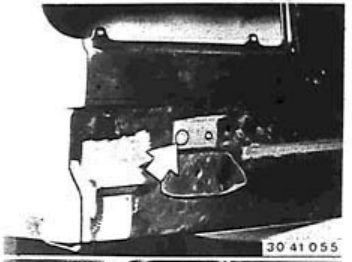
Grind down mating surfaces on new tail panel.
Coat surfaces required for spot welding with a zinc dust paint.



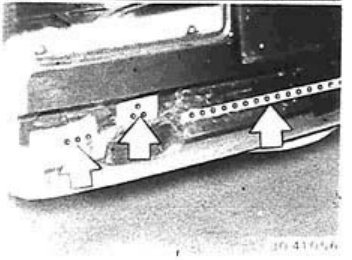
Cut off shouldered metal edge on one side far enough that tail panel can be pushed behind the side panel.



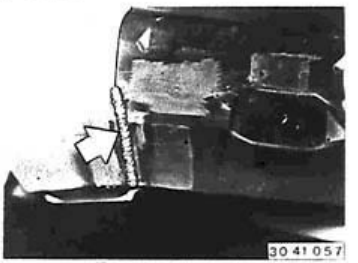
Fit in and tack weld tail panel.



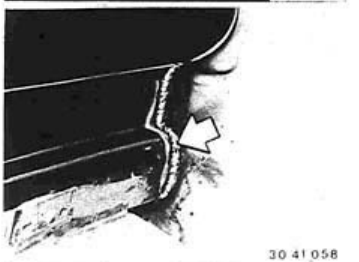
Mount tail panel on bumper bracket with a bolt.



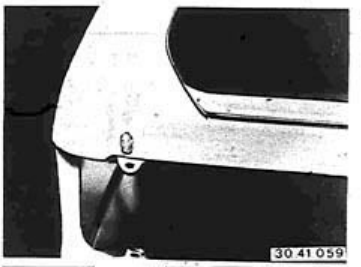
Spot weld tail panel on trunk floor plate and bumper bracket.



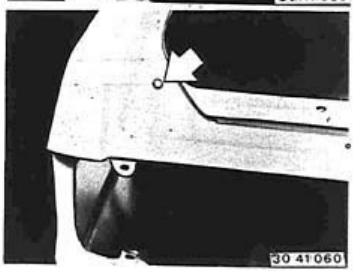
Weld bottom of tail panel on left and right side panels with an inert gas welder.



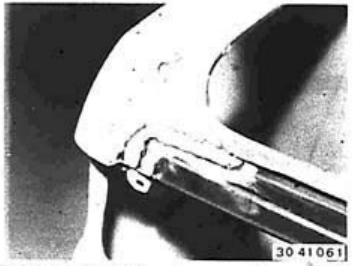
Weld web of tail panel and left and right side panels in area of trunk with an autogen welder.



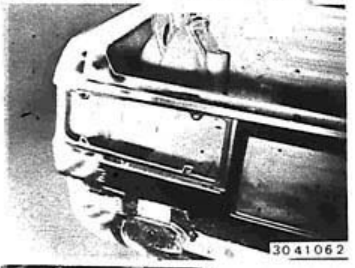
Weld tail panel on side panel.



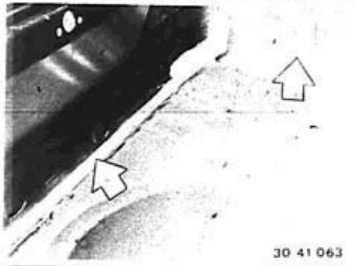
Spot weld tail panel on side panel.



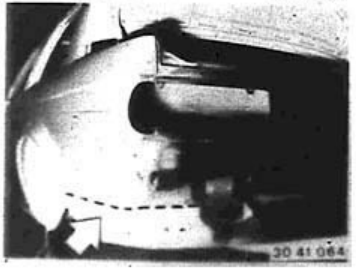
Braze reinforcement corner on tail panel.



Grind down all welded joints.



Coat all welded joints with body sealing compound* and spray with anti-drumming compound*.

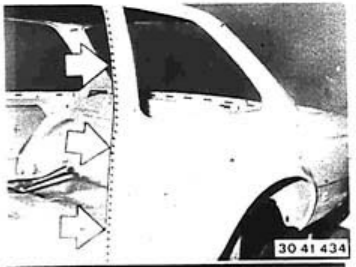


Spray an anti-drumming compound* on the side panel/tail panel joint underneath the bumper.

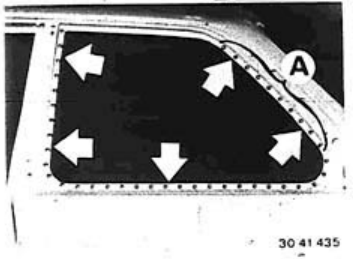
* Source: HWB

41 35 101 REPLACING LEFT REAR SIDE PANEL (Up To Roof Connection) – Two Door Models –

Refer to Information on page 41 - 001. Remove or disconnect following parts. Battery ground lead, rear bumper, left tail lights, trunk mat, wall trim panel, left wheel house trim panel, tail panel trim panel, trunk lid seal, rear window complete with frame, side window, rear seat cushion and backrest, side trim panel, hatrack, entrance cover strip, carpet partially, roof liner partially, door pillar trim, seat belt, front door seal, door striker, C pillar air extraction slot plate, rear side panel rubbing strip, left wheel house cover, fuel tank complete, strut on floor assembly and wire harness in trunk partially.

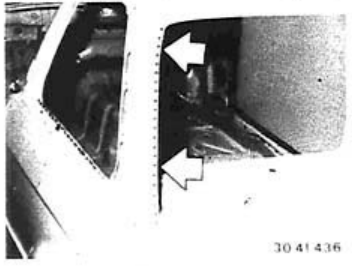


Uncover and drill off welding spots.

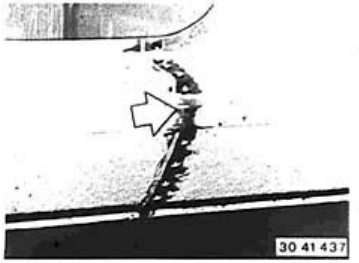


Uncover and drill off welding spots.

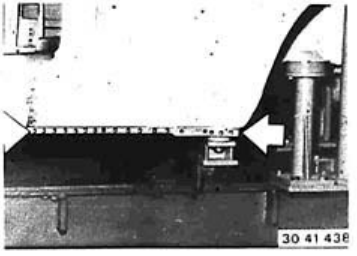
Note:
Drill through two panels in area (A) of the version with air extraction via the C- pillar.



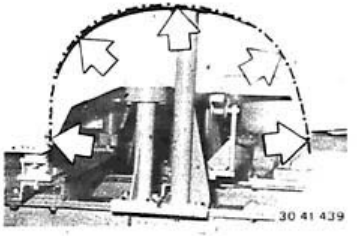
Uncover and drill off welding spots.



Uncover and drill off welding spots. Remove brazing solder.

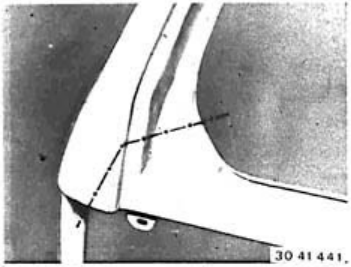


Uncover and drill off welding spots.

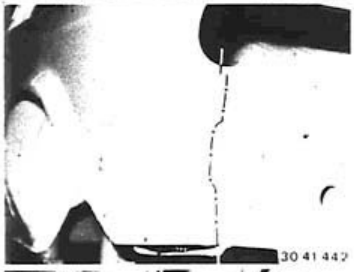


Grind off edge.

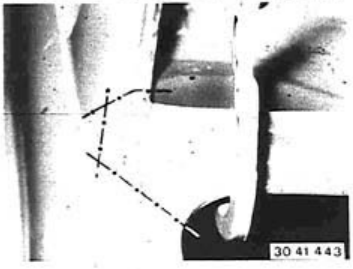
Uncover and drill off welding spots.



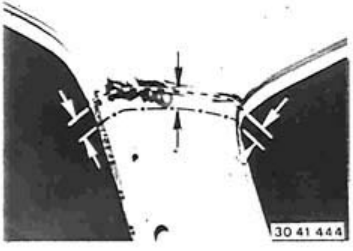
Cut off side panel along line.



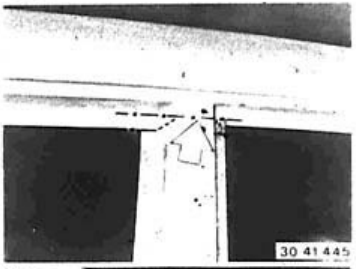
Cut off side panel along line.



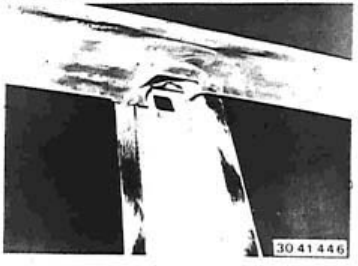
Cut off side panel along line.



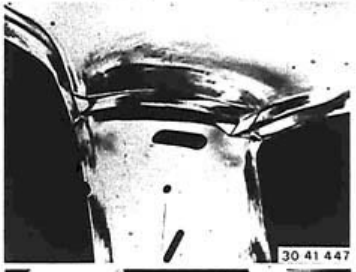
Uncover brazed roof joint.
Cut through side panel about 10 mm (0.394") below joint.



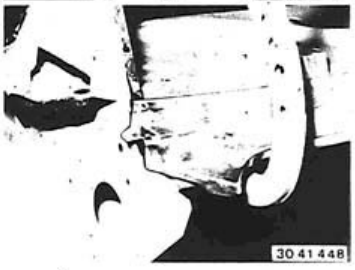
Cut through side panel in area of B pillar at top
Caution!
Don't cut end plate.
Lift off side panel.



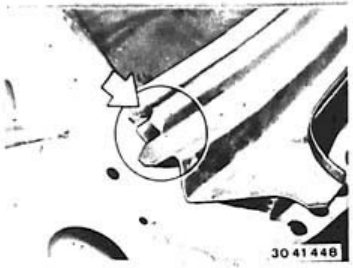
Remove scrap metal (brazing solder).
Straighten and grind mating surfaces.



Remove scrap metal (brazing solder).
Straighten and grind mating surfaces.

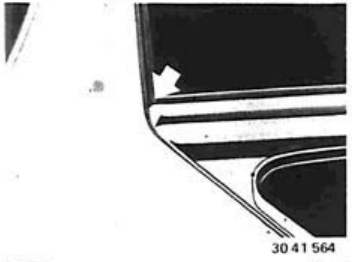


Remove scrap metal (brazing solder).
Straighten and grind mating surfaces.

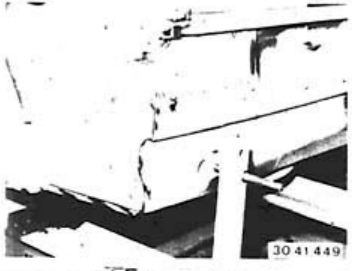


Note:
Side panel and window frame have been changed at bottom.

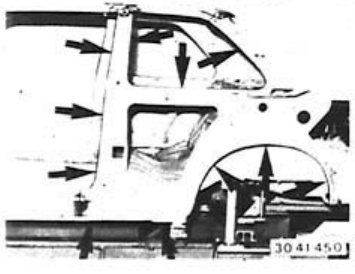
Correct bottom of window frame accordingly.



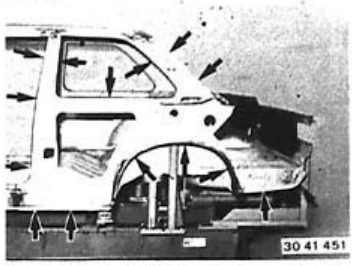
There must be a flat channel with the side panel installed.



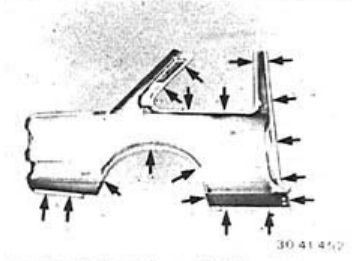
Remove scrap metal.
Straighten and grind mating surfaces.



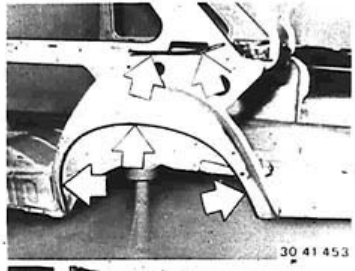
Remove scrap metal.
Straighten and grind mating surfaces.



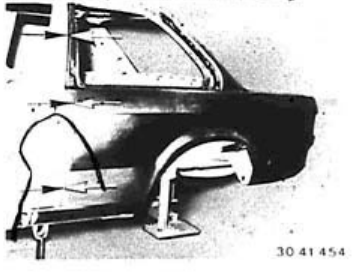
Coat mating surfaces needed for spot welding with zinc dust paint.



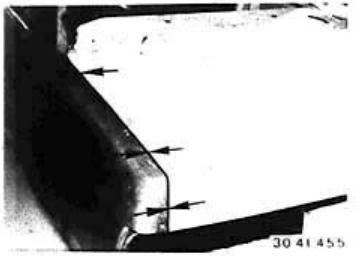
Grind mating surfaces on new side panel.
Drill holes for plug spot welding at the entrance joint.
Coat mating surfaces needed for spot welding with zinc dust paint.



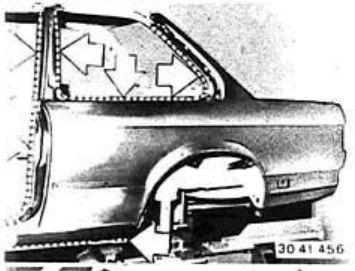
Use Terostat tape on wheel house joint and side frame reinforcement.



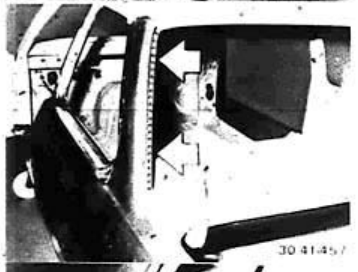
Install and clamp side panel, tack welding if necessary.
Check door gap.



Install trunk lid and check gap.

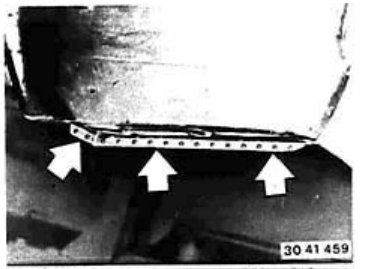


Spot weld side panel.

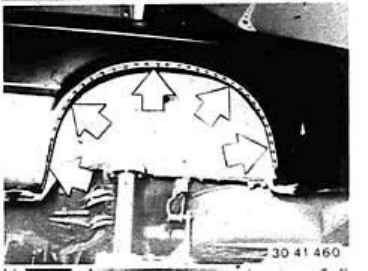


Spot weld side panel.

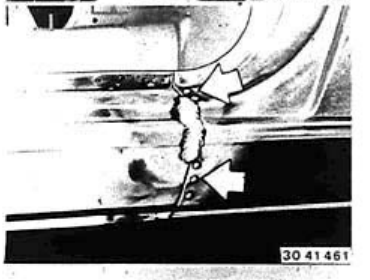
Spot weld side panel in area of trunk.



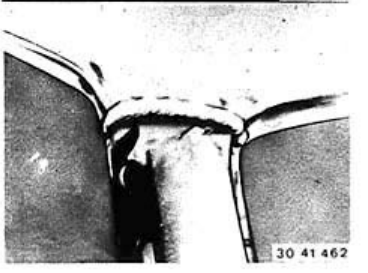
Spot weld side panel.



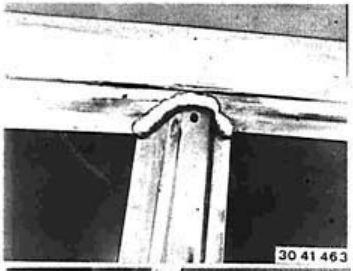
Spot weld side panel in wheel opening.



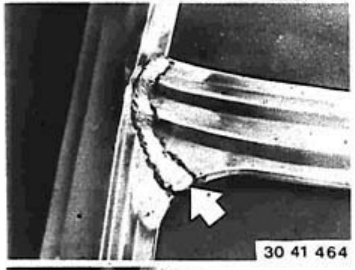
Plug spot weld side panel on entrance cover strip.
Braze on outside edge.



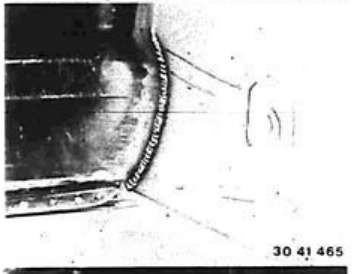
Braze roof joint.



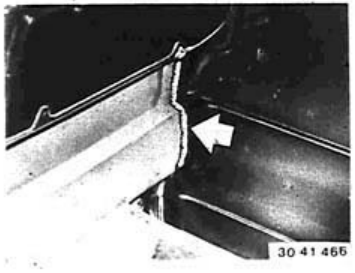
Braze B pillar joint.



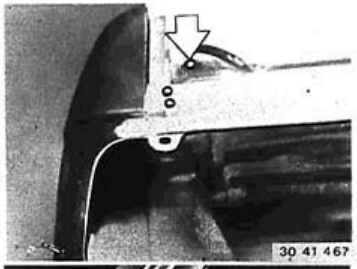
Braze side panel in area of rear window frame and trunk.



Inert gas weld side panel on tail panel.
Grind down welding bead.

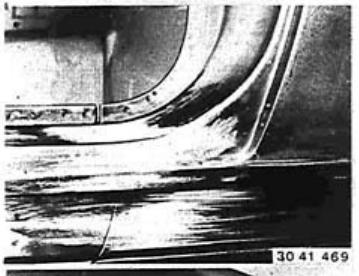


Weld connector between tail panel and side panel from inside with an autogen welder.

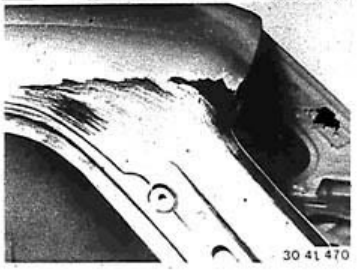


Spot weld tail panel on side panel.

Braze and grind down side panel/tail panel joint.

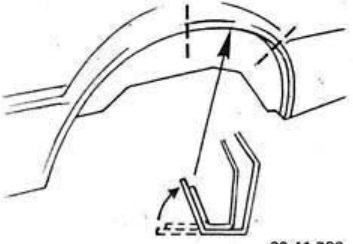


Grind joint, tinning if necessary.

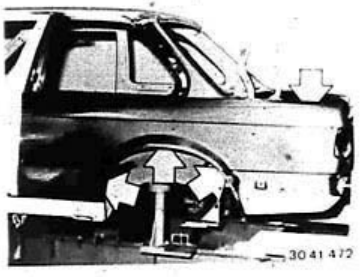


Grind joint, tinning if necessary.

Grind joint, tinning if necessary.



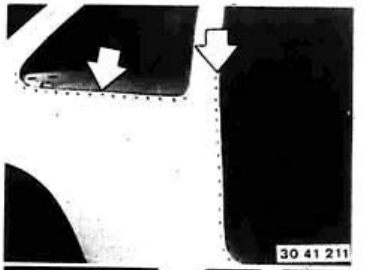
Important!
The spot welded flange in the rear area of the wheel opening must be cringed on cars beginning with 1988 models or when using wider tires.
Compare with opposite side if necessary.



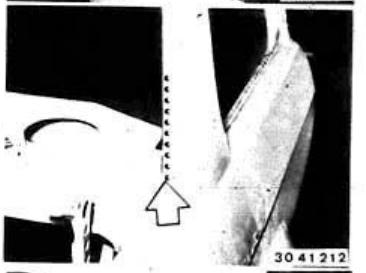
Seal all joints with a joint sealing compound. Replace damaged anti-drumming coat in wheel house, on bottom of side panel or in trunk.

41 35 291 REPLACING RIGHT REAR SIDE PANEL (PARTIAL REPLACEMENT UP TO WINDOW LINE) – Two Door Model –

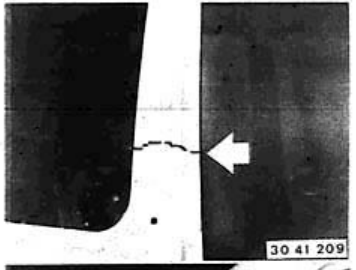
Refer to information on page 41 - 001.
Remove or disconnect following parts: rear bumper, right tail lights, trunk mat, wall trim panel, right wheel house trim panel, tail panel trim panel, trunk lid seal, rear window complete with frame, side window, rear seat cushion and backrest, side trim panel, hatrack, entrance cover strip, carpet partially, roof liner partially, door pillar trim, seat belt, front door seal, door striker, C pillar air extraction plate, rear side panel rubbing strip, right wheel house cover, fuel filler neck, expansion tank, fuel tank assy., floor brace, wire harness in trunk partially.



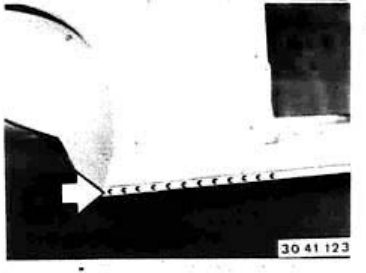
Uncover and drill out spot welds.



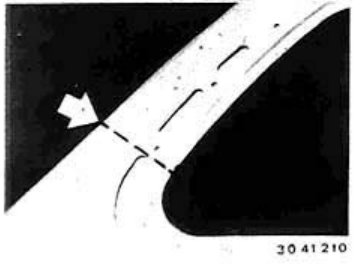
Uncover and drill out spot welds.



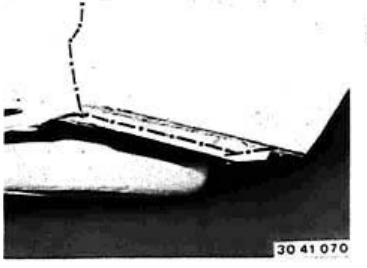
Make cutting line for partial replacement.



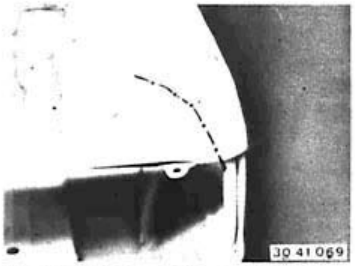
Uncover and drill out spot welds.



Make cutting line for partial replacement.

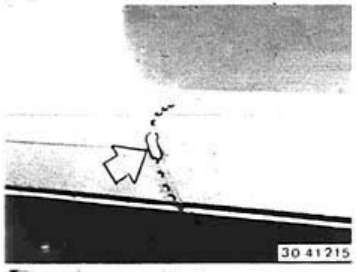


Cut off side panel on tail panel and trunk side section panel.

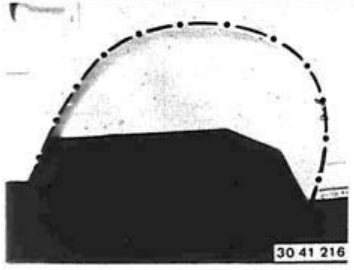


Cut off side panel on tail panel.

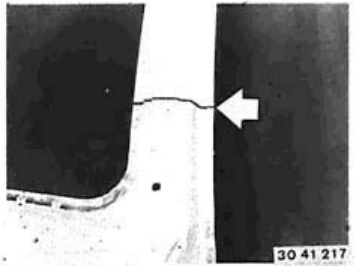
Cut off side panel along line.



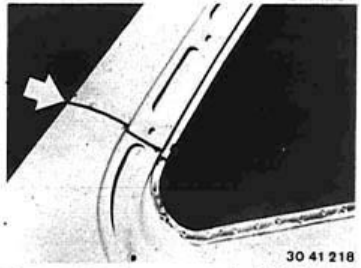
Clear joint and drill off welded spots.
Remove brazing solder.



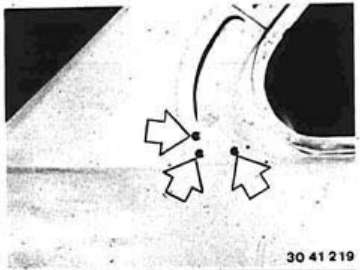
Grind off edge.



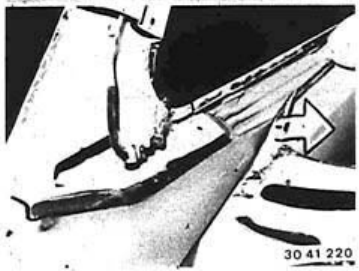
Cut through B pillar to end plate along marked cutting line.



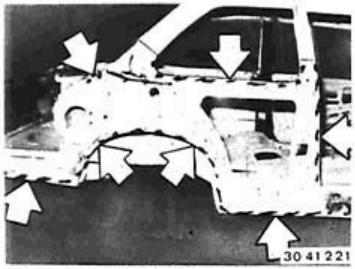
Cut off side panel along line.
Caution!
Don't cut through guide plate for forced air extraction.



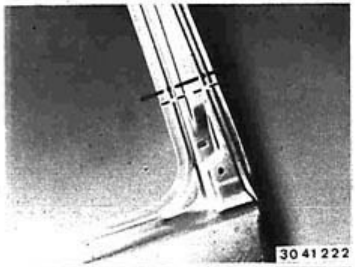
Drill off welded spots.



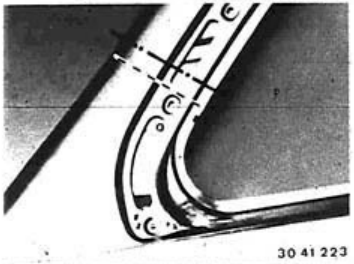
Cut off side panel on guide plate.
Remove side panel.



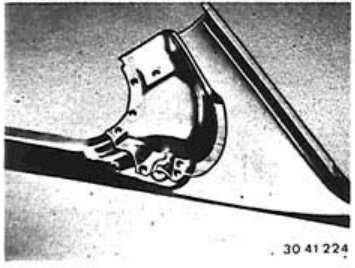
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



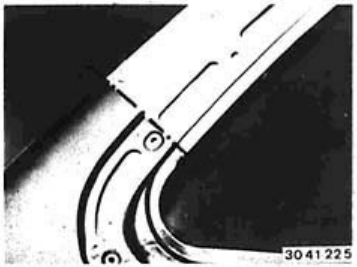
Cut off B pillar on new side panel to overlap planned mating surface upward by approx. 10 mm (3/8").



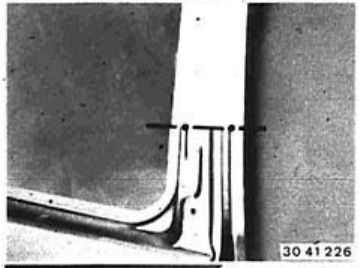
Cut through C pillar on new side panel above planned mating surface by approx. 10 mm (3/8").



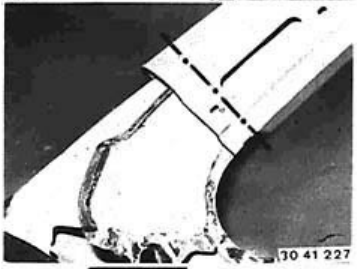
Drill off rest of guide plate.
Clean mating surfaces.



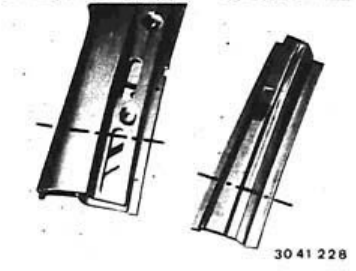
Install side panel and mark cutting line.



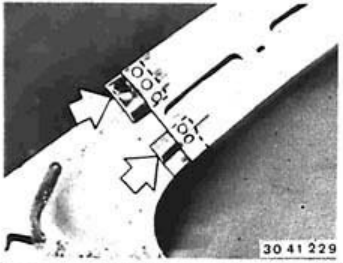
Mark cutting line.



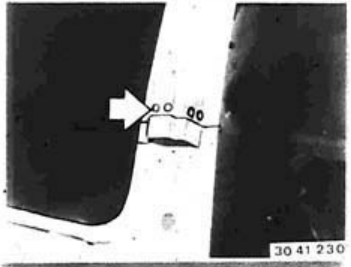
Remove scrap metal on B and C pillars.
Caution!
Don't damage the air-guide plate.



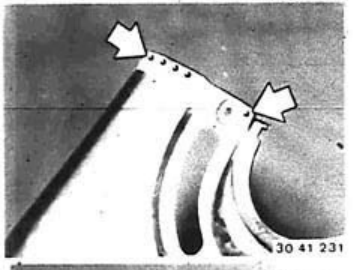
Produce an approx. 50 mm (2") wide brace from the pillar sections cut off of the new side panel.



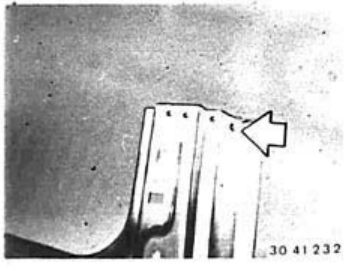
Cut brace to size, sliding half of it into C pillar and spot welding.



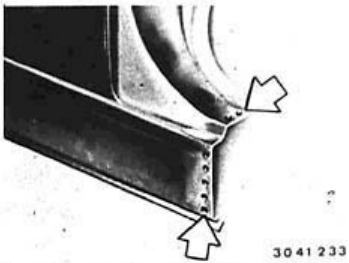
Cut brace to size, sliding half of it into B pillar and spot welding.



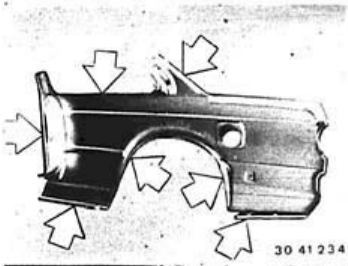
Drill holes for plug spot welding in C pillar joint.



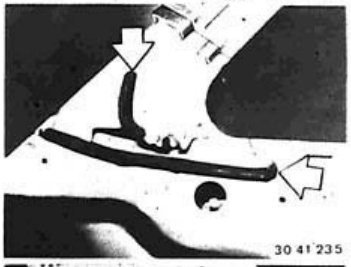
Drill holes for plug spot welding in B pillar joint.



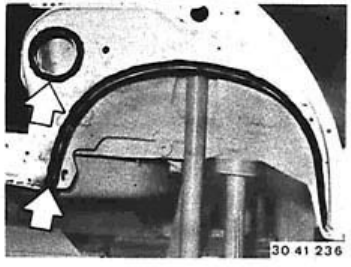
Drill holes for plug spot welding in entrance joint.



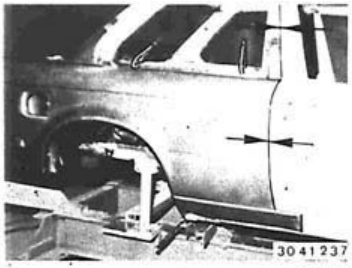
Grind mating surfaces on new side panel.
Coat mating surfaces intended for spot welding with zinc dust paint.



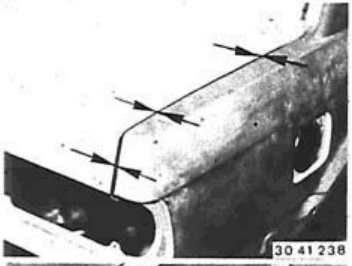
Use body sealing compound on bearing surfaces of air guide plates.



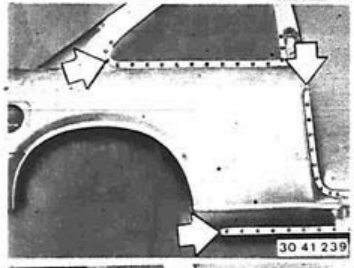
Apply coat of body sealing compound on bearing surface for fuel filler neck and on edge of wheel opening.



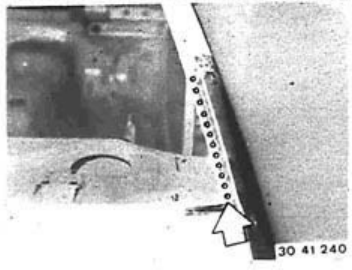
Mount and clamp side panel, tack welding if necessary.
Check door gap.



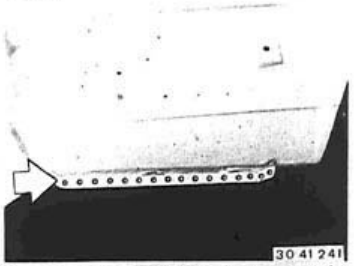
Check trunk lid gap.



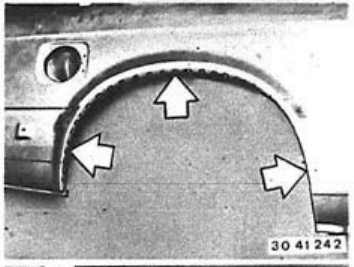
Spot weld side panel.



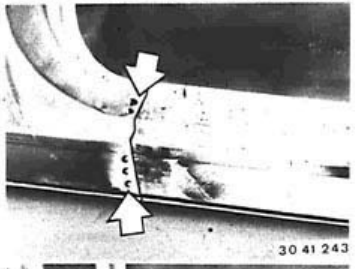
Spot weld side panel on rear window frame.



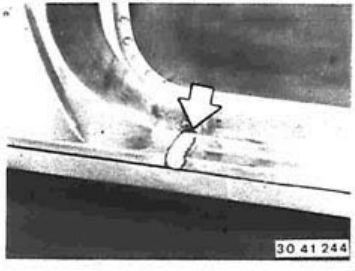
Spot weld side panel on trunk floor plate.



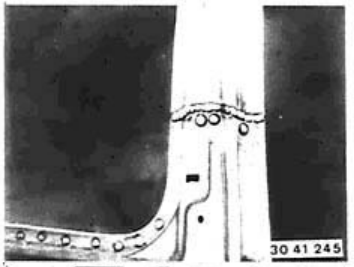
Spot weld side panel in wheel opening.



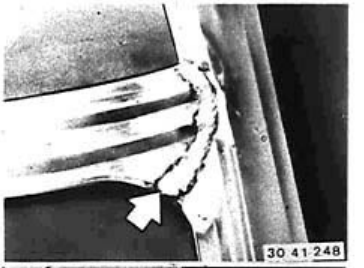
Inert gas plug weld joint on entrance.



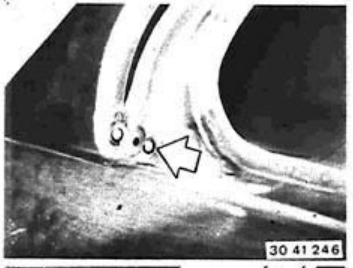
Braze entrance along outside edge.



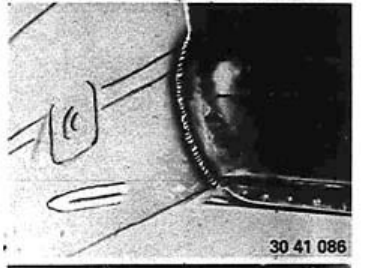
Plug spot weld joint on B pillar.
Inert gas weld joint.



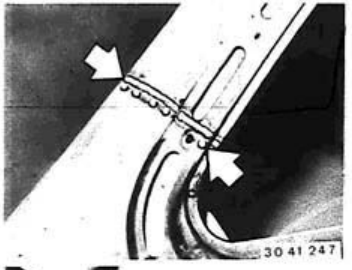
Braze joint.



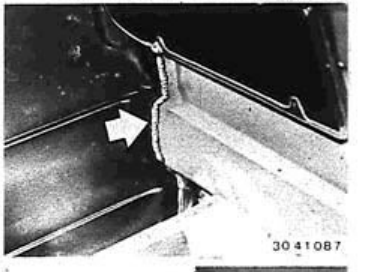
Inert gas plug weld cowl panel.



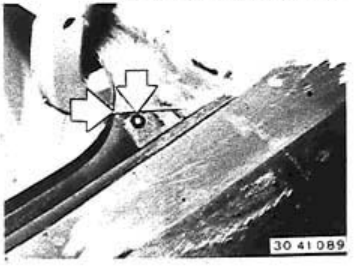
Inert gas weld side panel on tail panel.



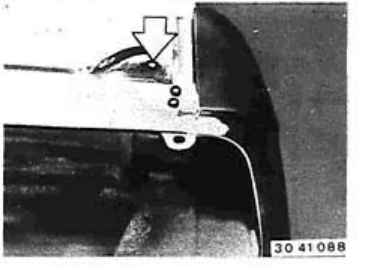
Plug spot weld joint on C pillar.
Inert gas weld joint.



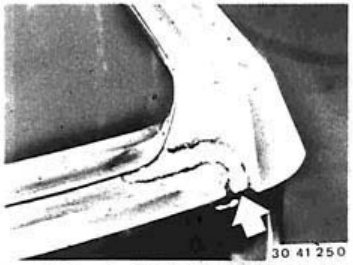
Autogen weld connecting panel on tail panel and side panel.



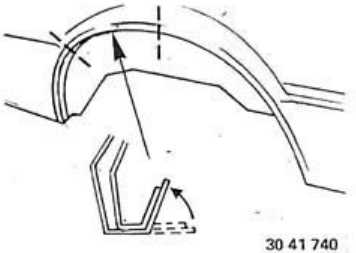
Spot weld side panel on trunk opening edge.



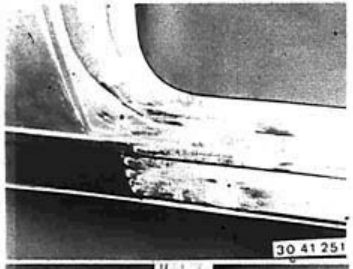
Spot weld tail panel on side panel.



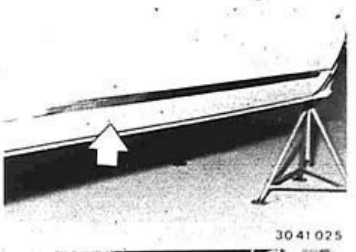
Braze and grind down connecting plate between side panel and tail panel.



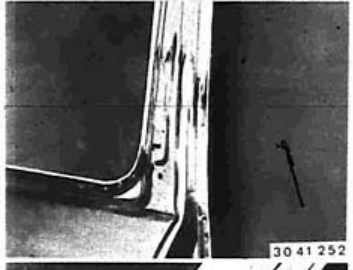
Important!
The spot welded flange in the rear area of the wheel opening has to be cringed in cars beginning with 1988 models or when using wider tires.
Compare with opposite side if necessary.



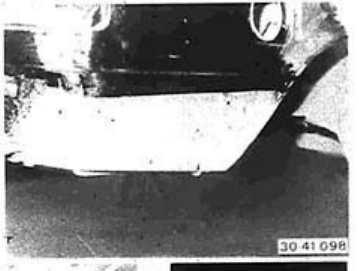
Grind dwon entrance joint and, if necessary, tin out.



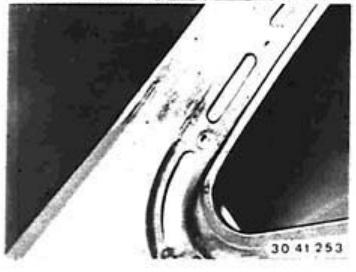
Spray an anti-drumming compound* on side panel and entrance from below.



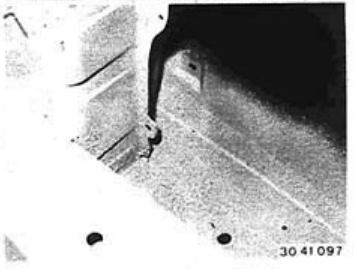
Grind down B pillar joint and, if necessary, tin out.



Spray an anti-drumming compound* on side panel and tail panel below bumper.



Grind down C pillar joint and, if necessary, tin out.



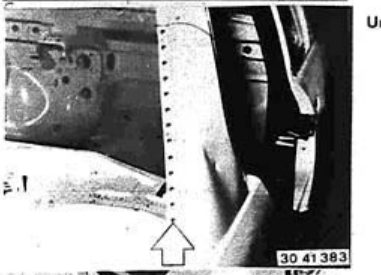
Seal inside of all joints with a body sealing compound* and spray on an anti-drumming compound*.

* Source of Supply: HWB

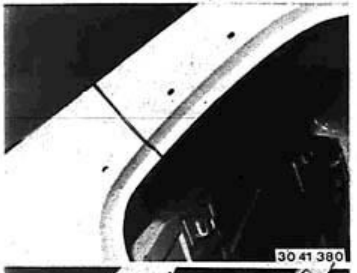
41 35 291 REPLACING RIGHT REAR SIDE PANEL (PARTIAL REPLACEMENT UP TO WINDOW LINE)
— Four Door Model —

Refer to information on page 41 - 001.
Remove or disconnect following parts: complete trunk trim panels, trunk lid seal, rear bumper, right tail lights, upper tail panel plate, spare wheel, rear seat cushion and backrest, hatrack, rear window with rubber frame, entrance cover strip with cover plate, roof liner partially, carpet partially, rear seat belt, rear door edge guard, door striker, C pillar plate, rear wheel, wheel house cover, expansion tank, fuel tank, brace mounting parts.

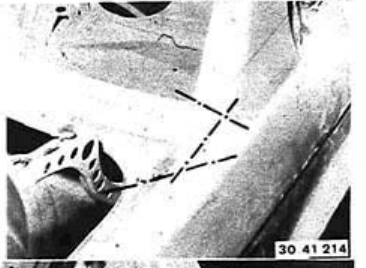
Remove brazing solder.
Drill out spot welds.



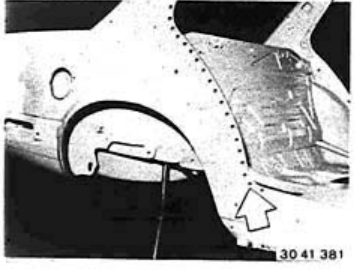
Uncover and drill out spot welds.



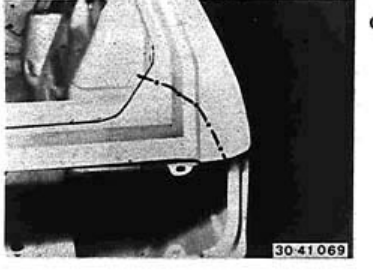
Make cutting line for partial replacement.
Cut through side panel along cutting line up to the end plate.
Caution!
Don't damage or bend the end plate.
Note:
Make cutting line in such a manner that roof joint paint finish can be touched up.



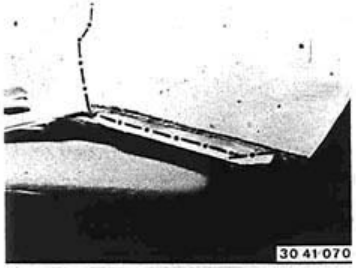
Cut out side panel along line.



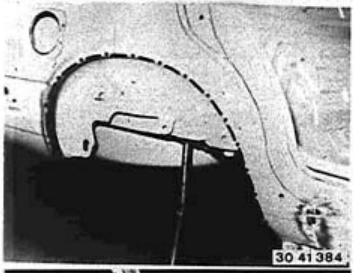
Uncover and drill out spot welds.



Cut side panel off of tail panel along line.

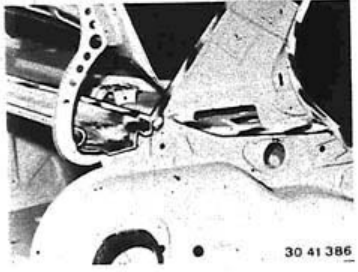


Cut off side panel on tail panel and trunk side section panel.

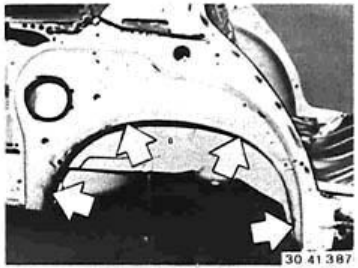


Grind down edge on wheel house.

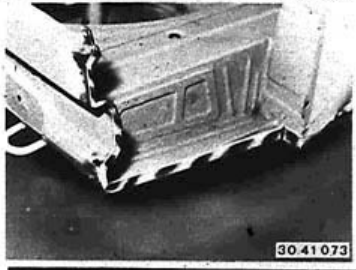
Lift off side panel.
Important!
Heat or cut off sealing material on C pillar and tank filler neck.



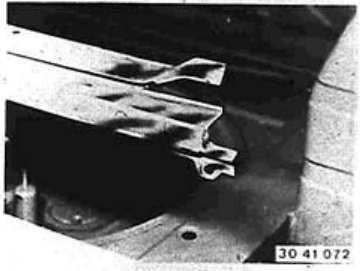
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



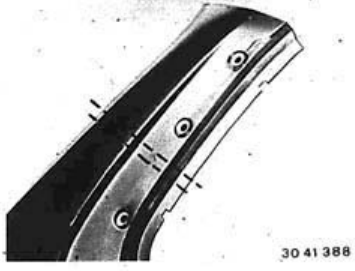
Remove scrap metal.
Straighten and grind mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.

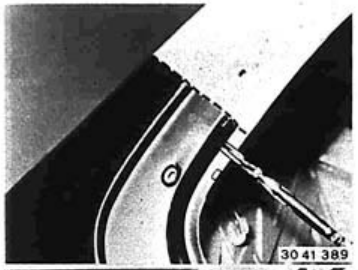


Remove scrap metal.
Straighten and grind mating surfaces.

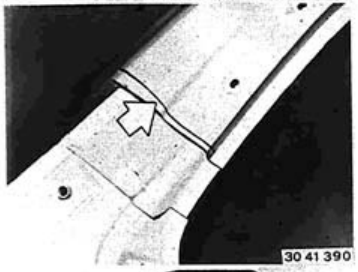


Cut off C pillar on new side panel approx. 10 mm (3/8") above planned mating point.

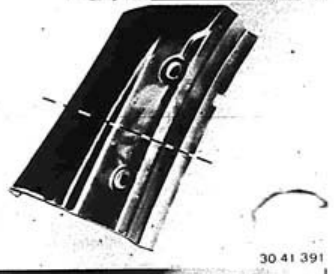




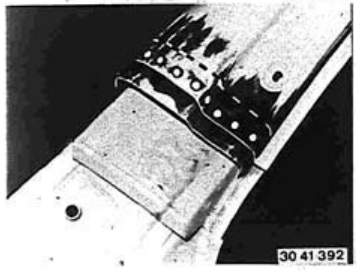
Install side panel and make cutting line.



Remove scrap metal on C pillar.
Caution!
Be careful not to damage end plate on inside.

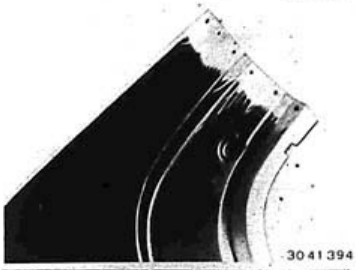


Produce an approx. 50 mm (2") wide brace from section cut off of new side panel.

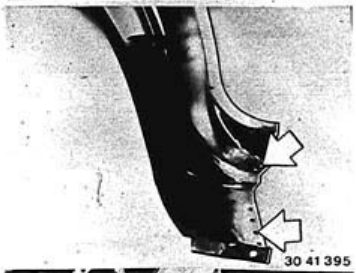


Slide brace into C pillar halfway and spot weld.

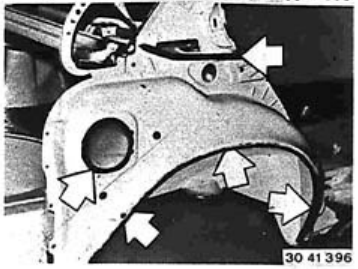
Grind mating surfaces on new side panel. Coat mating surfaces required for spot welding with zinc dust paint.



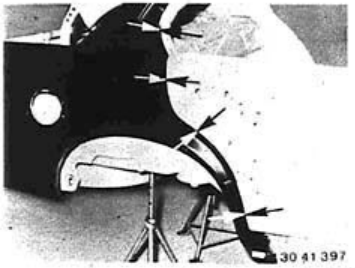
Drill holes for plug spot welding in C pillar mating surface.



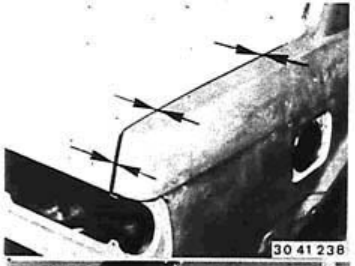
Drill holes for plug spot welding in entrance mating surface.



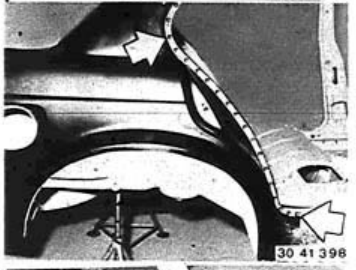
Coat bearing surfaces on guide plate, tank filler neck and in wheel opening with a body sealing compound.



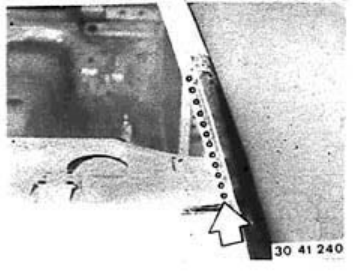
Install and clamp down side panel, tack welding if necessary.
Check door gaps.



Check trunk lid gaps.

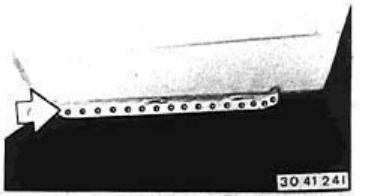


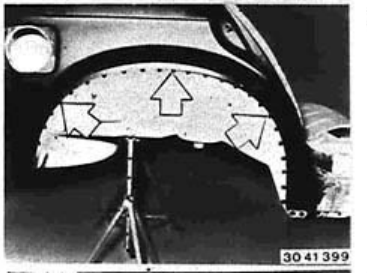
Spot weld side panel in door opening.



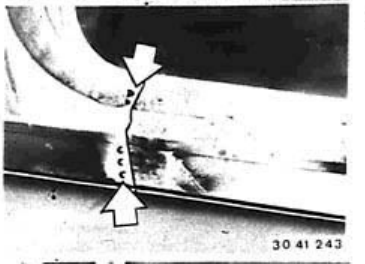
Spot weld side panel on rear window frame.

Spot weld side panel on trunk floor plate.

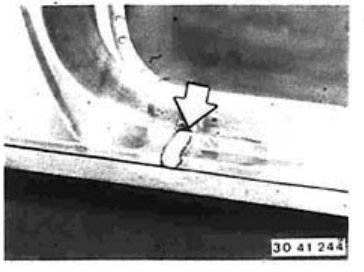




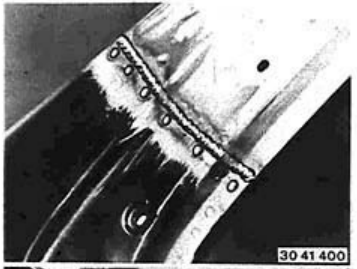
Spot weld side panel in wheel opening.



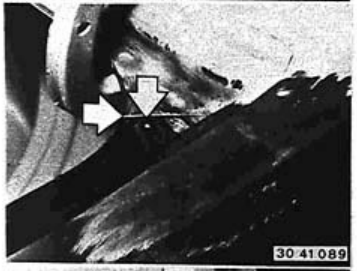
Inert gas plug weld entrance connection.



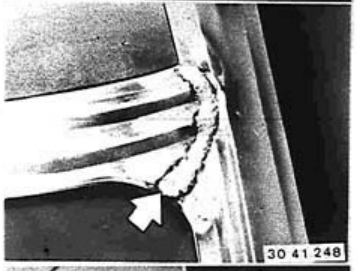
Braze entrance on outside edge.



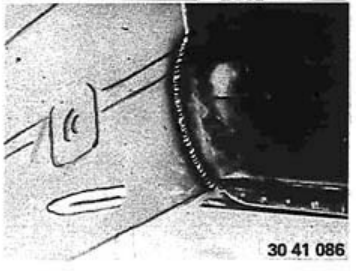
Plug spot weld mating surface on C pillar.
Inert gas weld joint.



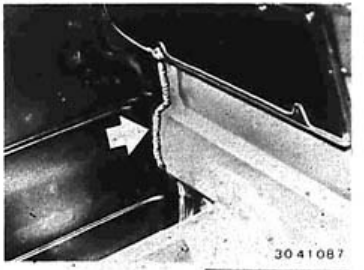
Spot weld side panel in trunk lid opening.



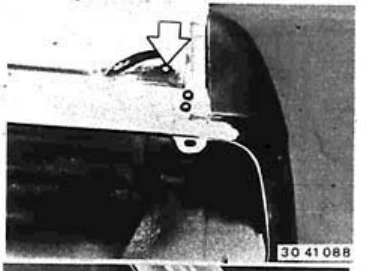
Braze joint.



Inert gas weld side panel on tail panel.
Grind down welding seam.

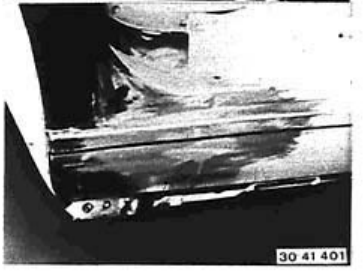


Autogen weld connector on tail panel and side panel from inside.

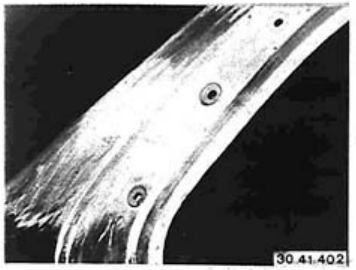


Spot weld tail panel on side panel.

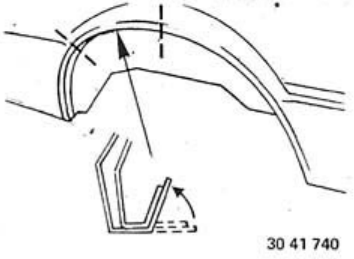
Braze and grind down joint between side panel and tail panel.



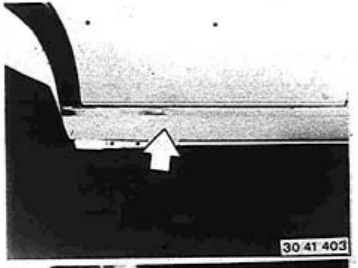
Grind down joints on entrance, tinning out if necessary.



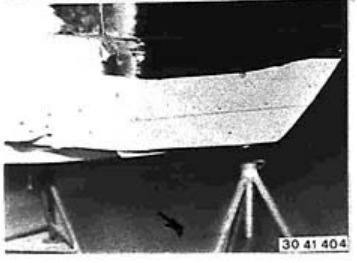
Grind down C pillar joint, tinning if necessary.



Important!
The spot welded flange in rear area of the wheel opening must be cringed on cars beginning with 1988 models or when using wider tires.
Compare with opposite side if necessary.

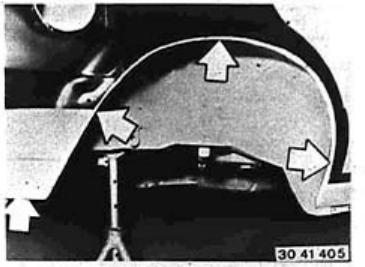


Spray coat of anti-drumming material* on bottom of side panel and entrance.

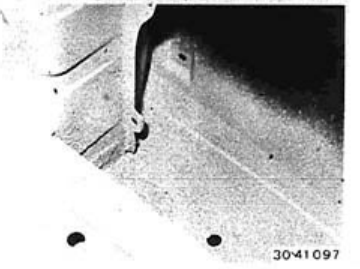


Spray coat of anti-drumming material* on side panel and tail panel below the bumper.

* Source of Supply: HWB



Repair spot welded flange and damaged anti-drumming coat in wheel house and on trunk floor plate.

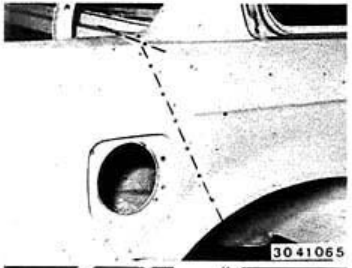


Seal inside of all joints with a body sealing compound* and spray on a coat of anti-drumming material.

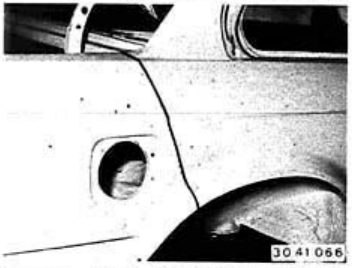
* Source of Supply: HWB

41 35 338 REPLACING RIGHT REAR SIDE PANEL (PARTIAL REPLACEMENT UP TO WHEEL HOUSE)

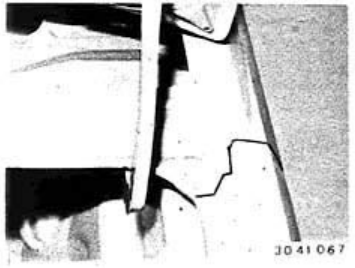
Refer to information on page 41 - 001.
Remove bumper assembly, tail lights, trunk mat, rear trim panel, right wheel house trim panel, tail panel trim panel, tail panel plate, trunk lid seal, fuel tank assembly, right wheel house cover, fuel filler neck and right expansion tank.



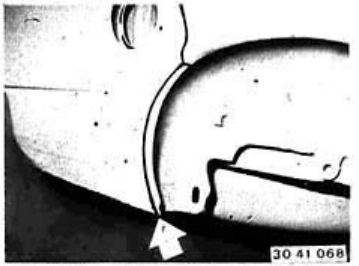
Draw cutting line for partail replacement.



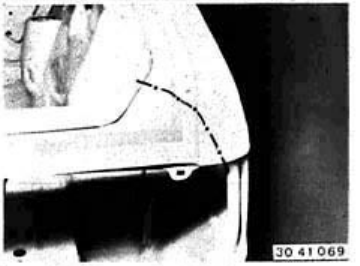
Cut off side panel along the line.



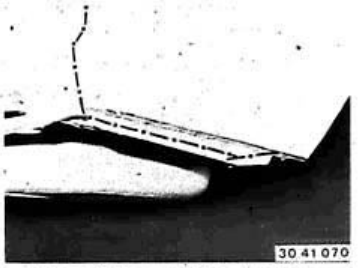
Cut off side panel along the line.



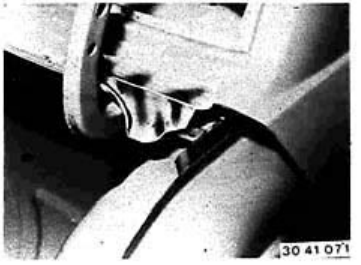
Cut off side panel around the wheel opening.



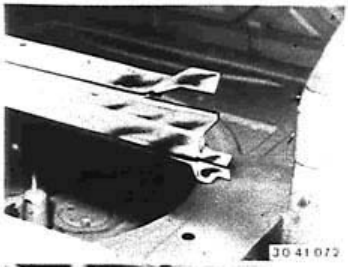
Cut off side panel on the tail panel.



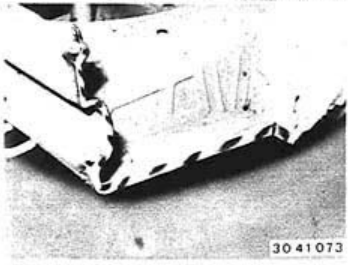
Cut off side panel on tail panel and trunk side section.
Take off side panel section.



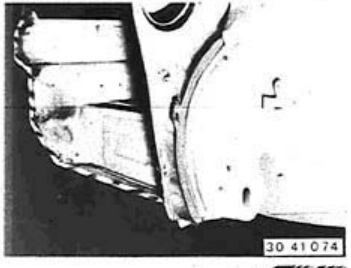
Remove scrap metal.



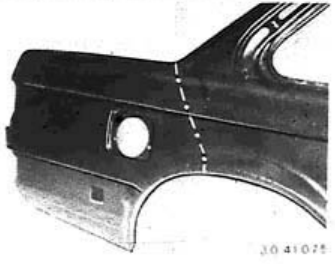
Remove scrap metal.



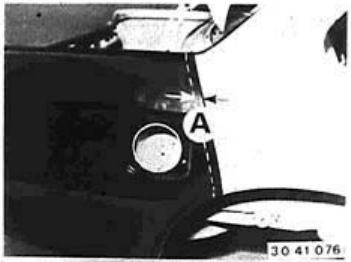
Remove scrap metal.



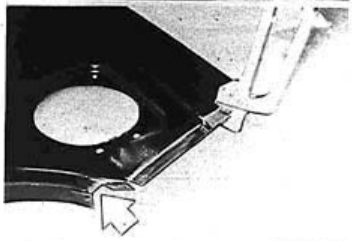
Remove scrap metal.



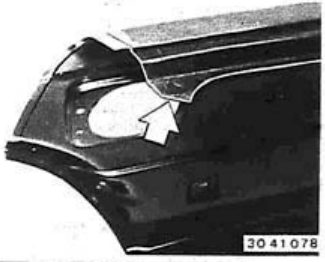
Cut off new side panel to overlap on mating surfaces.



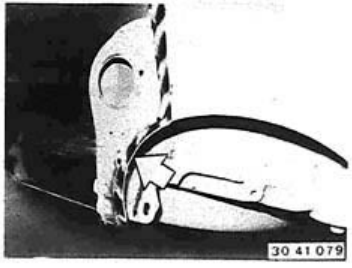
Cut mating surface to size that mating surface overlaps by distance A = 10 mm (0.394").



Make cuts in edges of partial replacement section and shoulder with a shouldering pliers.
Disengage wheel house on connection.

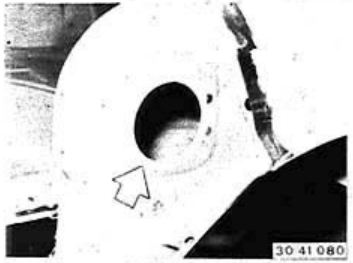


Notch in area of trunk for butt welding.

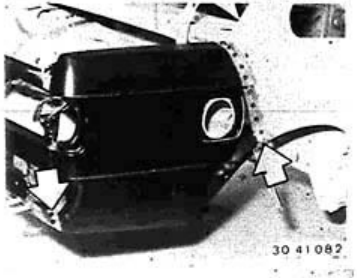


Grind mating surfaces.
Apply coat of spot welding paint on wheel house opening.

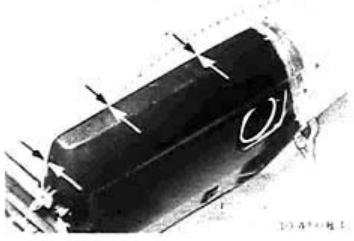
Grind mating surfaces on partial replacement section.
Apply coat of spot welding paint on wheel house opening and end plate/trunk floor plate.



Apply body sealing compound* in area of fuel tank filler neck.

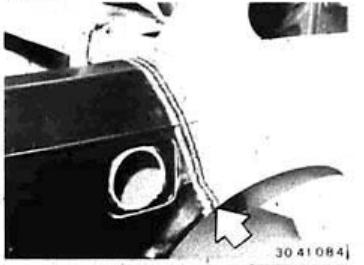


Clamp on and tack weld partial replacement section.

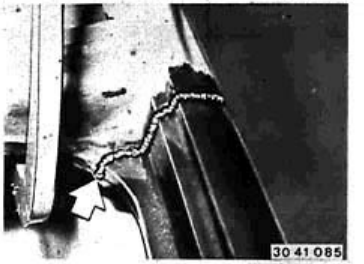


Check gap between trunk lid and side panel.

* Source: HWB

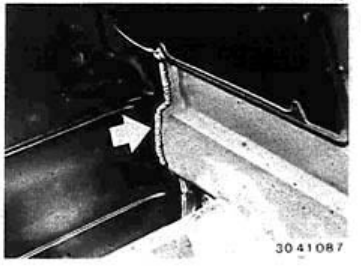


Inert gas weld mating surface joint.

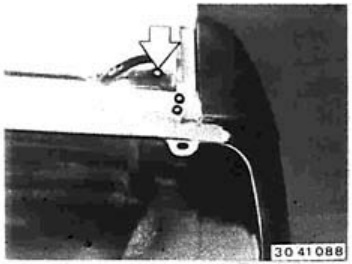


Inert gas weld mating surface joint.

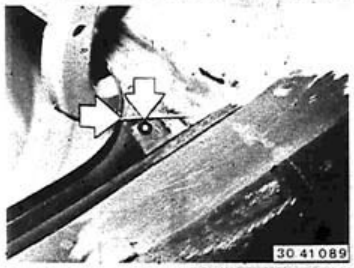
Inert gas weld side panel on tail panel.



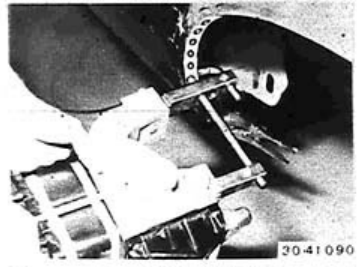
Autogen weld web of tail panel and side panel.



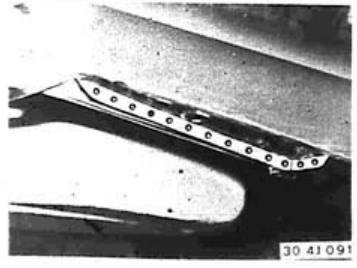
Reinforcement.
Spot weld tail panel on side panel.



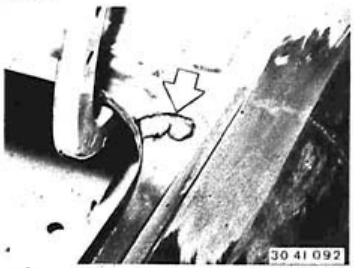
Spot weld side panel in trunk lid opening.



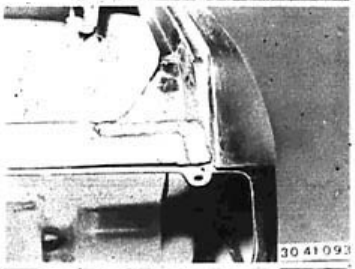
Spot weld side panel in wheel house opening.



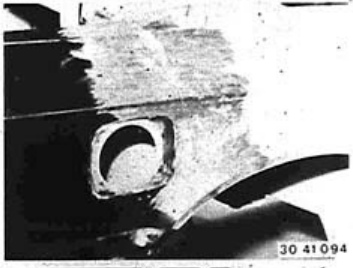
Spot weld side panel on joint of trunk floor and wheel house.



Braze mating surface joint.

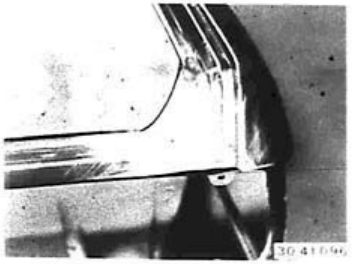


Braze side panel/tail panel reinforcement plate.

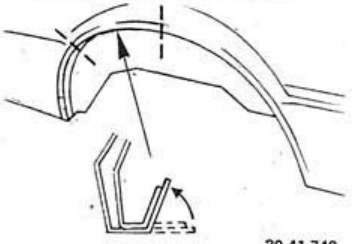


Grind down all welding seams.

Tin mating surface joints of side panel partial replacement section.

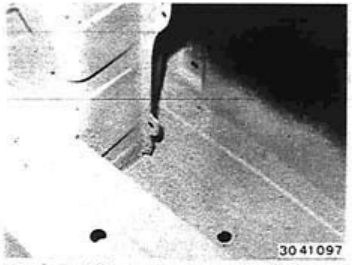


If applicable, tin upper tail panel-connecting joint.



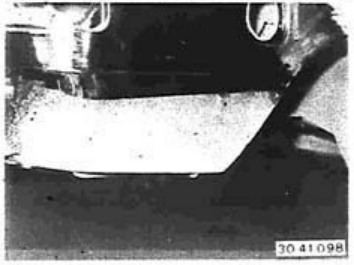
30 41 740

Important!
The spot welding flange in the rear area of the wheel housing opening must be cringed on cars beginning with 1988 models or when using wider tires.
Compare with opposite side if necessary.



30 41 097

Seal all joints with body sealing compound*.
Spray with anti-drumming compound*.



30 41 098

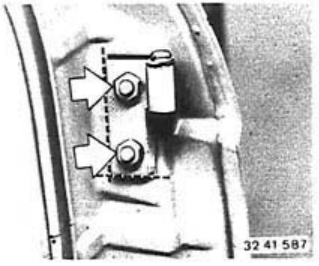
Spray an anti-drumming compound* on side panel/tail panel joint underneath the bumper.

* Sourec of Supply: HWB

41 51 ... REPLACING BEARING SLEEVES FOR DOOR HINGES

Remove front or rear doors – see 41 51 080 or 41 52 080.

Note:
The bearing sleeve fitted with a hinge is on the door in reference to the top hinge or on the body in case of the bottom one.
The hinge must be unscrewed on the door to replace the upper bearing sleeve.

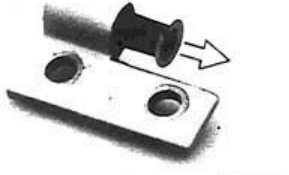


32 41 587

Mark position of door hinge.
Touch up damaged paint finish.

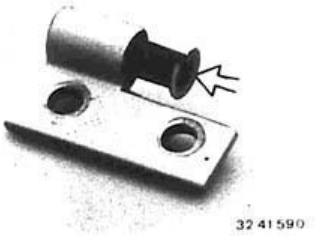
32 41 588

Lift off retainer and washer.
Pull out bolt.



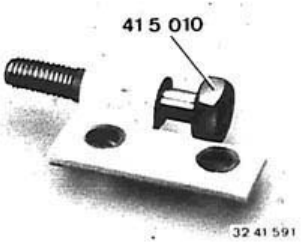
32 41 589

Remove old bearing sleeve.



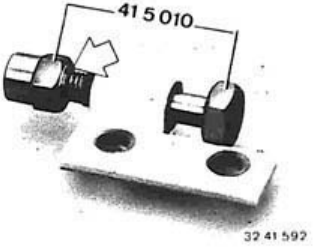
32 41 590

Insert new bearing sleeve.



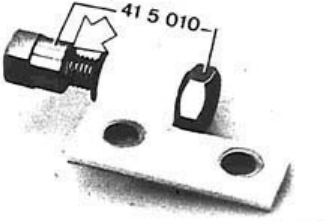
32 41 591

Push in bolt on Special Tool 41 5 010.



32 41 592

Screw nut on Special Tool 41 5 010 with conical side as shown.
Cringe the sleeve.
Unscrew nut.

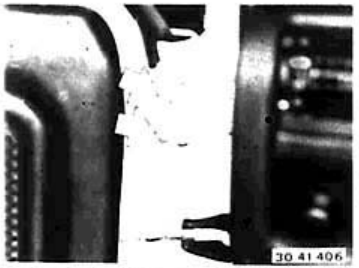


32 41 593

Screw nut on Special Tool 41 5 010 with flat side as shown.
Press the cringe flat.

Installation:
Lubricate bearing surface with grease*.

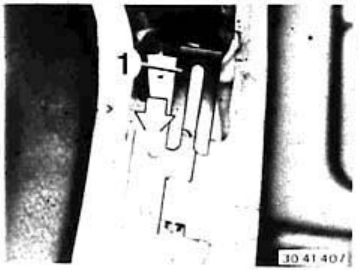
* Sourec of Supply: HWB



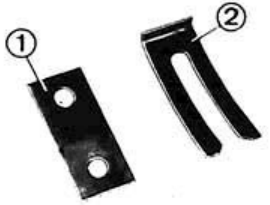
41 51 004 ADJUSTING LEFT OR RIGHT FRONT DOOR

Adjusting Front Door On Hinges:

Note:
Engine hood, trunk lid and doors are fitted and bolted in an unfinished body shell. Unpainted surfaces will be visible after making adjustments.
Paint such surfaces with pertinent body color
Loosen bolts at top and bottom.

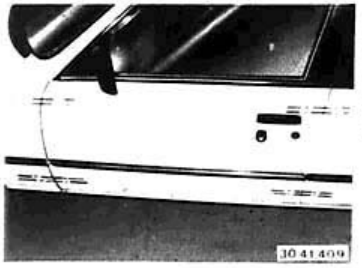


Adjust door outer panel surface to same plane of front side panel with shims (1).

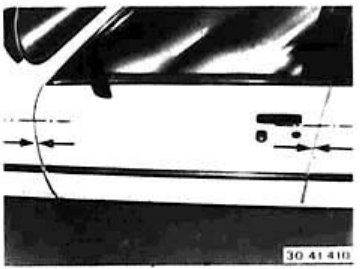


30 41 408

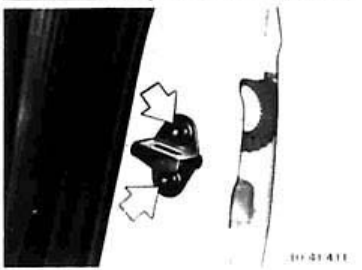
Note:
Basic adjustment should be made with 1 mm (0.039") thick shims (1).
Fine adjustments are made with shims (2) in thicknesses of optionally 0.5 mm (0.020") or 1.0 mm (0.039").



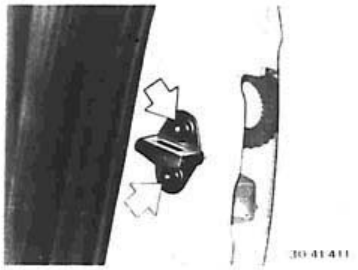
Note:
The door outer panel surface can be adjusted "deeper" than the front side panel by up to max. 1 mm (0.039"), in order to prevent wind noise and stone damage as well as to compensate optical irregularities (tolerances in the curvature).



Align door to have uniform gaps at front and rear
Align door at top with the embossed edges



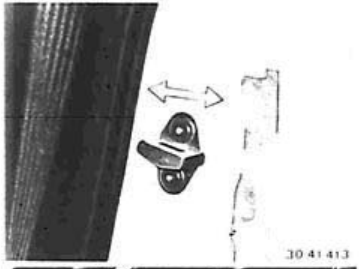
Note:
Loosen striker on door lock, if necessary



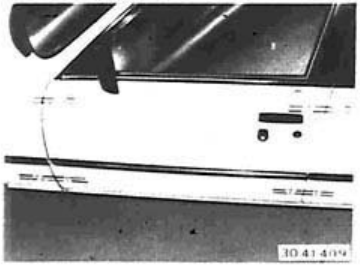
Adjusting Door Lock:

Loosen bolts (Torx).

Adjust striker vertically until guide engages in door without tension.

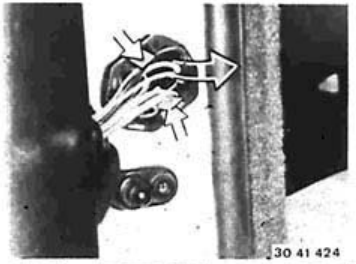


Adjust striker horizontally until outer panel surface of closed door (2nd catch) is in same plane with rear side panel or rear door.



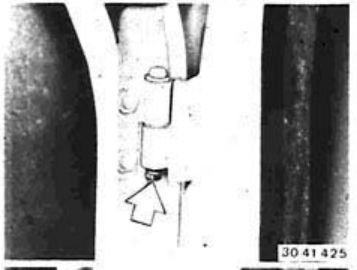
Note:

The adjacent rear side panel or rear door can be adjusted "deeper" by up to max. 1 mm (0.039"), in order to prevent wind noise and stone damage as well as for compensation of optical irregularities.

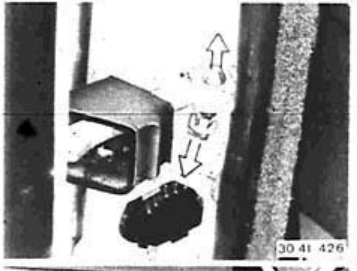


41 51 080 REMOVING AND INSTALLING LEFT OR RIGHT FRONT DOOR
– Detachable Front Door Type –

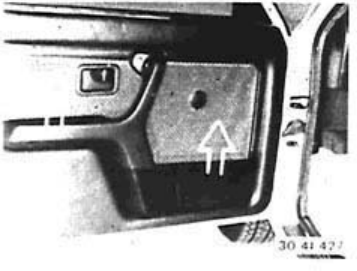
Disconnect plug on A pillar.



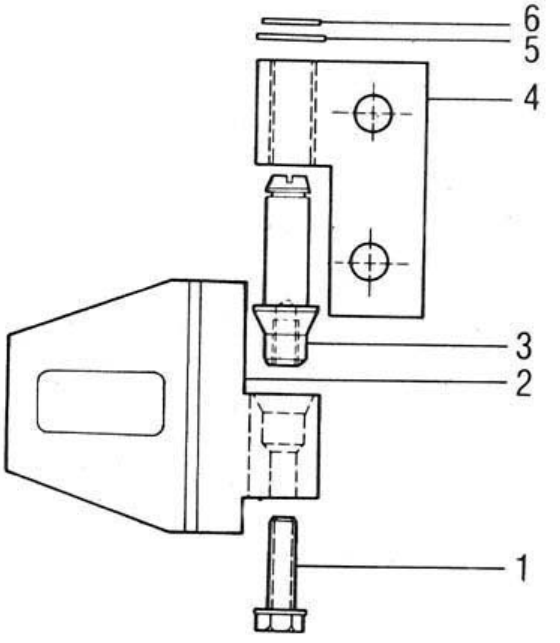
Unscrew bolts at top and bottom.



Lift off rubber cap.
Pull off retainer.
Press out pin.
Caution!
Be careful not to damage the side panel and door outside panel surface when opening the door.



Detach front door from above.



30 41 432

1 Bolt
2 Hinge (body end)*
3 Hinge pin
4 Hinge (door end) with bearing sleeve*
5 Washer
6 Lockwasher

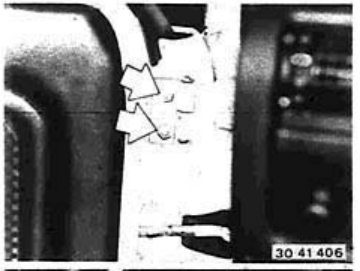
* Sketch shows the top hinge.
Mounting parts are located in inversed order on the bottom hinge.

41 51 101 REPLACING LEFT OR RIGHT FRONT DOOR

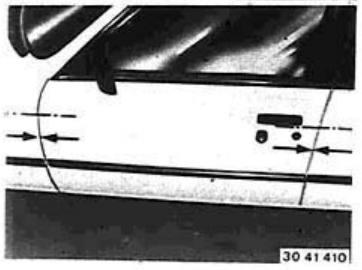
The following jobs must be performed in the given sequence.
Installation is in reverse sequence.
Seal cavities of a new door.

Remove front door trim panel – see	51 41 001
Remove door window – see	51 32 170
Remove window regulator – see	51 32 020
Remove power window, if applicable – see	51 33 000
Remove mirror – see	51 16 000
Remove complete ornamental frame on window frame – see	51 32 410
Remove door lock – see	51 21 090
Remove door lock cylinder – see	51 21 140
Remove outside handle and locking mechanism – see	51 21 300
Remove rubbing strip on front door – see	51 15 330
Remove door retarder – see	51 21 280

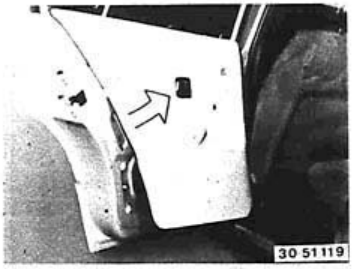
Pull wire harness out of door.
Transfer door weatherstrip from old to new door.
Transfer or replace all clamps and clips.



Unscrew hinges at top and bottom.
Lift off door.



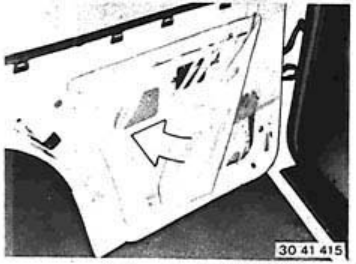
Installation:
Adjust front door, see 41 51 004



41 52 004 ADJUSTING LEFT OR RIGHT REAR DOOR

Adjusting Rear Door On Hinges:

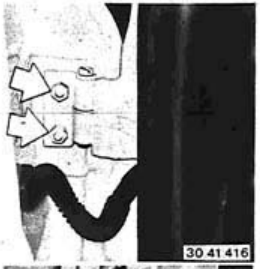
Remove door trim panel, see 51 42 001.



Pull off plastic sheet partially.

Installation:

Replace damaged plastic sheet.



Loosen bolts at top.

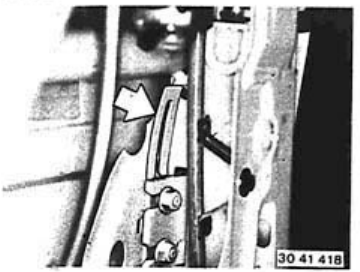
Note:

Engine hood, trunk lid and doors are fitted and bolted in an unfinished body shell.

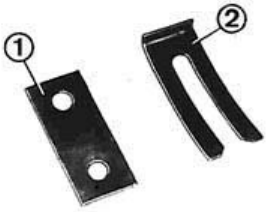
Unpainted surfaces will be visible after making adjustments.

Paint these surfaces with pertinent body color paint.

Loosen bolts at bottom.



Adjust door outer panel surface to same plane of front door with shims.



30 41 408

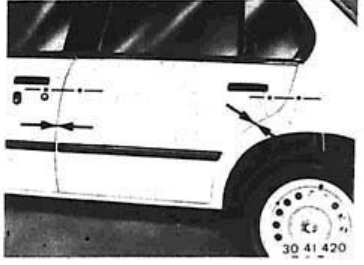
Note:

Basic adjustment should be made with 1 mm (0.039") thick shims (1).

Fine adjustment is made with shims (2) in thicknesses of optionally 0.5 mm (0.020") and 1.0 mm (0.039").

Note:

The rear door outer panel surface may be adjusted "deeper" than the front door by up to max. 1 mm (0.039"), in order to prevent wind noise and stone damage as well as for compensation of optical irregularities (tolerances in the curvature).

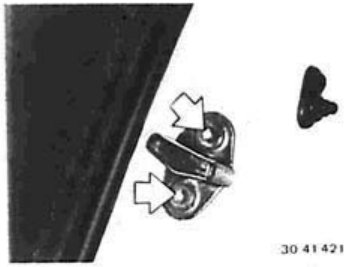


Adjust door to have uniform gaps at front and rear.

Adjust door at top with embossed edges.

Note:

Loosen striker on door lock, if necessary.



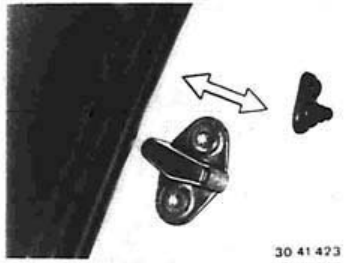
30 41 421

Adjusting Door Lock:

Loosen bolts (Torx).

30 41 422

Adjust striker vertically until guide engages in door without tension.



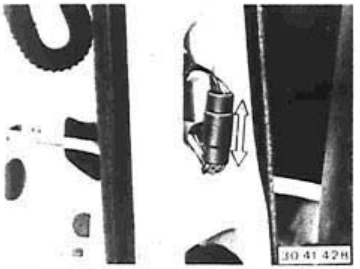
30 41 423

Adjust striker horizontally until outer panel surface of closed door (2nd catch) is in same plane with rear side panel.

30 41 419

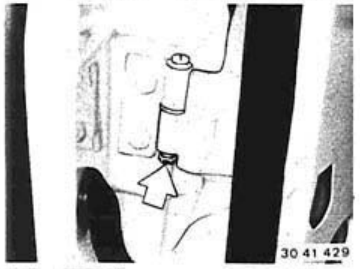
Note:

Rear side panel may be adjusted "deeper" by up to max. 1 mm (0.039"), in order to prevent wind noise and stone damage as well as for compensation of optical irregularities.

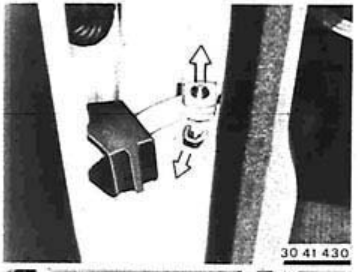


41 52 080 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR
– Detachable Door Version –

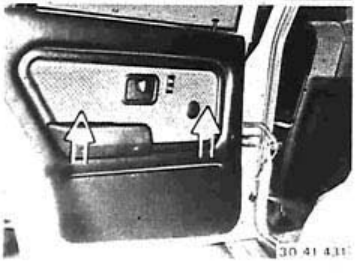
Note:
Disconnect plug in B pillar of cars with power windows or central locks.
Remove B pillar plate, see 51 43 150.
Pull door wire harness out of B pillar.



Unscrew bolts at top and bottom.



Lift off rubber cap.
Pull off retainer.
Press out pin.
Caution!
Open front door.
Be careful not to damage door outer panel surface and B pillar while opening rear door.



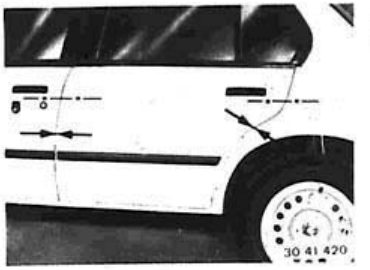
Detach rear door from above.

41 52 101 REPLACING LEFT OR RIGHT REAR DOOR

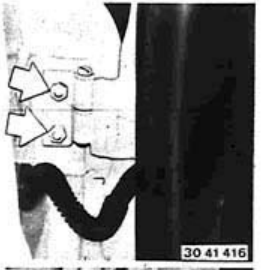
The following jobs must be performed in the given sequence.
Installation is in reverse sequence.
Seal cavities of a new door.

Remove rear door trim panel – see	51 42 001
Remove door window – see	51 34 170
Remove window regulator – see	51 34 020
Remove power window regulator – see	51 37 000
Remove window fixed in rear door window frame – see	51 34 190
Remove complete ornamental frame – see	51 34 380
Remove door lock – see	51 22 090
Remove outside handle and locking mechanism – see	51 22 220
Remove rubbing strip on rear door – see	51 15 360
Remove door retarder – see	51 22 280

If applicable, pull wire harness out of door.
Transfer door weatherstrip.
Transfer or replace all clamps and clips.

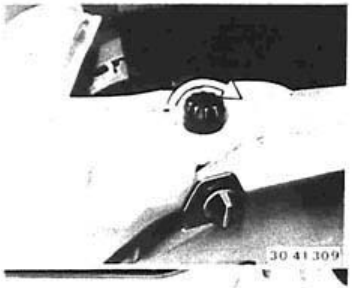


Installation:
Adjust rear door, see 41 52 004.



Unscrew hinge at top.

Unscrew hinge at bottom.
Lift off door.



41 61 014 ALIGNING ENGINE HOOD

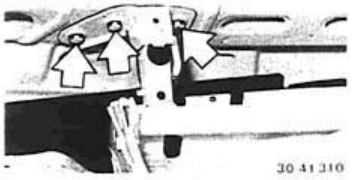
Note:
Engine hood, trunk lid and doors are fitted and bolted in an unfinished body shell.
Unpainted surfaces will be visible through subsequental adjustment.
These surfaces must be touched up with the pertinent body color paint.

Fitting Engine Hood in Body Opening:

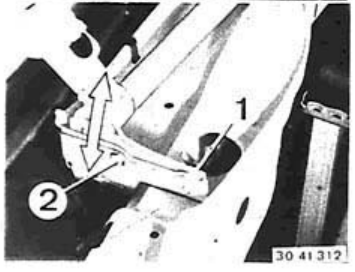
Screw in left and right stop pads completely.

Installation:
Affer finishing adjustments loosen stop pads enough that engine hood has light tension and is in same plane with side panels.

Loosen left and right screws.



Align engine hood to the side panels at front and sides.



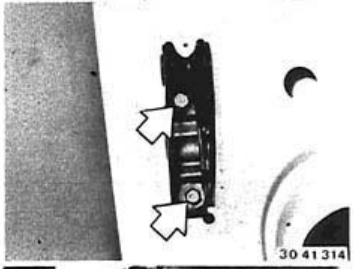
Front Engine Hood Height Adjustment:

Loosen screws (1 and 2) on left and right sides.
Adjust console at screw (2) down or up.

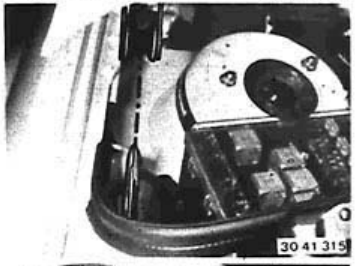
Adjust engine hood in height that engine hood is approx. 1 mm (0.039") deeper than the side panels.

Adjusting Rear Guide Roller:

Loosen screws.

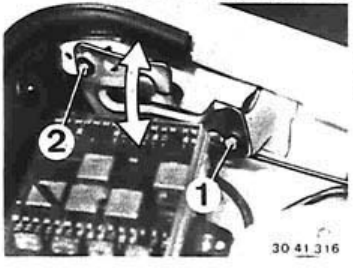


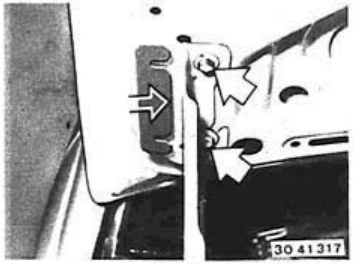
Adjust holder laterally until guide roller slides into catch correctly.
Check gap between left and right side panels and engine hood.

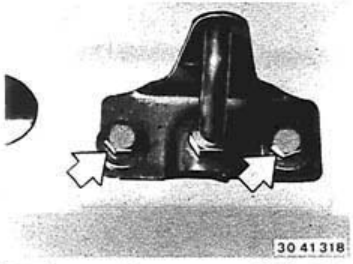


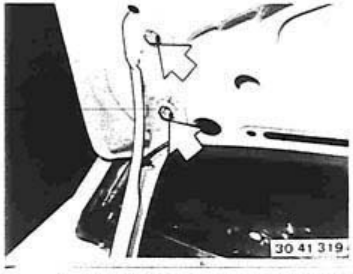
Rear Engine Hood Height Adjustment:

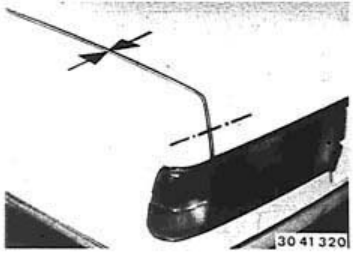
Loosen screws (1 and 2).
Adjust catch at screw (2) that closed engine hood is in same plane with side panels.











41 62 014 ALIGNING TRUNK LID

Note:
Engine hood, trunk lid and doors are fitted and bolted in an unfinished body shell. Subsequential adjustments could uncover unpainted surfaces. These surfaces must be painted with paint of same color as the body paint.

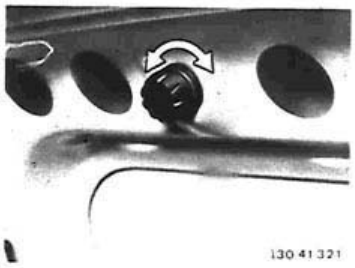
Trunk Lid Height at Front End:
Loosen bolts and install spacers as required.

Aligning Trunk Lid in Body Opening:
Loosen locking bar, unscrewing if necessary.

Installation:
Align locking bar according to the lock base.

Loosen bolts.

Align trunk lid.



Trunk Lid Height at Rear End:
Screw in left and right stop pads completely.

Installation:
Unscrew stop pads after finishing adjustments until the trunk lid rests on them with light tension and is in same plane with the side panels.

Adjust length of locking bar by turning the nut, until the surface of a closed trunk lid at rear is approx. 1 mm (0.039") deeper than the side panels.

Important Special Features of 1991 Model E 30 Convertible Body in Comparison with Sedan Body

- Two-piece engine carrier
- Front panel same as 1988 model sedan
- Side members stronger at front side
- Side member shoulder designed as second member
- Rear wheel housings modified on inside and outside
- Center pillars modified
- Carrier for dashboard same as sedan with airbag (SRS)
- Support for steering column with supporting pipe
- Left/right front cowl panels with inserted, two-piece reinforcement pipes extending into A-pillars
- Rear side panels as 1988 model sedan
- Tail panel as 1988 model sedan
- Front doors reinforced as US version and with fixed triangle windows

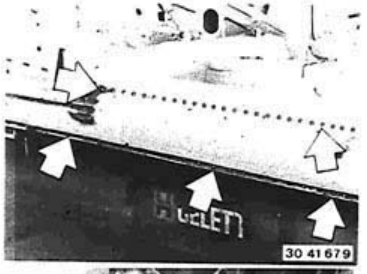
Note:
Left or right front cowl panel can only be replaced complete with reinforcement pipe and corresponding work on A-pillar.

When working on body special attention must be given to features of convertible bodies and repair procedures adapted to changed conditions accordingly.

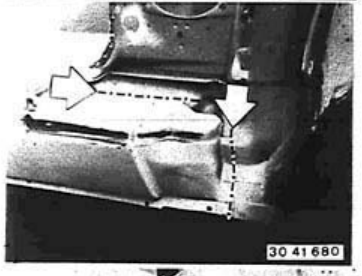
41 11 520 REPLACING COVER FOR LEFT OR RIGHT SIDE MEMBER
(Rear Side Panel and Door Pillar Removed)
– Convertible –

Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.
Remove front side panel.
Remove rear side panel, see 41 35 111.
Remove door pillar with reinforcement, see 41 21 501.

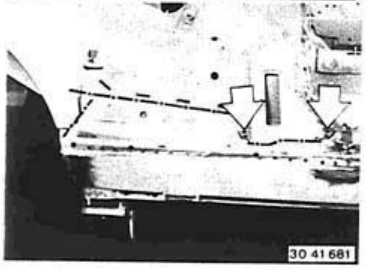
Drill out spot welds.



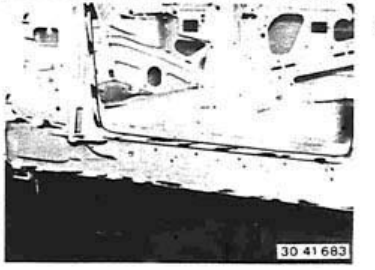
Grind off welding bead.



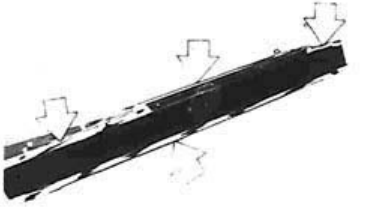
Drill out spot welds.
Grind off welding beads.



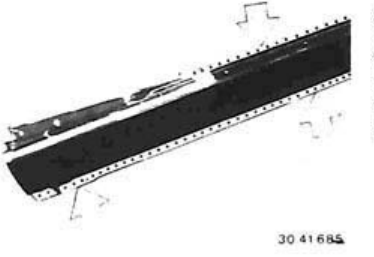
Grind off edge.
Lift off cover
Important!
Don't damage the end plate.



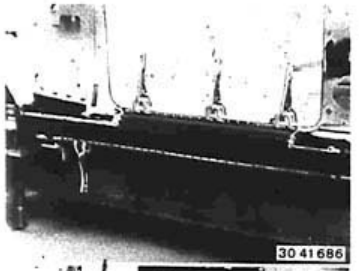
Straighten and grind all mating surfaces.



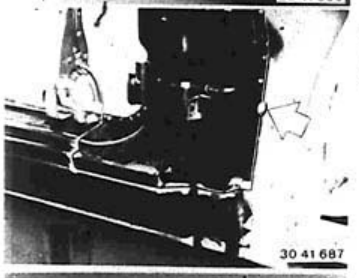
Grind mating surfaces on new cover.



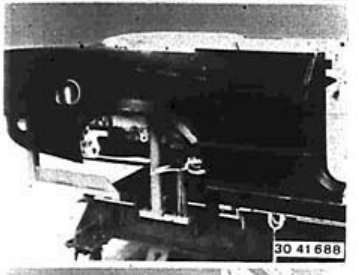
Sheet metal panels are too thick for perfect resistance spot welding with workshop equipment.
Drill holes in all mating surfaces required for plug spot welding.
Take spacing between holes from removed part.



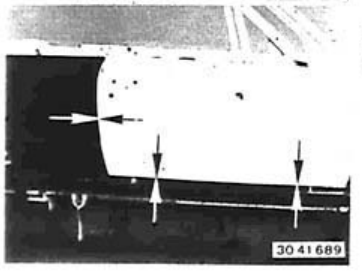
Clamp down and tack weld cover.



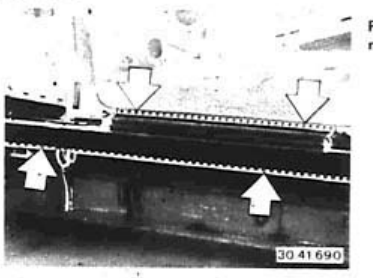
Set up and tack weld new door pillar lightly.
Note:
Door pillar must be removed again after fitting in.



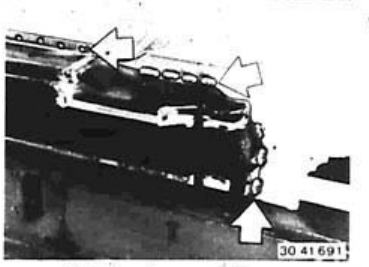
Set up and clamp down rear side panel.



Install door.
Check gap to entrance and rear side panel.
Lift off door, door pillar and rear side panel.

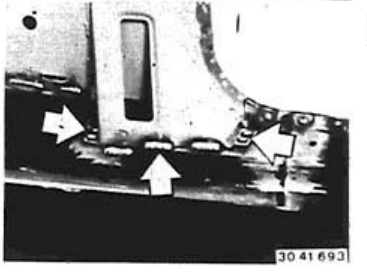


Plug spot weld cover on entrance and underneath.

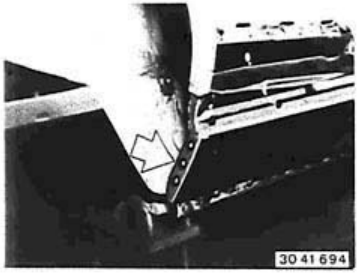


Weld cover on A pillar.

Inert gas weld connection on wheel house and end plate.



Plug spot weld support through the provided holes and lock with inert gas welding seams.

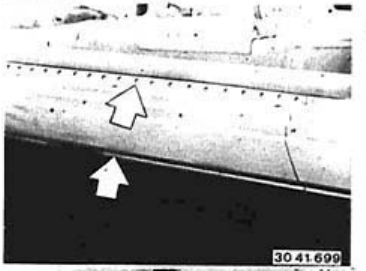


Plug spot weld connection on wheel house at rear.

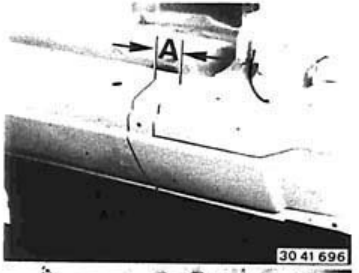
After Installation of Door Pillar With Reinforcement and Rear Side Panel:
Seal off connections with body sealing compound.
Spray on anti-drumming compound on the wheel house, trunk floor plate and entrance from underneath.

41 11 530 **REPLACING COVER FOR SIDE MEMBER LEFT OR RIGHT (Partial Replacement From Door Pillar / Rear Side Panel Removed) – Convertible –**

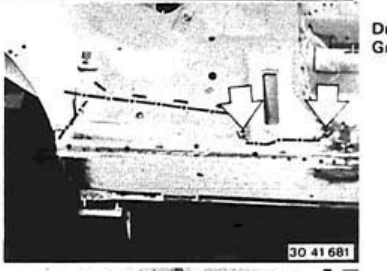
Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.
Remove rear side panel – see 41 35 111.



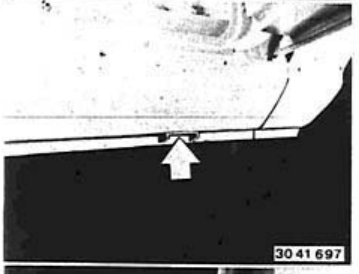
Drill out spot welds.



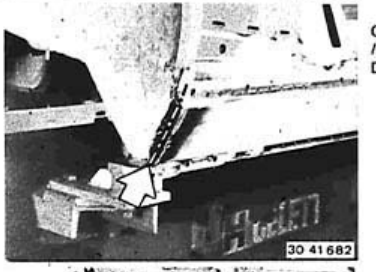
Mark cutting line.
Cutting line (A) must be at least 40 mm (1.575") away from door pillar connection.



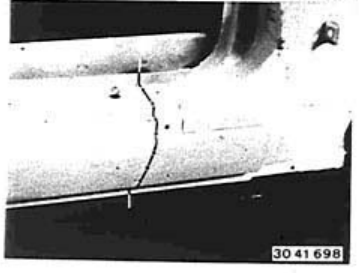
Drill out spot welds.
Grind off welding beads.



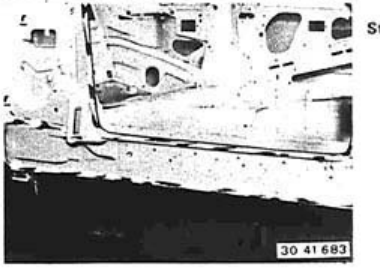
Note:
Make the cutting line in such a manner whenever possible, that the jack holder will not be cut.



Grind off edge and lift off cover.
Important!
Don't damage the end plate.

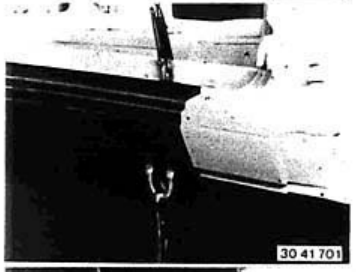


Cut off cover along marked cutting line.

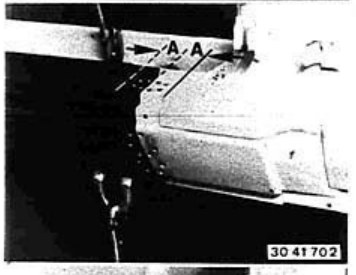


Straighten and grind all mating surfaces.

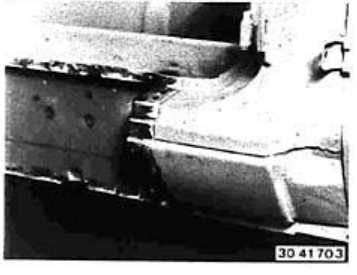
Make cutting line on new cover and cut off.



Fit in cover, cutting to size if necessary.

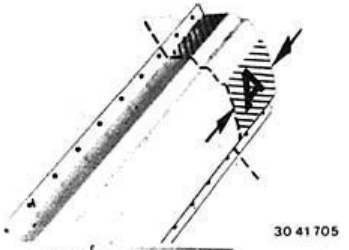


Mark location of and drill plug spot welding holes required for reinforcement strips.
Distance A = 30 mm (1.181").
Four holes each at top.
Six holes each at bottom.

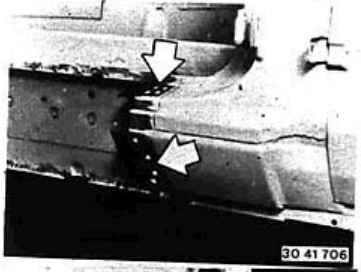


Lift off section panel.
Grind mating surfaces.
Deburr holes.

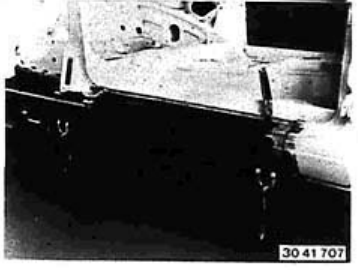
The sheet metal panels are too thick for perfect resistance spot welding with workshop equipment.
Drill holes for plug spot welding in all mating surfaces required for spot welding.
Take spacing between holes from removed part.
Grind mating surfaces.
Deburr holes.



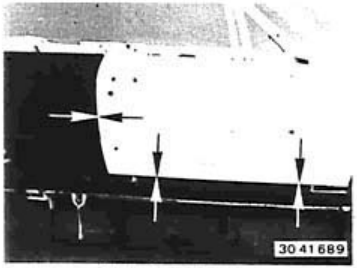
Prepare strips from the cut off cover for reinforcements.
A = 60 mm (2.362")



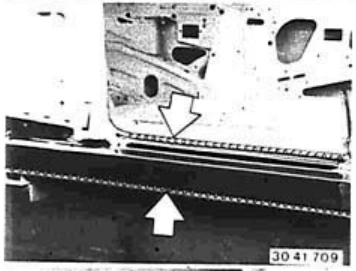
Slide in reinforcement strips half way, align and plug spot weld.



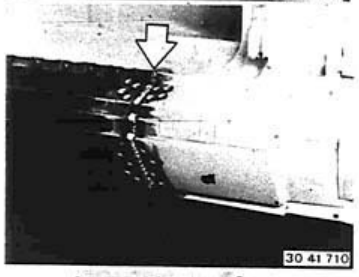
Clamp down and tack weld cover.



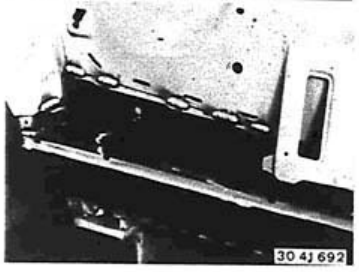
Fit in the rear side panel.
Install door.
Check gaps.



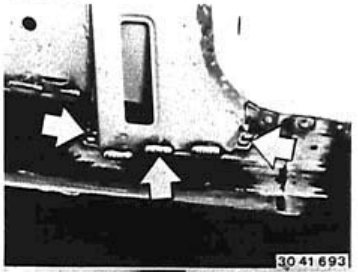
Remove door and rear side panel.
Plug spot weld cover on entrance and from underneath.



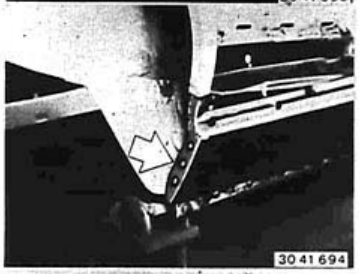
Plug spot weld panel section connection.
Weld mating surface point.



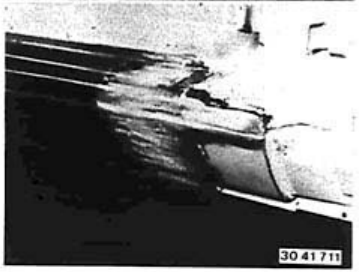
Inert gas weld connection on wheel house and end plate.



Plug spot weld the support through the provided holes and lock with inert gas welded seams.



Plug spot weld connection on wheel house at rear.

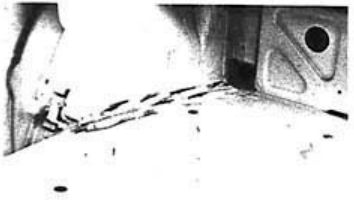


Grind panel section connection, tinning if necessary.

After Installation of Rear Side Panel:
Seal off connections with a body sealing compound.
Spray an anti-drumming compound on the wheel house, trunk floor plate and entrance from underneath.

41 12 570 REPLACING TRUNK FLOOR PLATE (Partial Replacement In Front of Cross Member) (Tail Panel Removed) – Convertible –

Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.

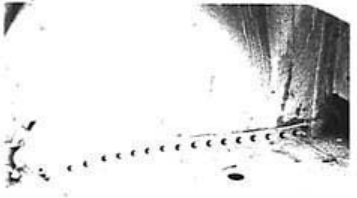


30 41 607

Make left and right connections accessible.

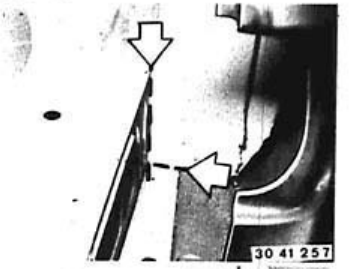
30 41 608

Mark cutting lines at height of transition on left and right sides.



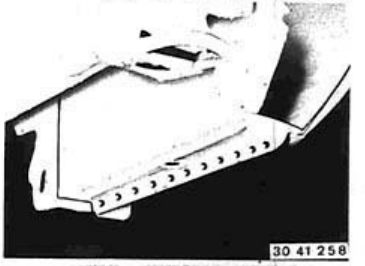
30 41 609

Drill out spot welds on left and right sides.



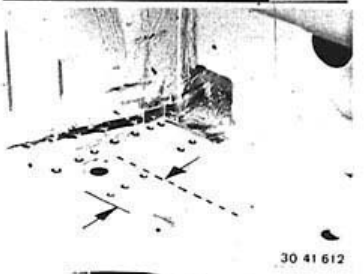
30 41 257

Cut off trunk floor plate from wheel house on left and right sides.



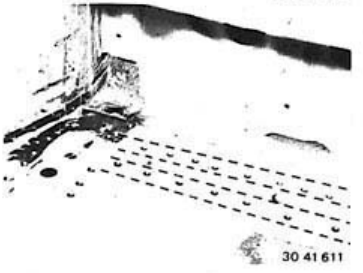
30 41 258

Make left and right spot welding accessible and drill out spot welds.



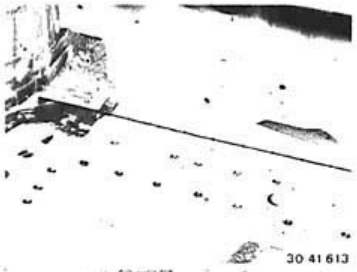
30 41 612

Drill out spot welds on side members forward up to cutting line and approx. 80 mm (3.150") toward rear.

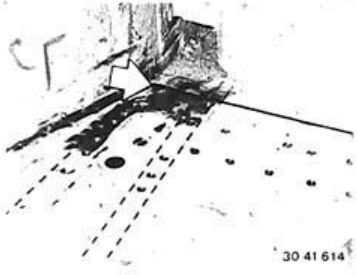


30 41 611

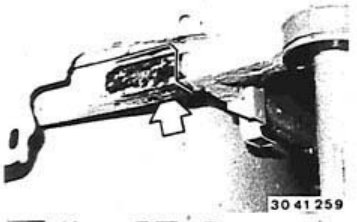
Make connections accessible.
Drill out spot welds.



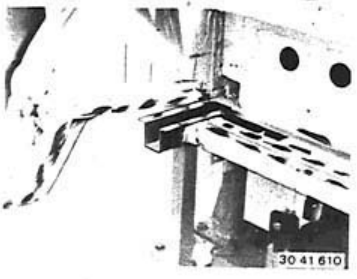
Cut off trunk floor plate along marked line.



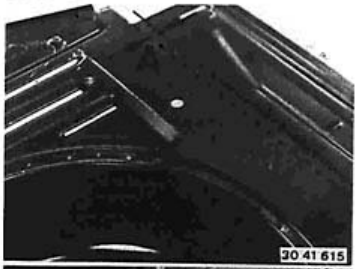
Important!
Don't damge the side members.



Uncover connections of left and right side members.
Drill out spot welds.
Lift off trunk floor plate complete with side members.

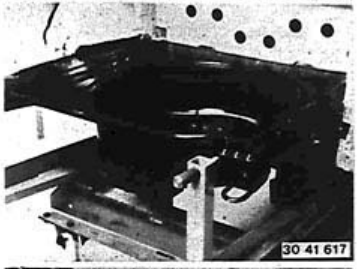


Remove scrap metal.
Straighten and grind mating surfaces.

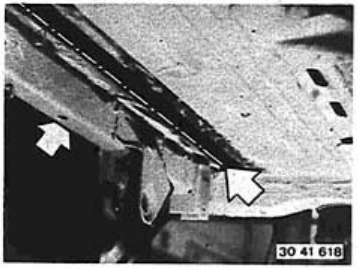


Prepare new trunk floor plate for partial replacement.
Mark line on transition.
Mark overlapping distance A = 20 mm (0.787") toward front.

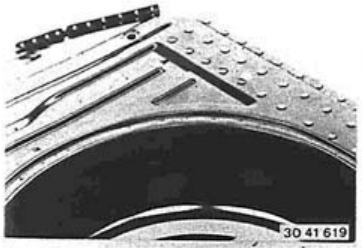
Cut off sheet metal.
Shoulder overlap upwards with a shouldering pliers.



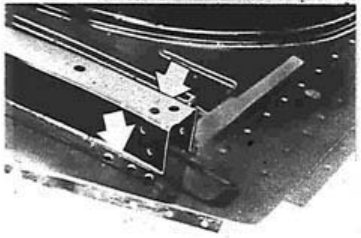
Set up car on straightening bench.
Fit in trunk floor plate.



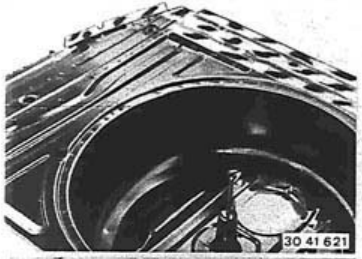
Mark location of cross member on the trunk floor plate.



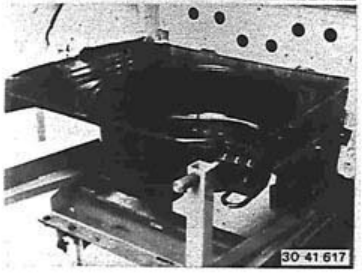
Lift off trunk floor plate.
Drill plug spot welding holes in mating surfaces which are not accessible for spot welding (cross member, partial replacement panel, wheel house).
Spacing between holes = 40 mm (1.575").



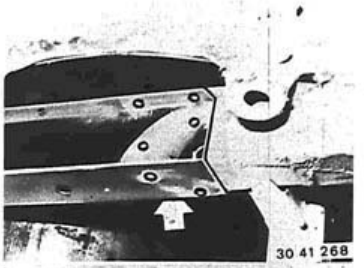
Drill plug spot welding holes in mating surfaces for side members.
Note:
Drill the holes in the flanges of side members through the trunk floor plate.



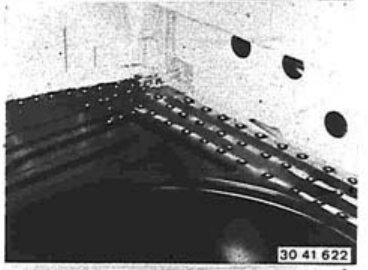
Grind all mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



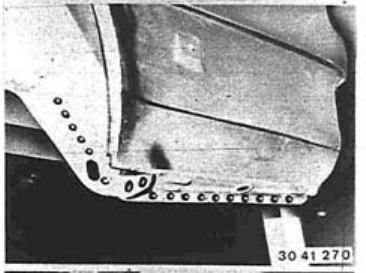
Insert trunk floor plate and align on straightening bench.



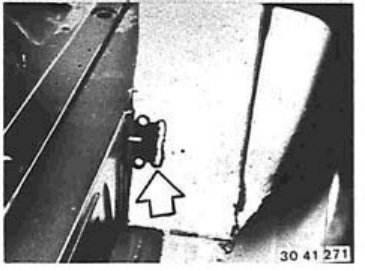
Plug spot weld both side members.



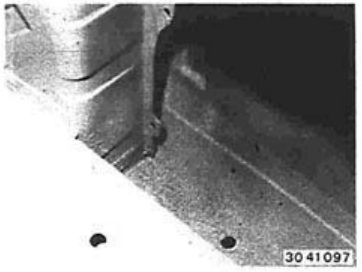
Plug spot weld front end of trunk floor plate on cross member, side members and wheel houses.



Spot weld connector on wheel house and side panel at left and right sides.



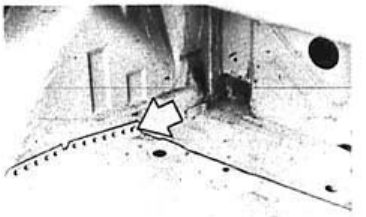
Weld on reinforcement brackets if necessary.



Install tail panel.
Seal off all mating surfaces from top and bottom with a body sealing compound.
Spray an anti-drumming compound on bottom of car, wheel houses and tail panel from underneath.

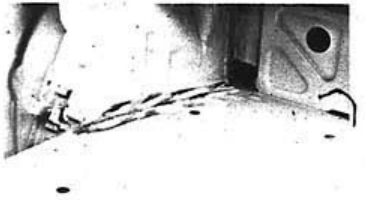
41 12 585 **REPLACING TRUNK FLOOR PLATE (Partial Replacement Behind Cross Member) (Tail Panel Removed) – Convertible –**

Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.



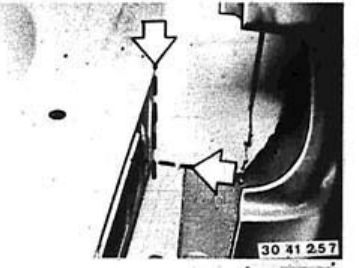
30 41 625

Drill out spot welds on left and right sides.



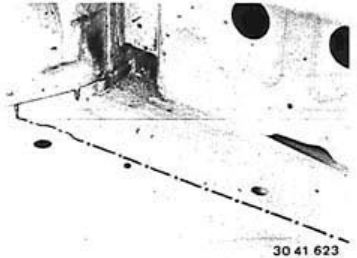
30 41 607

Uncover connections on left and right sides.



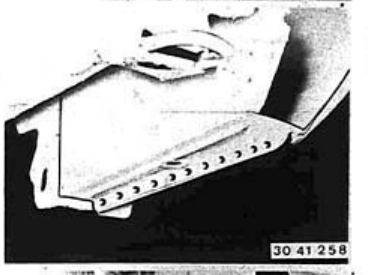
30 41 257

Cut off trunk floor plate at wheel house on left and right sides.



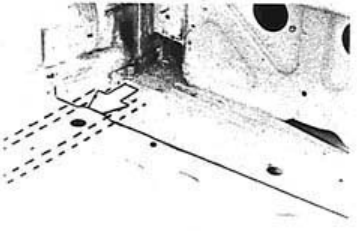
30 41 623

Mark cutting line behind flange of the cross member.
(Cutting line is approximately along edge of bead.)



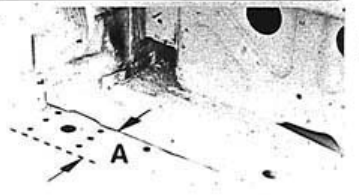
30 41 258

Uncover and drill out spot welds on left and right sides.



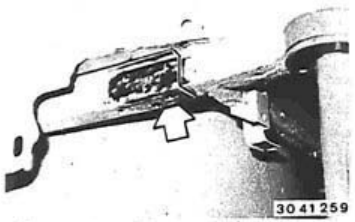
30 41 624

Cut off trunk floor plate along line.
Important!
Don't damage the side members.

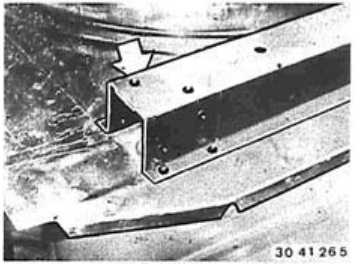


30 41 626

Drill out spot welds along side members approx. 80 mm (3.150") toward rear.

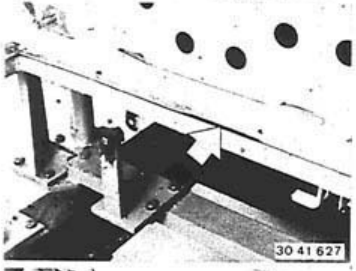


Uncover connections of left and right side members.
Drill out spot welds.
Lift off trunk floor plate complete with side members.



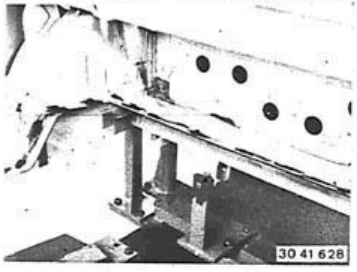
Drill plug spot welding holes in mating surfaces for side members.

Note:
Also drill holes in flanges of side members through the trunk floor plate.
Drill off welding spots when applicable.

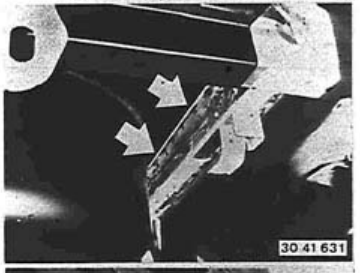


Grind off cut flush with flange of the cross member.
Check opening in area of the spare wheel well.

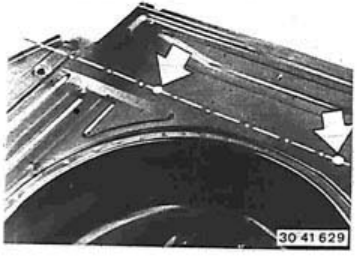
Set up car on a straightening bench.
Insert trunk floor plate.



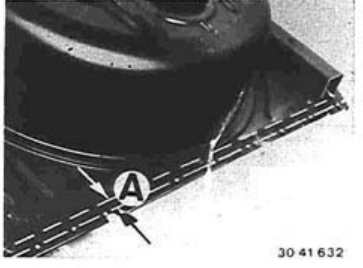
Remove scrap metal.
Straighten and grind mating surface.
Coat mating surfaces required for spot welding with zinc dust paint.



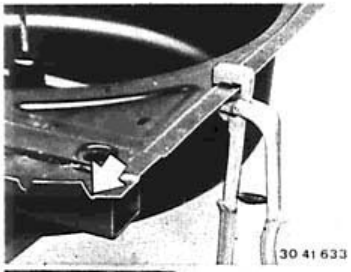
Mark location of cross member connections on new part from underneath.
Lift off trunk floor plate.



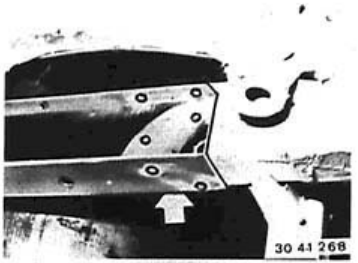
Cut off new trunk floor plate in area of holes.



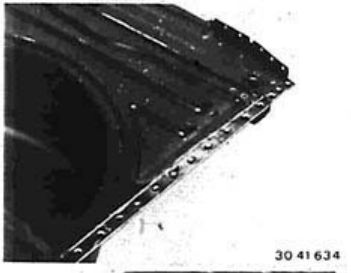
Mark distance A = 20 mm (0.787") forward from the marked line for overlapping.
Cut off excessive metal.



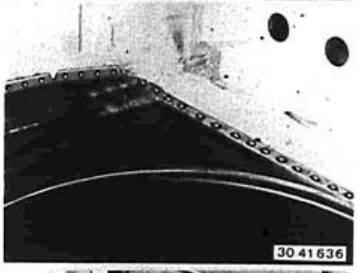
Shoulder overlap upwards.
Notch wheel house spot welding flange on left and right sides.



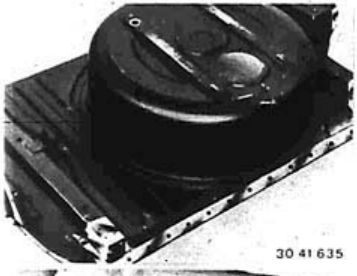
Plug spot weld both side members.



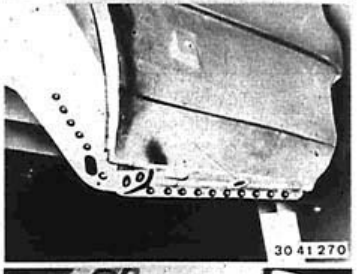
Drill plug spot welding holes in mating surfaces which are not accessible for spot welding.
Spacing between holes = 40 mm (1.575").



Plug spot weld trunk floor plate on the cross member, side members and wheel houses.

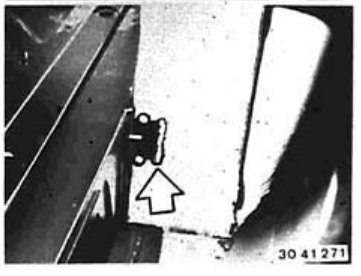


Grind all mating surfaces.
Coating mating surfaces required for spot welding with zinc dust paint.

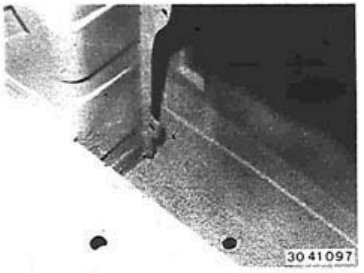


Spot weld connector on wheel house and side panel at left and right sides.

-Insert trunk floor plate and align on straightening bench.



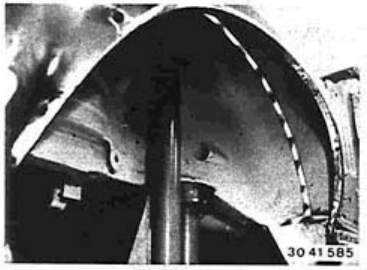
Weld on reinforcement brackets, if necessary.



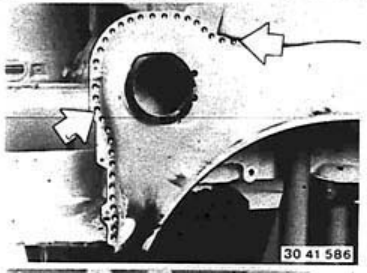
Install tail panel.
Seal off mating surfaces from top and bottom with a body sealing compound. Spray an anti-drumming compound on underside of car, wheel housings and tail panel from underneath.

41 14 161 REPLACING RIGHT WHEEL HOUSE OUTER SECTION AND REAR SIDE PANEL
– Convertible –

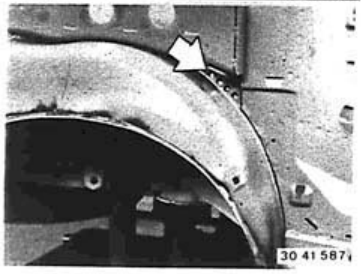
Refer to information on page 41 - 001.
Remove right rear side panel – see 41 35 110.



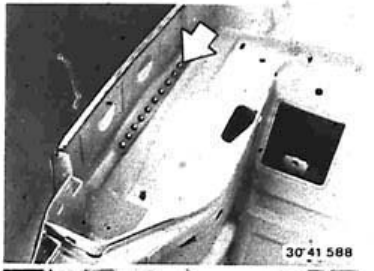
Remove anti-drumming coat on cutting surfaces.



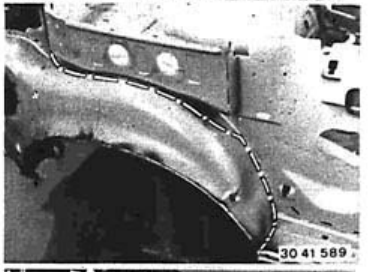
Drill out spot welds.



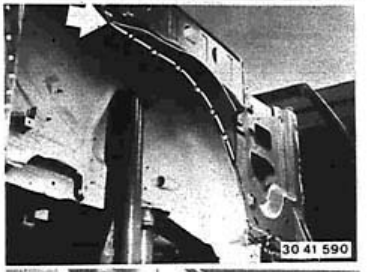
Drill out spot welds.



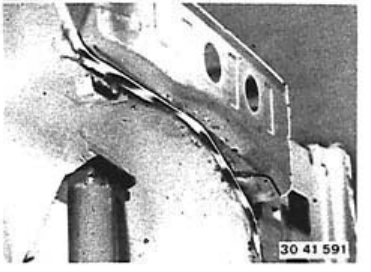
Drill out spot welds.



Cut off wheel house outer section along line.
Lift off wheel house outer section.

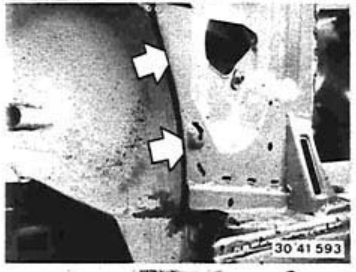


Grind off scrap metal in area of top box on edge.
Important!
Don't damage the inner wheel house panel.

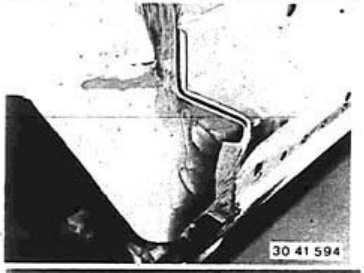


Remove scrap metal.
Straighten mating surface.

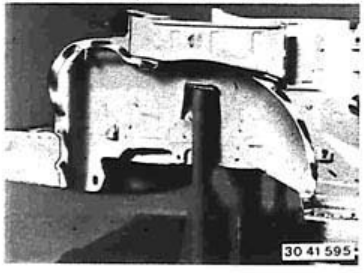
Grind off welding beads.



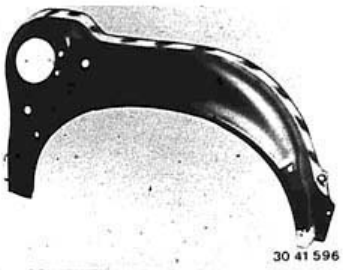
Lift end plate slightly.
Remove scrap metal.



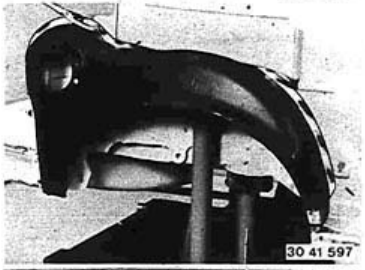
Remove scrap metal.



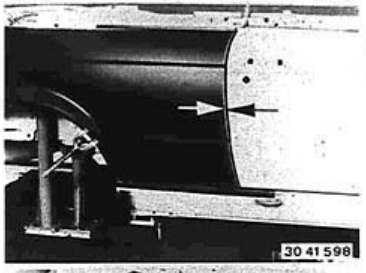
Straighten and grind all mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



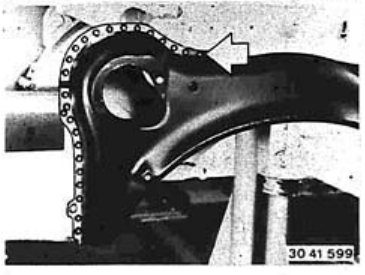
Grind mating surfaces on new wheel house outer section.
Coat mating surfaces required for spot welding with zinc dust paint.



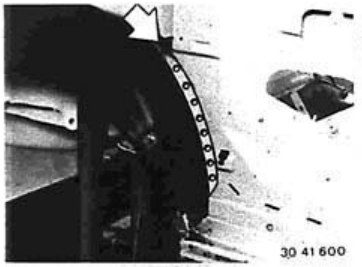
Insert and clamp down new wheel house outer section, tack welding if necessary.



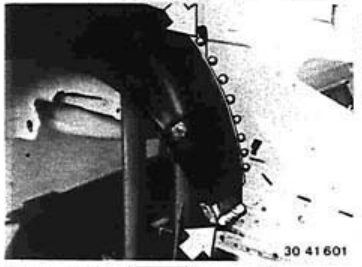
Mount side panel.
Check door gap and transition to the tail panel, correcting with wheel house if necessary.



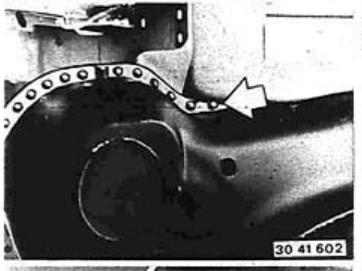
Spot weld wheel house.
Prepare areas for plug spot welding, when they are not accessible for spot welding tongs.



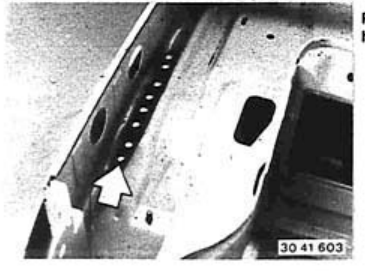
Drill plug spot welding holes through the reinforcement and wheel house outer section in area of the front reinforcement.



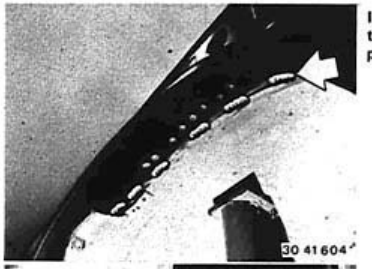
Plug spot weld reinforcement and wheel house outer section on the wheel house inner section.
Tack weld wheel house on the entrance cover strip.



Plug spot weld areas which are accessible for plug spot welding.



Plug spot weld the top box through provided holes.



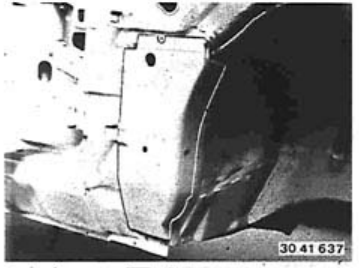
Inert gas weld wheel house outer section with the inner section in area of the top box by producing beads.

Weld bottom of wheel house on the end plate.

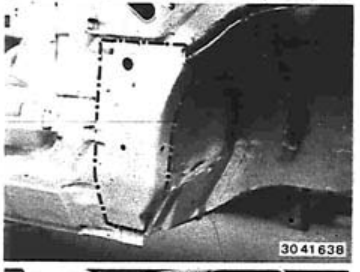
After Installation of Side Panel:
Seal off joints with a body sealing compound.
Spray an anti-drumming compound on the wheel house.

41 21 501 REPLACING LEFT OR RIGHT FRONT DOOR PILLAR
(Front Side Panel Removed)
– Convertible –

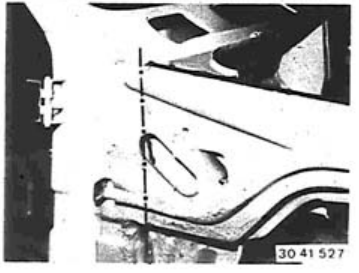
Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.



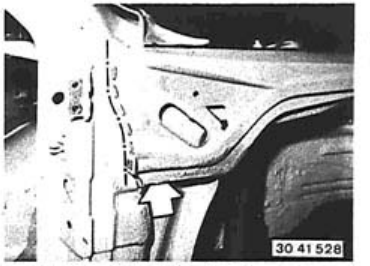
Uncover connections.



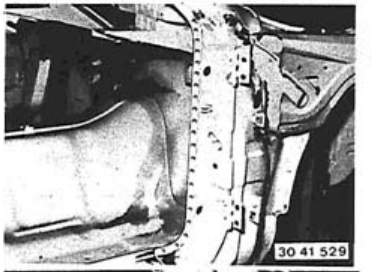
Grind off welding beads.
Lift off reinforcement.



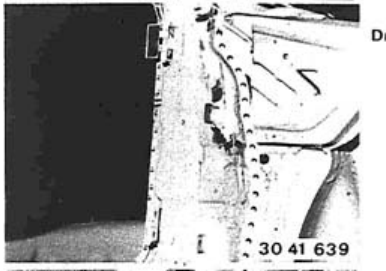
Cut through end plate along line.



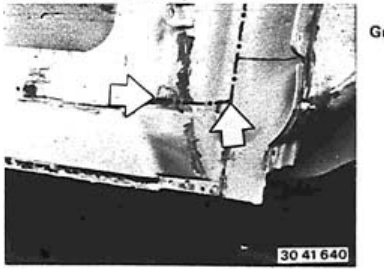
Grind off welding seams.
Drill out spot welds from underneath.
Take off end plate.



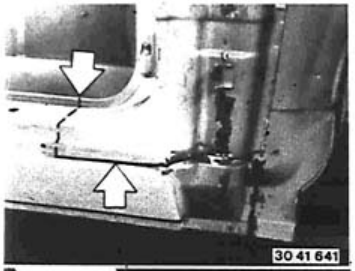
Uncover connections.
Drill off spot welding seam.



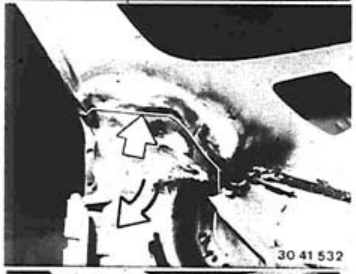
Drill out spot welds.



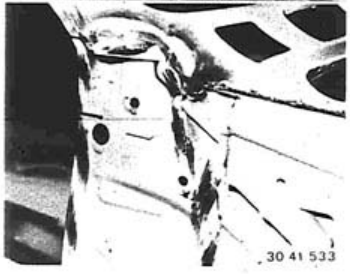
Grind off welding beads.



Remove brazing solder.
Loosen pillar.

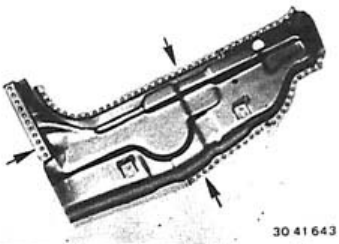


Remove brazing solder.
Lift off the door pillar.

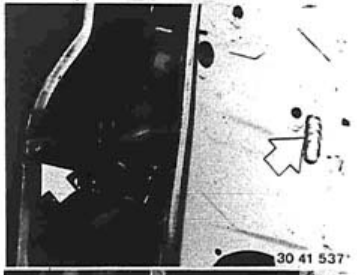


Remove scrap metal.
Straighten and grind mating surfaces.

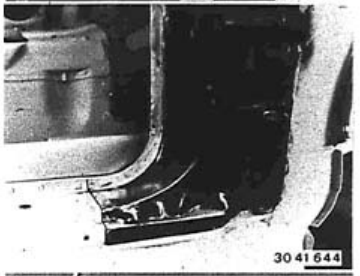
Grind mating surfaces on new door pillar.



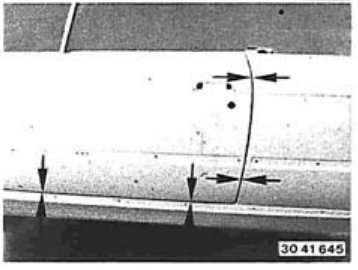
The sheet metal panels are too thick for perfect resistance spot welding with workshop equipment.
Drill plug spot welding holes in all mating surfaces required for plug spot welding.
Take spacing between holes from removed part.



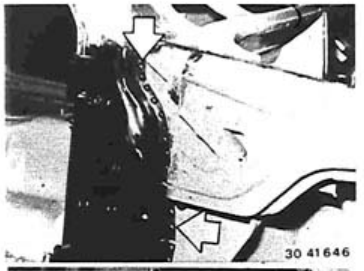
Use sealing tape* on bearing surface of the reinforcement.



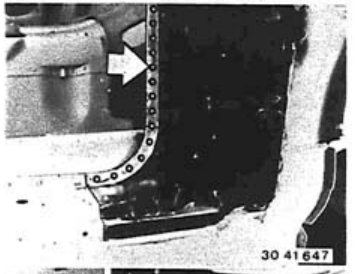
Mount and tack weld new door pillar.



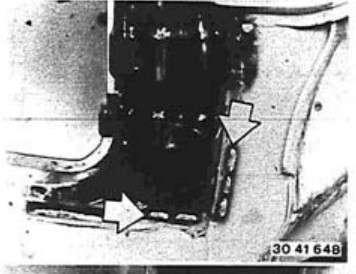
Install door.
Check gaps of entrance and rear side panel.
Remove door.



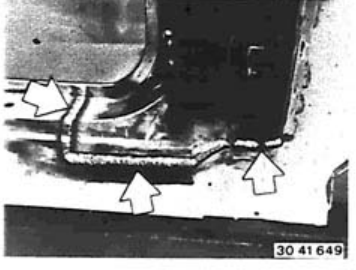
Plug spot weld the door pillar.



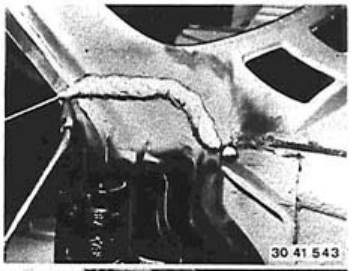
Plug spot weld the door pillar.



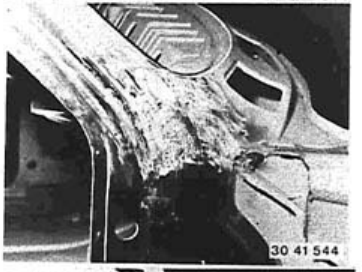
Inert gas weld bottom of door pillar.



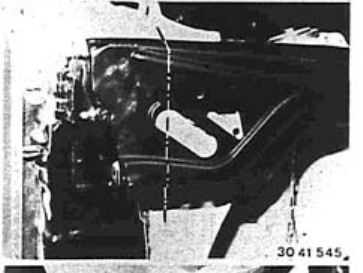
Braze the side member cover joint.



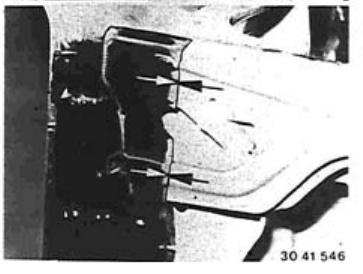
Braze the cowl panel joint.



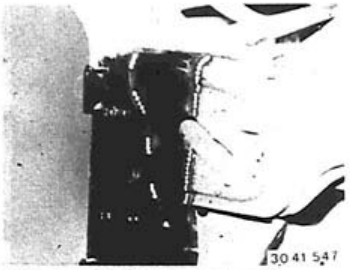
Grind mating surface.



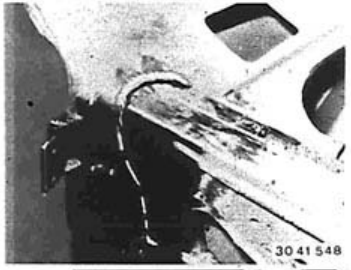
Install new end plate.
Mark cutting lines for partial replacement section.



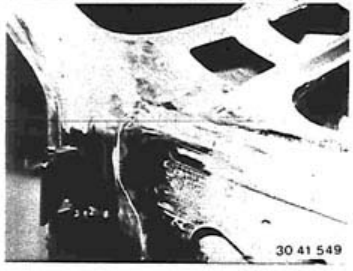
Grind mating surfaces on partial replacement section and fit in section.



Inert gas weld the partial replacement section.

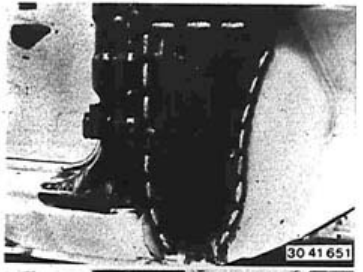


Braze in area of the cowl panel.

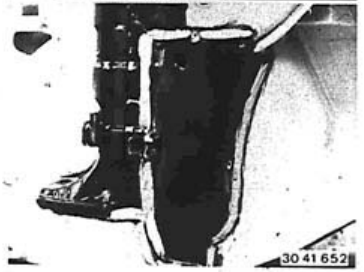


Grind down joints, tinning if necessary.

Grind mating surfaces on new reinforcement for door pillar.



Mount and weld the reinforcement.

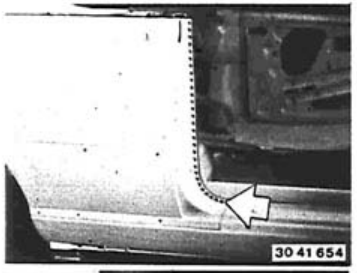


Seal off all mating surfaces with a joint sealing compound.

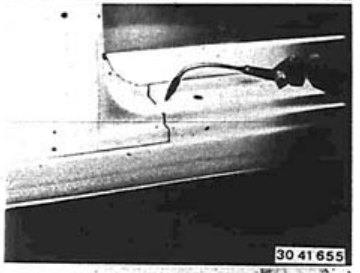
Replace anti-drumming compound on entrance and in wheel house.

41 35 110 REPLACING RIGHT REAR SIDE PANEL
– Convertible –

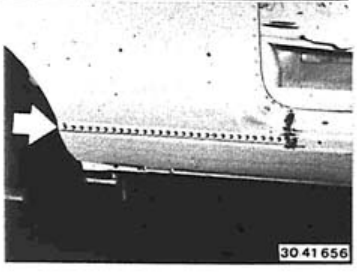
Refer to information on page 41 - 001.
Remove or cover up all car parts, which are located in the repair area or subjected to heat, sparks and dust.



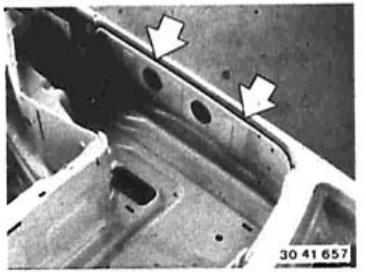
Uncover and drill out spot welds.



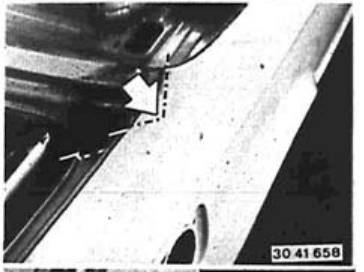
Remove brazing solder.
Uncover spot welding.



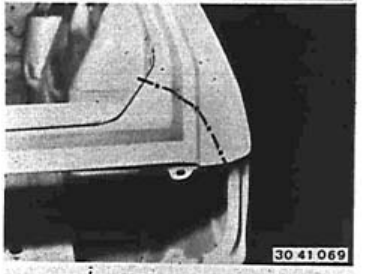
Uncover and drill out spot welds.



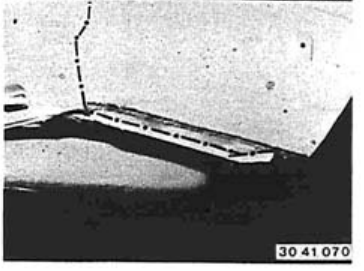
Uncover and drill out spot welds.



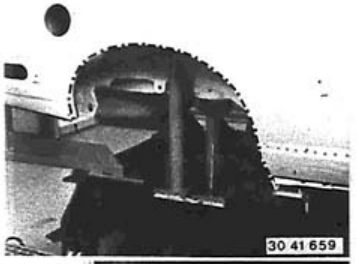
Uncover joint – cut off side panel along line.



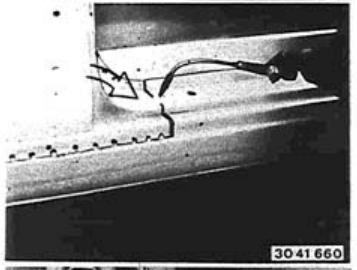
Cut off side panel from tail panel along line.



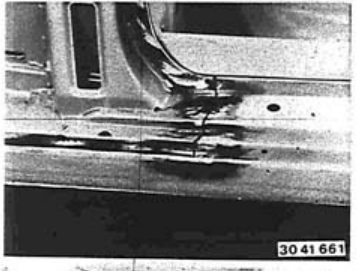
Cut off side panel from tail panel and trunk side section.



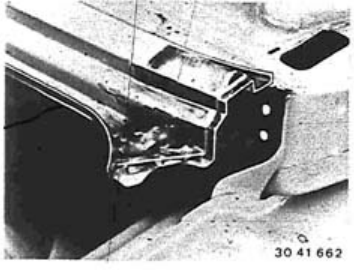
Grind off edge on wheel house.



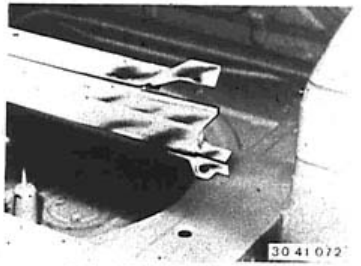
Heat brazing solder.
Lift off side panel.



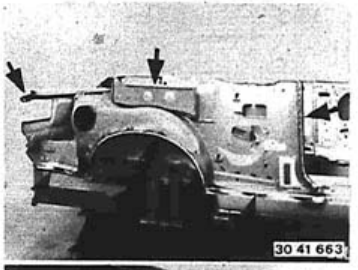
Remove scrap metal.
Straighten mating surfaces.



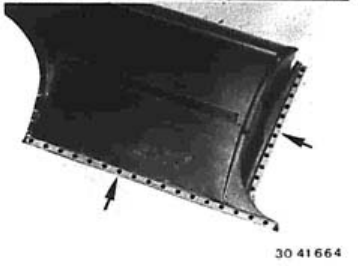
Remove scrap metal.
Straighten mating surfaces.



Remove scrap metal.
Straighten mating surfaces.

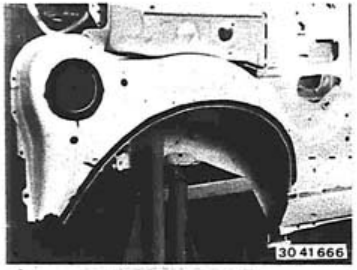


Remove scrap metal.
Straighten mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.



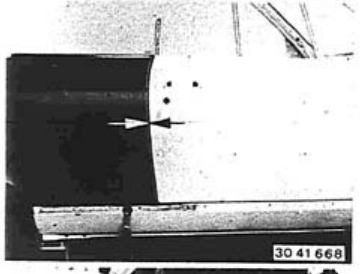
The sheet metal panels are too thick for perfect resistance spot welding with workshop equipment.
Drill plug spot welding holes in mating surfaces of the "B pillar" and side member cover.
Take spacing between holes from the removed part.

Grind all mating surfaces.
Coat mating surfaces required for spot welding with zinc dust paint.

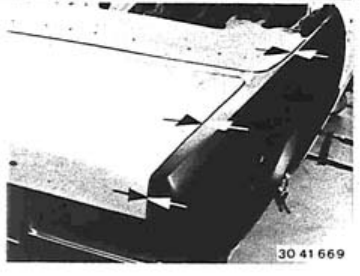


Apply a coat of body sealing compound on the wheel opening surface and fuel tank filler neck.

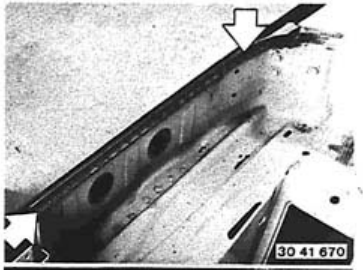
Mount and clamp down side panel, tack welding if necessary.



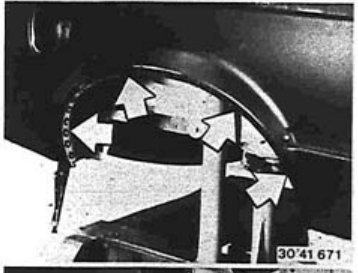
Check door gaps.



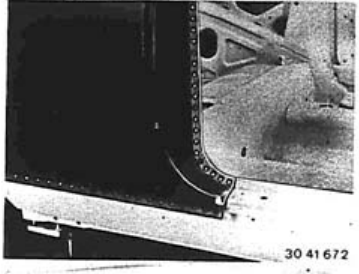
Install trunk lid and top lid. Check gaps.



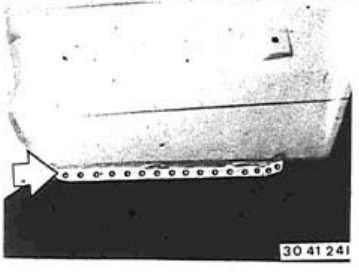
Spot weld side panel on the top box.



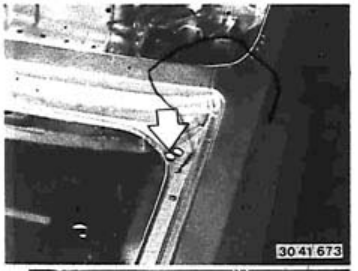
Spot weld side panel on wheel opening surface.



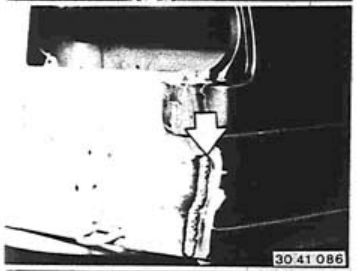
Plug spot weld side panel on side member cover and B pillar.



Spot weld side panel on trunk floor plate.

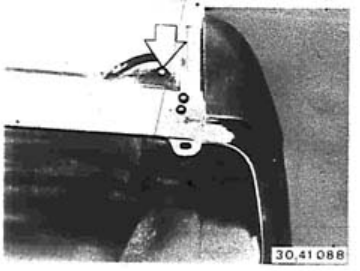


Spot weld side panel on trunk lid opening surface.

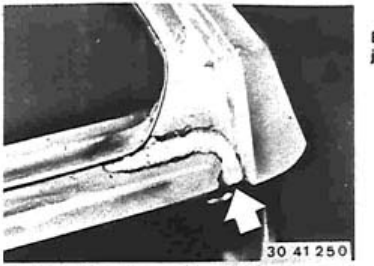


Inert gas weld side panel on tail panel. Grind down the welding bead.

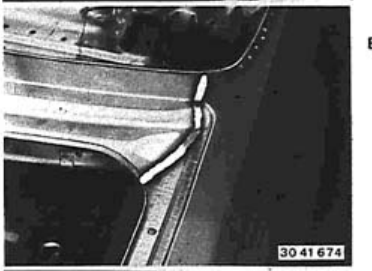
Autogen weld connector on tail panel and side panel from inside.



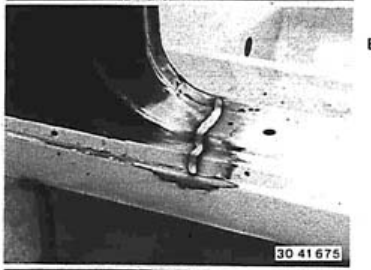
Spot weld tail panel on side panel.



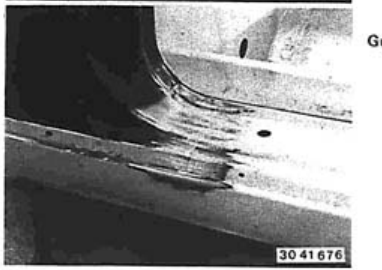
Braze and grind down side panel/tail panel joint.



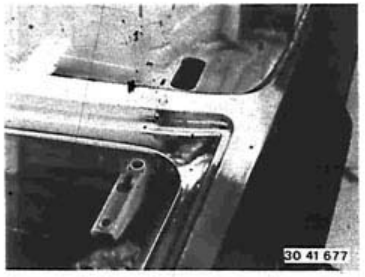
Braze transition.



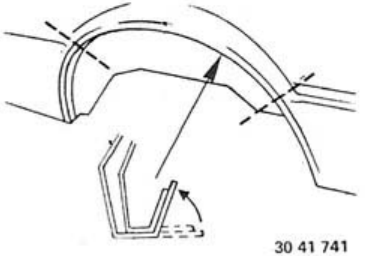
Braze entrance.



Grind down joint, tinning if necessary.



Grind down joint, tinning if necessary.



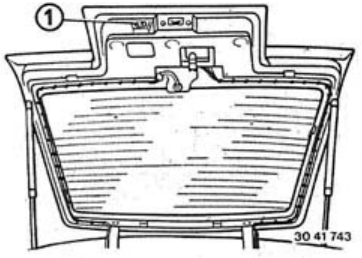
30 41 741

Important!
Cringe the spot welded flange on the wheel opening edge in the shown area.
Compare with opposite side if necessary.

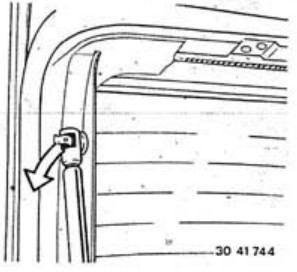
Seal off all joints with a body sealing compound.
Replace damaged anti-drumming compound in trunk and on outside.

41 62 000 REMOVING AND INSTALLING TAILGATE

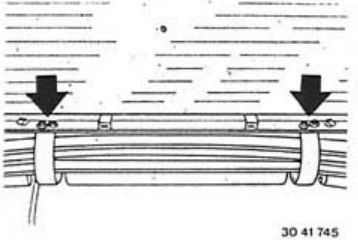
Remove hinge cover, hinge bar trim panel, tailgate frame cover and tailgate trim panel at bottom - see Group 51.



Remove inside light switch (1).
Unclip wire harness and washing fluid hose.
Pull off rear window defogger plug.
Remove wiper motor - see Group 61.
Unscrew ground connection.
Pull off plugs on license plate lights.
Pull wire harness out of the tailgate.



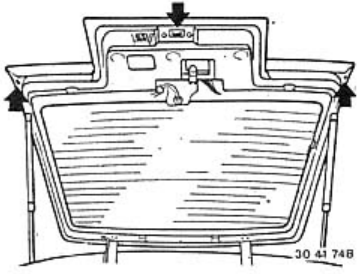
Lift out retainer and disconnect left and right gas pressure props,



If applicable, mark installed position of tailgate.
Unscrew bolts and take off tailgate.
Installation:
Align tailgate if necessary - see 41 62 014.

41 62 014 ALIGNING TAILGATE

Installation:
Engine hood, tailgate and doors are fitted and bolted in a rough bodyshell. Unpainted surfaces could become visible when adjusting these parts later. If applicable, touch up such surfaces with paint of pertinent body color.

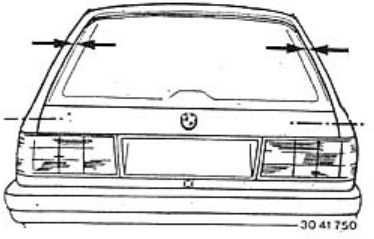


30 41 748

Remove hinge cover, tailgate frame trim panel and hinge bar cover - see Group 51.
Unscrew rubber stops on left and right sides.
Loosen or unscrew the lock baseplate.

30 41 749

Pull roof liner out of clips at bottom.
Loosen hinge screws on roof hoopstick.

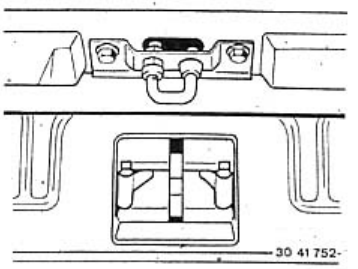


30 41 750

Align tailgate with side panels at top to have equal gaps on left and right sides. Bottom of tailgate must be flush with the left and right side panels in depth.

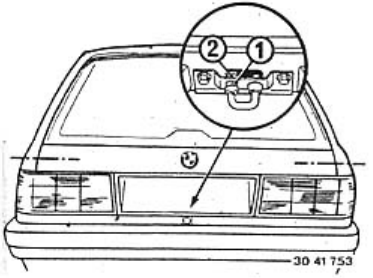
30 41 751

Unscrew hinge screws on tailgate. Adjust height of tailgate that the outer roof panel surface and rear spoiler are aligned.



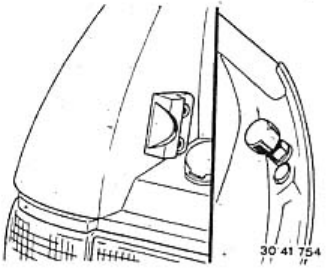
30 41 752

Align the lock baseplate with the lock.



30 41 753

Unscrew nut (1) and turn nut (2) to move the lock baseplate in or out. The tailgate should be flush with the side panels when closed.

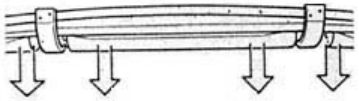


30 41 754

Screw in rubber stops on sides completely and align the catching wedges with the rubber stops. Unscrew rubber stops again far enough that there is contact with the catching wedges only after applying light pressure on the tailgate corners.

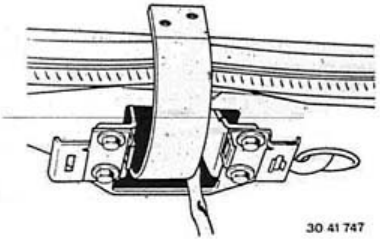
41 62 050 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT HINGE FOR TAILGATE

Remove tailgate - see 41 62 000.



30 41 746

Pull roof liner down out of clips.



30 41 747

Mark installed position of tailgate hinge on the roof hoopstick, loosening the hose clamps if necessary.
Unscrew screws and take off hinge.

51 Body Equipment

51 00 ... 51 26 .....

51 31 ... 51 71 .....

51 Body Equipment

51 00 . . .	Instructions for repairing plastic parts	51- 100
51 11 001	Front bumper – replace (with assembly drawings)	51- 110
51 12 001	Rear bumper – replace (with assembly drawing)	51- 120
51 13 000	Radiator grill centre section – remove and install	51- 130
040	Radiator grill side section – remove and install	51- 130
076	Heater air inlet grill – remove	51- 130
311	Rain moulding strip, left or right – replace	51- 131
51 14 000	BMW emblem, front – remove and install	51- 140
010	BMW emblem, rear – remove and install	51- 140
110	Model sign, rear – replace	51- 141
51 15 300	Rubbing strip on left or right front side panel – remove and install or replace	51- 150
330	Rubbing strip on left or right front door – remove and install or replace	51- 150
360	Rubbing strip on left or right rear door – remove and install or replace	51- 150
390	Rubbing strip on left or right rear side panel – remove and install or replace	51- 150
51 16 000	Mirror on left or right front door – remove and install or replace	51- 160
026	Mirror glass – replace	51- 160
060	Mirror, inside – remove and install	51- 161
. . .	Mirror base – cement	51-161/1
200	Centre console – remove and install	51- 162
360	Glove box, right – remove and install	51- 164
450/480	Grab handle – remove and install	51- 164
51 21 003	Front door striker, left or right – replace	51- 210
090	Front door lock, left or right– remove and install or replace	51- 211
140	Front door lock cylinder, left or right – remove and install or replace	51- 213
200	Outside handles and lock mechanisms of both front doors – remove and install or replace	51- 215
300	Window recess cover strip, outside – remove and install	51- 216
330	Window recess cover strip, inside – remove and install	51- 216
51 22 001	Rear door striker, left or right – replace	51- 220
090	Rear door lock, left or right – remove and install	51- 221
51 23 110	Engine hood lock – remove and install	51- 230
51 24 100	Trunk lid lock – remove and install or replace	51- 240
130	Trunk lid lock base – remove and install or replace	51- 240
341	Trunk lid torsion bars – replace	51- 241
. . .	Gas pressure prop – remove and install or replace	51- 241
51 25 . . .	Locking element – remove and install or replace	51- 250
. . .	Cables for top lid locks – remove and install or replace	51- 251
. . .	Top lid lock – remove and install or replace	51- 252
51 26 000	Switch for door lock (drive), front, left or right – replace	51- 260
010	Switch for door lock (drive), rear, left or right – replace	51- 261
020	Switch for trunk lid lock (drive) – replace	51- 262
025	Switch for tank flap lock (drive) – replace	51- 263

51 Body Equipment

51 31 011 Windshield – replace 51- 310
200 Rear window – replace 51- 311
. . . Window installing instructions (M3) 51- 312
000 Windshield – remove and install (M3) 51- 313
200 Rear window – replace (M3) 51- 316
200 Rear window – remove and install (touring) 51- 319/1
. . . Rear window – remove and install (hardtop) 51- 319/7
. . . Stone damaged laminated glass windshields (clear and tinted) – repair 51-319/10
51 32 020 Window regulator in front door, left or right – remove and install or replace 51- 320
154 Front door window, left or right – adjust 51- 321
170 Front door window glass, left or right – remove and install 51- 323
. . . Front door window (fixed) – remove and install or replace 51- 325
51 33 000 Power window regulator in front door, left or right – remove and install 51- 330
51 34 020 Window regulator in rear door, left or right – remove and install 51- 340
154 Rear door window, left or right – adjust 51- 341
171 Rear door window glass, left or right – replace 51- 342
191 Rear door window (fixed) in window frame, left or right – replace 51- 344
51 36 050 Rear side window, left or right – remove and install 51- 360
071 Rear side window, left or right – replace 51- 360
545 Ornamental strips (all) on rear side window – replace (side window removed) 51- 361
050 Rear side window, left or right – remove and install (touring) 51- 362
. . . Ornamental strips and plates on side windows – install (touring) 51- 365
51 37 000 Power window regulator, rear, left or right – remove and install 51- 370
000 Power window regulator, rear, left or right – remove and install or replace (convertible) 51- 371
154 Rear side window, left or right – adjust 51- 372
51 41 001 Door trim panel, front, left or right – replace 51- 410
51 42 000 Door trim panel, rear, left or right – remove and install 51- 420
51 43 000 Side trim panel, rear, left or right – remove and install or replace 51- 430
150 Door pillar trim panel, left or right – remove and install 51- 432
51 44 011 Roof liner – replace (touring) 51- 435
150 Front plate for roof liner – remove and install 51- 440
51 45 030 Trim panel for dashboard – remove and install 51- 450
180 Trim panel for dashboard, bottom, left – remove 51- 456
200 Trim panel for dashboard, bottom, centre, right – remove 51- 456
51 46 000 Trim panel for hatrack – remove and install 51- 460
51 47 000 Cover strip for entrance, front, left or right – remove and install or replace 51- 470
030 Cover strip for entrance, rear, left or right – remove and install or replace 51- 471
140 Trim panel for trunk separating wall – remove and install 51- 472
220 Trunk trim panel on right side wall – remove and install 51- 473
240 Trunk trim panel on tail panel wall – remove and install 51- 473
. . . Trunk trim panel, left or right – remove and install (touring) 51- 474
490 Splash guard, front (engine) – remove and install or replace 51- 475
491 Splash guard, rear (transmission) – remove and install 51- 475
. . . Combination sun shade – disassemble and assemble 51- 476
51 71 404 Front spoiler – remove and install 51- 710
434 Plate on front side panel – replace (four wheel drive) 51- 711
440 Plate on rear side panel – replace (four wheel drive) 51- 712
446 Trim panel for cover on side member – replace (M-Technique) 51- 714
456 Stone guard panel, rear – replace (four wheel drive) 51- 716
394 Front spoiler – install (M-Technique) 51- 750
412 Rear spoiler – install 51- 756
414 Rear spoiler – install (M-Technique) 51- 757
423 Rear panel – install (M-Technique) 51- 759
452 Panels for covers of both side members – install (M-Technique) 51- 763
452 Panels for covers of both side members – install (M-Technique Version II) 51- 765
. . . Front spoiler – install (before 1986 models) 51- 768
. . . Footrest – install (M-Technique) 51- 769
Central locks with unlocking arrest – description and troubleshooting 51- 800
Troubleshooting:
1. Failure of entire system 51- 801
2. No function when operating driver's door lock (unlocking – locking) 51- 803
3. No function when operating passenger's door lock
A. Unlocking not possible 51- 804
B. Locking not possible 51- 805
4. No function when operation trunk lid lock (unlocking – locking) 51- 806
5. No function of one or both rear doors (unlocking – locking or arresting) 51- 807
6. No function when operating unlocking arrest 51- 808
Power windows – description / troubleshooting 51- 810
Troubleshooting:
1. Failure of entire system 51- 811
2. No function when operating power window push button of driver's door 51- 812
3. No function when operating power window push button of left rear door (in console) 51- 813

51 00 ... INFORMATION FOR REPAIRING PLASTIC PARTS

The plastic part repairing conditions mentioned below conform with legislation in the Federal Republic of Germany. Always conform with pertinent legislation in a different country.

These repairing instructions are provided for qualified workers and assumes their skill, conscientiousness and sense of responsibility. The instructions are limited to factory approved repairing methods as well as associated tips and measures to make the work easier. Only general working procedures are described in these instructions. The scope of work and order of procedures will always have to be adapted to the pertinent damage condition. Repairs are an economical solution, so that optical deficiency cannot be excluded. Repairs should therefore only be carried out with explicit customer approval.

The following E 30 parts are made of plastic and can be repaired with 3 M Repair Material 5900.

- M-Technique body attachments
- Standard, M 3 and Touring rear spoilers
- Four wheel drive and M 3 entrance and side panels
- Bumpers beginning with 1988 models

Important!
Only such damage, which does not have influence on the strength and rigidness of the bumper, may be repaired. The following types of damage may not be repaired in the interest of safety.

- Damage on body mounting points.
- Damage in immediate vicinity of body mounting points.
- Peel-offs.
- Ruptures.
- Cracks, extending from corners and edges.
- Continuous cracks with a length of more than 100 mm (4").
- Holes from a size of 100 mm^2 (1.5 $in.^2$) on.

Parts with these types of damage must be replaced!

Refer to the BMW Painting Manual for information on painting plastic parts.

Required Materials:

- Aluminous abrasive fiber discs, grain size P 36 and P 80
- Sandpaper, grain size P 180
- 3M Cement Remover 8984
- 3M Aluminum Adhesive Tape Scotch 424
- 3M Glass Grid Fabric 9030
- 3M Plastic Repair Material 5900
- Mask
- Gloves

Source of Supply: HWB

Safety Precautions:

- Extracting of grinding abrasion.
- Wearing mask and gloves while grinding.
- Working only in well ventilated rooms.
- Washing hands frequently.
- Storing food separately.
- Not eating, drinking or smoking while working.
- Not inhaling vapors.

First Aid:

Take off dirty clothes immediately. If dust has gotten in eyes, rinse out with water thoroughly and go to a physician.
If great amount of vapors are inhaled, go outdoors in fresh air and, if necessary, visit a physician.

Information on Toxicology:

Irritates eyes, skin and the respiratory track. No damaging effects are known as long as handling is correct.

Measures in Case of Fire:

Fire extinguishing agents: powders, foam, CO_2, halon, water mist.

Scrapping:

Never let it get into drink water systems.
Single components of the repair material must be scrapped as special refuse. After mixing the single components and hardening, it can be brought to the normal refuse station.

Procedures:

1. Clean the area to be repaired with a cement remover.

   Note:
   Let cleaned surface dry at room temperature about 10 minutes before application of the repair material.

2. Grind down repair surface (grain size P 80).
   Grind damaged surface in V-shape (grain size P 36).
   If damage continues through the plastic, clean the back side of the repair surface with a cement remover and grind (grain size P 36).

3. Remove grinding abrasion.

4. Paste aluminum adhesive tape above the damaged surface on the front.

5. Cut glass grid fabric to size for the reapir surface.

6. Mix repair material to the instructions supplied with it.

7. Apply a coat of repair material on the back of the repair surface. Apply the glass grid fabric, cover it with repair material and let it harden at room temperature about 20 minutes.

8. Pull off aluminum adhesive tape and, if necessary, grind down and clean the repaired surface again.

9. Apply coat of repair material on the front and let it harden.

10. Grind down the repaired surface (grain size P 80) and smooth with grain size P 180.

    Important!
    It is absolutely necessary to use the specified grain size grinding materials in order to guarantee perfect results (thermal development).

Procedures for Repairing Minor Bruises and Scratches:

1. Grind down damaged zone generously (down into the subtrate) with dry sanding paper (grain size: 400 - 500).

2. Clean ground zone with a plastic cleaner.

3. Apply coat of plastic adhesion solution.
   Apply several coats of BMW Rapid Filler + 20 % BMW Softface Additive on the cleaned surface until the shape of the part can be restored after grinding.

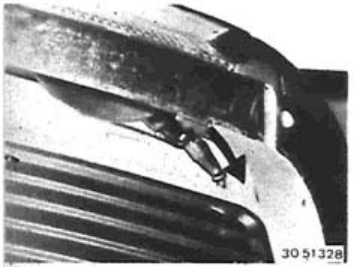
4. Grind down filled surface with wet sanding paper (grain size: 800 - 1000).
   Continue as described in point 3, if ground through spots or damaged spots are still visible.

5. Grind down entire part if applicable (depending on extent of damage).

6. Apply final coat of paint with two-component BMW acrylic paint + 20 % BMW softface additive; for double-layer metallic paint finishes 20 % softface additive is mixed with the BMW acrylic clear lacquer.

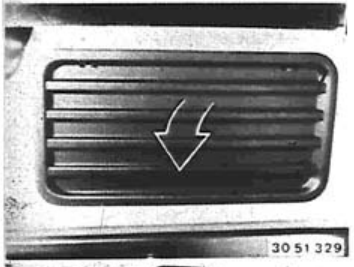
   Refer to the BMW Paint Spraying Manual for spraying instructions, materials and so on.

Caution!
Use mask and make sure of sufficient ventilation.
Conform with accident prevention stipulations for working with paints.
Conform with local and national legislation concerning safety at work and accident prevention as well as working material ordinances.
Refer to instructions supplied by the manufacturers!

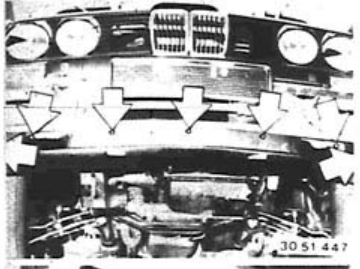


51 11 001 REPLACING FRONT BUMPER

Disconnect plugs on left and right turn signals.
Installation:
Make sure rubber grommets fit correctly.



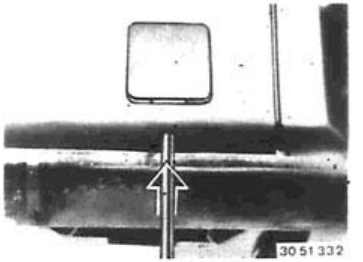
Before 1986 Models:
Lift out left and right covers.



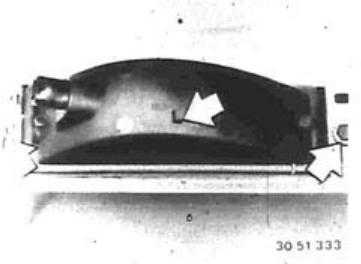
Cars with Front Fog Lamps:
Remove front spoiler 51 71 404.

Since 1986 Models:
Remove front spoiler 51 71 404.
Unscrew left and right bolts.
Installation:
Tightening torque*.

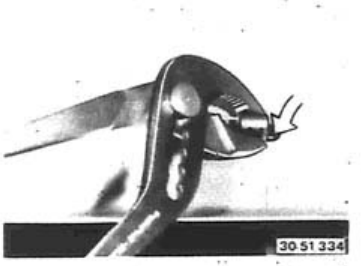
* See Specifications



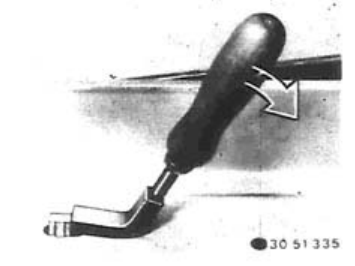
Pry off cover on left and right sides with a screwdriver.
Unscrew left and right nuts.
Installation:
Tightening torque*.
Arrows on back of covers face up.



Remove left and right turn signals.
Installation:
Turn signals are marked.
L = left
R = right

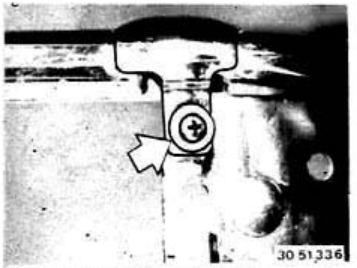


Compress locks and press out all strip clamps.
Take off rubbing strips.

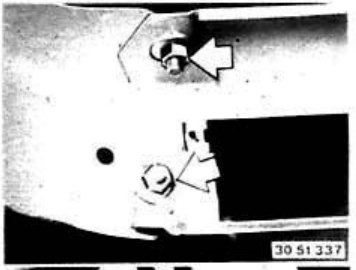


Installation:
Replace and pull in new strip clamps with Special Tool 5 13 160.

* See Specifications



Unscrew left and right bolts and take off plate.

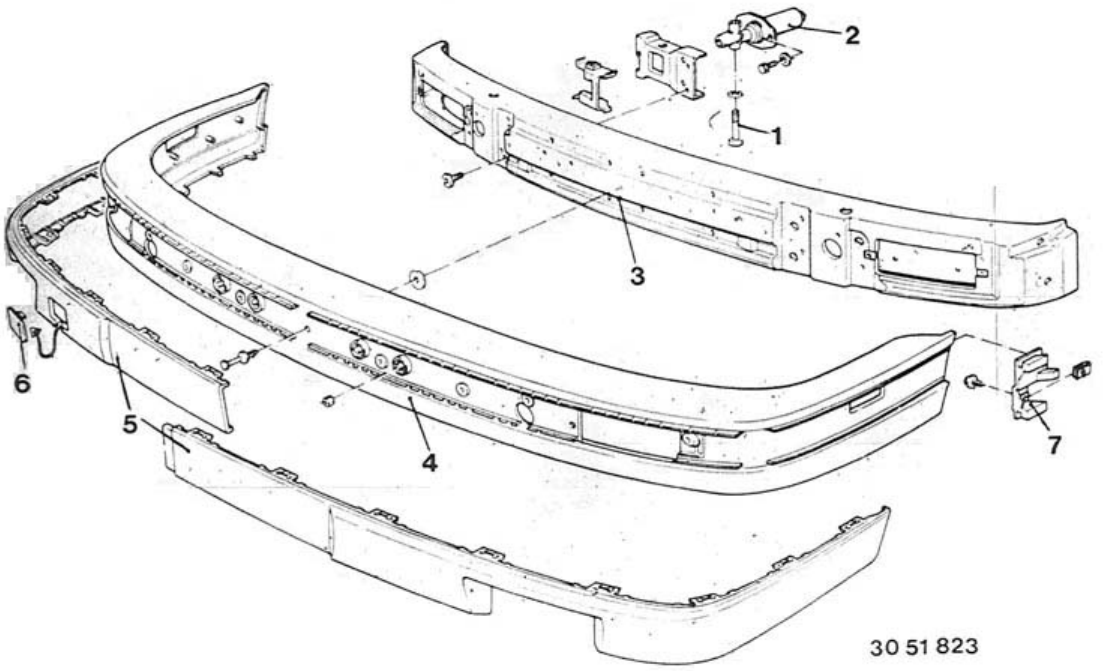


Unscrew left and right bolts.

Installation
Replace self-tapping nuts.

51–112

FRONT BUMPER ASSEMBLY DRAWING – Since 1988 Models



1 Bolt, left / right

2 Impact absorber

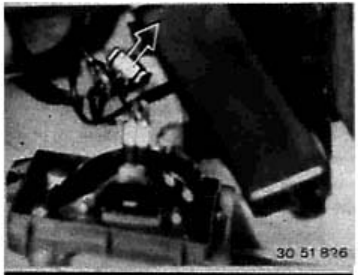
3 Bumper carrier

4 Bumper trim panel

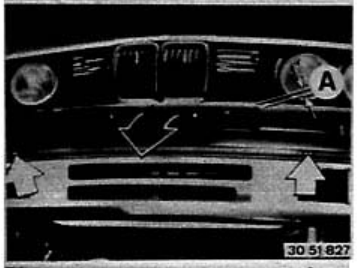
5 Rubber guard

6 Cover for towing eye

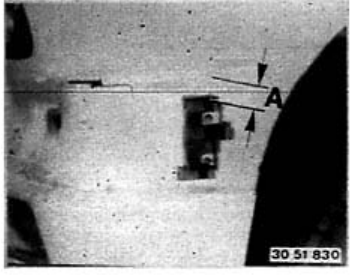
7 Bracket on side panel



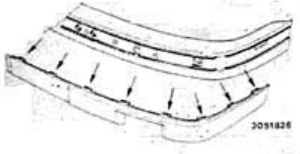
Since 1988 Models:
Pull off turn signal wires.



Unscrew bolts.
Take off bumper.
Installation:
Check gap between bumper and body.
A = 6 – 1 mm (0.236 – 0.039").
Tightening torque*.



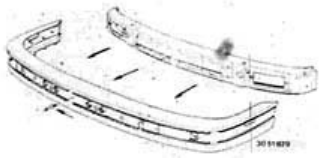
Installation:
Adjust basic distance A = 39 ± 1 mm (1.535 ± 0.039") after replacement of side panel or bracket.

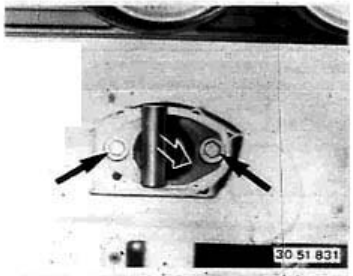


Lift out clips.
Take off rubber guard.

* See Specifications

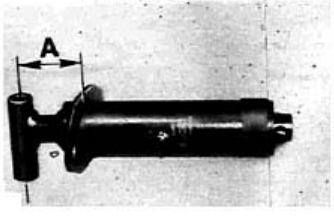
Press out plastic rivets.
Take off trim panel.





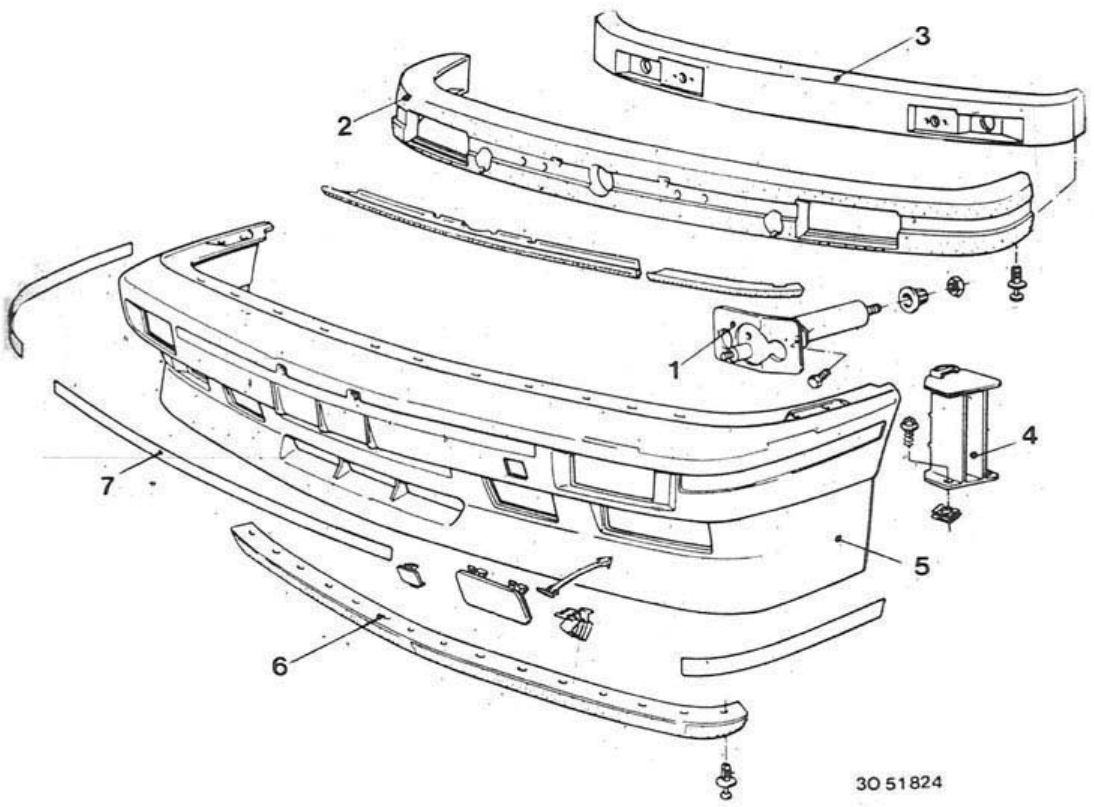
51 11 . . . REMOVING AND CHECKING IMPACT ABSORBERS

Remove bumper – see 51 11 001.
Unscrew bolts.
Lift out impact absorber.
Installation:
Align impact absorber, holding bumper in position if necessary and checking gap.

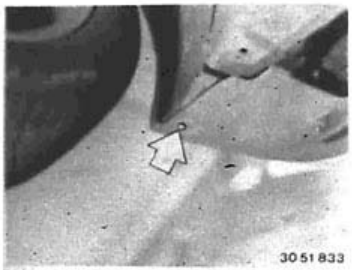


Note:
Distance A must not be less than 52 ± 1 mm (2.047 ± 0.039") after damaging car in an accident.

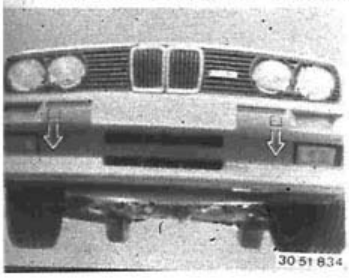
FRONT BUMPER ASSEMBLY DRAWING – M 3



1 Bracket with mounting parts
2 Foam rubber inlet
3 Bumper carrier
4 Bracket on side panel
5 Bumper trim panel
6 Spoiler
7 Ornamental strip



BMW M 3:
Unscrew bolts on engine splash guard.

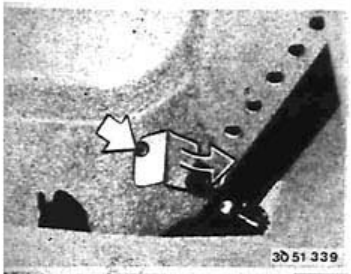


Lift out covers.
Unscrew bolts.
Installation:
Tightening torque*.

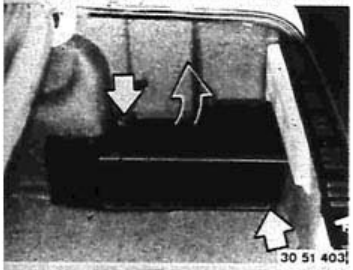
Pull off electric wires on turn signals, front fog lamps and temperature sensor.
Lift off bumper.

* See Specifications

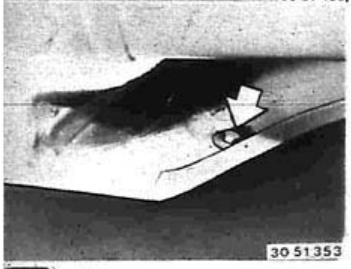
51 12 001 REPLACING REAR BUMPER



Break out opening in side panel and unscrew bolt on left and right sides.
Installation:
Tightening torque*.



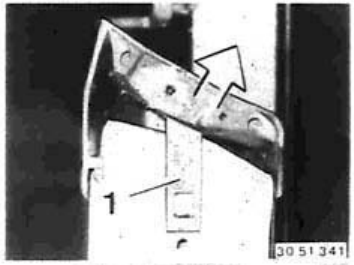
If applicable, remove battery cover.



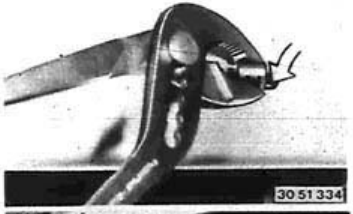
Unscrew bolts on left and right sides.
Installation:
Coat bolts with body sealing compound**.

Unscrew bolts on left and right sides.
Take off bumper.
Installation:
Tightening torque*.

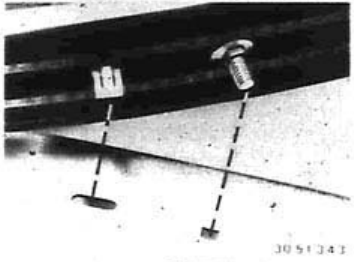
* See Specifications
** Source: HWB



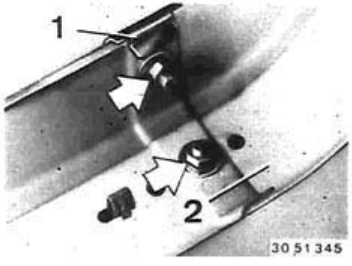
Lift tongue (1) and take off end piece.



Compress rubbing strip clips and push out.
Take off rubbing strip.

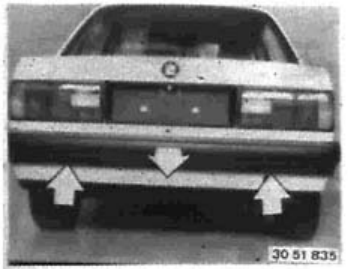


Installation:
Align mounting bolts and clips in rubbing strip with holes in bumper.
If applicable, use body sealing compound**.
Pull in clips with Special Tool 51 3 160.



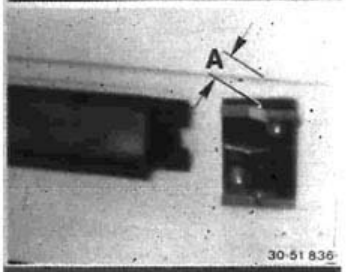
Unscrew bolts.
Take off plate (1) and side section (2).

** Source: HWB

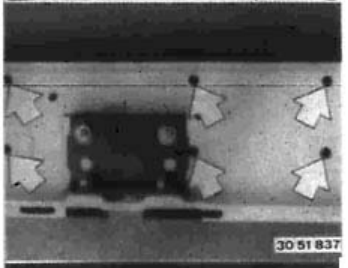


Since 1988 Models:

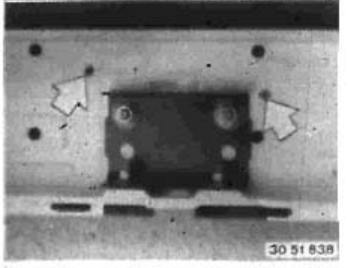
Unscrew bolts.
Take off bumper.
Installation:
Tightening torque*.



Installation:
Adjust distance A to 36 ± 1 mm (1.417 ± 0.040") after replacing the side panel or bracket.

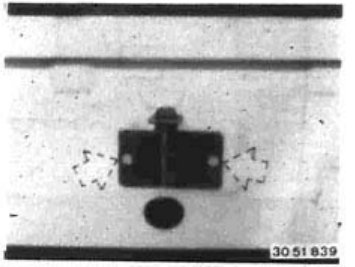


Lift out clips through holes.
Take off rubber guard.



Press out plastic rivets.
Take off trim panel.

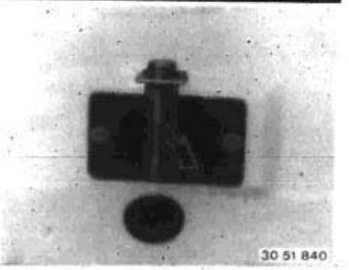
* See Specifications



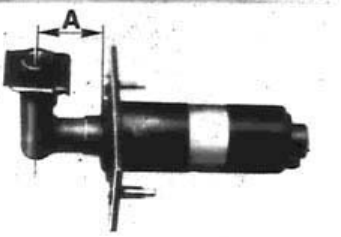
51 12 ... REMOVING AND CHECKING IMPACT ABSORBERS

Remove bumper - see 51 12 001.
Unscrew bolts.

Note:
Right end is bolted in the trunk.



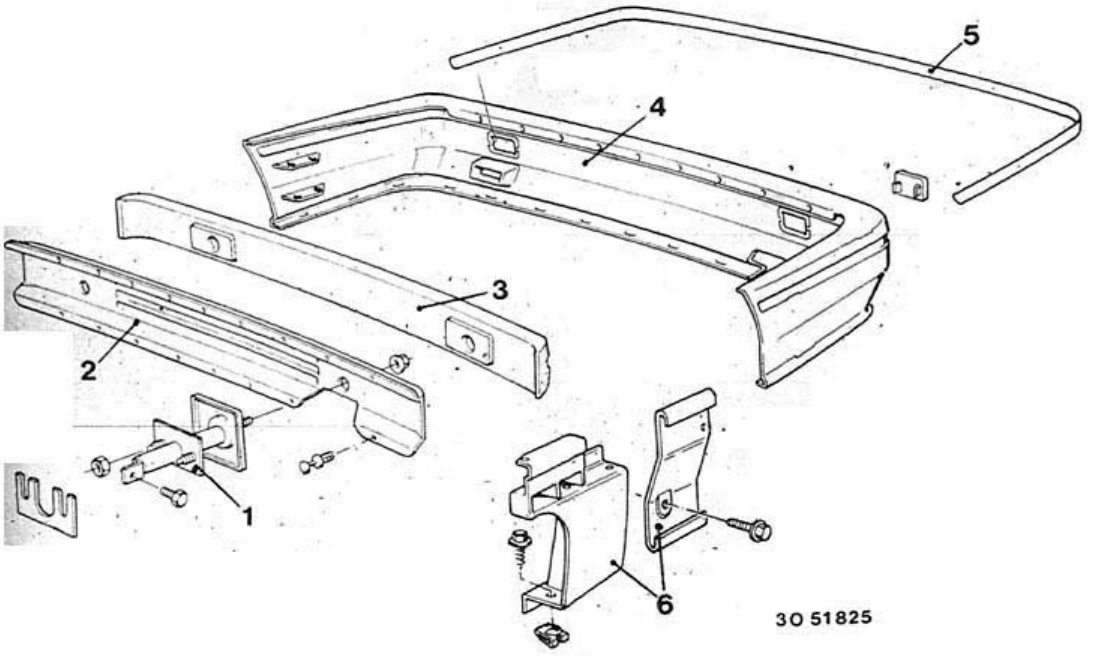
Lift out impact absorber.



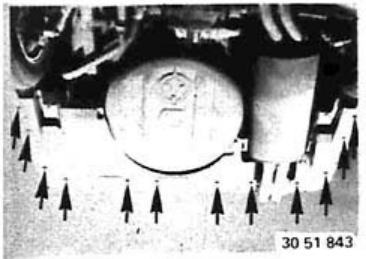
Note:
Distance A must not be less than 39 mm (1.535") after damage from an accident.

51–122

REAR BUMPER ASSEMBLY DRAWING – M 3



1 Bracket with mounting parts
2 Bumper carrier
3 Foam rubber inlet
4 Bumper trim panel
5 Ornamental strip
6 Bracket on side panel

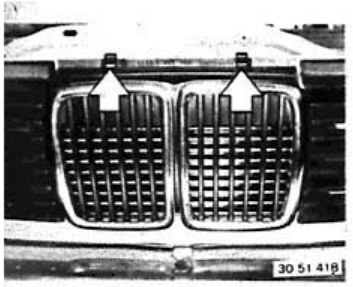


BMW M 3:
Unscrew bolts.

Lift off covers.
Unscrew bolts.
Installation:
Tightening torque*.

Lift off bumper.

* See Specifications

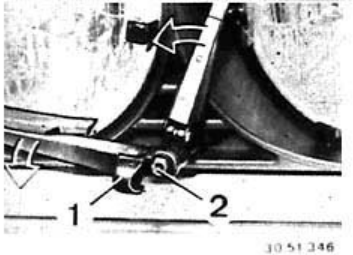


51 13 000 REMOVING AND INSTALLING RADIATOR GRILL CENTER SECTION

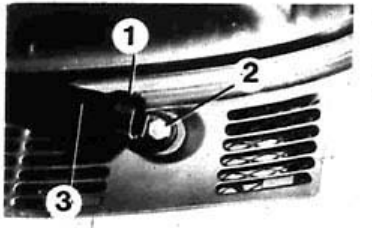
Open engine hood.
Lift off clamps.
Remove grill.

51 13 040 REMOVING AND INSTALLING RADIATOR GRILL SIDE SECTION

Lift off clamps.
Unscrew screws.
Remove grill.

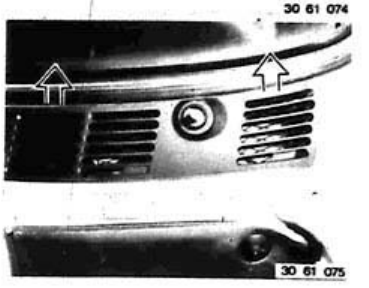


Cars with Headlight Cleaners:
Take off cap (1).
Unscrew nut (2).
Tilt wiper arms away from headlights and take them off.

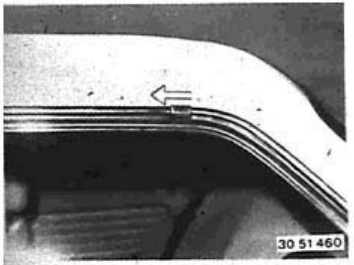


51 13 076 REMOVING HEATER AIR INLET GRILL

Lift out cover (1).
Unscrew nut (2).
Take off windshield wiper arm (3).

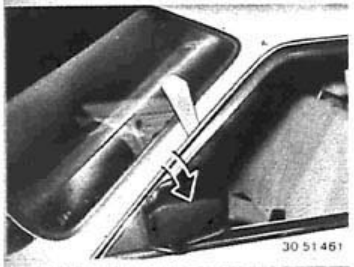


Lift out grill.

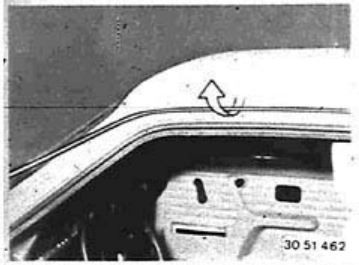


51 13 311 REPLACING ORNAMENTAL STRIP ON LEFT OR RIGHT RAIN MOLDING

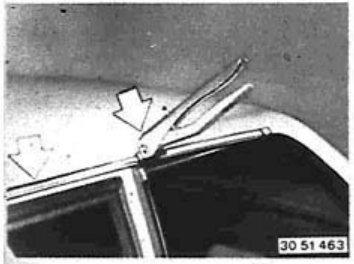
Slide clamp.



Lift out ornamental strip beginning at front end.

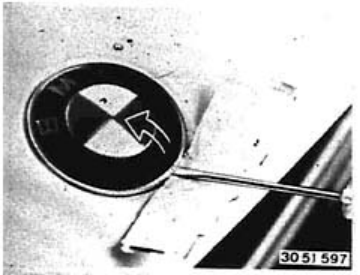


Turn and lift out ornamental strip from above.



Installation:
Replace clips located in front area if necessary.
Press on ornamental strip lightly with Special Tool 51 1 060.

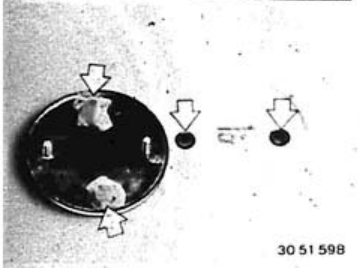
Convertibles:
Lift out ornamental strip.
Installation:
Replace clips if necessary.



51 14 000 REMOVING AND INSTALLING FRONT BMW EMBLEM

Lift out emblem carefully.

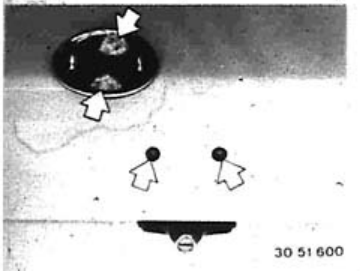
Installation:
Replace plastic clip, if necessary.
Use Terostat tape.



51 14 010 REMOVING AND INSTALLING REAR BMW EMBLEM

Lift out emblem carefully.

Installation:
Replace plastic clip, if necessary.
Use Terostat tape.



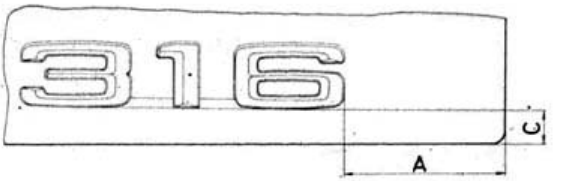
51 14 110 REPLACING REAR MODEL SIGN

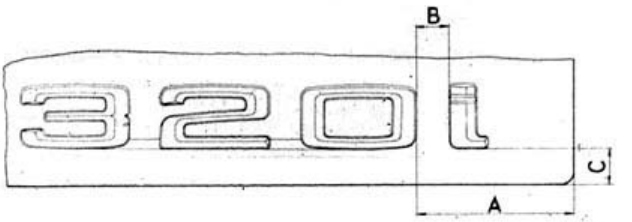
The model sign is cemented and cannot be reused.
Coat a nylon string or garn with Tenside (e.g. dish washing detergent) and "saw through" coat of cement between trunk lid and model sign.
Remove residual cement with gasoline.
Install new model sign at room temperature.
Locate tape up to upper edge "C" and mark distances according to table.
Heat model sign to approx. 40 ... 50° C (105 to 120° F) and press on firmly 5 to 10 seconds.

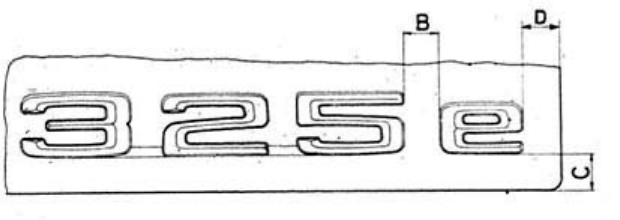
Distances for Model Signs:

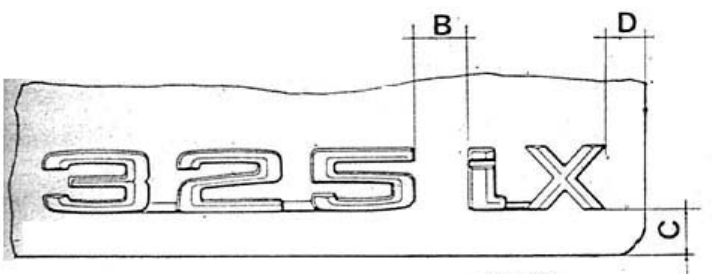
Distance in mm (inches)	A	B	C	D
BMW 316 - 325 i	62 (2.441)	16 (0.630)	19 (0.748)	
BMW 325 e / 324 d		18 (0.709)	19 (0.748)	22 (0.866)
BMW 324 td / 325 iX		18 (0.709)	19 (0.748)	22 (0.866)
BMW M 3		9 (0.354)	19 (0.748)	75 (2.953)

Note:
Model sign must be removed when baking paint at temperatures above 80° C (175° F).

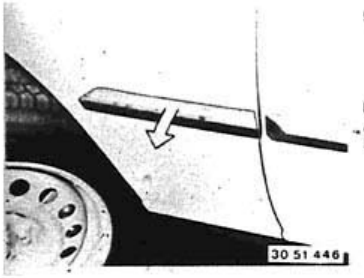






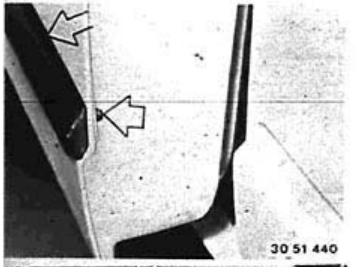


30 51 844



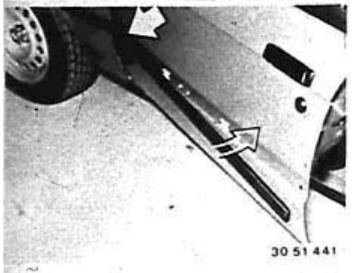
51 15 300 REMOVING AND INSTALLING OR REPLACING RUBBING STRIP ON LEFT OR RIGHT FRONT SIDE PANEL

Pull off rubbing strip.
Installation:
Replace clips, if necessary.

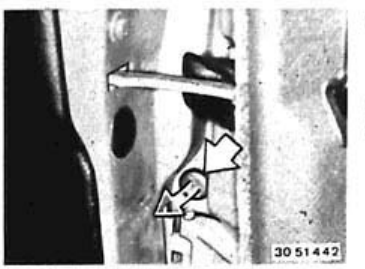


51 15 330 REMOVING AND INSTALLING OR REPLACING RUBBING STRIP ON LEFT OR RIGHT FRONT DOOR

Unscrew screw.
Pull off rubbing strip.

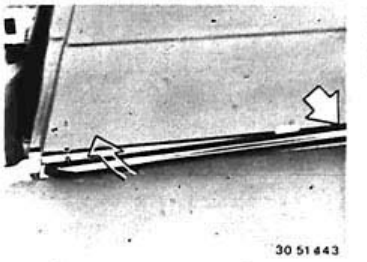


Installation:
Replace clips, if necessary.
First engage rubbing strip in angled clip.

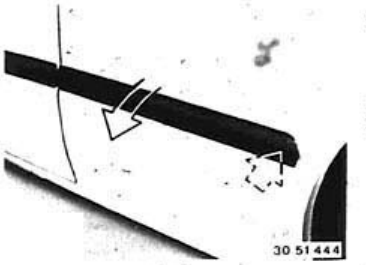


51 15 360 REMOVING AND INSTALLING OR REPLACING RUBBING STRIP ON LEFT OR RIGHT REAR DOOR

Lift off plug.
Unscrew screw.

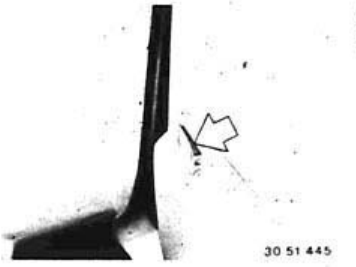


Pull off rubbing strip.
Installation:
Replace clips, if necessary.
First engage rubbing strip in angled clip.

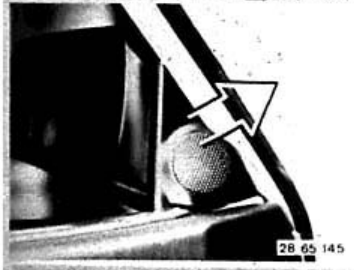


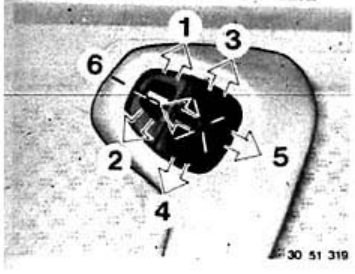
51 15 390 REMOVING AND INSTALLING OR REPLACING RUBBING STRIP ON LEFT OR RIGHT REAR SIDE PANEL

Unscrew screw.
Pull off rubbing strip.



Installation:
Replace clips, if necessary.
First engage rubbing strip in angled clip.





51 16 000 REMOVING AND INSTALLING OR REPLACING MIRROR ON LEFT OR RIGHT FRONT DOOR

Disconnect battery ground lead.
Pull off cover toward the rear.
Unscrew mirror mounting screws and disconnect the plug.

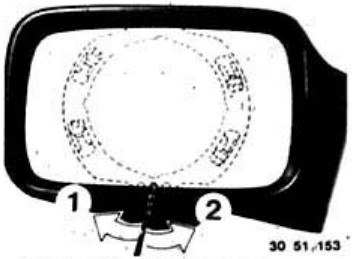
Note:
A blue dot indicates a heated outside mirror.

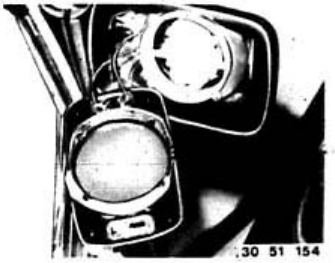
Cars with Sound System:
Pull off mirror triangle toward rear.
Pull off wires - also refer to Group 65.

Turn on ignition and check operation.
Switch Positions:
1 = Left outside mirror
2 = Right outside mirror
Adjusting Mirror:
3/4 Vertical plane
5/6 Horizontal plane

DESCRIPTION

The outside mirror can be adjusted and heated after turning on the ignition.
Heated is controlled automatically.
Heating is switched on by an integrated temperature switch when the mirror glass temperature is below + 15 ± 5° C (59 ± 9° F).
Heating is switched off automatically when a temperature of 60 ± 10° C (140 ± 18° F) is reached.
Heating switches in again when the temperature would drop below + 15 ± 5° C (59 ± 9° F).
The melting speed at - 10° C (+ 14° F) for a frozen mirror is about 5 minutes with a power consumption of approx. 1.5 A.



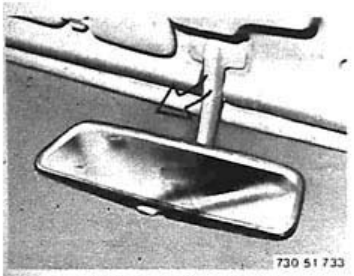


51 16 026 REPLACING MIRROR GLASS

Insert screwdriver in housing opening (bottom) a turn the retaining ring.
1 = Unlocking
2 = Locking

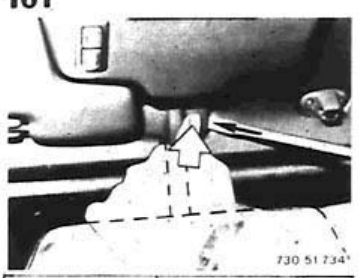
Installation:
Check for correct seating of the retaining ring (catching noticed).

Heated Mirror:
Pull off flat male plug and connect on new mirror glass.
Check operation - see 51 16 000.

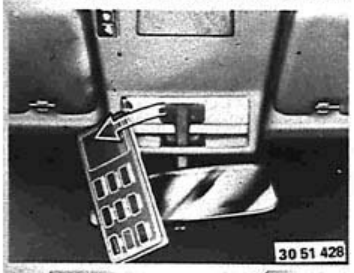


51 16 060 REMOVING AND INSTALLING INSIDE MIRROR

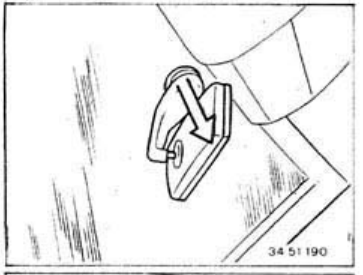
Lift off mirror.



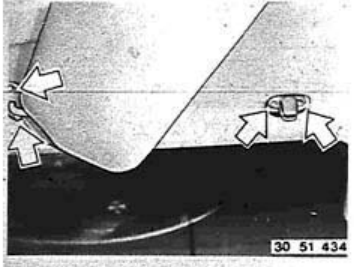
Installation:
Insert mirror diagonally and, if necessary, press in with the handle of a hammer.



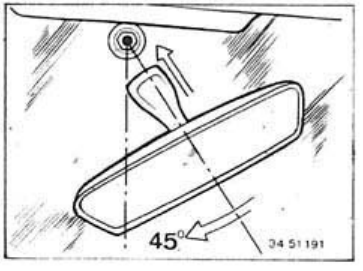
Installation:
If applicable, lift out display panel of cars with check control.



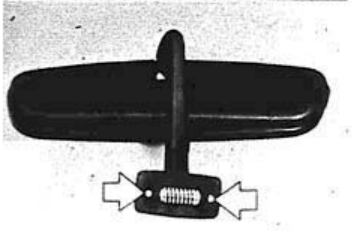
BMW Convertibles:
Pull mirror back off of the base.



Installation:
If applicable, remove front roof liner plate (see 51 44 150) of cars with a front roof liner plate not having check control.



Installation:
1. Mount mirror foot turned about 45° on the mirror base.
2. Turn the mirror foot until it engages in the mirror base.



Installation:
Spring has to be compressed.

51 16 . . . CEMENTING MIRROR BASE

Materials Required:

Mirror Base Cementing Repair Kit*
Primer XW 775*

1. Preparations

1.1 Cement at room temperature and make sure that on cold days the window glass and base are brought to room temperature in the workshop long enough, in order to prevent condensation on the surface.

1.2 Mark position of mirror base on outside of window glass. Scratch off old cement on glass and base with a sharp tool.

1.3 Clean cementing surface on glass and base with a clean shear wool cloth and alcohol/cetone and let surface dry!
Don't use paint thinners!

2. Primer Coat

Apply colorless, watery primer on the surface of the windshield intended for cementing with help of cotton tips (Q-Tips or similar).

Air drying time: min. 1 minute, max. 1 hour.

3. Cement Coat

3.1 Mixing Cement

Cut off sealing tips on containers of cement and hardener with a knife. Make sure that the openings are equal in size. Otherwise there could be mistakes in mixing.

The cap for subsequent plugging of these openings is located between both pistons of the tips. Break off cap.

Light pressure on the pistons will remove the required amount of cement and hardener. The mixing ratio for cement and hardener is 1 to 1 in weight and volume. It is important that the same volumes of cement and hardener are removed (increase size of openings when necessary).
Both components react chemically with each other. Thorough, homogenous and intensive mixing is a requirement for this reaction and for the quality of cementing.
Consequently both components must be mixed in such a manner, that there is an uniform, free-from-reams mixture color.

3.2 Application

The mixture is capable of being applied for about 5 to 10 minutes (potlife) with an ambient temperature of 20 to 25° C (70 to 75° F). Apply a thin (approx. 0.5 mm / 0.020" thick) and uniform coat of cement on the base with a spatula and press the base on the glass in such a manner, that the cement has good contact with the glass over the entire surface.

Note:
The temperature for the hardening process should not be lower than + 18° C (65° F).

3.3 Fixing Bonded Parts

Epoxide resin cements do not have an initial strength property. Consequently this makes it necessary to fix the bonded parts (with adhesive tape or something similar).
The joining and fixing of bonded parts must be accomplished within the potlife. Check that the arresting button is positioned correctly, so that the mirror mounted later will be straight (long side of mirror base hexagon parallel to upper edge of window).

3.4 Hardening of Cement

Hardening speed depends on the ambient temperature. Consequently the mirror base must be fixed with adhesive tape or something similar for at least 3 to 4 hours.
Button on the mirror after 12 hours at the earliest.

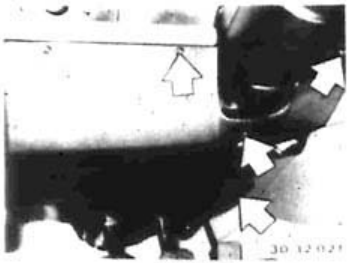
4. Working Hygiene

Caution!
Cement could impair the health if vapors are inhaled or cement has contact with the skin.
As is the case for all epoxide resins, sensitive persons might be confronted with an alergy through contact with the skin.

Make sure of good ventilation and that gloves are worn during application.

Wash off concerned spots of skin with soap and water immediately.
If cement gets in the eye, rinse the concerned eye with water thoroughly and visit a physician.

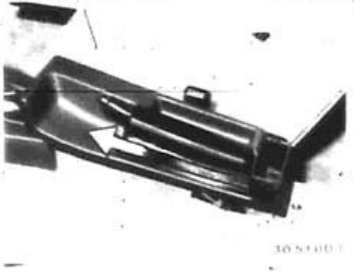
* Source of Supply: HWB



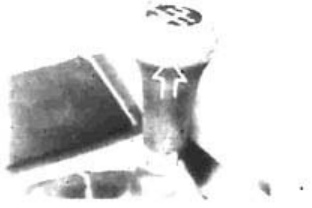
51 16 200 REMOVING AND INSTALLING CENTER CONSOLE

Disconnect battery ground lead.
Unscrew trim panel at bottom left.

Lift out ashtray.
Unscrew nut.

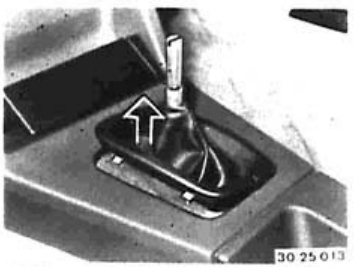


Disconnect console at front end by pulling back and pull it off of the parking brake lever.
Cars with EH Transmission:
Pull off plug.



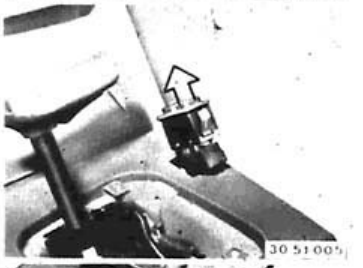
Cars with Manual Transmission:
Pull off shift lever knob.

Installation
Engage shift lever knob in the turning prevention lock.

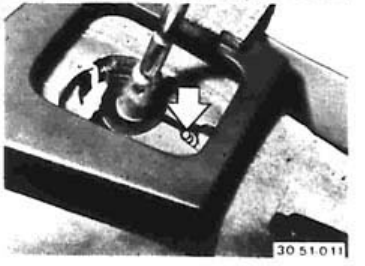


Lift off dust cover.

Cars with Automatic Transmission:
Lift out plate.
Unscrew screws.
Take off trim panel.

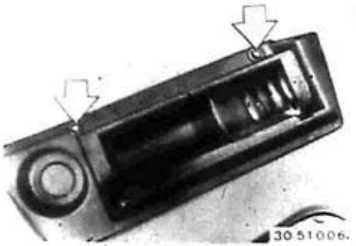


If applicable, lift out switches for power windows.
Pull off plugs.

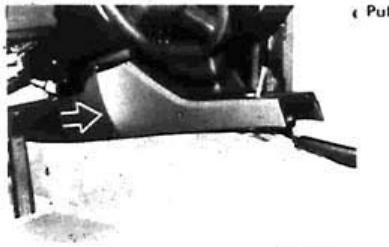


Remove insulation sheet.
Unscrew nut.

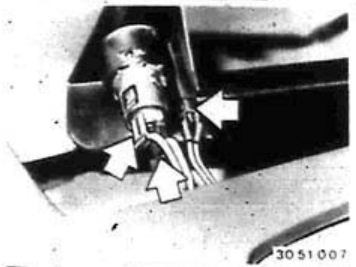
Installation:
Replace plastic nut and check tightness.
Tightening torque: 5 Nm (3.5 ft. lbs.).



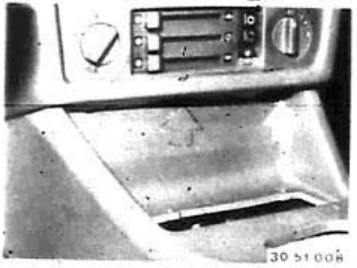
Unscrew bolts
Lift out ashtray console



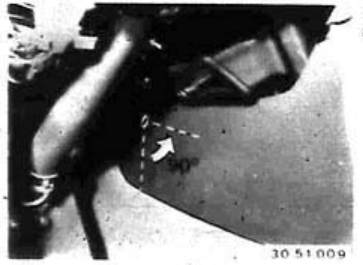
Pull out tray toward rear.



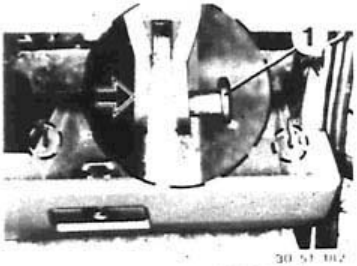
Pull off ashtray light and wires for cigar lighter



Unscrew bolt.

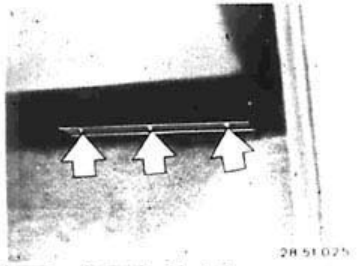


Remove retainers by turning clockwise and anticlockwise 90°.

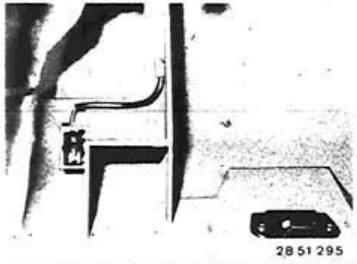


51 16 360 REMOVING AND INSTALLING RIGHT GLOVE BOX

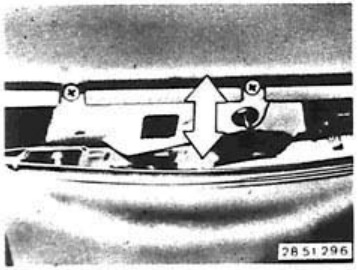
Push out pin.
Disconnect left and right retaining straps.
Remove trim panel.



Unscrew screws.

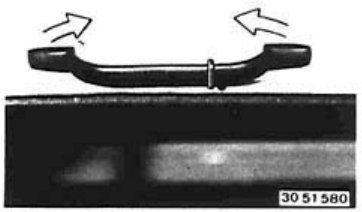


Lift out plug.

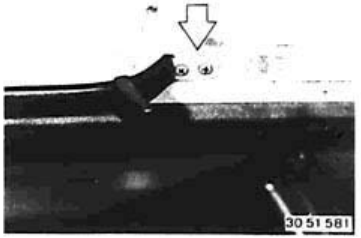


Installation:
If applicable, adjust striker for lock.

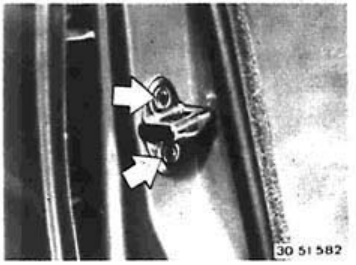
51 16 450/480 REMOVING AND INSTALLING GRAB HANDLE



Lift off plate.



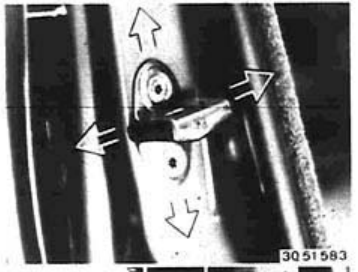
Unscrew bolt.



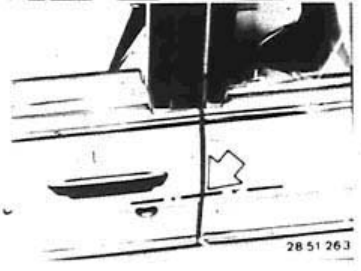
51 21 003 REPLACING LEFT OR RIGHT FRONT DOOR STRIKER

If applicable, mark installed position.
Unscrew bolts.

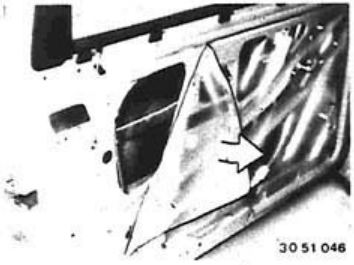
Four Door Model:
If applicable, remove B pillar trim – see 51 43 150.
Two Door Model:
If applicable, remove side panel trim – see 51 43 000.



Installation:
Tighten striker bolts lightly in middle position.
Close door with opened door handle.
This aligns the striker.

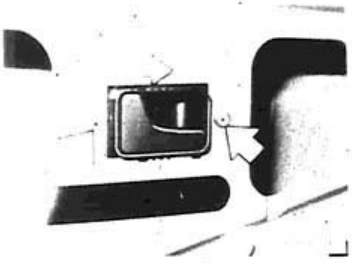


Tighten striker bolts.
Close door.
Check, correcting if necessary.
Edge of front door must be in same plane with rear door or side panel.

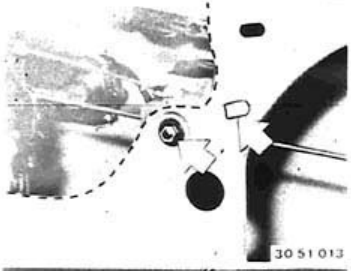


51 21 090 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT FRONT DOOR LOCK

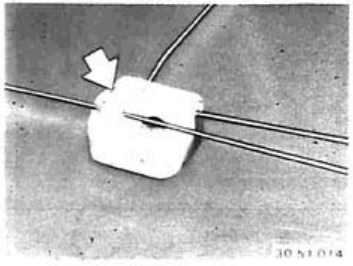
Note:
Some pictures show the sheet metal parts cut off for better understanding.
Remove door trim panel – 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



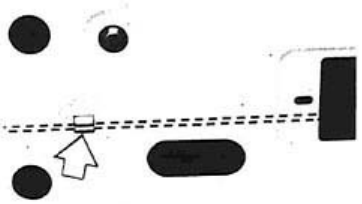
Unscrew door remote control.
Installation:
Preload door remote control lightly.



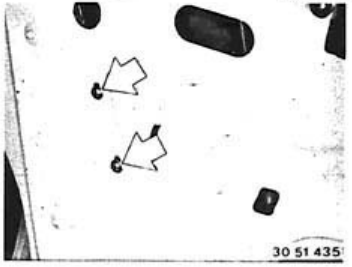
Two Door Cars:
Unscrew reversing lever.
Installation:
Insert twisting lock in opening.



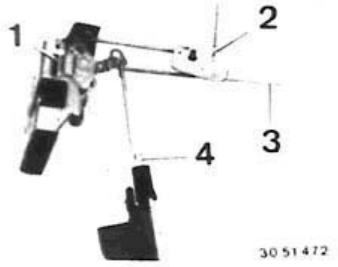
Two Door Cars:
Installation:
Engage remote control linkage in holder on protective cap of the reversing lever.



Four Door Cars:
Unclip remote control holder.

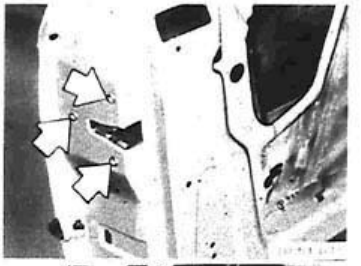


Cars with Central Locks:
Unscrew bolts.
Pull off plug.
Disengage drive.
Installation:
Adjust drive – see 51 26 000.
Troubleshoot central locks – see page 51 - 800.

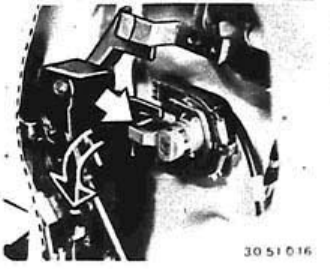


30 51 472

Two Door Arrangement:
1 = Lock
2 = Locking linkage
3 = Door remote control linkage
4 = Drive/connecting link



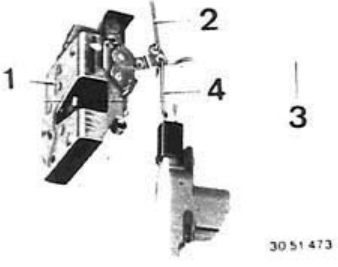
Unscrew bolts.



30 51 016

Disengage lock in lever on the lock cylinder.
Remove lock complete with remote control.

Convertibles:
Remove lock cylinder – see 51 21 140.

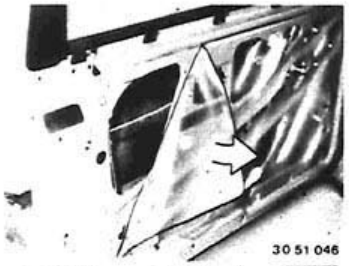


30 51 473

Four Door Arrangement:
1 = Lock
2 = Locking linkage
3 = Door remote control linkage
4 = Drive/connecting link

Installation:
Lubricate lock with grease*.

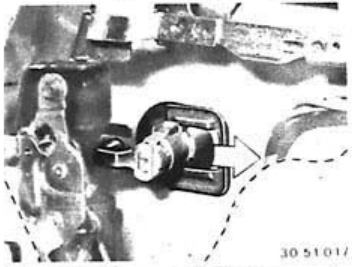
* Source: HWB



30 51 046

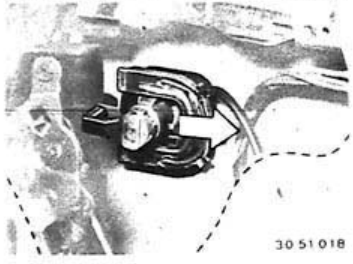
51 21 140 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT FRONT DOOR LOCK CYLINDER ASSEMBLY

Note:
Some pictures show the sheet metal cut off for better understanding.
Remove door trim panel – see 51 41 001.
Pull off plastic sheet partially.
Installation:
Replace damaged plastic sheet.



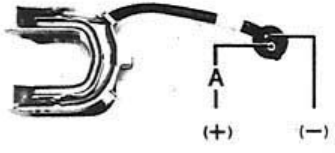
30 51 017

Pull off retainer.



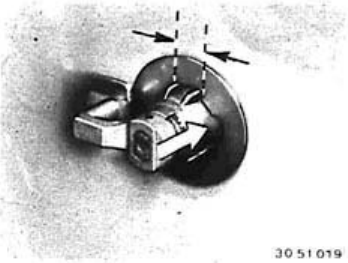
30 51 018

Version with Lock Heating:
Pull off retainer complete with heating ring.



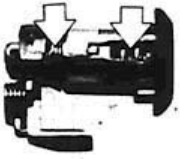
28 51 622

View of Door Lock Heating:
See Specifications of Group 61 for testing the power consumption.



30 51 019

Push out lock and remove washer.
Installation:
Wide opening of washer faces up.



30 51 704

Installation:
Lubricate lock cylinder with grease*.

30 51 705

Note:
The lock cylinder can be ordered from Parts by quoting the code number.

The old tumblers must be used as samples when using a lock cylinder repair set.
Note the number die-stamped on the tumbler. Insert the tumbler of the repair kit having the same number in the pertinent chamber of the new lock cylinder together with a new spring, lubricated with the supplied grease.

* Source of Supply: HWB

30 51 570

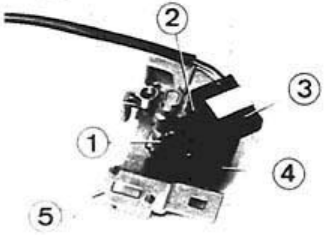
Driver's Door:
Installation:
Check for correct fit of spring in cars with central locks and unlocking arrest.

30 51 474

Installation:
Place drive for microswitch on holder.

30 51 475

Installation:
Plug in microswitch and secure it with a clamp.



30 51 476

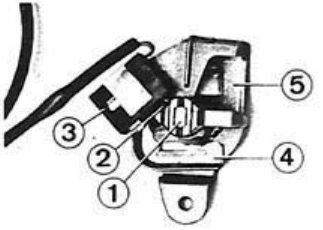
Driver's Door Lock Cylinder Layout:
1 = Lock cylinder
2 = Drive for microswitch
3 = Microswitch
4 = Clamp
5 = Holder
Checking Microswitch:
Switch pressed = ≈ 0 Ω
Switch opened = ≈ ∞ Ω
Troubleshoot central locks – see page 51 - 800.

30 51 070

Front Passenger's Door:
Installation:
Place drive for microswitch on holder in cars with central locks.

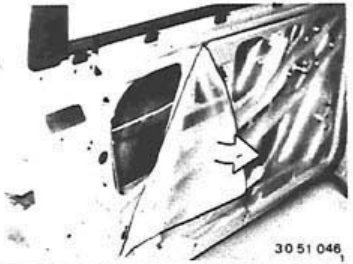
30 51 071

Plug in microswitch and secure it with a clamp.



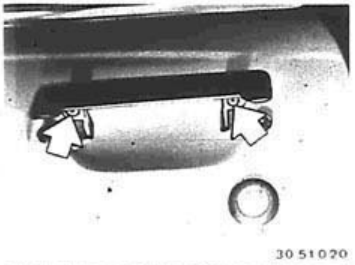
30 51 493

Front Passenger's Door Lock Cylinder Layout:
1 = Lock cylinder
2 = Drive for microswitch
3 = Microswitch
4 = Clamp
5 = Holder
Checking Microswitch:
Switch pressed = ≈ 0 Ω
Switch opened = ≈ ∞ Ω
Troubleshoot central locks – see page 51-800.

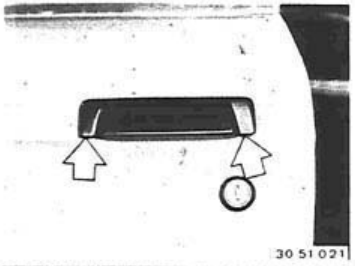


51 21 200 REMOVING AND INSTALLING OR REPLACING OUTSIDE HANDLE AND LOCKING MECHANISM OF LEFT OR RIGHT FRONT DOOR

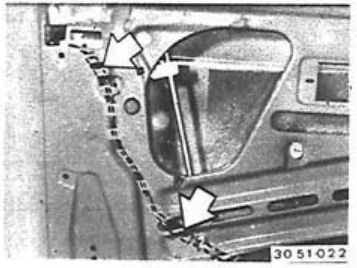
Note:
Some pictures show the sheet metal parts cut off for better understanding.
Remove door trim panel – see 51 41 001.
Pull off plastic sheet partially.



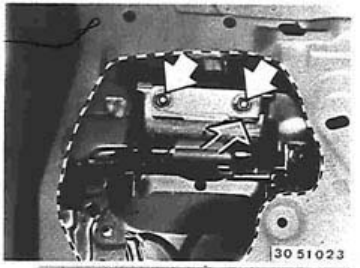
Installation:
Replace damaged plastic sheet.



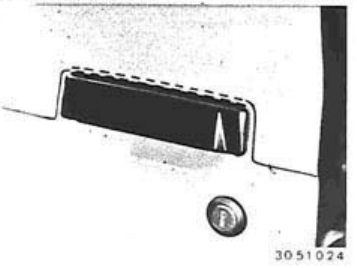
Unscrew outside handle.



Installation:
Align outside handle that it rests on the rubber pads.

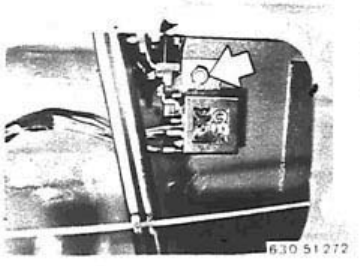


If applicable, disconnect plug

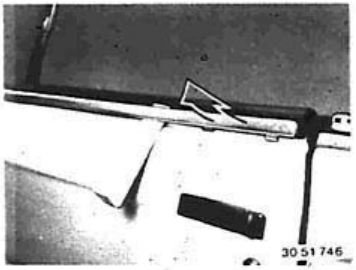


Unscrew nuts.
Remove locking mechanism.
Caution!
Be careful not to damage paint at openings.

Installation:
Align locking mechanism with bead in the door panel after screwing on the outside handle.



Installation:
If applicable, the lifted outside handle must operate the heating control unit for the door lock or the contact transmitter for inside light delayed action.
If applicable, adjust or bend the contact tongue.

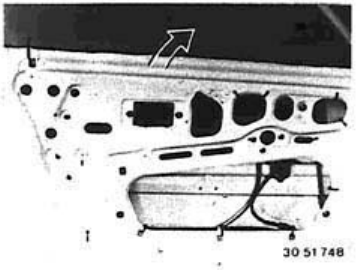


51 21 300 REMOVING AND INSTALLING OR REPLACING OUTSIDE WINDOW RECESS COVER STRIP

If applicable, remove outside mirror – see 51 16 000.
Lift out cover strip from above carefully.

Installation:
Replace damaged clips.

30 51 747



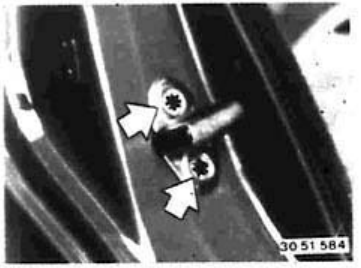
51 21 330 REMOVING AND INSTALLING OR REPLACING INSIDE WINDOW RECESS COVER STRIP

Remove door trim panel – see 51 41 001.
Lift out cover strip.

Installation:
Check for correct fit of cover strip in clips.

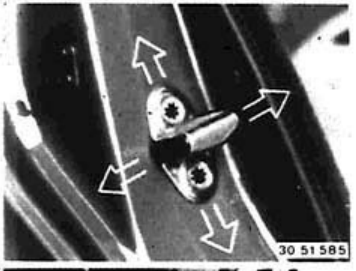
30 51 749

Convertibles:
Lift out cover strip.
Installation:
Check for correct fit of cover strip in clips.

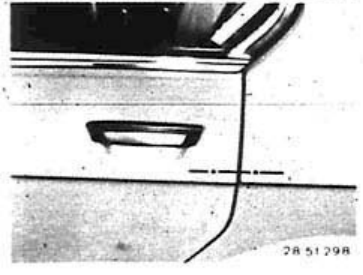


51 22 001 REPLACING LEFT OR RIGHT REAR DOOR STRIKER

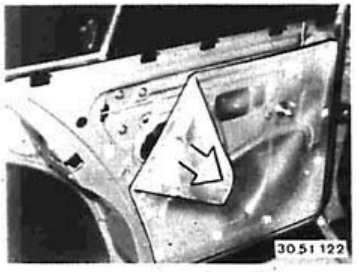
If applicable, mark installed position.
Unscrew bolts.



Installation:
Tighten striker bolts lightly in middle position.
Close door with opened door handle.
This aligns the striker.

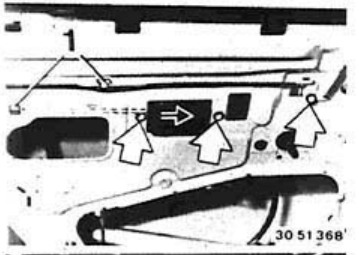


Tighten striker bolts.
Close door.
Check, correcting if necessary.
Edge of rear door must be in same plane with side panel.

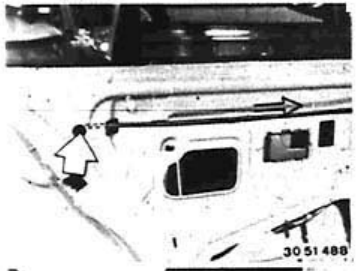


51 22 090 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR LOCK

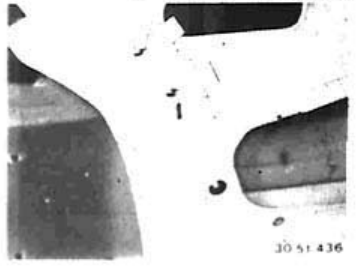
Raise window completely.
Remove door trim panel – see 51 42 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



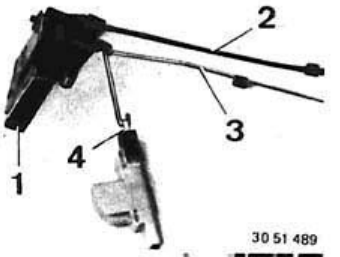
Unscrew bolts and unclip both holders (1).
Disengage door remote control.
Installation:
Preload remote control lightly.



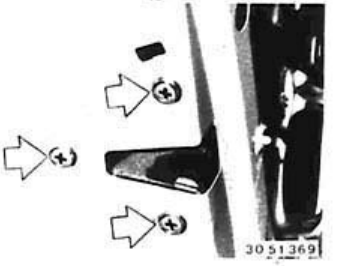
Disengage locking linkage.
Installation:
Pull linkage forward and press it into clip at same time.



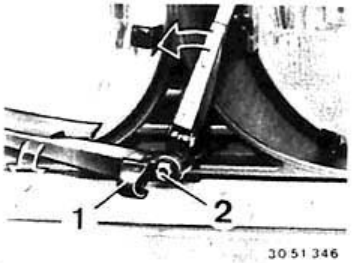
Cars with Central Locks:
Unscrew bolts.
Pull off plug.
Disengage drive.
Installation:
Adjust drive – see 51 26 010.
Troubleshoot central locks – see page 51 - 800.



Rear Door Lock Arrangement:
1 = Lock
2 = Locking linkage
3 = Door remote control
4 = Drive/connecting link

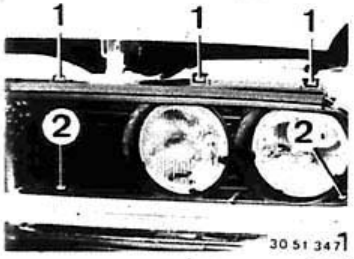


Unscrew bolts and take out door lock.

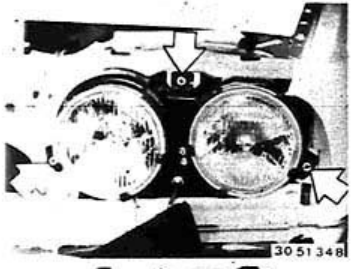


51 23 110 REMOVING AND INSTALLING OR REPLACING ENGINE HOOD LOCK

Raise engine hood.
Cars with Headlight Cleaners:
Take off cap (1).
Unscrew nut (2).
Pull wiper arms away from headlights and take off wiper linkage.

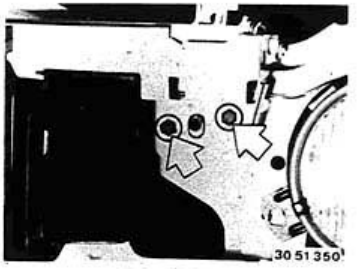


Lift clips (1) off of radiator grill on left-hand side.
Unscrew screws (2).



Unscrew left headlight.
Installation:
Aim headlights if necessary – see 63 10 004.

Unscrew and remove trim panel.

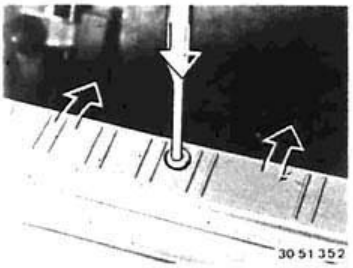


Unscrew screws.
Installation:
Align the striker through a hole provided in the body from the inside, before bolting down the striker.

Lift off cap.
Disconnect cable in holder.
Installation:
Lubricate lock with grease.
Make sure cable is seated correctly and engage in opened lock.

Installation:
The engine hood release must be installed prior to installation of the lock.

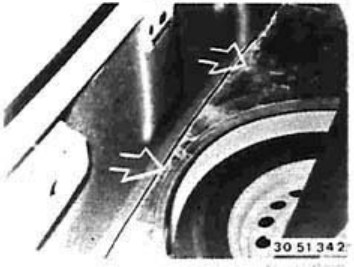
Installation:
Adjust engine hood if necessary – see 41 61 . . ..



30 51 352

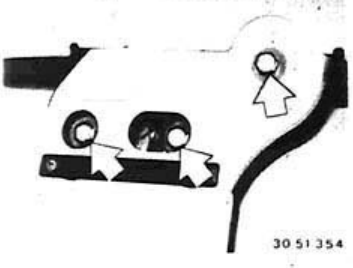
51 24 100 REMOVING AND INSTALLING OR REPLACING TRUNK LID LOCK

Cars with Ornamental Trunk Plate:
Press down on pins of clips and remove the ornamental plate.



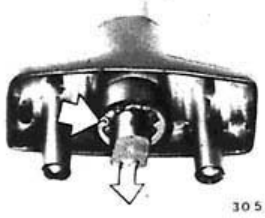
30 51 342

Fold back the trunk mat.
Lift rear wall trim panel slightly at bottom and pull it out.



30 51 354

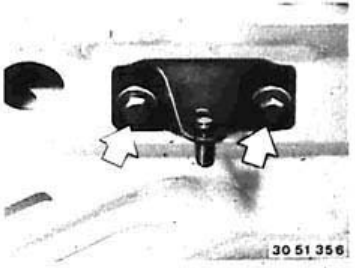
Unscrew screws.
Remove trunk lid lock.
Installation:
Take out lock from the side.
Prevent the lock cylinder from falling out.



30 51 355

Installation:
Service the lock cylinder if necessary.
Lift out circlip.
Pull out lock cylinder toward the rear.
Installation:
Check for correct fit of circlip in the groove.
Lubricate lock cylinder with grease*.

* Source: HWB

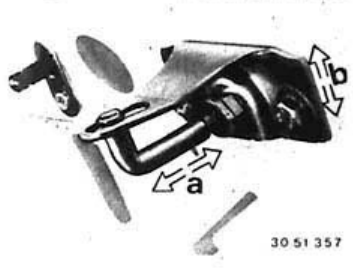


30 51 356

51 24 130 REMOVING AND INSTALLING OR REPLACING TRUNK LID LOCK BASE

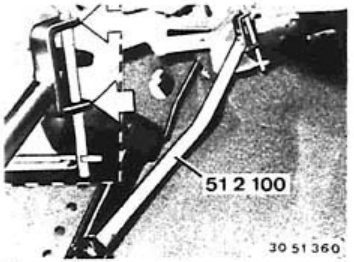
Unscrew screws.

Installation:
The lock base can be adjusted in height (a) and plane (b).



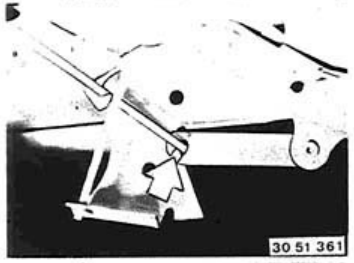
30 51 357

Installation:
Turn stop pads on left and right sides until the trunk lid has light preload.



51 24 341 REPLACING TORSION BARS FOR TRUNK LID

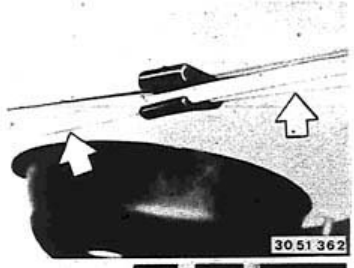
Disengage torsion bars with Special Tool 51 2 100.



Disengage torsion bars on trunk lid.

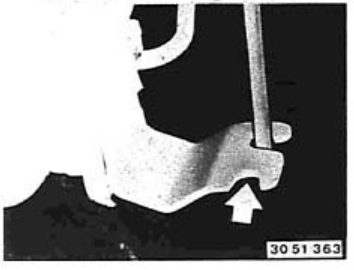
Installation:

Prevent trunk lid from falling down.
Torsion bars only have limited preload.



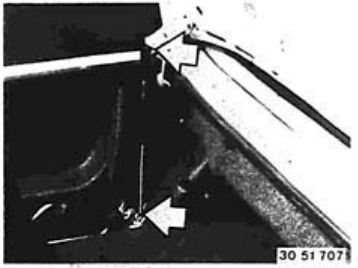
Installation:

Check torsion bars for rubbing spots in case of a grinding noise.
If necessary, lubricate joints with grease and align rubber mounts.



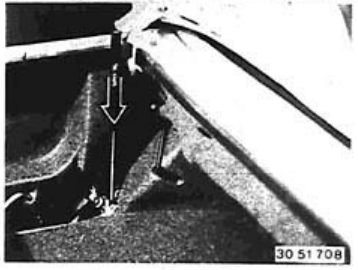
Installation:

The preload of torsion bars can be increased by inserting them in the second catch.
This could be necessary, for example, for the large toolbox.



51 24 . . . REMOVING AND INSTALLING OR REPLACING GAS PRESSURE PROPS

Lift out clips.
Remove gas pressure props.

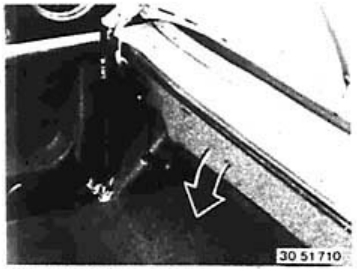


Installation:

Prevent trunk lid from falling down.
Compress gas pressure props slightly while installing.

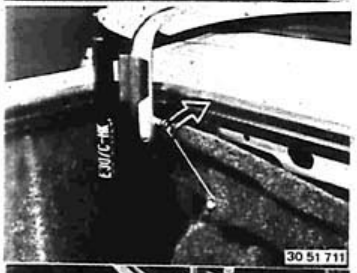
Installation:

Install piston rod facing down.
Protect piston rod against dirt, paint and damage.

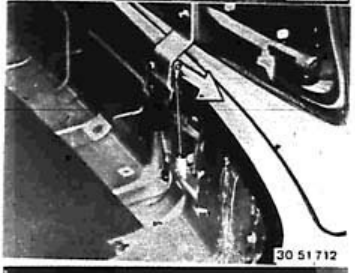


51 25 . . . REMOVING AND INSTALLING OR REPLACING LOCKING ELEMENT

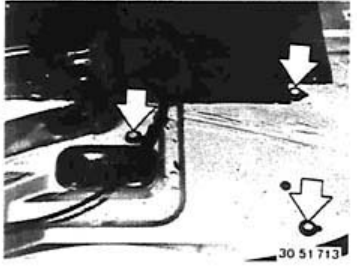
Lift out trim panel.



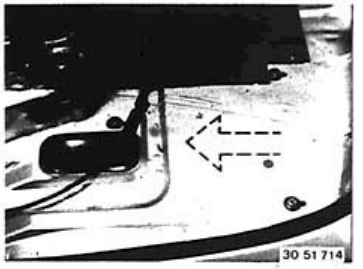
Lift out circlip.
Disconnect cable.
Note:
Only open one lid after disconnecting a cable (danger of damage).



Shut the trunk lid.
Open the top lid.
Lift out circlip.
Disconnect cable.

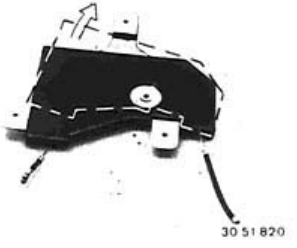


Unscrew bolts.
Lift out locking element.

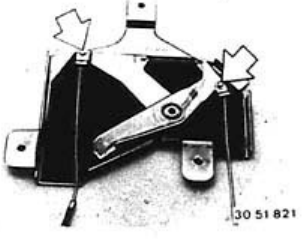


Adjusting Lock:
Tighten lock only finger tight.
Connect cables.
Shut the trunk lid.
Open the top lid.
Adjust lock in slots in forward direction until the cables are tight.
Screw on lock tight.

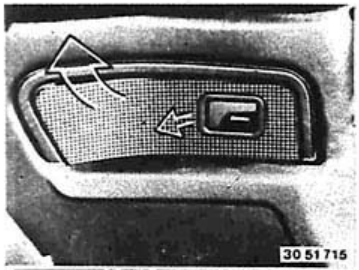
Checking Function:
Trunk lid and top lid must not interfere with each other when opened.



Note:
The plastic cover must be turned carefully to replace the cables.



The lock is shown in the picture without a plastic cover for better understanding.
If applicable, lift out retainer and remove the cable.

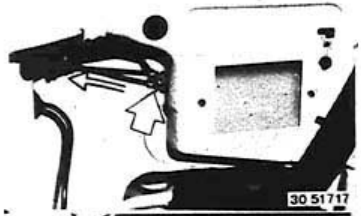


51 25 . . . REMOVING AND INSTALLING OR REPLACING CABLES FOR TOP LID LOCKS

Lift out plate.
Remove trim panel.

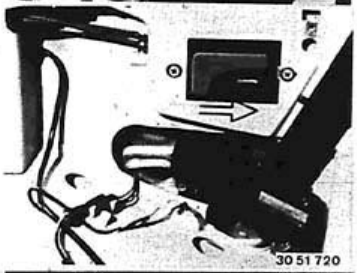
If applicable, lift out trim panel – see 51 43 000.
Remove remote control.

Disengage clips.



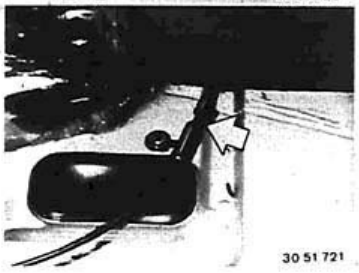
Disconnect left and right cables.

Pull out remote control.
Lift out caps.
Disconnect cables.

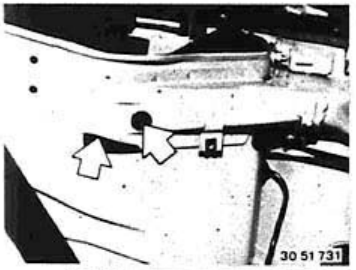


Installation:

1. Preload the short cable lightly by adjusting the remote control.

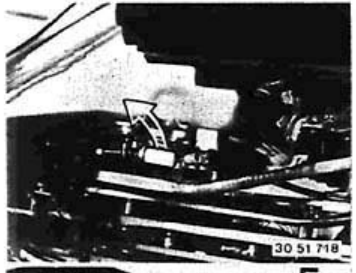


2. Preload the long cable lightly by adjusting.



51 25 . . . REMOVING AND INSTALLING OR REPLACING TOP LID LOCK

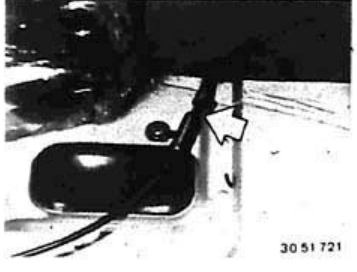
Remove trim panel – see 51 43 000.
Unscrew screws.



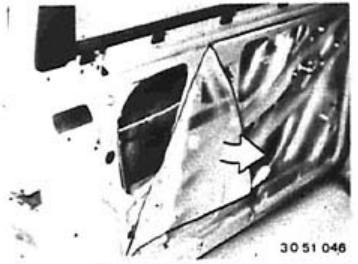
Disconnect cable.

Installation:

1. Preload the short cable lightly by adjusting the remote control.

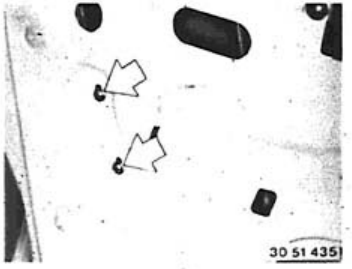


2. Preload the long cable lightly by adjusting.

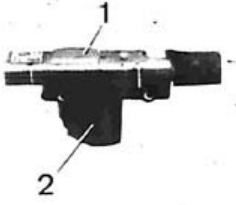


51 26 000 REPLACING SWITCH FOR LEFT OR RIGHT FRONT DOOR LOCK (DRIVE)

Remove door trim panel – see 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.

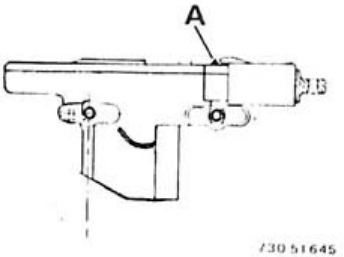


Unscrew screws.
Pull off plug.
Disengage drive.

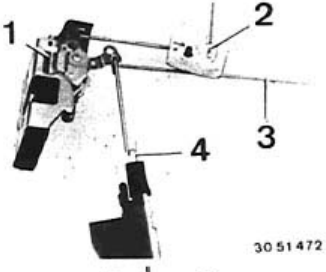


Installation:
Check identification.

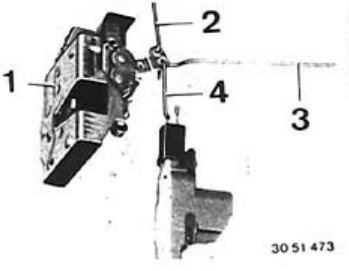
	Upper Section (1)	Lower Section (2)
Driver's door	white	red
Passenger's door	red	red
Rear doors	red	white
Trunk lid	white	red



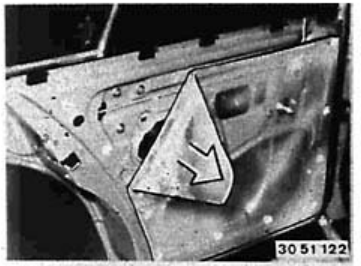
Troubleshooting central locks – see page 51 - 800.
Installation:
1. Lock in LOCKED position.
2. Locking linkage in LOCKED position.
3. Engage drive in connecting link and hold in installed position with a screw (screw is not tightened).
4. Screw in second screw.
Compress drive (position A), pull down slightly (linkage play) and then tighten screw with 2 Ncm (1.7 in. lbs.).
5. Tighten the screw installed first.
Upper section (1) faces
forward in 2-door cars
or
toward rear in 4-door cars.



Two Door Car Arrangement:
1 = Lock
2 = Locking linkage/reverse
3 = Door remote control linkage
4 = Drive/connecting link



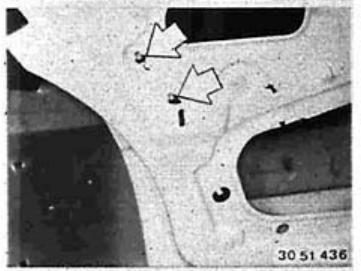
Four Door Car Arrangement:
1 = Lock
2 = Locking linkage
3 = Door remote control linkage
4 = Drive/connecting link



51 26 010 REPLACING SWITCH FOR LEFT OR RIGHT REAR DOOR LOCK (DRIVE)

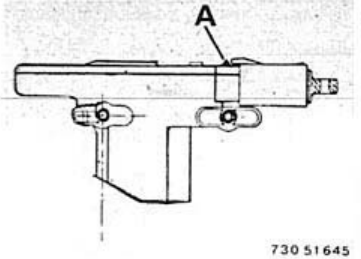
Remove door trim panel – see 51 42 001.
Pull off plastic sheet.

Installation:
Replace damaged plastic sheet.



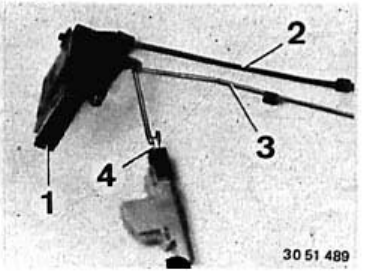
Unscrew screws.
Pull off plug.
Disengage drive.

Installation:
Check drive identification – see 51 26 000.

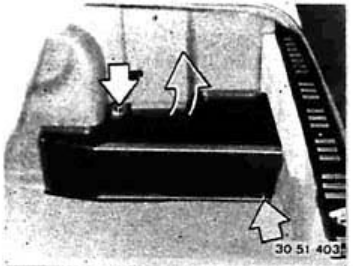


Troubleshoot central locks – see 51 - 800.

Installation:
1. Lock in LOCKED position.
2. Locking linkage in LOCKED position.
3. Engage drive in connecting link and hold in installed position with a screw (screw is not tightened).
4. Screw in second screw. Compress drive (position A), pull down lightly (linkage play) and then tighten screw to 2 Nm (1.4 ft. lbs.).
5. Tighten the screw installed first.

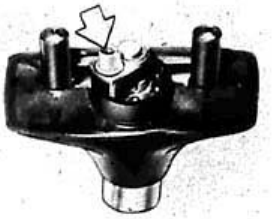


Rear Door Lock Arrangement:
1 = Lock
2 = Locking linkage
3 = Door remote control linkage
4 = Drive/connecting link

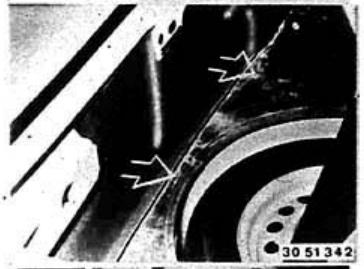


51 26 020 REPLACING SWITCH FOR TRUNK LID LOCK (DRIVE)

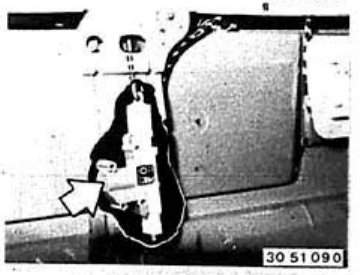
If applicable, remove battery cover.



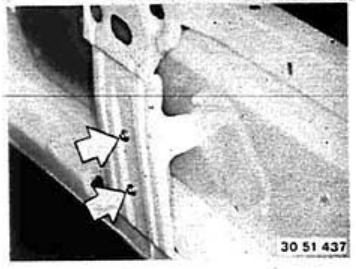
Installation:
Check for correct fit of linkage in lock.



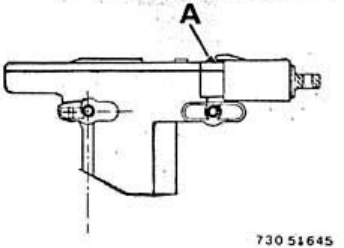
If applicable, disengage left and right tail light carriers.
If applicable, remove trim panel.



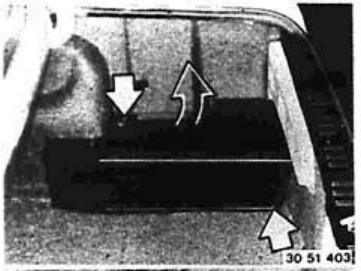
Installation:
Check drive identification — see 51 26 000.



Unscrew screws.
Disengage drive.
Pull off plug.
Installation:
Engage linkage in drive.
Slide in drive and engage in lock.

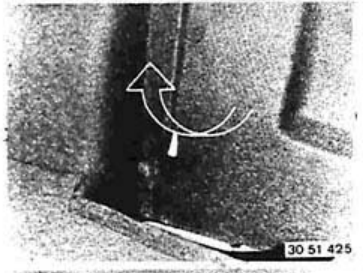


Installation:
1. Turn lock to UNLOCKED position (left).
2. Engage drive in connecting link and hold with a screw (screw is not tightened).
3. Screw in second screw.
   Compress drive (position A), pull down slightly (linkage play) and then tighten screw to 2 Nm (1.4 ft. lbs.).
4. Tighten the screw installed first.

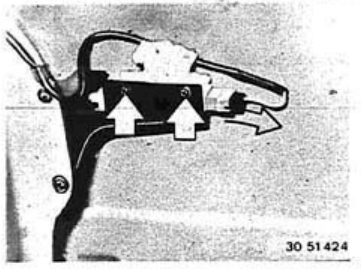


51 26 025 REPLACING SWITCH FOR FUEL TANK FLAP LOCK (DRIVE)

If applicable, remove battery cover.

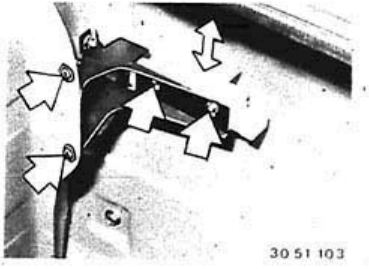


Lift out trim panel.



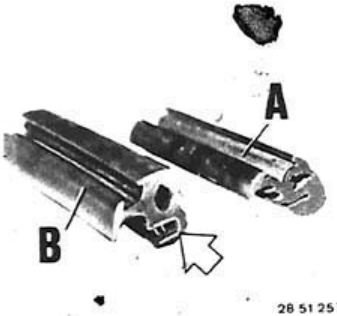
Unscrew screws.
Pull off plug.
Remove drive.

Installation:
Flat side faces down.



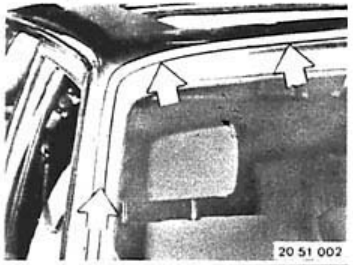
Align drive to tank flap and tighten screws.

51 31 011 REPLACING WINDSHIELD



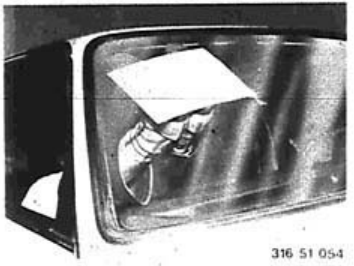
28 51 257

Note:
The rubber frame has sheet metal reinforcement in contradiction to older versions.
This changes the installation procedures.



20 51 002

Pull out filler strip.
Pull rubber frame off of body and window glass carefully with Special Tool 51 3 057.

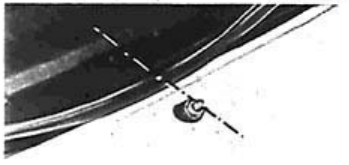


316 51 054

Loosen and press out windshield with foot pressure carefully, beginning at an upper corner.

Important!
The rubber frame remains in the body opening.

Installation:
Check rubber frame and filler strip, replacing if necessary.



316 51 357

Place rubber frame in body opening.
Begin with the seam at bottom center.

316 51 358

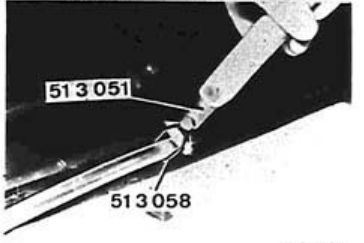
Press rubber frame firmly into body opening.

316 51 359

Rub in fold for window glass and filler strip with a lubricant*.
Slide windshield into window opening holder, starting from the middle, and center.

316 51 360

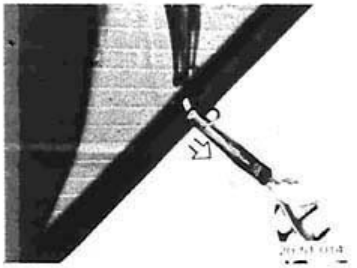
Pull rubber frame over window glass all around with a flat wood or plastic scraper.



30 51 612

Pull filler strip into rubber frame with Special Tools 51 3 051 and 51 3 058, beginning at bottom center.

* Source of Supply: HWB



51 31 200 REPLACING REAR WINDOW

Pull off connections for rear window defogger.
Installation:
Check operation.

Remaining procedures are identical with those described in 51 31 011.
If rear window glass had been broken, remove rear seat cushion and clean seat belt reels to remove glass splitters.

51 31 . . . WINDOW INSTALLING INSTRUCTIONS

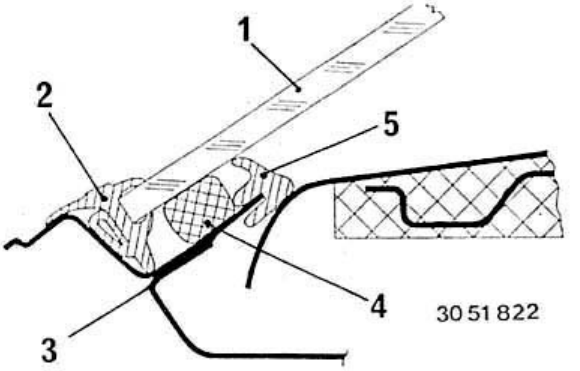
Windshield and rear window are cemented with the body for a positive connection. This improves the torsional strength of the car. Conformance with the following procedures is necessary to guarantee correctly cemented windows. Two different types of repairing are described.

1. When replacing windshield basic cement bead is already produced. For rear window clips for the ornamental frame are already installed on glass.
2. When installing windshield complete cement bead (basic and second beads) must be produced by hand. For rear window clips for the ornamental frame must be fitted.

Window glass is removed with an electric cutter* having an oscillating knife* without damaging the paint finish in the body opening as well as possible. Safety goggles and gloves must be worn for cutting out windows. Damaged body paint finish in the opening must be touched up with a BMW EP primer. The in-side of the glass has a coat of glass ceramic, which is ultra violet penetration proof, in the edge area for protection of the cement bead. The glass ceramic surface is brushed in thin with primer (repair kit*). Primer must dry at least 10 minutes. Edges of the body opening are also given a light coat of primer. The single component polyurethane (1 K-PUR) approved by BMW must be used as cement (repair kit*). The cement is applied on the window with a cartridge. Installation must be completed within 10 minutes, since otherwise the cement bead will have a skin and no longer provide sufficient adhesion.

Important!
Always remove contamination from cement remainders with benzin before the cement has hardened. Do not remove the window again for this purpose.

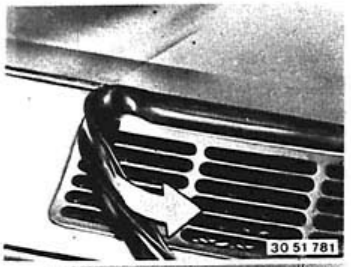
The cement hardens through reaction with air moisture at room temperature. Minimum hardening time is 4 hours at 22° C (72° F) and 38 % relative humidity. The car must not be subjected to onesided loads (e.g. one wheel on curbstone, lifting platform, etc.) during the minimum hardening time.
One side window should be opened, to avoid excessive pressure inside of the car when closing the doors.
The car can be towed or driven without a windshield or rear window.



M 3 Windshield at Bottom

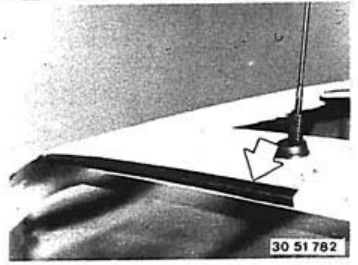
1 Windshield glass
2 Rubber frame
3 Body
4 Cement bead
5 Inside rubber seal

* Source of Supply: HWB



51 31 000 REMOVING AND INSTALLING WINDSHIELD – M 3 –

Lift out front roof liner plate and A pillar trim.
Remove windshield wipers – see Group 61.
Pull out rubber seal.

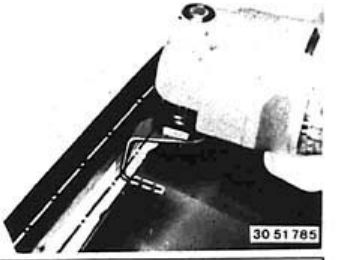


Remove cement on body.

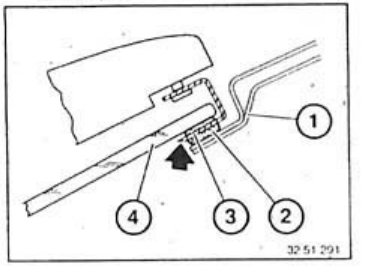
Mount knife* on electric tool*.
The knife must be parallel to the axis of the tool.

Guide in the knife* between the body and window carefully.

* Source of Supply: HWB

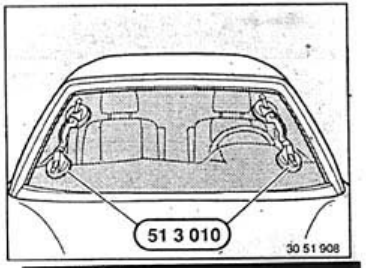


Guide traverse of knife* parallel to the window.



Cut through cement bead all around and as close as possible to the window.

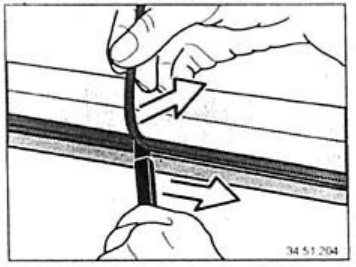
1 Body opening
2 Cement bead
3 Knife
4 Window glass



Lift out window with Special Tool 51 3 010.

If applicable, resharpen the knife* with the electric tool* running.

* Source of Supply: HWB



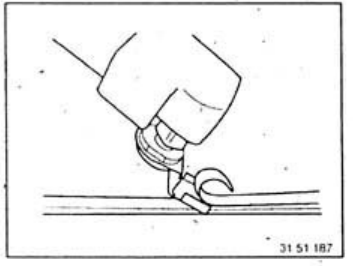
Remove residual cement on body opening but for a thickness of about 0.5 mm (0,020").

Cut off residual cement with universal knife (sharp as a razor blade) carefully to avoid damaging paint finish on body opening.

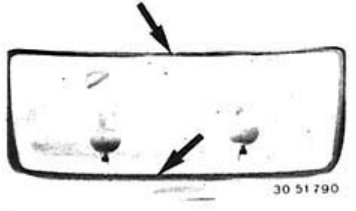
Important!
Always repair damaged paint finish to guarantee longterm corrosion inhibition!
Use BMW EP filler (2K) for this purpose.

Remove residual cement, sand out and touch up scratches in non-visible surfaces with BMW EP filler.

Large-surface damage must be sanded down to blank metal and coated with BMW EP filler (30 ... 40 µm thick coat). If complete paint buildup is necessary on visible surface, prime coated cement flange must be removed prior to application of final paint coat.



Reduce thickness of resdiual cement to about 0.5 mm (0.020") with knife*, if window can be used again.

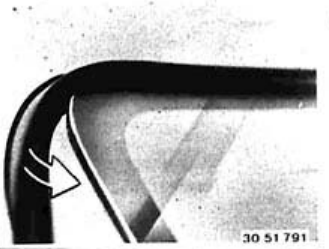


Coat window in area of cement surface with primer (repair kit*).

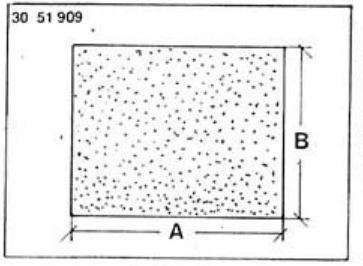
Important!
Only apply primer in area of cement surface, since otherwise glass would be impaired permanently.

Note:
Min. air drying time: 10 minutes.

* Source of Supply: HWB

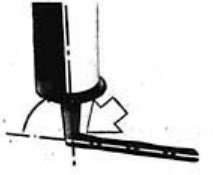


Mount rubber frame on window.



Produce new cement bead in two steps when reusing a window.
Produce first (basic) cement bead in rectangular shape (if necessary, correct the cement bead shape with a spatula).
a 12 mm (0.472")
b 10 mm (0.394")
Allow time for basic bead to harden.

Note:
Basic bead is produced in the factory for replacement windows.



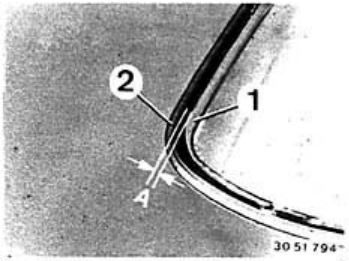
If necessary, make a sample bead before cementing.
Cartridge (repair kit*) must be perpendicular to window surface.
Make sure of uniform feed and pulling speed while producing a cement bead.

Note:
Use a cartridge gun* (pneumatic or electric) to produce uniform beads of cement.

30 51 793

Check the cement's date of expiry!

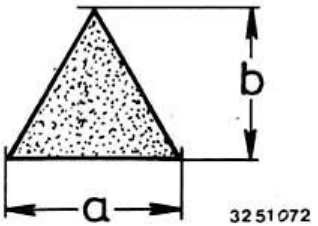
* Source of Supply: HWB



Produce first (basic) cement bead (1) on window glass next to rubber frame (2) at distance A all around.

Let first cement bead harden at least 12 hours before producing second cement bead.

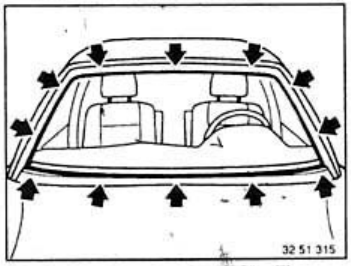
Distance A = 5 mm (0.197").



Shape of Second Cement Bead:

a 10 mm (0.394")
b 12 mm (0.472")

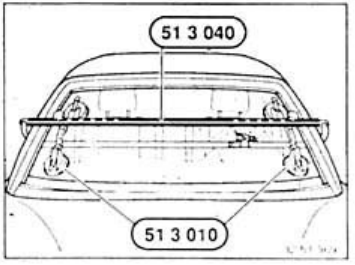
Produce second bead on the basic bead all around.



Important!
Repaired paint finish spots must be hardened!

Coat body in area of cement surface and basic bead with primer (repair kit*).

Note:
Min. air drying time: 10 minutes.



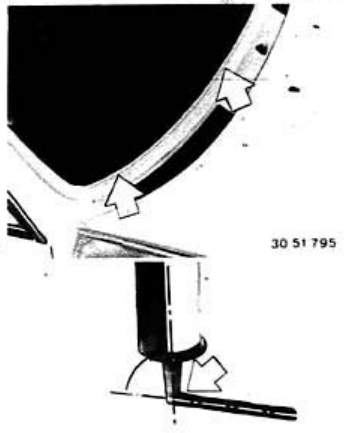
Fit in and press on window glass carefully with Special Tool 51 3 040 (used together with Special Tool 51 3 010).

Check for uniform spacing between the body and rubber frame all around.

Preload window lightly with the strap.

Important!
Always remove dirt from residual cement with cleaning benzol before the cement hardens. Don't press out the window glass again for this purpose.

Note:
Leaks can be detected by spraying water underneath the sealing lip or with an ultrasonic leak detector. Leaks can be sealed with a corresponding nozzle (repair kit*).



Place rubber in bottom area of the body opening.

If necessary, make a sample bead before cementing.
Cartridge (repair kit*) must be perpendicular to window surface.
Make sure of uniform feed and pulling speed while producing the cement bead.

Note:
Use a cartridge gun* (pneumatic or electric) to produce uniform beads of cement.

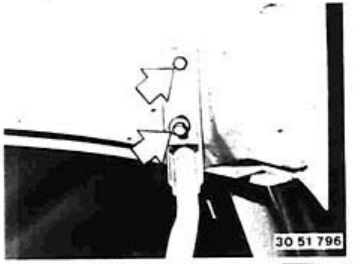
Check the cement's date of expiry!

* Source of Supply: HWB

* Source of Supply: HWB

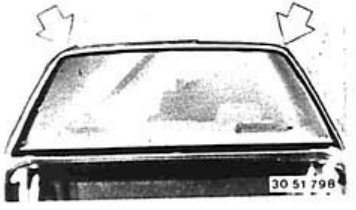
51 31 200 REPLACING REAR WINDOW – M 3 –

The same conditions are applicable to the rear window as to the windshield – also refer to the M 3 window installing instructions (51 31 . . .).

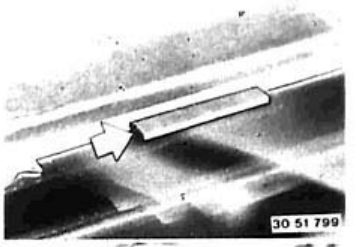


Unscrew bolts.
Remove trunk lid.
Disconnect torsión bars – see 51 24 341.

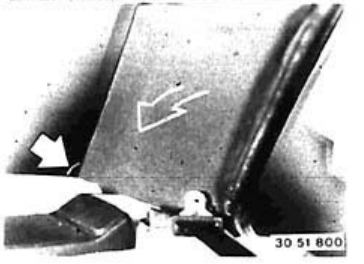
Push the cover aside.
Lift out the ornamental frame.



Remove cement on the body.



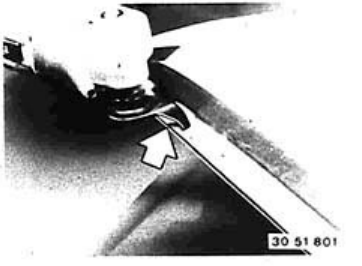
Lift out clips.



Lift out C pillar trim and pull off plug for the rear window defogger.
Remove side window in cars without a vent window – see 51 36 050.

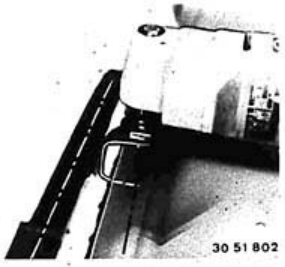
Installation:
Cement the C pillar trim on the body opening edge for the window.

Mount the knife* on the electric tool*. The knife must be parallel to the axis of the tool.

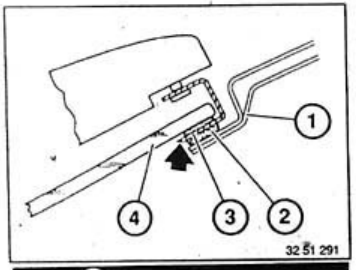


Guide in the knife between the body and window carefully.

* Source of Supply: HWB

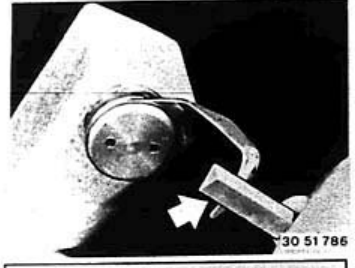


Guide traverse of knife parallel to window.

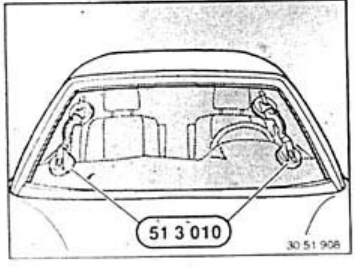


Cut through cement bead as close as possible to window glass.

1 Body opening
2 Cement bead
3 Knife
4 Window glass

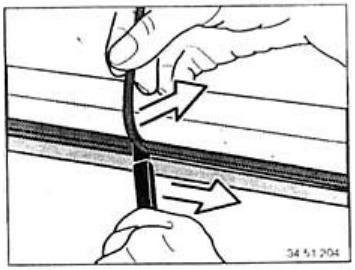


If applicable, resharpen the knife* while electric tool is running.



Lift out window with Special Tool 51 3 010.

* Source of Supply: HWB

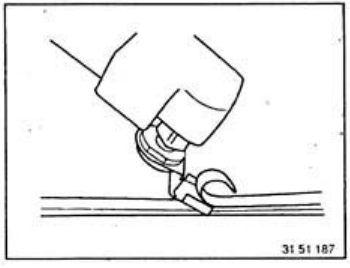


Reduce thickness of residual cement on body opening surface to about 0.5 mm (0.020").

Cut off residual cement with universal knife (sharp as a razor blade) carefully, to avoid damaging the paint finish on body opening surface.

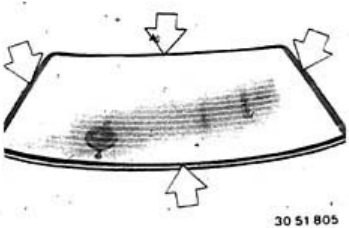
Important!
Always repair damaged paint finish to guarantee longterm corrosion inhibition!
Use BMW EP filler (2K) for this purpose.
Remove residual cement, sand out and touch up scratches in non-visible surfaces with BMW EP filler.

Large-surface damage must be sanded down to blank metal and coated with BMW EP filler (30 ... 40 µm thick coat). If complete paint buildup is necessary on visible surface, prime coated cement flange must be removed prior to application of final paint coat.



Reduce the residual cement to about 0.5 mm (0.020") when reusing the window.

Brush in window and body in area of cement surface with a primer (repair kit*).



Important!
Repaired paint finish spots must be hardened. Only apply primer in area of cement surface, since otherwise window glass will be impaired permanently.

Note:
Air drying time: at least 10 minutes.

* Source of Supply: HWB

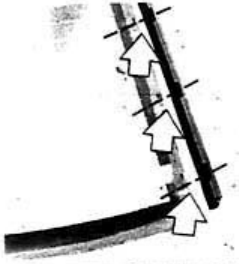
The clips must be installed by hand when re-using the window.
Pull off cover on back of adhesive strips.

30 51 806

Moisten the adhesive strip covers with water to make installation easier.

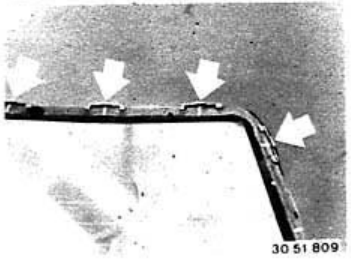
30 51 807

Mark window to match openings in the ornamental strips.
Center of ornamental strip opening = center of clip.

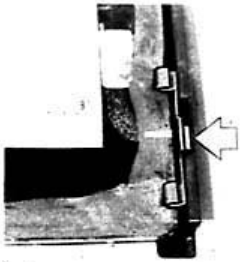


30 51 808

Mount clips to match the marks.

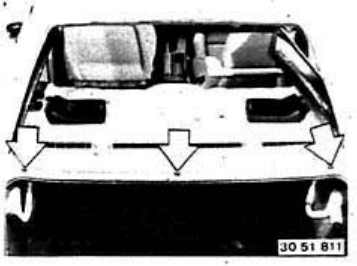


30 51 809



30 51 810

Clip in ornamental strips.

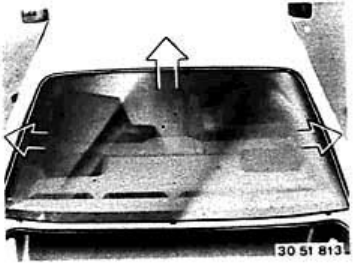


30 51 811

Place adjusting pads in openings of the window opening in the body.

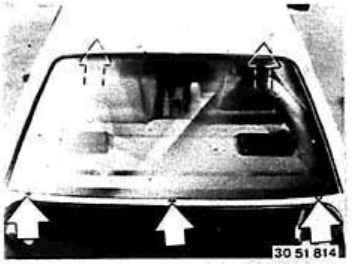
30 51 812

Note:
Three different heights, in steps of 1.5 mm (0.059") can be selected by turning the adjusting pads.

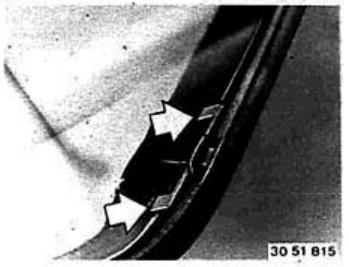


30 51 813

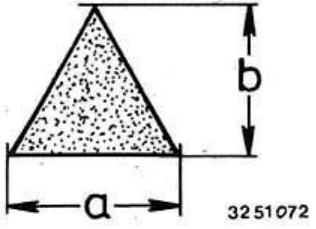
Install and fit window in the body opening with Special Tool 51 3 010. Ornamental strips and clips can be moved slightly (until moisture has evaporated) and therefore aligned with the body opening.



Adjust window by turning adjusting pads until window bears uniformly in body opening.

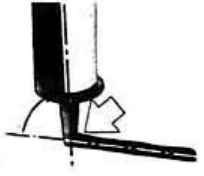


Lift out window with Special Tool 51 3 010 and cut off tabs on clips all around.



Shape of Cement Bead:

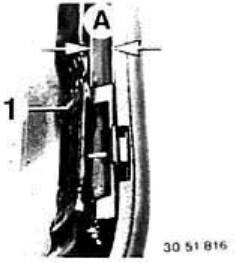
a 10 mm (0.394")
b 12 mm (0.472")



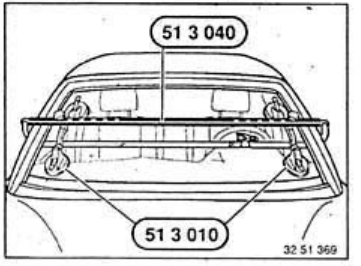
If necessary, make a sample bead before cementing. Catridge must be perpendicular to window surface. Check for uniform feed and pulling speed during application of cement.

Note:
Use a cartridge gun* (pneumatic or electric) to produce uniform beads of cement.
Check the cement's date of expiry!

* Source of Supply: HWB



Produce cement bead (1) on window all around.
Distance A to edge of window = approx. 5 mm (0.197").



Fit in and press on window carefully with Special Tool 51 3 040 (used in conjunction with Special Tool 51 3 010).

Check for uniform spacing between body and ornamental strip all around.

Preload window lightly with a strap.

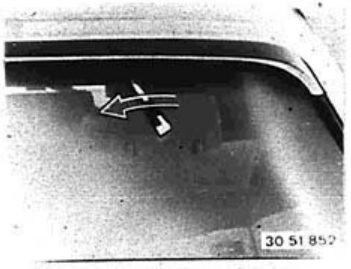
Important!
Always remove dirt from residual cement with cleaning benzol before the cement has hardened. Don't press out window again for this purpose.

Note:
Leaks can be detected by spraying water underneath sealing lip or with an ultrasonic leak detector.
Leaks can be repaired with a corresponding nozzle (repair kit*).

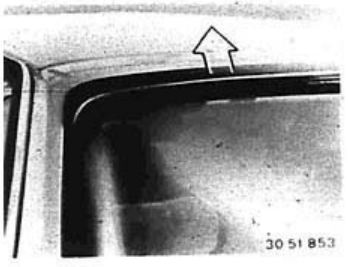
* Source of Supply: HWB

51 31 200 REMOVING AND INSTALLING REAR WINDOW – Touring –

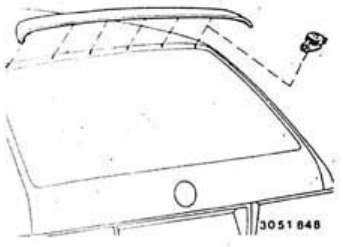
The same conditions are applicable to the rear window as to the windshield – also refer to M 3 window installing instructions (51 31 . . .).



Cut through the cement bead on the rear spoiler, as applicable, with a sharp flat knife or an electric tool* and knife*.

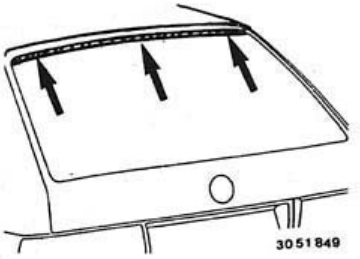


Lift off rear spoiler.



Installation:
Replace clips when reusing the spoiler. If applicable, remove the adhesive sheet uniformly.

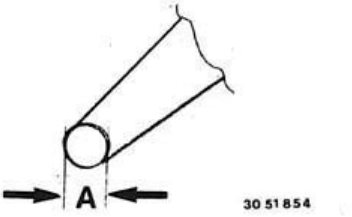
* **Source of Supply: HWB**



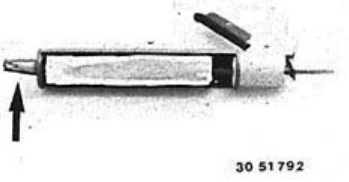
Brush in window in area of the cement surface with a primer*.

Note:
Air drying time: at least 10 minutes.

Important!
Apply the primer only in the area of the cement surface, since otherwise the window glass would be impaired permanently.

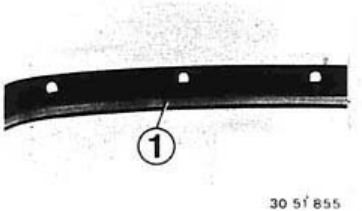


Cut off the closed nozzle tip in such a manner to have a cross section opening A of 5 mm (0.197").



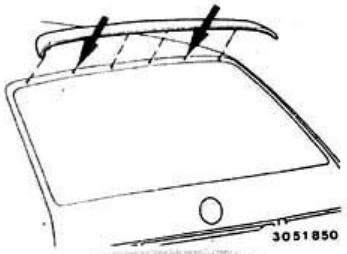
Produce sample beads before cementing.
Check for uniform feed and pulling speed during application of the cement.

Note:
Check the cement's date of expiry!



Produce cement bead (1) in area of the adhesive sheet.

* **Source of Supply: HWB**



Fit and press on the spoiler carefully.

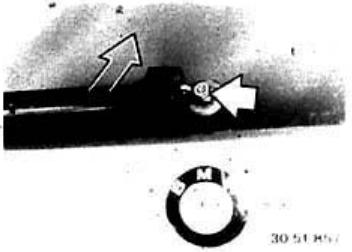
Hold spoiler on car with adhesive tape.

<u>Installing New Spoiler:</u>

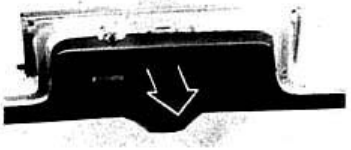
The spoiler must be heated to 40 ... 50° C (115 ... 130° F) for maximum 30 minutes prior to installation, in order to have greater initial adhesive force from the adhesive tape. The orange-red liner must be pulled off of the adhesive tape prior to installation.

The spoiler is pressed firmly on the window glass by hand after clipping in and positioning the spoiler. This requires a minimum pressing-on force of 10 N (2 lbs.) / cm^2; in other words it must be pressed on thoroughly and firmly.

Installation of the spoiler has then been completed and it is not necessary to hold it in position additionally.



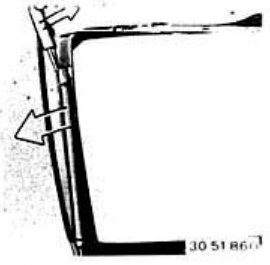
Lift off cap.
Unscrew screw and take off window wiper.



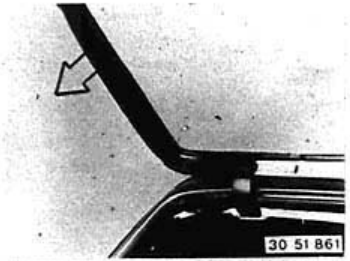
Unclip trim panel.

Installation:
Replace damaged clips.

Unscrew screws and take off window wiper motor.

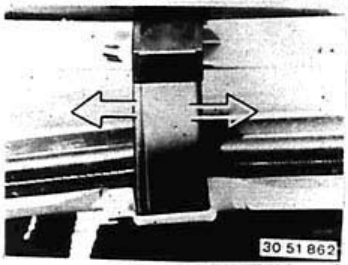


Prevent the tailgate from falling down.
Disconnect retainers on left and right sides.
Pull off gas pressure props on left and right sides.

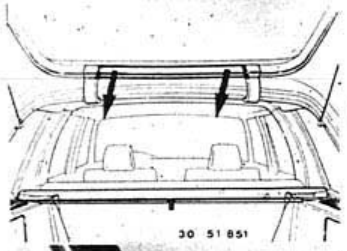


Unclip trim panel on left and right sides.
If applicable, reconnect gas pressure props.

Installation:
Replace damaged clips.

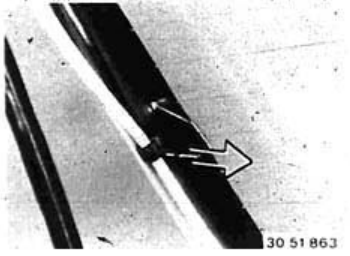


Remove hinge trim panel.



Unclip trim panel.

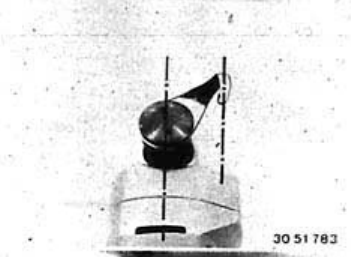
Installation:
Replace damaged clips.



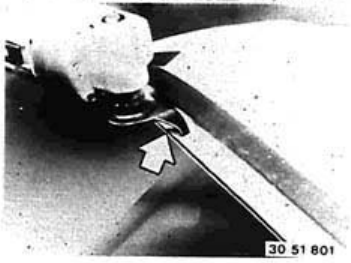
Pull off and hold plug on the window glass with adhesive tape.

Lift off ornamental strips on left and right sides.

Pull out rubber seal.

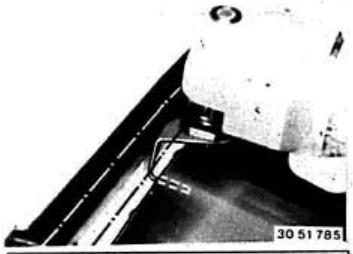


Mount knife* on electric tool*.
The knife must be parallel to the axis of the tool.

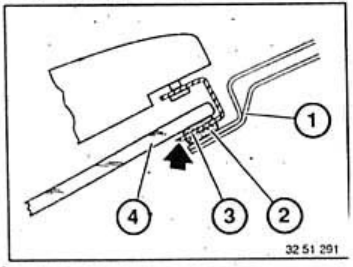


Guide in knife* carefully between the body and window glass.

* Source of Supply: HWB



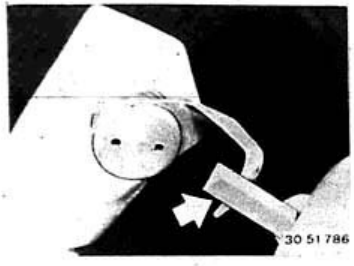
Guide traverse of knife* parallel to window glass.



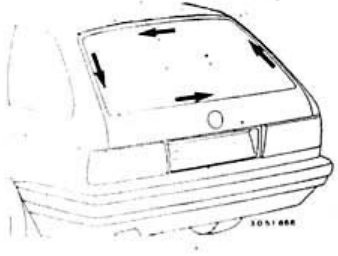
Cut through cement bead as close as possible to window.

1 Body opening
2 Cement bead
3 Knife
4 Window

If applicable, resharpen knife* while operating the electric tool*.



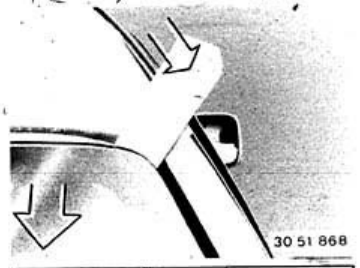
Cut through cement bead from outside all around.



Cut through cement bead in corners, in bottom zone from inside, with a straight knife*.

* Source of Supply: HWB

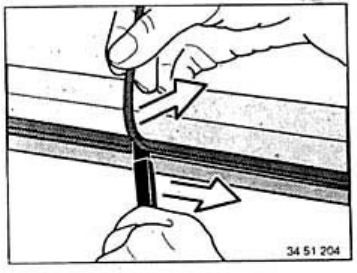
If applicable, lift window glass slightly with a wood wedge and lift out carefully with Special Tool 51 3 010.



Reduce residual cement on body opening surface to a thickness of approx. 0.5 mm (0.020").

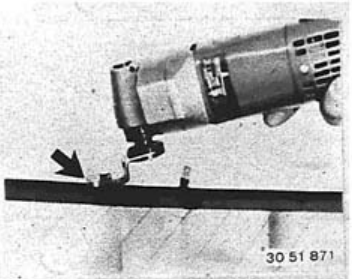
Cut off residual cement with an universal knife (sharp as a razor blade) carefully to avoid damaging paint finish on body opening surface.

Important!
Always repair damaged paint finish to guarantee longterm corrosion inhibition!
Use BMW EP filler (2K) for this purpose.



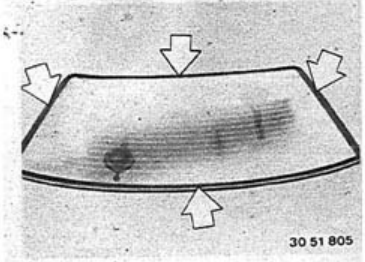
Remove residual cement, sand out and touch up scratches in non-visible surfaces with BMW EP filler.

Large-surface damage must be sanded down to blank metal and coated with BMW EP filler (30 ... 40 µm thick coat). If complete paint buildup is necessary on visible surface, prime coated cement flange must be removed prior to application of final paint coat.



Reduce residual cement on window glass to a thickness of approx. 0.5 mm (0.020") with knife* and clean cement surface to remove dust, dirt and grease when reusing window.

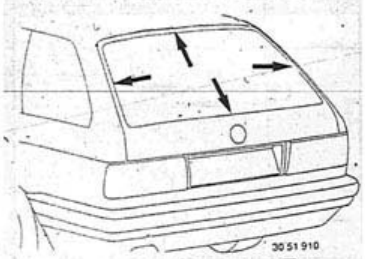
Important!
Don't damage glass ceramic layer.



Brush in window with a primer (repair kit*) in area of cement surface.

Important!
Apply primer only in the area of cement surface, since otherwise window glass would be impaired permanently.

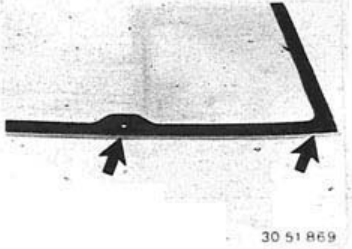
Note:
Air drying time: at least 10 minutes.



Brush in body with a primer (repair kit*) in area of cement surface.

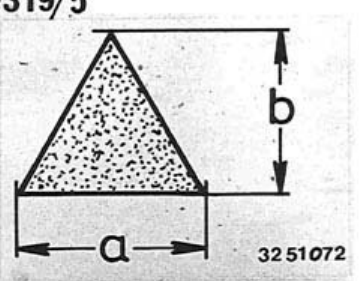
Important!
Repaired paint finish spots must be hardened.

Note:
Air drying time: at least 10 minutes.



Installation:
Install rubber seal on window glass.

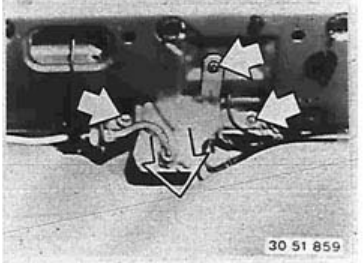
* Source of Supply: HWB



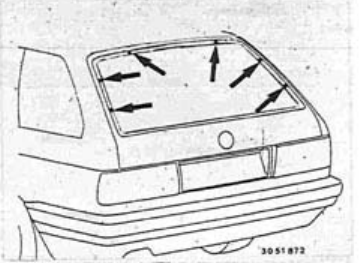
Shape of Cement Bead:

a 6 to 8 mm (0.236 to 0.315")
b 8 to 10 mm (0.315 to 0.394")

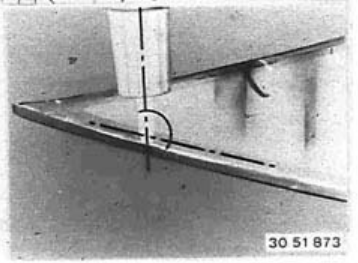
Shorten nozzle from repair kit* accordingly.



Mount window wiper motor (used to center window glass).

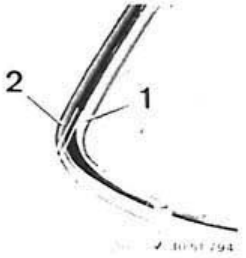


Insert spacers (repair kit*).



If necessary, produce a sample bead before cementing. Cartridge must be perpendicular to window surface. Make sure of uniform feed and pulling speed while producing cement bead.
Note:
Usa a cartridge gun* (pneumatic or electric) to produce uniform beads of cement.
Check the cement's date of expiry!

* Source of Supply: HWB



Produce cement bead (1) all around at distance (A) to window glass edge (2). Distance A =5 mm (0.197").

Fit in and press on window glass carefully with Special Tool 51 3 040 (used in conjunction with Special Tool 51 3 010).

Check for uniform spacing between the window glass and body all around.

Preload the window glass lightly with a strap.

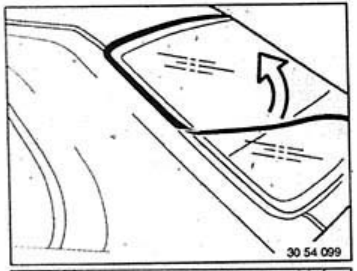
Important!
Always remove dirt from residual cement with a cleaning benzol before the cement has hardened. Don't press out the window glass again for this purpose.

Note:
Leaks can be detected by spraying water underneath the sealing lip or with an ultrasonic detector.
Leaks can be repaired with a corresponding nozzle (repair kit*).

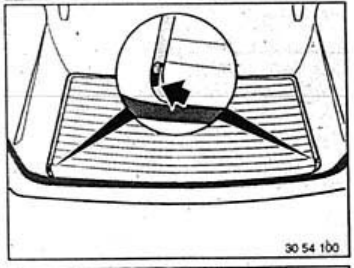
* Source of Supply: HWB

51 31 ... REMOVING AND INSTALLING REAR WINDOW
– Hardtop –

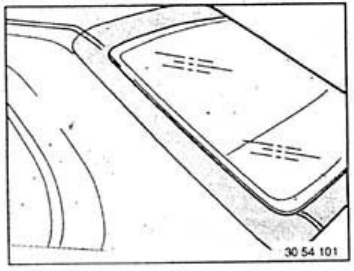
Same conditions apply to rear window installation as for windshield installation.
Also refer to M 3 window installing instructions – see 51 31 ....



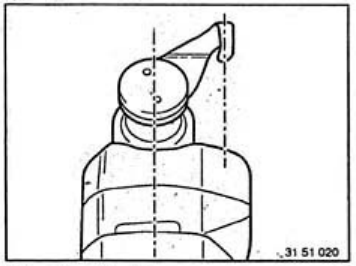
Pull out rubber inlet.



Pull off plugs for rear window defogger on left and right sides from inside.

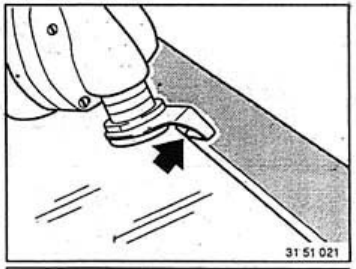


Cover hardtop in area of body opening generously.

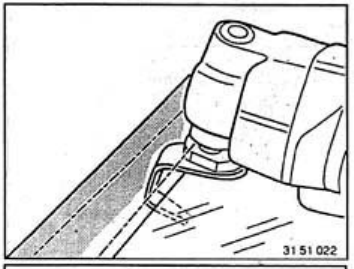


Install short knife* on electric cutter*.

Note:
Knife* must be parallel to tool axis.

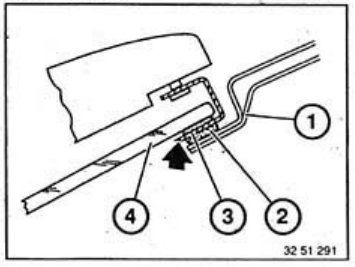


Guide in knife carefully between body and window.



Guide traverse of knife parallel to window.

Caution!
Don't damage hardtop skin.

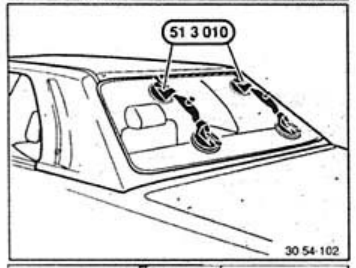


Cut through cement bead as close as possible to window.

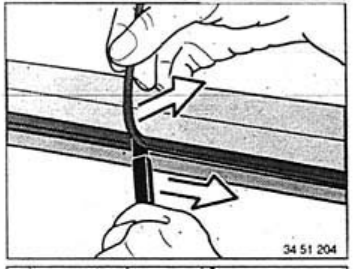
1 Body opening (hardtop)
2 Cement bead
3 Knife
4 Window

*** Source of Supply: HWB**

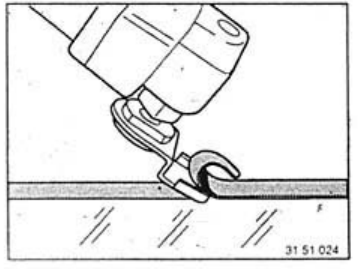
If necessary, resharpen knife* with electric tool* running.



Lift out window with Special Tool 51 3 010.

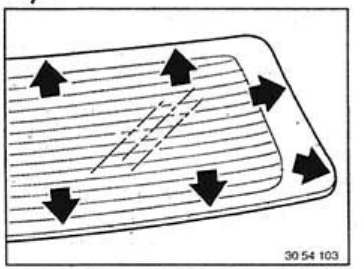


Reduce thickness of residual cement in body opening to about 0.5 mm (0.197"). Cut off residual cement with universal knife (sharp as razor blade) to avoid damaging hardtop skin.



If reusing window, reduce thickness of residual cement on glass with knife* to about 0.5 mm (0.020") and clean cement surface to remove dust. dirt and grease.

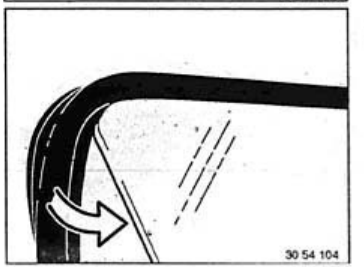
* Source of Supply: HWB



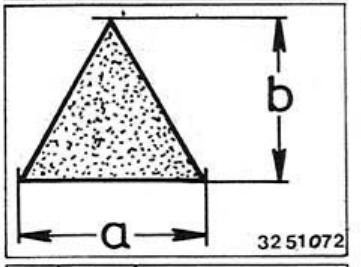
Brush in window and body opening in area of cement surface with primer (repair kit*).

Important!
Only apply primer in area of cement surface as otherwise non-removable dull spots will be produced on window.

Note:
Air drying time: at least 10 minutes.

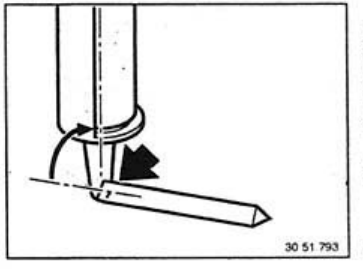


Install rubber inlet on window.



Shape of cement bead:

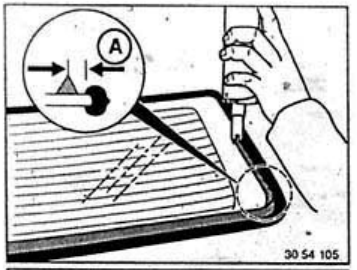
a = 10 mm (0.394")
b = 12 mm (0.472")



If necessary, make sample bead prior to cementing.
Cartridge must be perpendicular to window.
Make sure of uniform feed and pulling speed while producing cement bead.

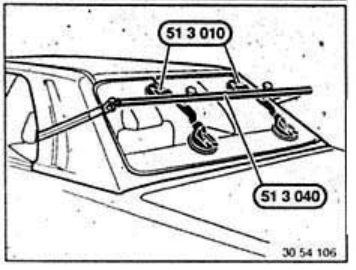
Note:
Check the cement's date of expiry!

* Source of Supply: HWB



Produce cement bead (1) on window glass all around next to rubber inlet (2) at distance (A).
A = 5 mm (0.197").

Important!
Cement spots on hardtop skin cannot be removed completely.



Fit in and press on window carefully with Special Tool 51 3 040 (used in conjunction with Special Tool 51 3 010).

Check for uniform spacing between body and rubber inlet all around.

Preload window lightly with a strap.

Note:
Leaks can be detected by spraying water underneath sealing lip or with ultrasonic leak detector.
Leaks can be repaired with corresponding nozzle (repair kit*).

* Source of Supply: HWB

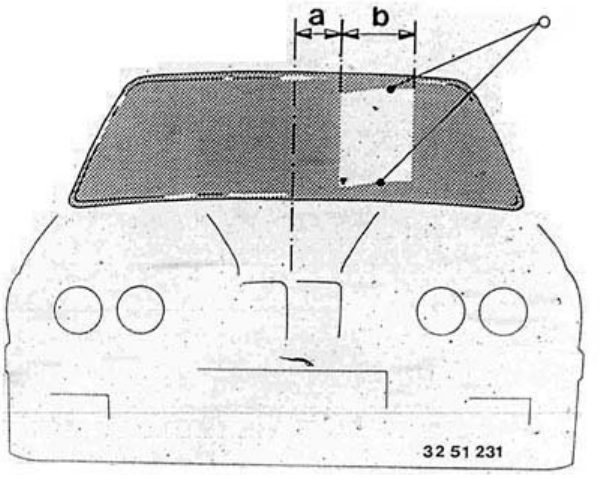
51 31 ... REPAIRING LAMINATED SAFETY GLASS WINDSHIELDS (CLEAR AND TINTED) DAMAGED BY FLYING STONES

These instructions are meant for specialists and assume their skill, conscientiousness and sense of responsibility. The instructions are also limited to factory approved repairing materials*, repairing methods and tips to make the work easier. Only general procedures are described in the instructions. Scope of work must be adapted to the actual damage situation. Repairing procedures are an economical solution, so that optical deficiencies cannot be excluded. Consequently the repair should only be carried out when explicitly ordered by the customer.

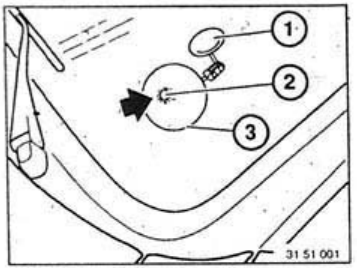
The conditions listed below for repairing laminated safety glass windshields conform with legislation in Germany. Always conform with the pertinent legislation in other countries!

Important!

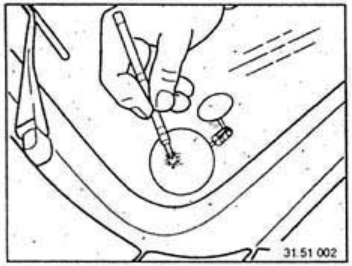
1. Only damage on the outside surface of the windshield may be repaired. Inside window surface and the plastic sheet between inside window and outside window must not be damaged at all.
2. Repairing should take place as soon as possible after the window had been damaged. Moisture and dirt or similar must not have been allowed to penetrate into the damaged spot.
3. The crater produced where the stone had hit the window must not exceed a diameter of 5 mm (0.197").
4. Cracks extending radially from the point where the stone had hit must not be longer than 50 mm (1.969"). They must not end in the rubber frame or ornamental frame of the windshield.
5. Repairs may be carried out only outside of the driver's field of view (see sketch). View through the repaired point must be clear, transparent and without distortion whenever possible.
6. Always conform with instructions supplied by the manufacturers.



a = 210 mm (8.268") (distance from view field to center of car)
b = 290 mm (11.417") (view field width)
o = Wiped field limit

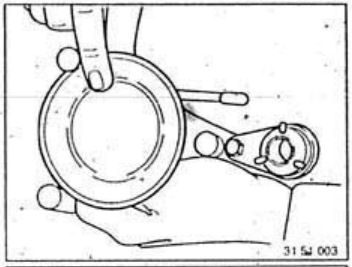


Apply a thin coat of gel on suction cup (1) of the concave mirror and position suction cup on inside of the windshield in such a manner that the impact spot (2) can be seen from the outside in concave mirror (3).

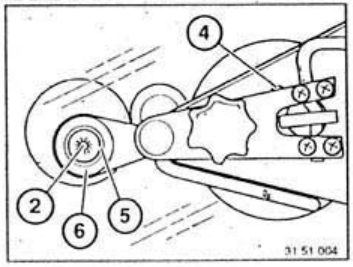


Remove all glass splitters from the impact spot from the outside with a scribe so that a rough surface is produced.

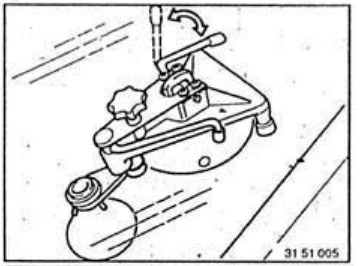
Important!
Don't increase the size of the impact spot hole.



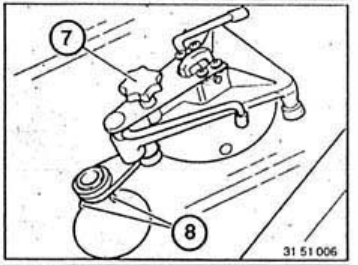
Apply a thin coat of gel on the suction cup of the tool holder.



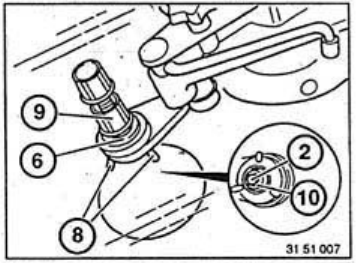
Position tool holder (4) on outside of the window in such a manner that opening (5) of head (6) is precisely over the impact spot (2).



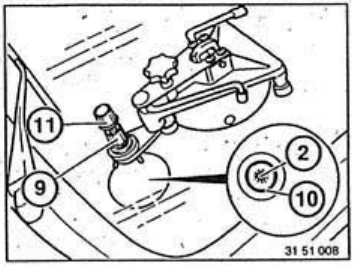
Move locking lever forward and back.



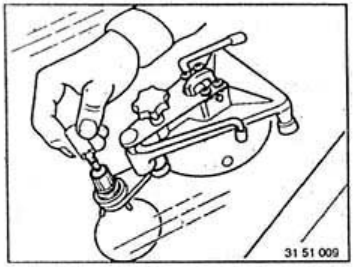
Screw in knurled head screw (7) far enough that base (8) bears firmly on the windshield.



Screw in cylinder (9) in head (6) far enough that rubber seal (10) surrounds impact spot (2) on the window firmly and base (8) just barely lifts off again.

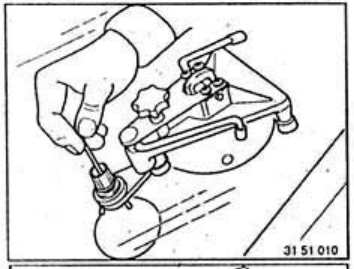


Screw injector (11) out of cylinder (9). Look into cylinder (9) from above and check whether rubber seal (10) is positioned centrally over impact spot (2). Reposition, if necessary.

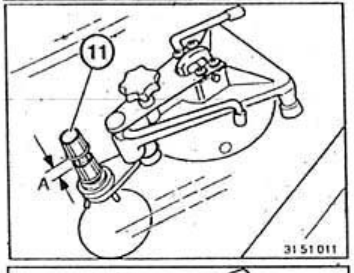


Open bottle of resin and pour about 1/3rd of its contents into the cylinder.

Important!
Always close the resin bottle immediately after use and protect it against ultraviolet light.

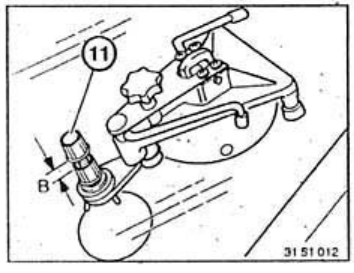


Stirr resin poured into the cylinder with a wooden rod to remove air bubbles.



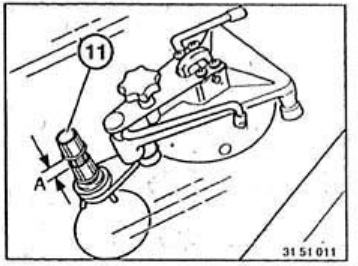
Screw injector (11) into cylinder up to distance A (slight resistance noticed) and let everything rest about 5 minutes.
Distance A = 5 mm (0.197").

Note:
Pressure will be about 16 bar (225 psi) in this position. When observing the impact spot,it will be recognized that air in the impact spot disappears slowly (recognized as black shade).



Unscrew injector (11) quickly to distabce B.
Distance B = 12 mm (0.472").

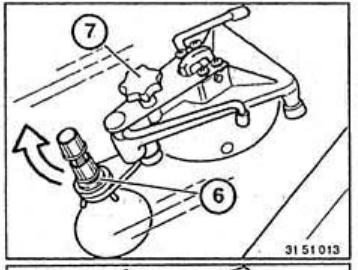
Note:
In this position there will now be vacuum which "pulls" the remaining air out of the impact spot.



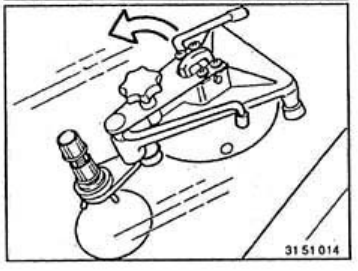
Screw injector (11) into cylinder to distance A again (slight resistance noticed) and let everything rest several minutes again.
Distance A = 5 mm (0.197").

Repeat this step several times, alternating between pressure and vacuum, and then let injector (11) rest for a time in an intermediate position between distance A and distance B.

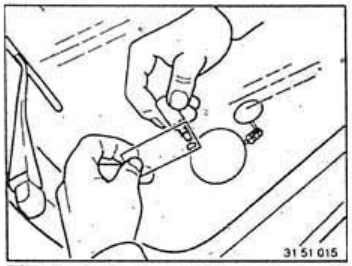
Note:
If this has still not removed all of the air, heat the inside of the window with a lighter several seconds. The flame should be held as close as possible to the window, but not touch it.



Loosen knurled head screw (7), swing head (6) aside and observe the repaired spot from above and in the concave mirror from various angles.
Air inclusions should no longer be visible.
Should air inclusions still be seen, swing head (6) back over the impact spot and screw in knurled head screw (7) as far as before.
Repeat the steps as from the pressure/vacuum step.

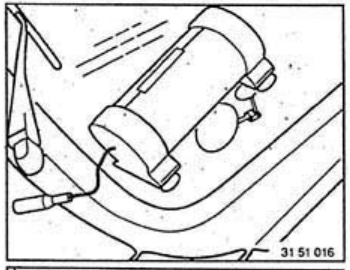


Swing locking lever forward and remove tool holder from the windshield.

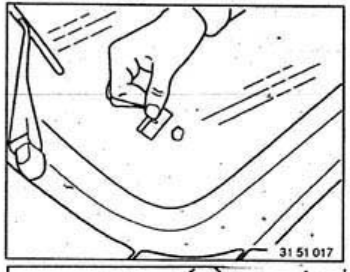


Let one drop of resin drip on the impact spot and cover with clear plastic sheet.

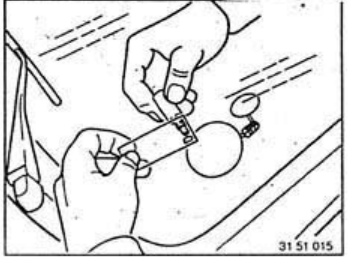
Note:
Only place clear plastic sheet over the impact spot — don't press it on!



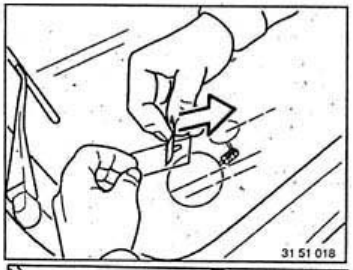
Apply ultraviolet lamp over the repaired spot and press on firmly (suction cups).
Connect ultraviolet lamp and let resin harden about 10 minutes.



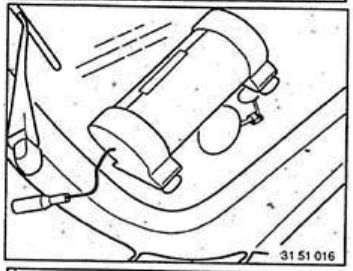
Remove ultraviolet lamp, pull off clear plastic sheet and scrape off excessive resin with a razor blade.



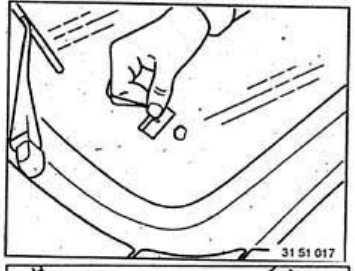
Let another drop of resin drip on the impact spot and cover with a new piece of clear plastic sheet.



Move the razor blade over the clear plastic sheet carefully to have excessive resin run out on the sides.

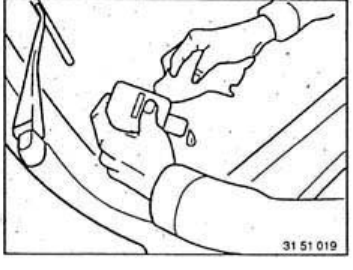


Set up ultraviolet lamp over the repaired spot again and press on firmly (suction cups).
Connect ultraviolet lamp and let resin harden about 10 minutes.

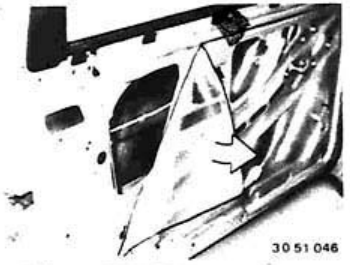


Remove ultraviolet lamp, pull off clear plastic sheet and scrape off excessive resin all around the impact spot with a razor blade.

Important!
Don't scrape on impact spot (2)!

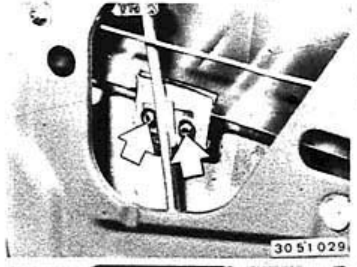


Polish the repaired spot with a cloth not losing lint and a polish until the surface is clean and smooth.

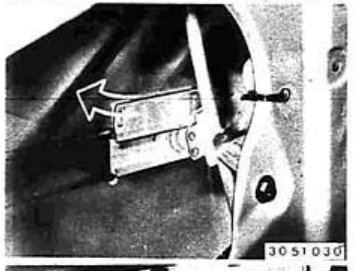


51 32 020 REMOVING AND INSTALLING OR REPLACING WINDOW REGULATOR IN LEFT OR RIGHT FRONT DOOR

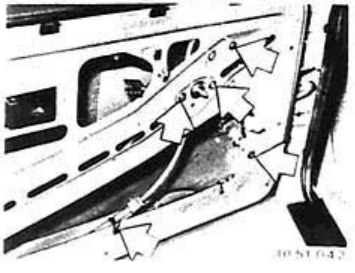
Remove door trim panel 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



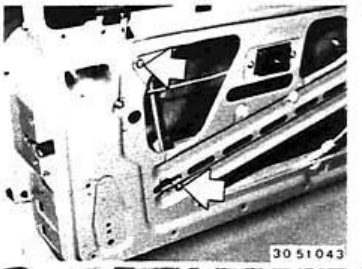
Position door window glass that mounting screws can be unscrewed.
Note:
Hold door window glass.
Installation:
Adjust door window 51 32 154.



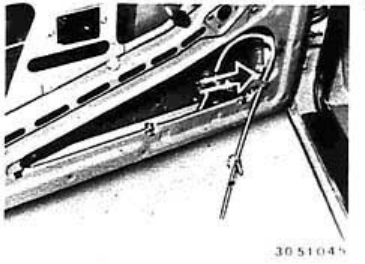
Swing front end of glass out of guide roller.
Lower door window glass.



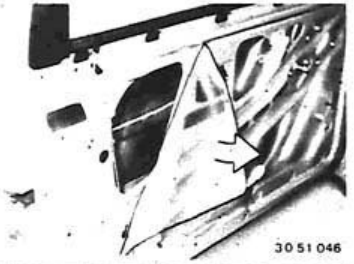
Unscrew screws.
Cut off electrician's tape.



Unscrew screws.

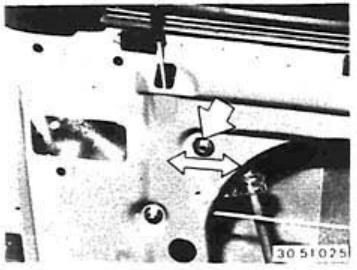


Remove window regulator.

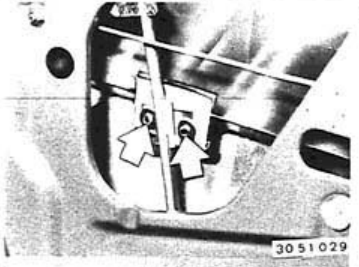


51 32 154 ADJUSTING LEFT OR RIGHT FRONT DOOR WINDOW

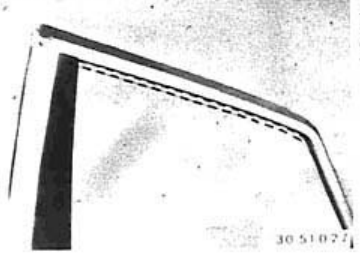
Remove door trim panel – see 51 41 001.
Pull off plastic sheet partially.
Installation:
Replace damaged plastic sheet.



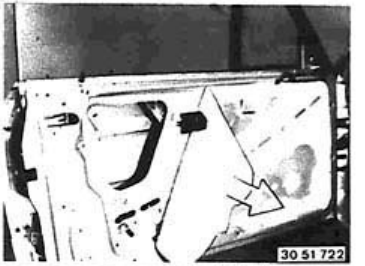
Raise window completely.
Loosen screw.
Bolt down window guide again without tension.



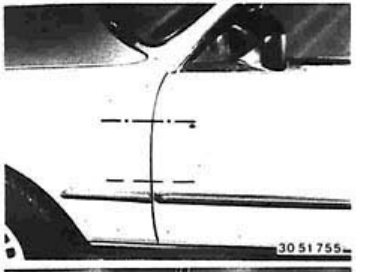
Loosen screws.



Adjust window in slots until there is an uniform gap between the window glass and window frame at top.
Tighten screws.



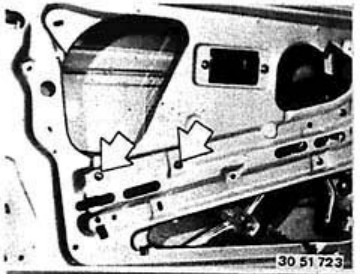
Convertibles:
Remove door trim panel – see 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



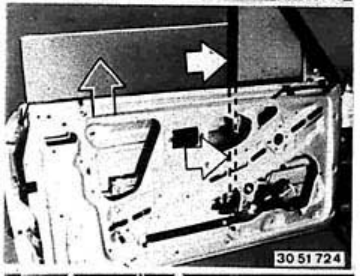
Requirements for Side Window Adjustment:
1. Correct Adjustment of Door:
   a) If necessary, correct door outside panel in area of front side panel with shims – see Group 41.

   b) If necessary, correct door outside panel in area of rear side panel by adjusting the door striker – also see 51 21 003.

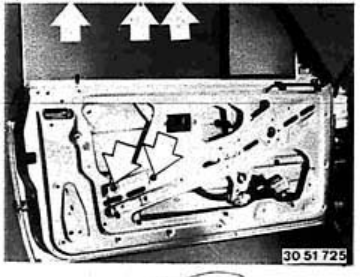
   c) Triangular window in area of cowl panel.
2. Correct Adjustment of Top:
   See Group 54.



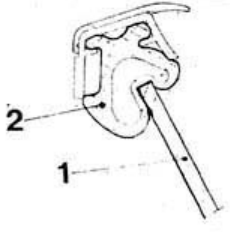
Operate window to half-open position.
Loosen screws.



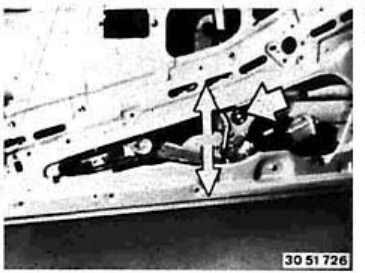
Shut window, while pressing against the front guide rail.
Window glass must be parallel in the guide rail.



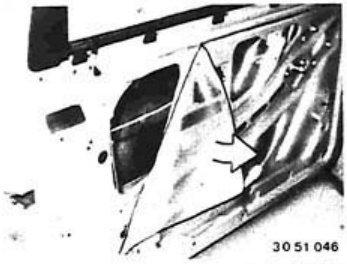
Tighten screws.
Check that there is easy movement as well as the system on the top, correcting if necessary.



Installation:
The window glass (1) must bear on rubber seal (2) as shown.

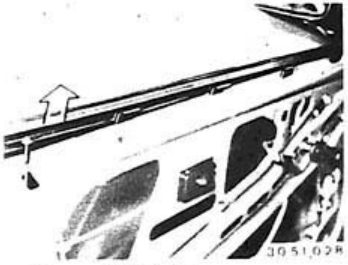


Limitation of window movement is adjusted with the stop.

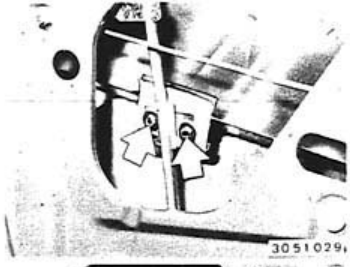


51 32 170 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT FRONT DOOR WINDOW GLASS

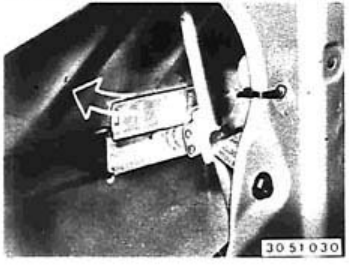
Remove door trim panel 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



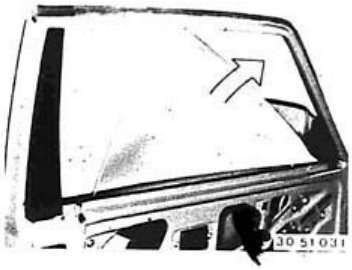
Pull off inside window recess cover.



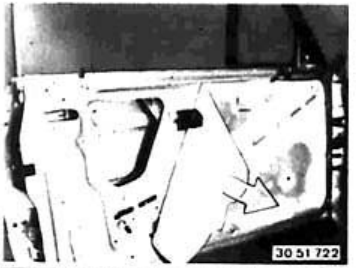
Unscrew screws.
Note:
Hold window glass.
Installation:
Adjust window, see 51 32 154.



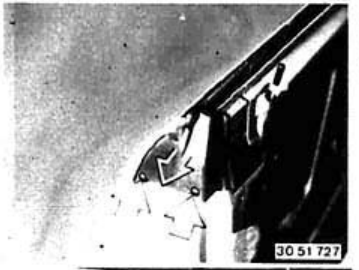
Swing front end of glass pane out of guide roller.



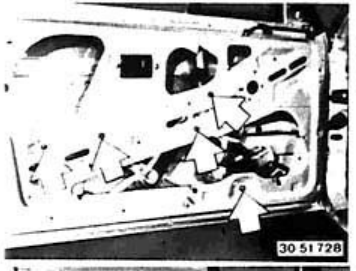
Remove door window glass.



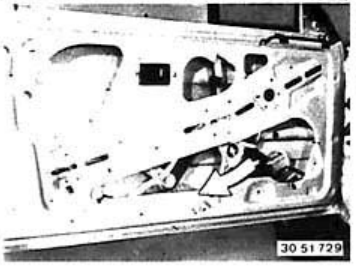
Convertibles:
Remove door trim panel – see 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



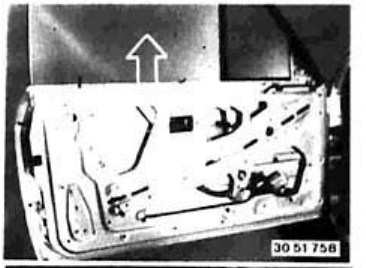
Lift out spreader rivets.
Remove trim panel.
Installation:
Use new spreader rivets, if necessary.



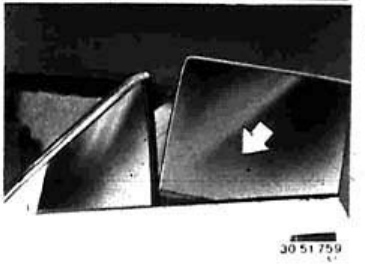
Remove outside window recess cover – see 51 21 300.
Run down the window – unscrew screws.
Installation:
Adjust window – see 51 32 154.



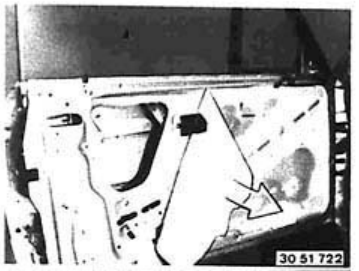
Pull off plug and slide window regulator forward out of the guides.
Installation:
Guide guiding rollers of window regulator into rails of window glass.
Align mounting holes of window regulator.



Pull out window glass from above

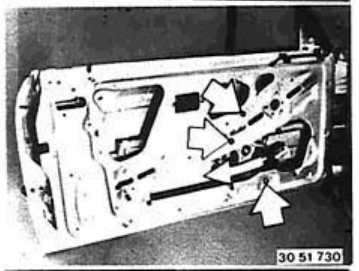


Installation:
Insert window glass at inclination – turn slightly – and slide down parallel.

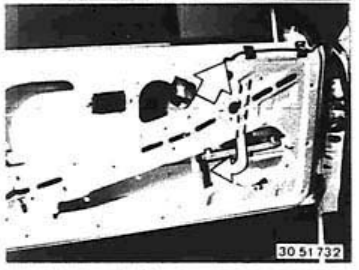


51 32 ... REMOVING AND INSTALLING OR REPLACING (FIXED) FRONT DOOR WINDOW

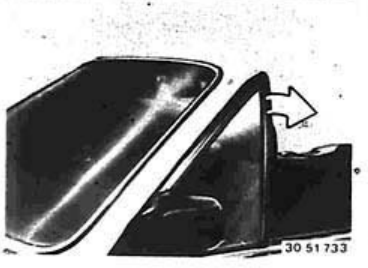
Remove door trim panel – see 51 41 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



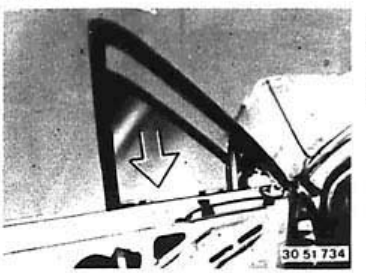
Unscrew screws.
Push the window regulator back.



Unscrew screw.
Lift out holder.
Installation:
Insert holder in provided openings.

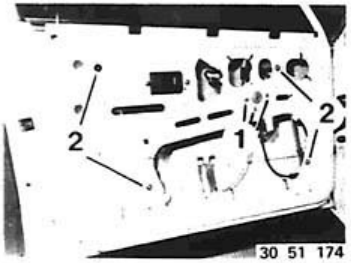


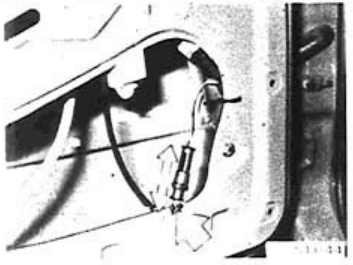
If applicable, lift off trim on door frame.



Slide out window glass and rubber frame downward.
Installation:
Rub in rubber frame with a lubricant*.
Slide in window glass parallel to the stop.

* Source: HWB



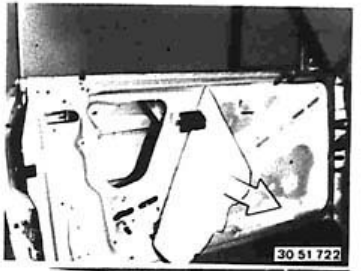


51 33 000 REMOVING AND INSTALLING POWER WINDOW REGULATOR IN LEFT OR RIGHT FRONT DOOR

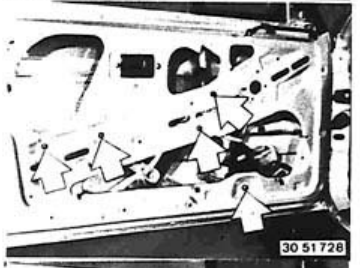
Procedures are identical with those described in 51 32 020.

Plus:
Mounting (1) with 3 nuts.

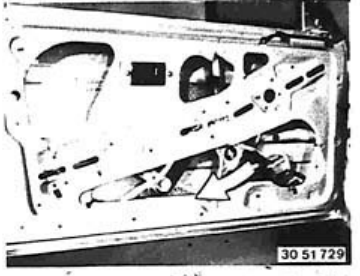
Disconnect plug.
Installation:
If applicable, secure wires with wire strap.



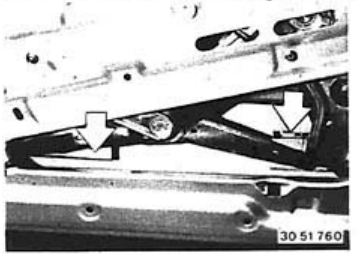
Convertibles:
Remove door trim panel – see 51 41 001
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



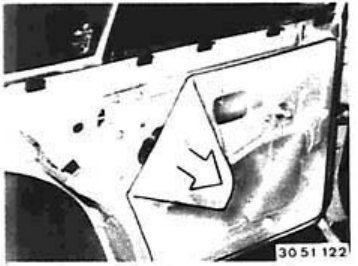
Run the window down.
Unscrew screws.
Installation:
Adjust window – see 51 32 154.



Pull off plug and slide window regulator forward out of the guides.
Lift out complete window regulator.

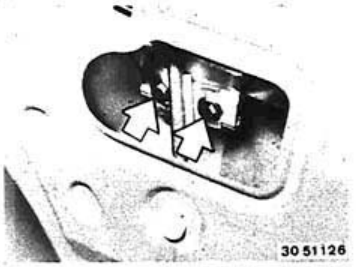


Installation:
Guide guding rollers of window regulator into rails of window glass.
Align mounting holes of window regulator.

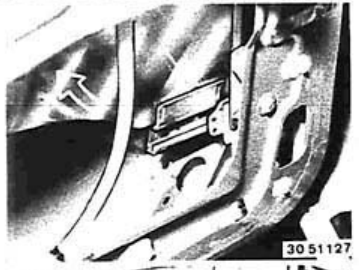


51 34 020 REMOVING AND INSTALLING OR REPLACING WINDOW REGULATOR IN LEFT OR RIGHT REAR DOOR

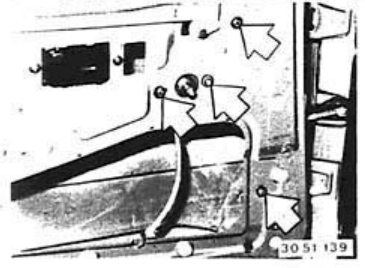
Remove door trim panel 51 42 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



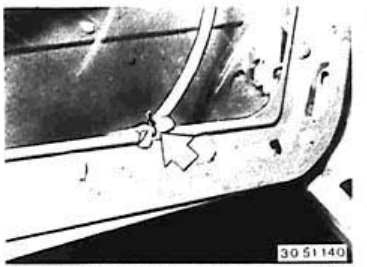
Unscrew screws.
Note:
Hold window glass.
Installation:
Adjust window, see 51 32 154.



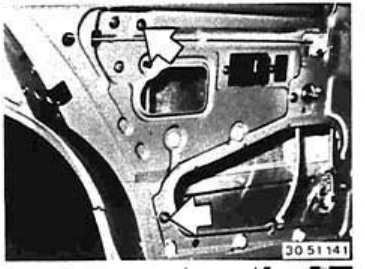
Wind down window glass and swing it out of guide roller.
Let window glass rest on bottom.



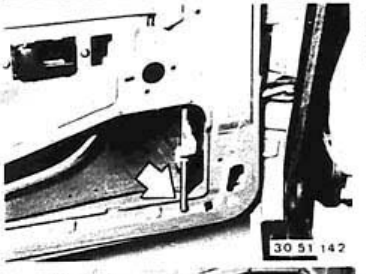
Unscrew screws.



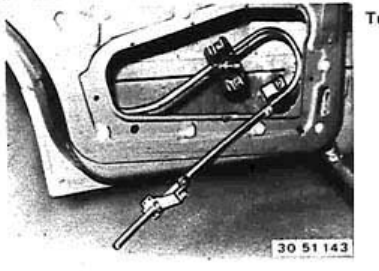
Remove wire strap.



Unscrew screws.

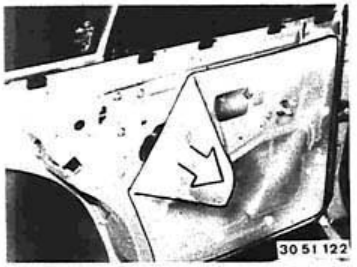


Push up window regulator far enough that front end can be taken out of the inside door panel.

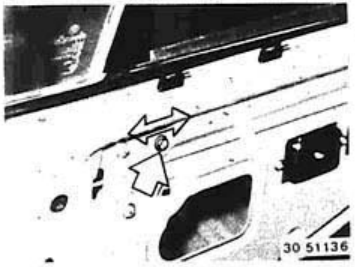


Turn and take out window regulator.

51 34 154 ADJUSTING LEFT OR RIGHT REAR DOOR WINDOW

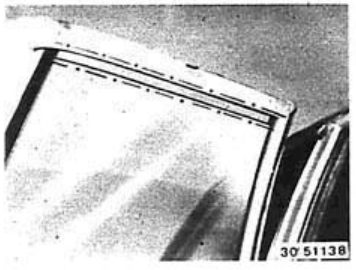


Remove door trim panel 51 42 001.
Pull off plastic sheet partially.
Installation:
Replace damaged plastic sheet.



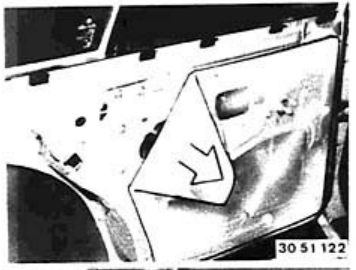
Close window.
Loosen screw.
Tighten window regulator again without tension.

Loosen screws.

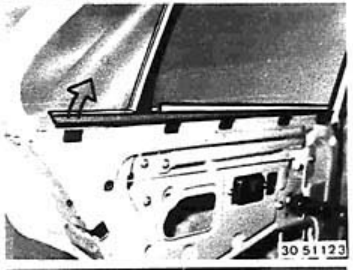


Adjust window in slots until there is an uniform gap between the window glass and window frame at top.
Tighten screws.

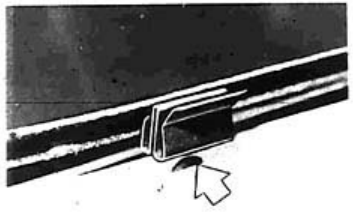
51 34 171 REPLACING LEFT OR RIGHT REAR DOOR WINDOW GLASS



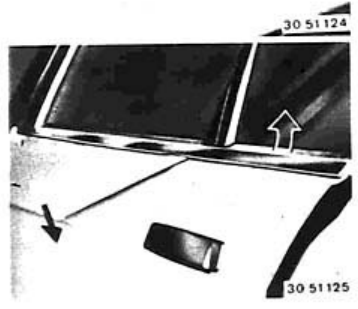
Remove door trim panel 51 42 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



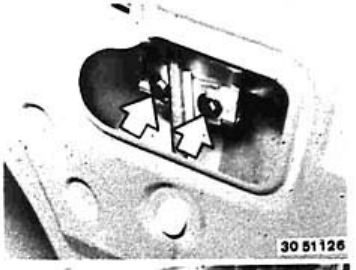
Pull off inside window recess cover.



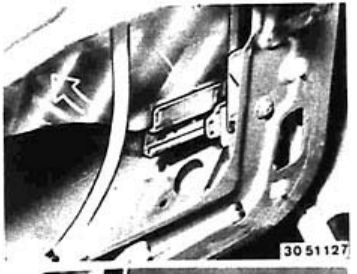
Lift clamps out of retaining tabs.



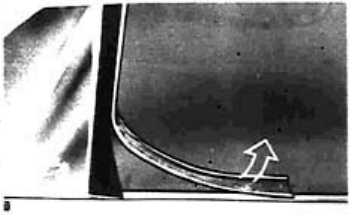
Loosen cover strip and window recess cover on outside by pressing up out of retaining clamps with a wooden wedge or similar tool (be careful not to damage the paint finish!).



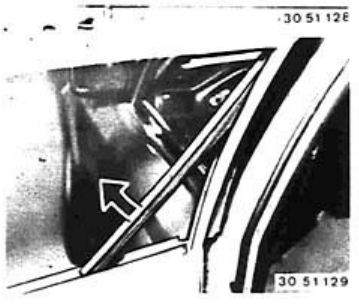
Unscrew screws.
Note:
Hold window glass.
Installation:
Adjust window, see 51 32 154.



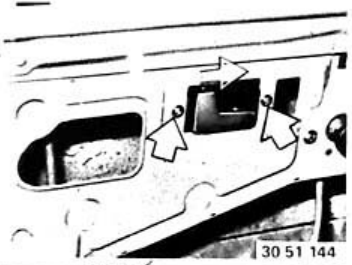
Wind down window glass and swing it out of guide roller.
Let glass rest on bottom.



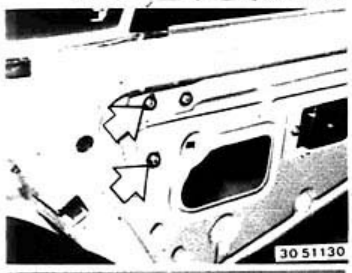
Pull out rear rubber window guide.



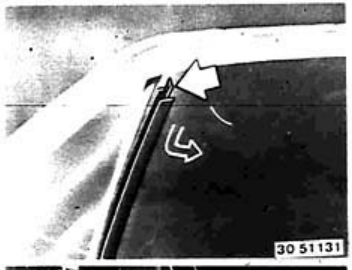
Pull out front rubber window guide.



Unscrew door remote control.
Open clip and let remote control hang down.
Installation:
Pre-load door remote control slightly.

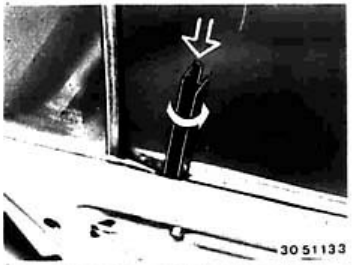


Unscrew bolts.

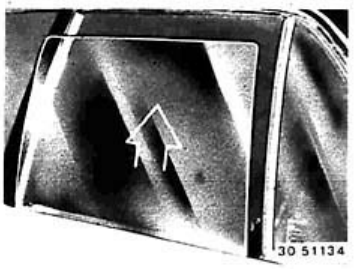


Loosen guide rail on rubber frame of fixed window and disconnect at top retainer.
Installation:
Coat rubber frame with relaxed water for easier installation.

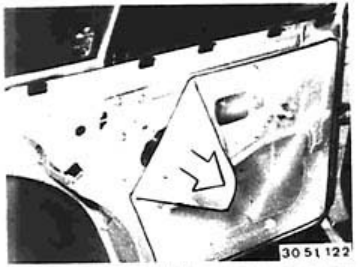
Installation:
Beads on rubber frame grab in holes of window guide.



Turn and push down guide rail.

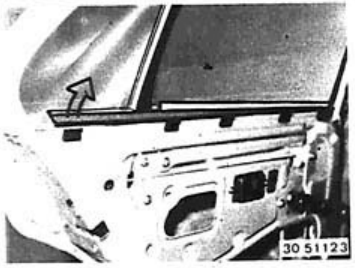


Pull out window glass from above.

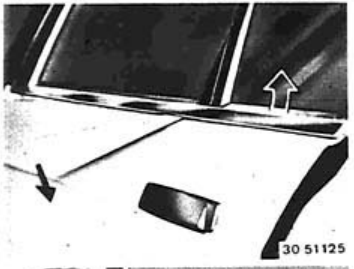


51 34 191 REPLACING WINDOW FIXED IN LEFT OR RIGHT REAR DOOR WINDOW FRAME

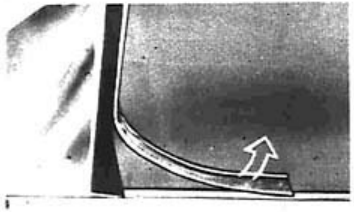
Remove door trim panel 51 42 001.
Pull off plastic sheet.
Installation:
Replace damaged plastic sheet.



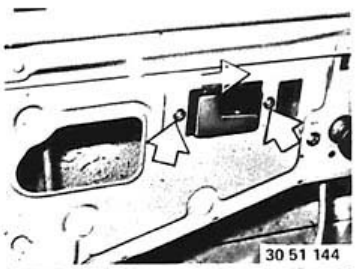
Pull off inside window recess cover.



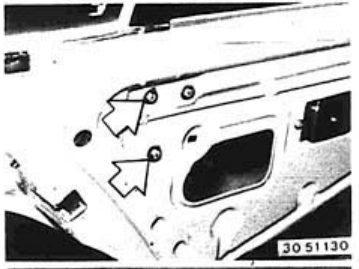
Loosen cover strip and window recess cover on outside by pressing up out of retaining clamps with a wooden wedge or similar tool (be careful not to damage the paint finish!).



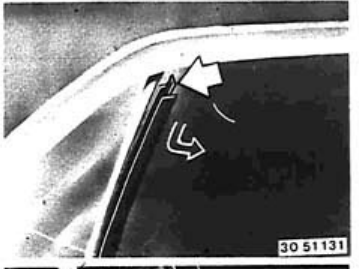
Wind down window glass.
Pull out rear rubber window guide.



Unscrew door remote control.
Loosen clips and let remote control hang down.
Installation:
Preload door remote control slightly.

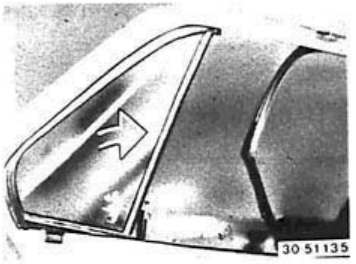


Unscrew screws.



Loosen guide rail in rubber frame of fixed window and disconnect in retaining tabs at top.
Installation:
Coat rubber frame with relaxed water to make installation easier.

Installation:
Beads on rubber frame engage in holes in window guide.

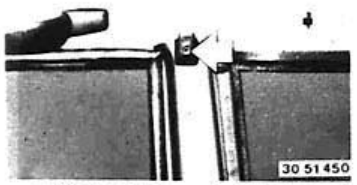


Tilt window glass with rubber frame out of window frame.

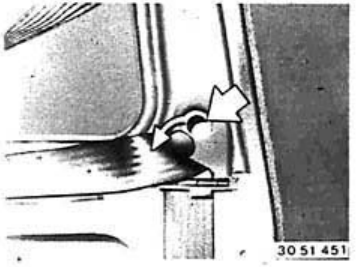
Installation:

Coat rubber frame with relaxed water for easier installation.

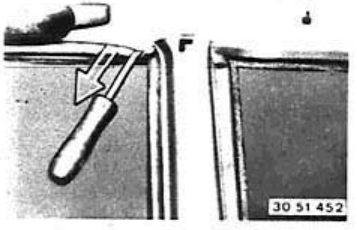
51 36 050 REMOVING AND INSTALLING LEFT OR RIGHT REAR SIDE WINDOW



Remove rear side trim panel, see 51 43 000.
Lift off C pillar plate.
Loosen screw.
Remove clotheshook.
Loosen screw.



Lift off cover.
Loosen screw.

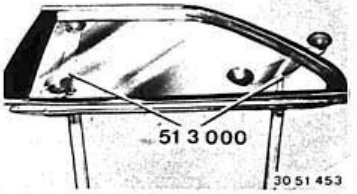


Lift out rubber frame, beginning at a corner, and press out window glass.
Caution!
Prevent window glass from falling down.

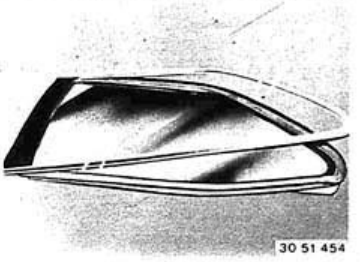
Installation:
Coat rubber frame with a lubricating solution*.
Press on window glass and pull in rubber frame all around with Special Tool 51 3 057 and a plastic spatula.

* See Specifications

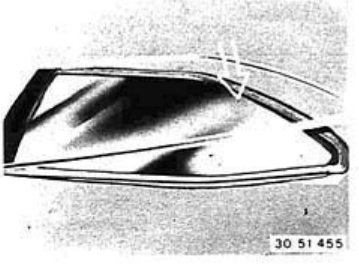
51 36 071 REPLACING LEFT OR RIGHT REAR SIDE WINDOW



Remove window, see 51 36 050.
Apply Special Tool 51 3 000 in toolbox.
Mount window glass.



Lift out ornamental strips.
Pull off rubber frame.

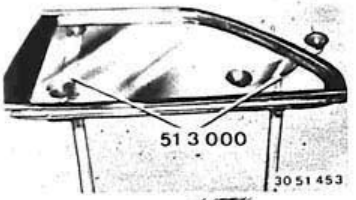


Installation:
Check rubber frame, replacing if necessary.
Insert ornamental strips, beginning at upper edge of window.
If necessary, coat rubber frame with a lubricating solution*.

Note:
If window had been broken, clean seat belt reel to remove glass splitters.

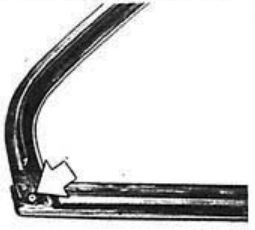
* See Specifications

51 36 545 REPLACING ALL ORNAMENTAL STRIPS ON REAR SIDE WINDOW
– Side Window Removed –



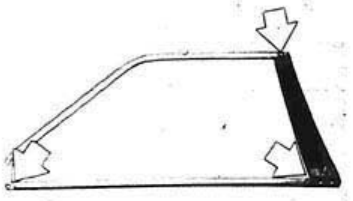
30 51 453

Apply window holder in toolbox.
Mount window glass.



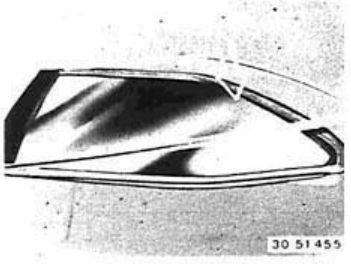
30 51 457

Lift off ornamental frame.
If applicable, drill out rivet and insert new ornamental strip.



30 51 458

Rivet ornamental strips together.

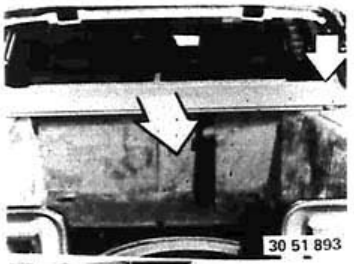


30 51 455

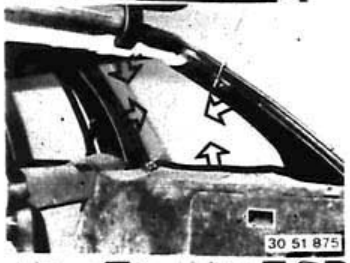
Installation:
Check rubber frame, replacing if necessary.
Insert ornamental strips, beginning at upper edge of window.
If necessary, coat rubber frame with a lubricating solution*

* See Specifications

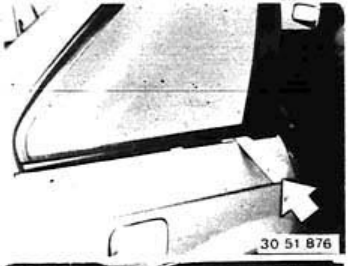
51 36 050 REMOVING AND INSTALLING LEFT OR RIGHT REAR SIDE WINDOW – Touring –



Press down, twist and lift out the shade holder.

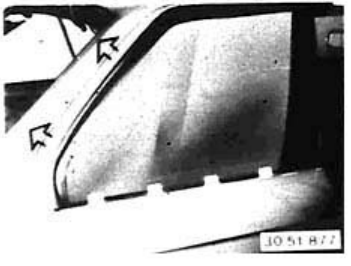


Lift and pull off seal carefully.



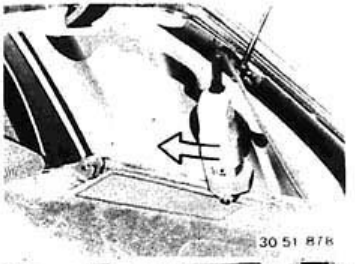
Unclip ornamental strip carefully.

Installation:
Replace damaged clips.



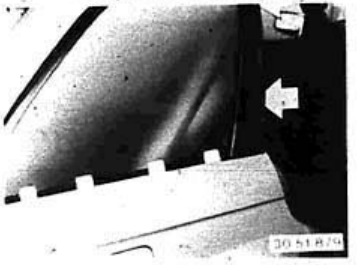
Unclip plate carefully.

Installation:
Replace damaged grommets.



Note:
Uncover radio speakers.

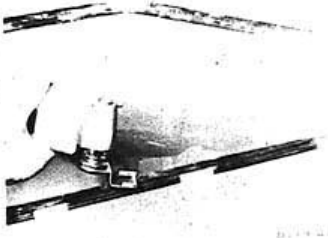
Cut through the cement bead from the inside all around with an electric tool* and knife*.



Cut through the cement bead underneath the plate.

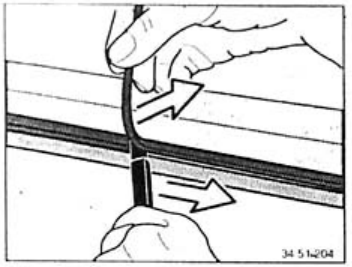
Installation:
Replace a damaged plate.

Press out the side window with a wood wedge or similar item, beginning at the rear.



Reduce the residual cement to a thickness of about 0.5 mm (0.020") with an electric tool* and knife* when reusing the window.

* Source of Supply: HWB



Reduce residual cement on body opening surface to thickness of approx. 0.5 mm (0.020").

Cut off residual cement carefully with universal knife (sharp as a razor blade) to avoid damaging paint finish in body opening.

Important!
Always touch up damaged paint finish to guarantee longterm corrosion inhibition!
Use BMW EP filler (2K) for this purpose.

Remove residual cement, sand out and touch up scratches in non-visible surfaces with BMW EP filler.

Large-surface damage must be sanded down to blank metal and coated with BMW EP filler (30 ... 40 µm thick coat). If complete paint buildup is necessary on visible surface, prime coated cement flange must be removed prior to application of final paint coat.

Important!
Repaired paint finish spots must be hardened.

Brush in body in area of cement surface with primer (repair kit*).

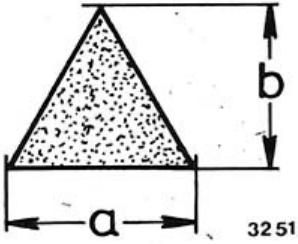
Note:
Air drying time: at least 10 minutes.

Brush in window glass in area of cement surface with primer (repair kit*).

Important!
Apply primer only in area of the cement surface, since otherwise window glass would be impaired permanently.

* Source of Supply: HWB

Mount plate (D pillar).

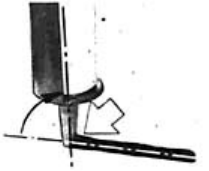


Shape of Cement Bead:

a 8 to 10 mm (0.315 to 0.394")
b 12 to 14 mm (0.472 to 0.551")

Shorten nozzle from the reapir kit* accordingly.

Note:
Use a cartridge gun* (pneumatic or electric) to produce uniform beads of cement.
Check the cement's date of expiry!

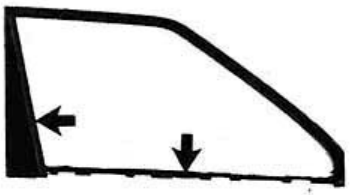


If necessary, produce a sample bead before cementing.
Cartridge must be perpendicular to window surface.
Make sure of uniform feed and pulling speed during application.

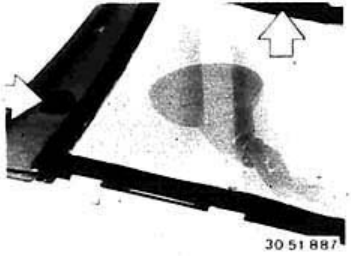
Important!
Always remove dirt from residual cement with cleaning benzol before cement has hardened.

30 51 793

* Source of Supply: HWB



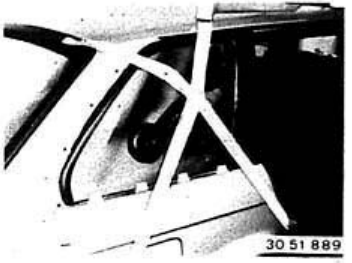
Produce a cement bead all around.
Spacing to edge of window glass in front and bottom areas is about 3 mm (0.118").



The ornamental strip is cemented at the same time in the upper and inclined rear areas.
Spacing to edge of ornamental strip is about 5 mm (0.197").

Fit in and press on side window carefully with Special Tool 51 3 010.

Check for uniform spacing between the window glass and body.
Check door gap and seating of the door's rubber seal after closing the door.



Preload the window glass with adhesive tape and foam rubber rolls or Special Tool 51 3 010.
Holding time is about 4 hours at room temperature - also refer to information on the installation of M 3 windows.

Note:
Leaks can be located by spraying on water or with an ultrasonic tester and sealed off from the inside of the window with a suitable size nozzle from the repair kit*.
This nozzle must be shortened to an appropriately small cross section size opening for this purpose.

* Source of Supply: HWB

51 36 ... INSTALLING SIDE WINDOW ORNAMENTAL STRIPS AND PLATES
- Touring -

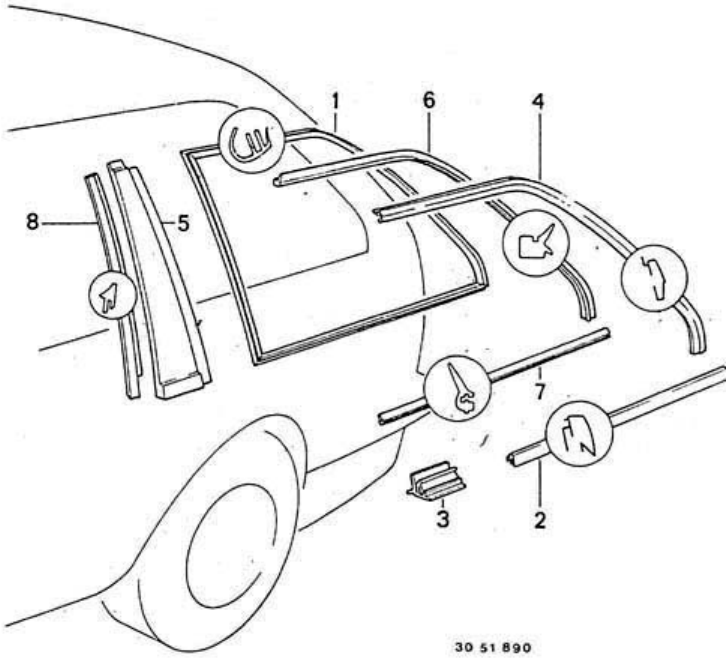
Lift off D-pillar plate.

Cut ornamental strip (4) and plate (5) off of the window with a flat knife* and special tool*, and lift them off.
If necessary, cut through the cement bead underneath plate (5) in the upper and middle areas with a flat spatula.

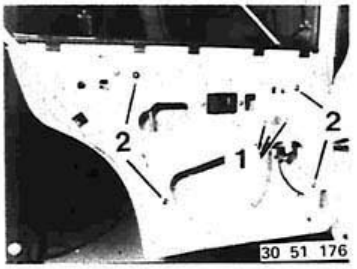
Installing:

1. If necessary, install / cement a new seal (8) on plate (5).
   Produce a thin cement bead (repair kit*) on the plate in the area of the window glass (close to the seam).
   Install, press on and, if necessary, hold plate with adhesive tape.

2. If necessary, install a new seal (6) on ornamental strip (4).
   Produce a thin cement bead (repair kit*) on the center web of ornamental strip (4).
   Install D-pillar plate.
   Fit in, press on and, if necessary, hold ornamental strip (4) with adhesive tape.



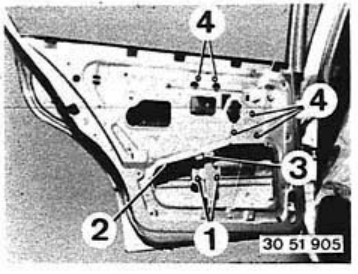
* Source of Supply: HWB



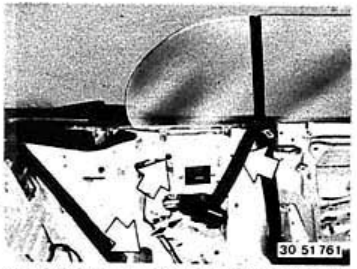
51 37 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR POWER WINDOW REGULATOR

Procedures are identical with those for removing and installing window regulator in left or right rear door – see 51 34 020.

Additional:
Disconnect plug.
Installation (1) with three nuts.

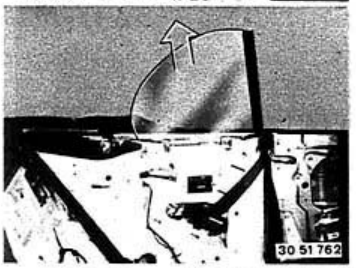


With Cable Regulator:
Lower window half the full distance and unscrew screws (1).
Push up and prevent window glass from falling down.
Loosen clamp (2) and disconnect plug (3).
Unscrew screws (4).
Twist and lift out the window regulator.

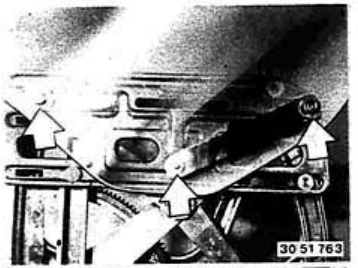


51 37 000 REMOVING AND INSTALLING OR REPLACING WINDOW REGULATOR

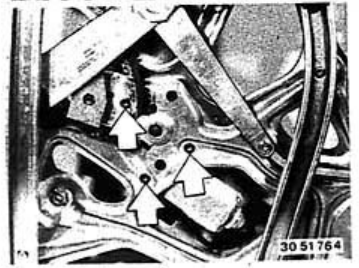
Remove trim panel – see 51 43 000.
Window closed.
Disconnect plug.
Unscrew screws.



Remove complete window regulator from above.
Installation:
Adjust rear window regulator – see 51 37 . . ..



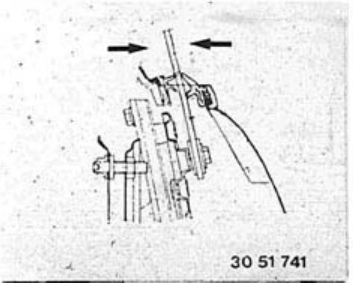
Unscrew screws.
Remove window glass.



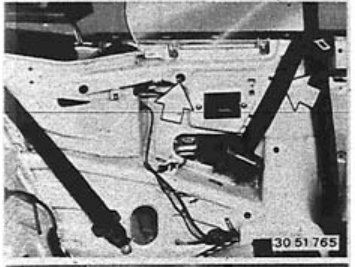
Unscrew screws.
Remove power window motor.

51 37 154 ADJUSTING LEFT OR RIGHT REAR SIDE WINDOW

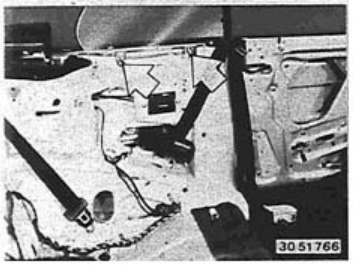
Remove rear side trim panel – see 51 43 000.
Requirement:
Front window adjusted correctly – see 51 32 154.



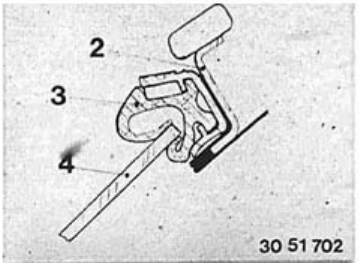
1. Adjust center position.



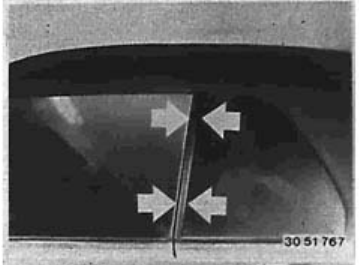
Align window uniformly at left and right.



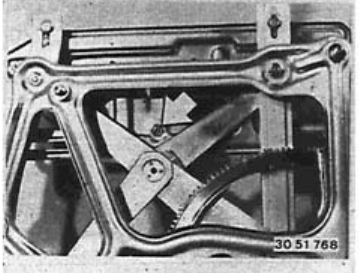
2. Adjust top stop.



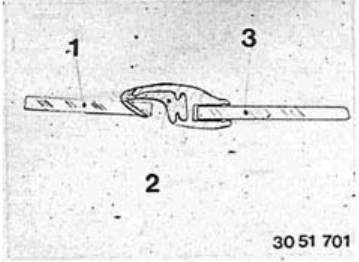
Window glass (4) must submerge uniformly in rubber seal (3) and roof frame (2).



Adjust gap between side window to be uniform at front and rear.

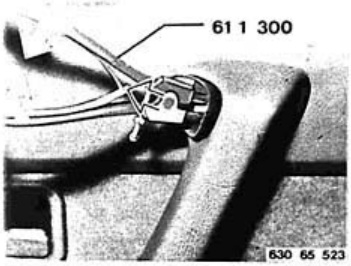


3. Adjust tension of side window.

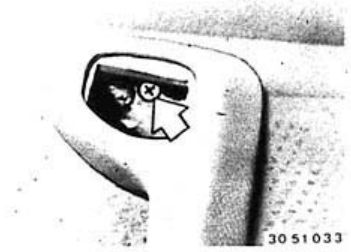


Rear side window (3) must bear together with seal (2) on front side window (1) uniformly with light tension.

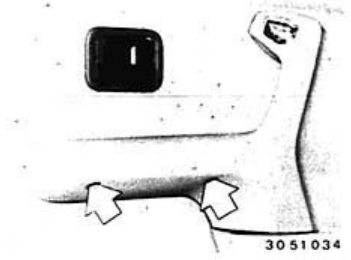
51 41 001 REPLACING LEFT OR RIGHT FRONT DOOR TRIM PANEL



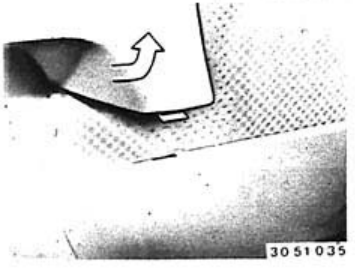
Pull off outside mirror adjusting button.
Lift out mirror switch with Special Tool 61 1 300.
Pull off plug.



Unscrew screw.



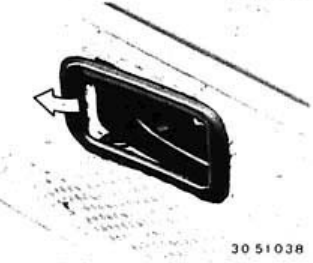
Unscrew screws.



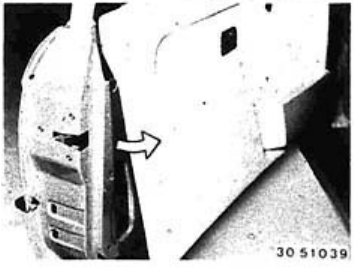
Pull armrest forward and disengage.

Lift off cover.
Pull off lock or unscrew screw.

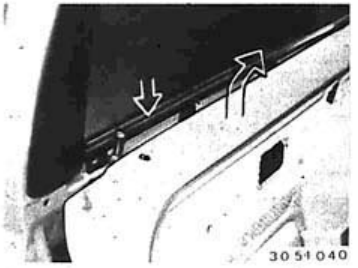
Pull off window winder and washer.
Installation:
Window winder faces forward with window raised fully.



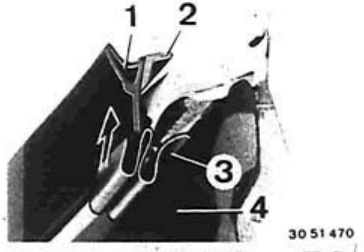
Pull off mask toward rear.



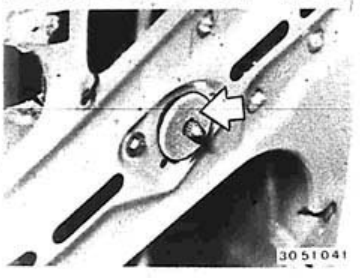
Door window lowered.
Lift door trim panel out of clips.
Installation:
Check clips, replacing if necessary.



Lift door trim panel out of clamps.
Note:
The window recess seal will also be lifted out.

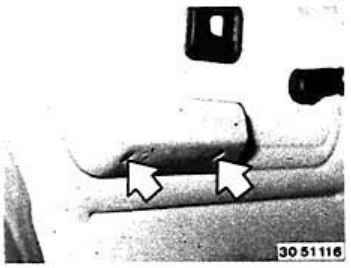


Installation:
Check for correct fit of clips.
1 Window recess seal
2 Ornamental strip
3 Clip
4 Door trim panel
Install door trim panel complete with window recess seal after lowering the door window.



Installation:
Check foam rubber washer on window regulator.

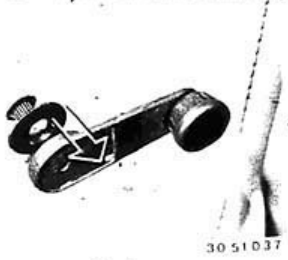
51 42 000 REMOVING AND INSTALLING LEFT OR RIGHT REAR DOOR TRIM PANEL



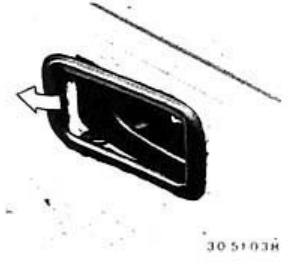
Unscrew screws.

Important!
An additional screw holds the armrest on the trim panel from behind.

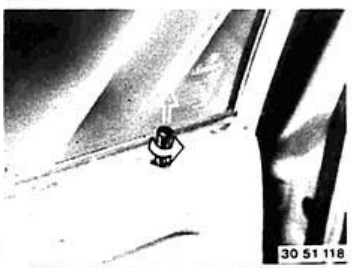
Lift off cover.
Remove circlip or unscrew screw.



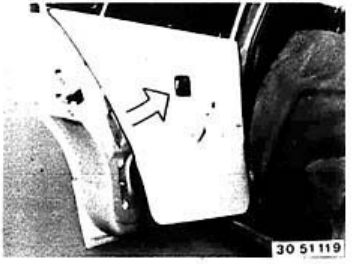
Pull off winder and washer.



Pull off mask toward rear.

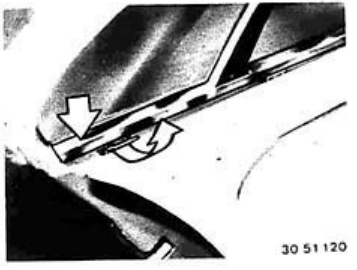


Unscrew catch button.



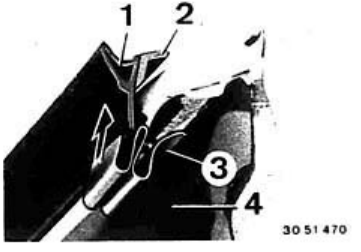
Door window lowered.
Lift off door trim panel with armrest.

Installation:
Check clips, replacing if necessary.



Lift door trim panel out of clamps.

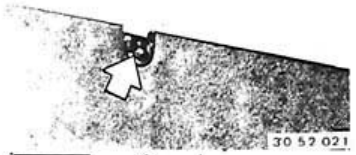
Note:
The window recess seal will also be pulled off.



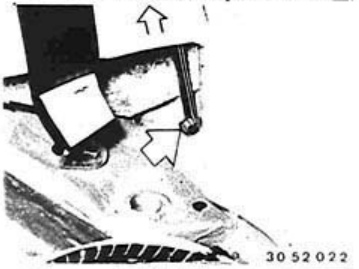
Installation:
Check for correct fit of clamps.
1 Window recess seal
2 Ornamental strip
3 Clamp
4 Door trim panel
Install door trim panel complete with window recess seal after lowering the door window.

51 43 000 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT REAR SIDE TRIM PANEL

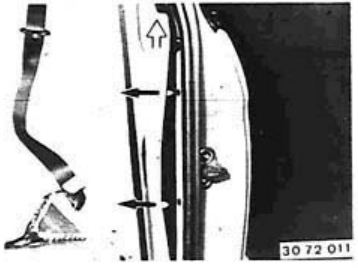
Lift out seat cushion.
Cars with Bolted Version:
Pull off covers and unscrew bolts on left and right sides.

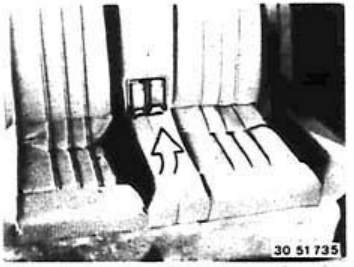


Unscrew left and right bolts.
Pull up and remove seat backrest.
Installation:
Engage backrest in upper holder.

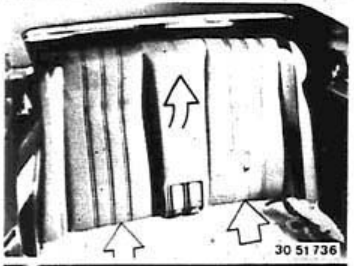


Disconnect side trim panel in three clips and pull up out of clamps.

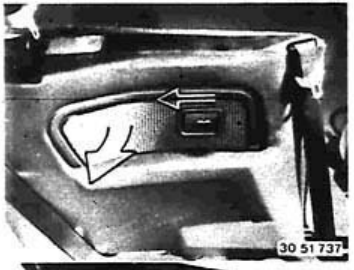




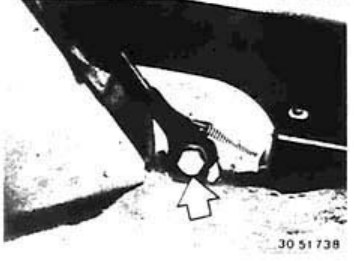
Convertibles:
Lift out the rear seat cushion.
Installation:
Seat cushion must engage in the openings.



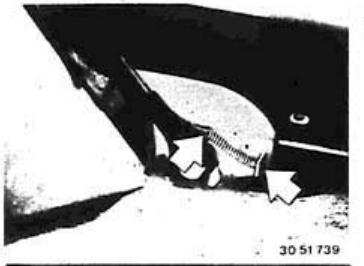
Unscrew bolts.
Pull out seat backrest from above.
Installation:
Engage backrest in holder (top).



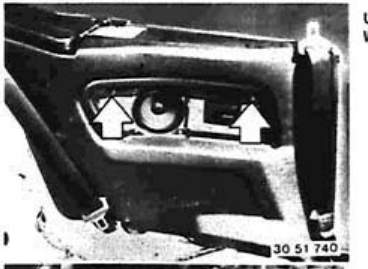
If applicable, lift out plate.
Pull off trim.



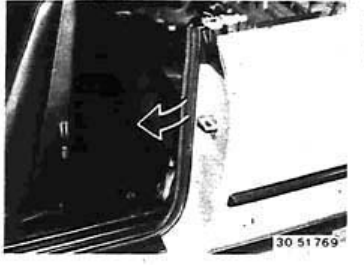
Unscrew bolt.
Lift out seat belt.



Installation:
Check for correct fit of spring.

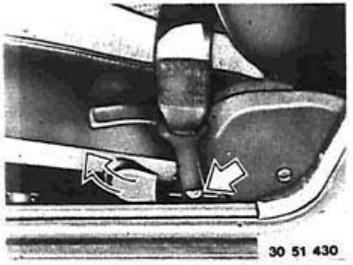


Unscrew screws.
Window open.

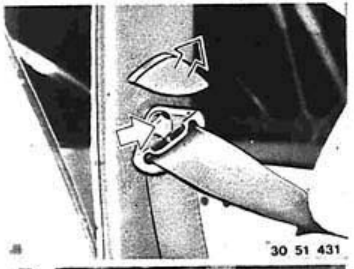


Pull off door weatherstrip.
Lift out trim.
If applicable, pull off speaker wires.

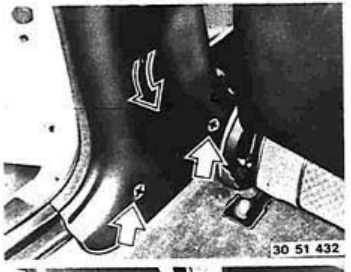
51 43 150 REMOVING AND INSTALLING TRIM FOR LEFT OR RIGHT DOOR PILLAR



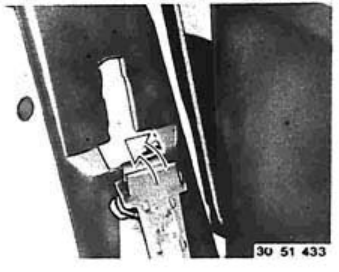
Pull off cap.
Unscrew screw.
Installation:
Tightening torque*.



Pull off cap.
Unscrew screw.
Installation:
Tightening torque*



Lift out clamps.
If applicable, unscrew screws.
Pull trim out of upper holder.

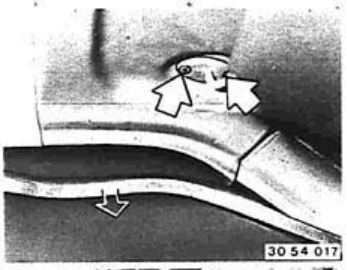


Press out cover and insert belt through trim of B pillar.
Remove trim.

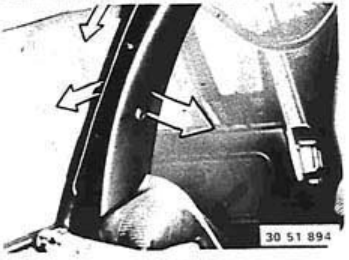
* See Specifications

51 44 011 REPLACING ROOF LINER – Touring –

Remove complete sun roof – see Group 54.
Remove check control – see Group 62.
Remove inside mirror – see 51 16 060.
Remove all grab handles – see 51 16 450/480.
Remove trim panels for left and right door pillars – see 51 43 150.
Remove all entrance strips – see 51 47 000/030.
Remove ceiling lights – see Group 63.



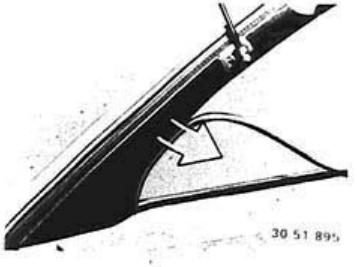
Unscrew sun visors with holders.
Pull off edge guard partially on all doors.



Unscrew seat belt and lift off C pillar trim.
Pull off rubber seals on both side windows in area of the roof liner.

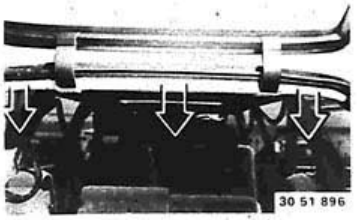
Installation:
Tightening torque*.

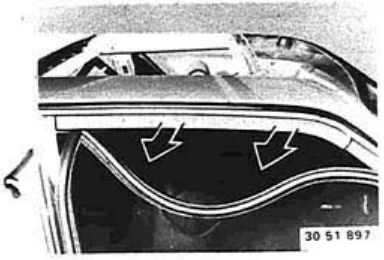
* See Specifications of Gr. 72



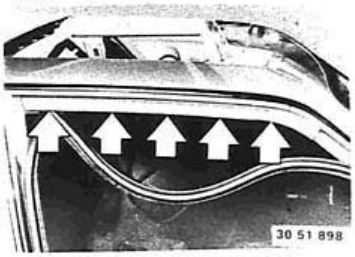
Lift off D pillar trim.

Remove tailgate hinge trim.
Pull roof liner down out of the clips.



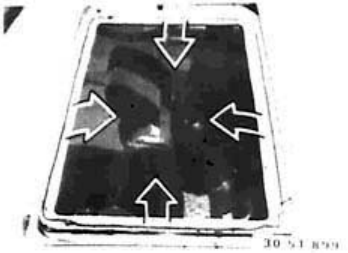


Pull off cemented roof liner.
Use a plastic or wood spatula to loosen a sticking roof liner.
Remove residual cement with a cement cleaner**.

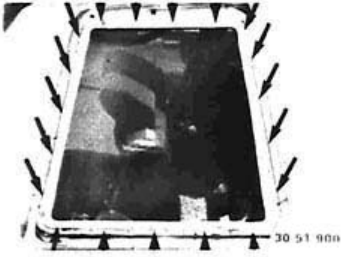


Installation:
Cement roof liner on sheet metal fold.
Cut off protruding material.
No protrusion should be visible after installation of edge guards.

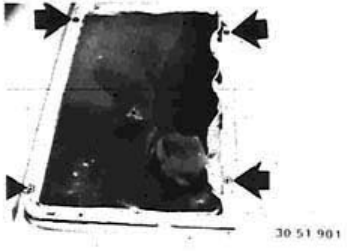
** Source of Supply: HWB



Pull off cemented roof liner.
Use a plastic or wood spatula to loosen a sticking roof liner.
Remove residual cement with a cement cleaner**



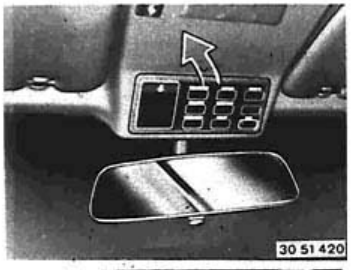
Installation:
Cement roof liner on the roof opening surface.
Cut off protruding material.
No protrusion should be visible after installation of the sun roof strips.



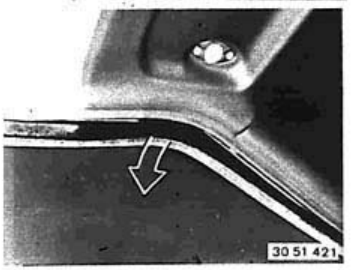
Unscrew screws.
Pull back and lift out the roof liner.

* Source of Supply: HWB

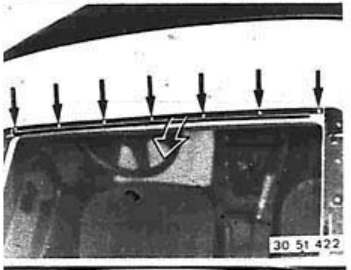
51 44 150 REMOVING AND INSTALLING FRONT ROOF LINER PLATE



If applicable, remove check control, see 62 14 070.
If applicable, remove sun roof winder, see 54 12 020.



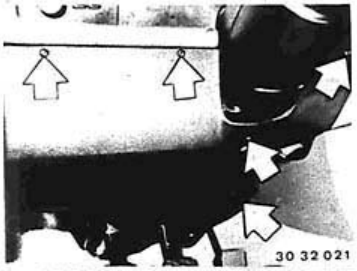
Pull off left and right door weatherstrips partially.
Unscrew screws.
Remove sun visor and holder.



Cars with Sun Roof:
Open sun roof.
Unscrew screws.
Take off strip.
Installation:
Use Terostat tape* in strip.

Pull off plate cover.
Unscrew screws.
Take off plate.

* Source: HWB



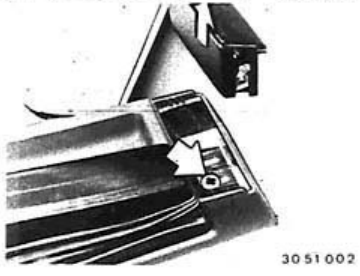
30 32 021

51 45 030 REMOVING AND INSTALLING INSTRUMENT PANEL TRIM

Disconnect battery ground lead.
Unscrew bolts.
Remove trim.
Remove steering wheel, see 32 33 000.

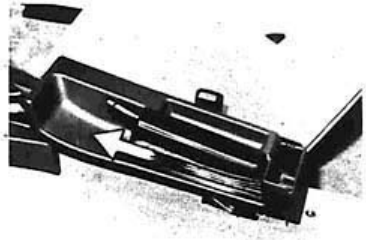
30 32 082

Detach steering column casing lower section.



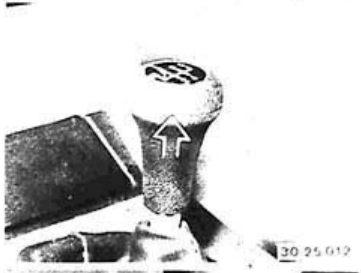
30 51 002

Lift out ashtray.
Unscrew nut.



30 51 003

Disconnect console at front by pulling back and pull off on parking brake lever.



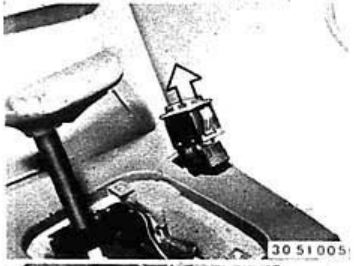
30 25 012

Manual Transmission:
Pull off shift lever knob.
Installation:
Shift lever knob must engage in twist lock.

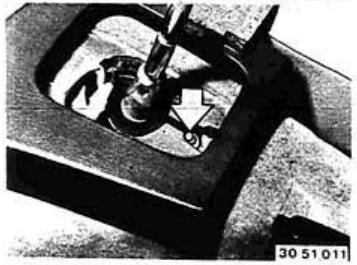
30 25 013

Lift off dust cover.

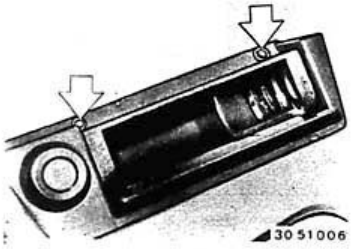
Automatic Transmission:
Lift out plate.
Unscrew bolts.
Remove trim.



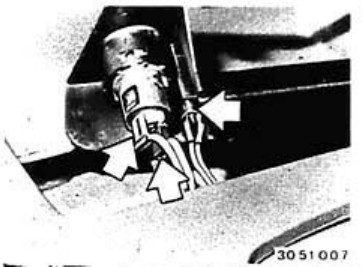
Cars with Electric Windows:
Lift out switch (1).
Pull off plug (2) on switch (1).



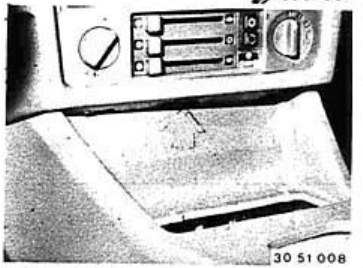
Remove insulation sheet.
Unscrew nut.



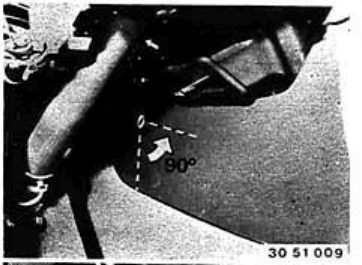
Unscrew bolts.
Lift out ashtray console.



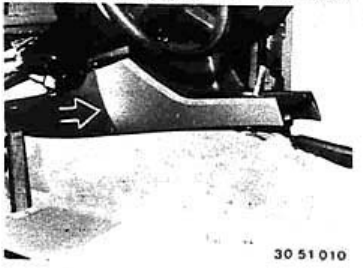
Pull off ashtray light and wires for cigar lighter.



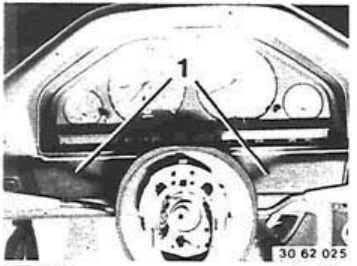
Unscrew bolt.



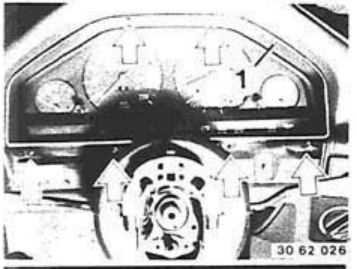
Remove retainer by turning anticlockwise and clockwise 90°.



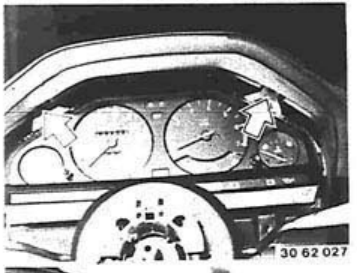
Pull out tray toward rear.



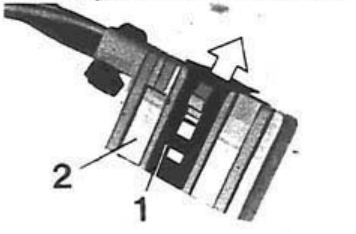
Unscrew nuts (1) and remove trim.



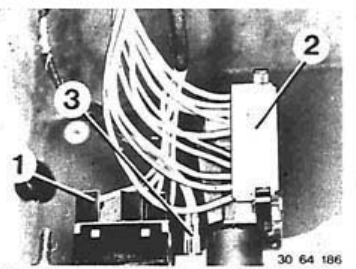
Unscrew bolts (1) and remove trim.



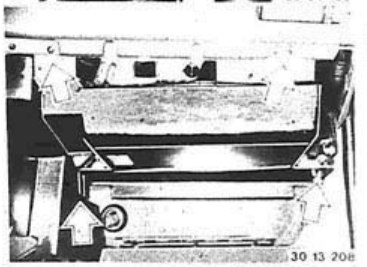
Unscrew bolts.



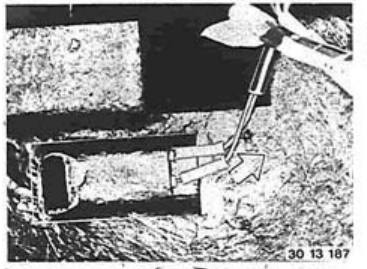
Lift instrument carrier out of instrument panel.
Pull off all plugs.
Note:
First pull back slider (1) on combination plug (2) to pull off combination plug on instrument carrier.



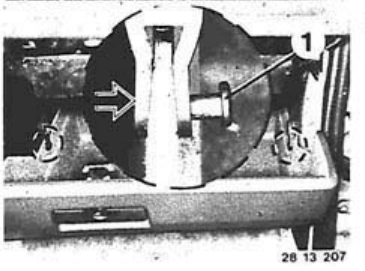
Pull off plugs (1 ... 3) on light switch.



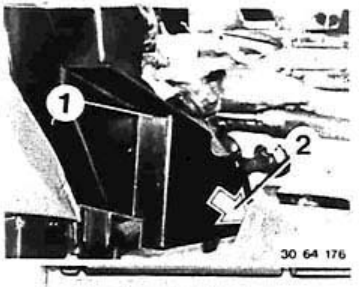
Open glove box.
Unscrew bolts.



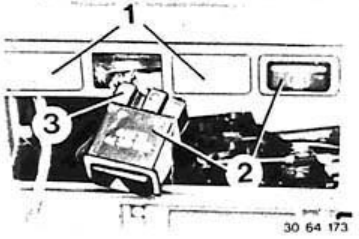
Pull off plug on glove box light.
Take off trim.



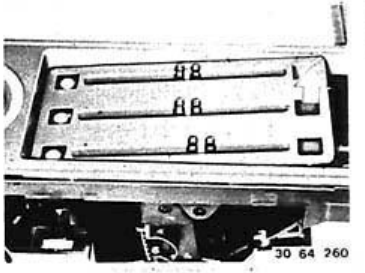
Disconnect pins of both retaining straps.



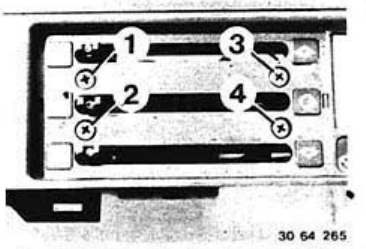
Unscrew screw (2).
Remove trim (1).



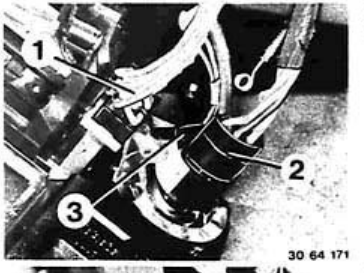
Remove radio mask or remove radio.
Pull masks (1) or switch (2) out of control panel.
Pull off plugs (3) on switches (2).



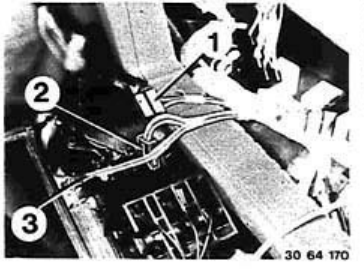
Pull off heating and ventilating controls.
Lift out sliding control.
Pull off plate.



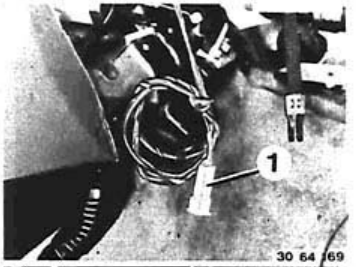
Unscrew screws (1 ... 4).



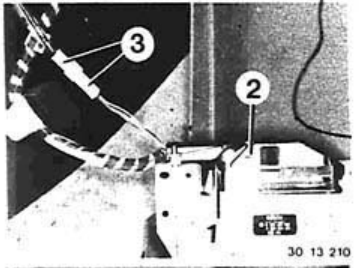
Pull off plug (1) on air conditioner switch.
Pull off plug (2) on blower switch.



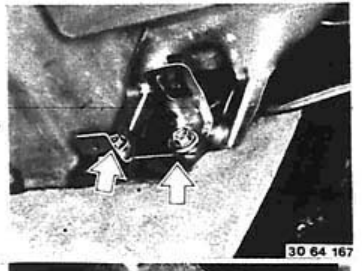
Pull off plug (1) on temperature selection housing.
Pull off plug (2) on sliding control.
Pull off bulb holder (3).
Pull off plug on clock.
Lay control unit aside.



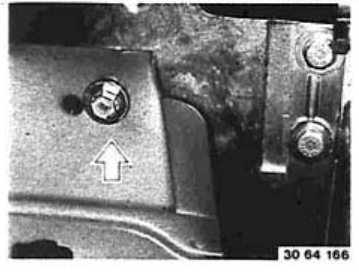
Only Cars with Additional Turn Signals:
Pull off plug (1) on right additional turn signal.



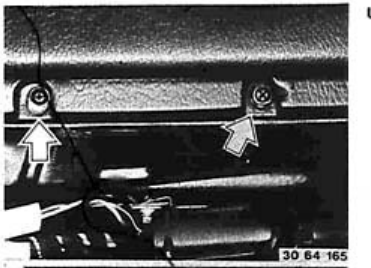
Push back retainer (1).
Pull off multiple pin plug (2) on control unit.
Disconnect plug (3).



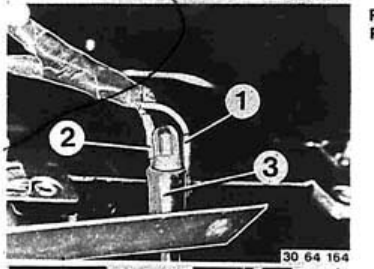
Unscrew bolts.



Unscrew bolt.

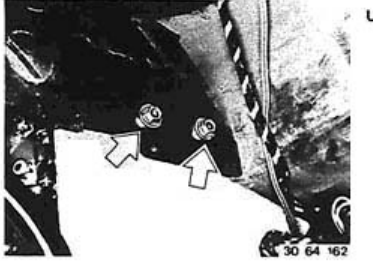


Unscrew bolt.

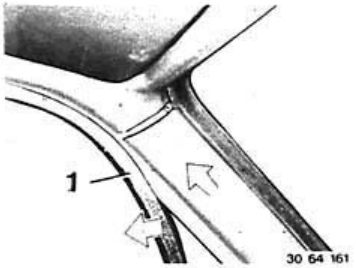


Pull off plugs (1 and 2) on switch (3).
Remove control unit with holders.

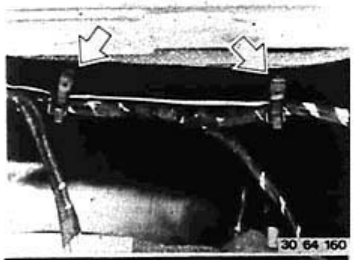
Unscrew bolt.



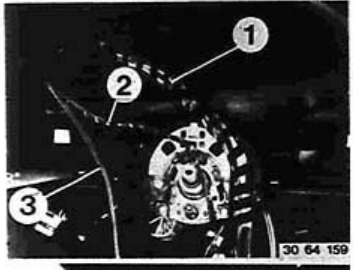
Unscrew both bolts.



Pull off edge guard (1) on body in area of left and right A pillars.
Pull away both column casings from A pillars and remove from above.

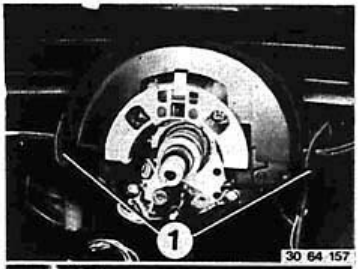


Open both wire straps.

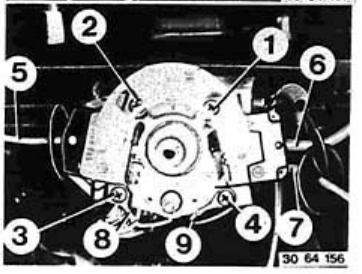


Disconnect wire harnesses (1 ... 3) underneath the instrument panel and pull back into footwell.
1 = Instrument panel wire harness
2 = Radio wire harness
3 = Radio speaker wire

Remove shim (1).

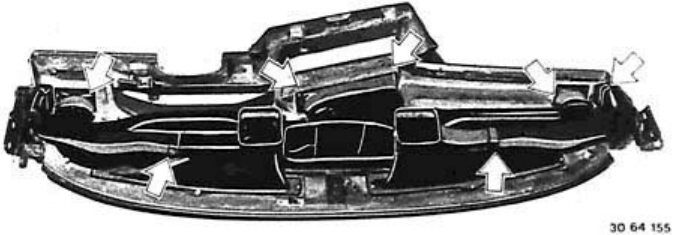


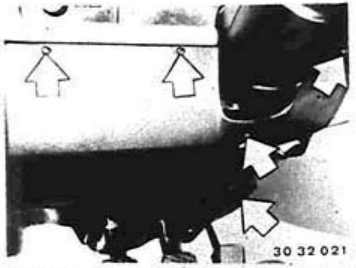
Remove upper steering column casing.
Installation:
Use rubber washers (1) behind casing.



Unscrew bolts (1 ... 4) and remove control levers (5 ... 7).
5 = Turn signal lever
6 = Wiper lever
7 = Cruise control lever
Installation:
Also secure ground wires (8 and 9).
Both tabs of cruise control lever must engage in bores.

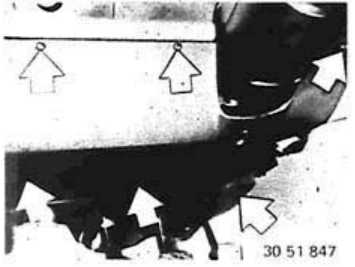
Remove instrument panel.
Installation:
Make sure air ducts fit properly.



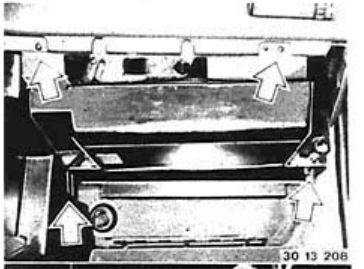


51 45 180 REMOVING DASHBOARD TRIM PANEL AT BOTTOM LEFT

Unscrew screws.
Take out trim panel.

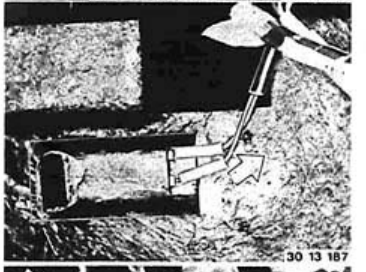


Cars with Airbag:
Unscrew screws and lift off trim panel.

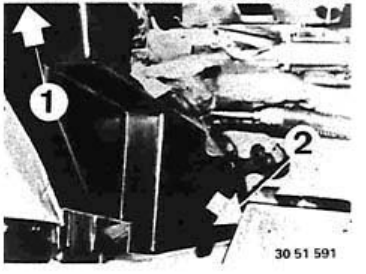


51 45 200 REMOVING DASHBOARD TRIM PANEL AT BOTTOM CENTER RIGHT

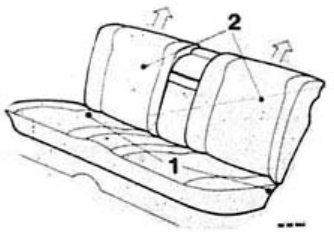
Open glove box.
Unscrew screws.



Pull off glove box light plug.
Lift out trim panel.

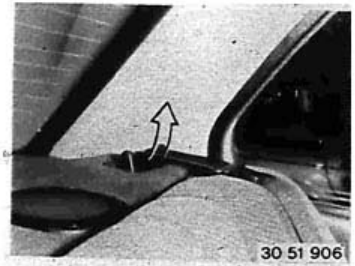


Unscrew screws (1 and 2).
Lift out trim panel.



51 46 000 REMOVING AND INSTALLING HATRACK TRIM PANEL

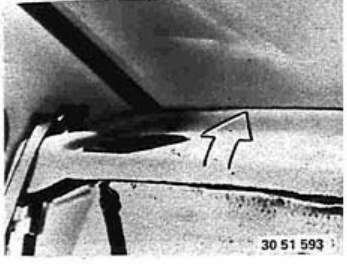
Pull out rear seat cushion from above.
Unscrew bolts (1) and disconnect backrest in holders (2).



Lift out front end of and pull out cover.

Unscrew left and right screws.

Installation:
Tightening torque*.

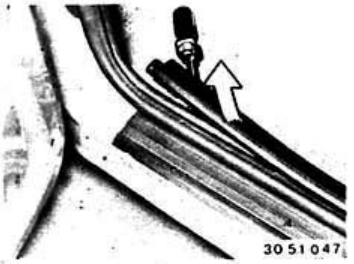


Unclip trim panel in middle and lift out panel.
If applicable, pull off radio speaker wires.

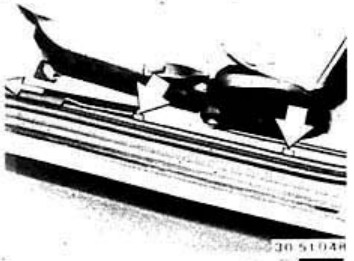
Installation:
Openings are marked for service installation of radio speakers.

* See Specifications of Gr. 72

51 47 000 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT FRONT ENTRANCE COVER STRIP

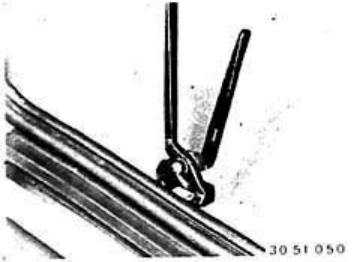


Pull cover strip off of first clip.
Note:
Pulling off will be difficult, pry off carefully with a screwdriver if necessary.



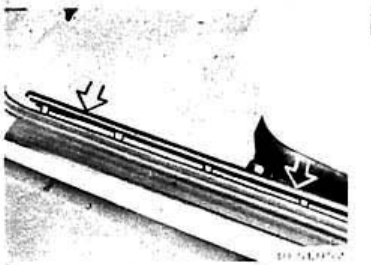
Slide cover strip forward as far as possible until rear clips are accessible.

Pull off cover strip toward rear.

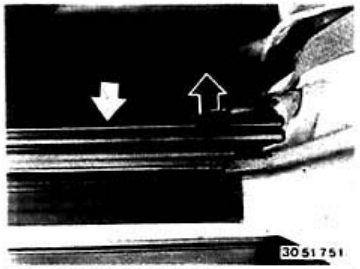


Compress clips with a pliers as shown and lift out.

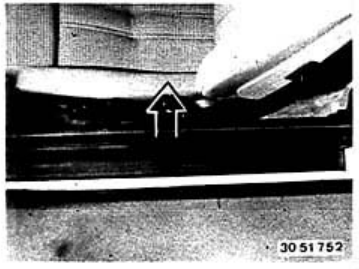
Slide clips on to cover strip.



Align clips with holes in entrance.
Press on cover strip.

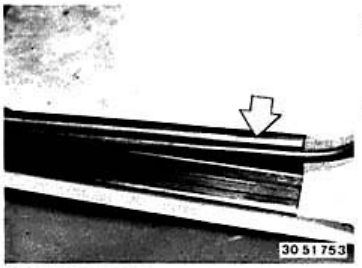


Convertibles:
Lift off cover on seat belt.
Lift out clips.

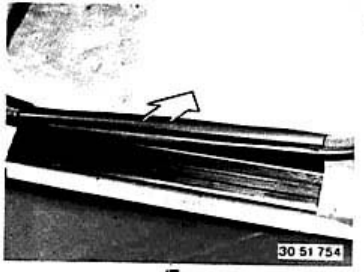


Remove cover.

51 47 030 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT REAR ENTRANCE COVER STRIP



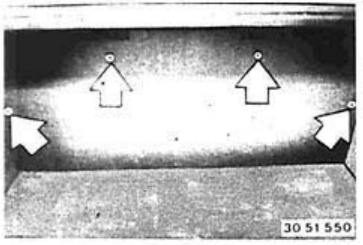
Pull out expander rivet.



Lift out cover.

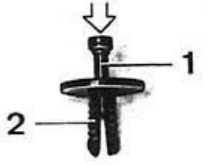
Compress and lift out clips with a pliers.

Installation:
If applicable, slide on and align new clips.



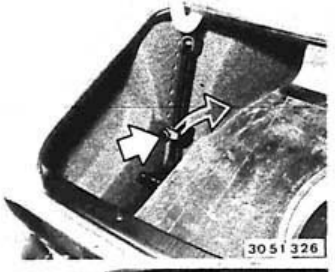
51 47 140 REMOVING AND INSTALLING TRIM PANEL FOR REAR TRUNK WALL

Pull out expander rivet.
Lift out plugs.
Remove trim panel.



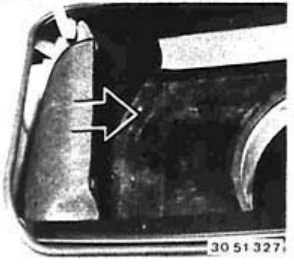
30 51 325

1 = Expander rivet
2 = Plug
Installation:
First insert the plug and then press in the expander rivet.

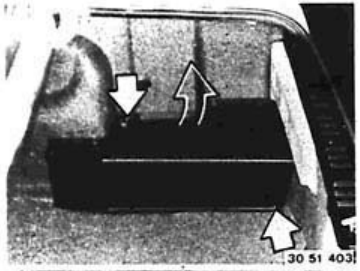


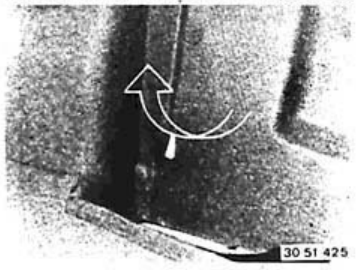
51 47 210 REMOVING AND INSTALLING TRUNK TRIM PANEL ON LEFT SIDE WALL

Remove trim panel for rear trunk wall – see 51 47 140.
Remove floor mat.
Unscrew screw, turn up lock and take out the car jack.



If applicable, lift out tail light bulb holder.
Pull out trim panel at top first and then remove it.

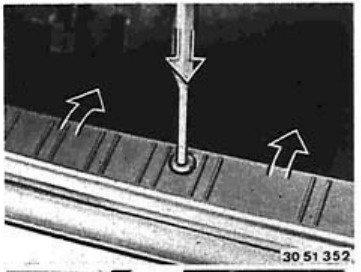


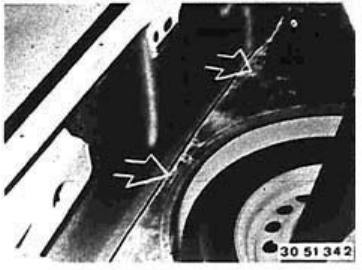


51 47 220 REMOVING AND INSTALLING TRUNK TRIM PANEL ON RIGHT SIDE WALL

If applicable, remove battery cover.
Remove trim panel for trunk rear wall – see 51 47 140.
Remove floor mat.

If applicable, lift out tail light bulb carrier.
Lift out trim panel.





51 47 240 REMOVING AND INSTALLING TRUNK TRIM PANEL ON TAIL PANEL WALL

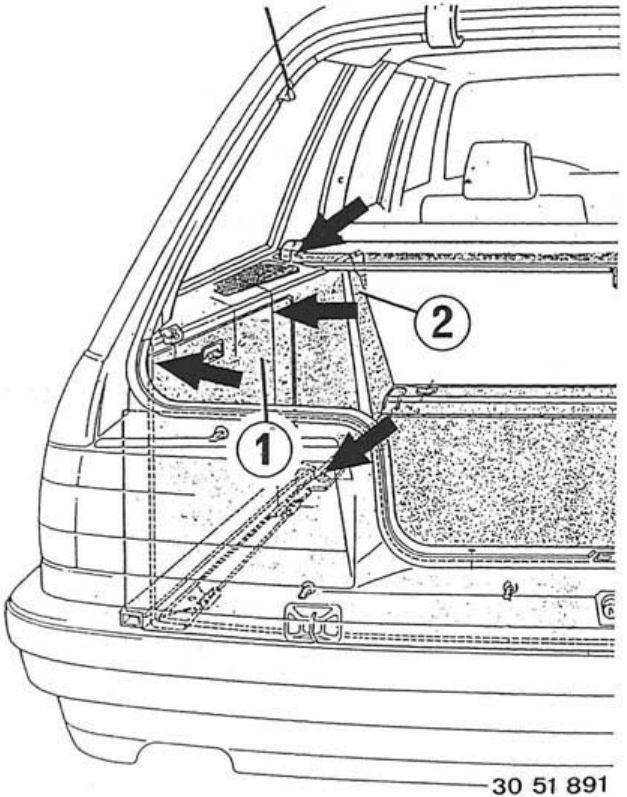
Press out pins of clips downward.
Take off plate.

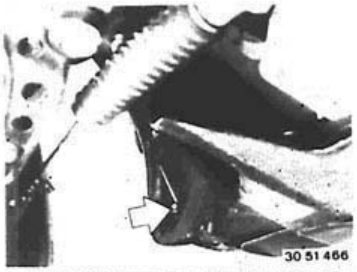
If applicable, lift out tail light bulb carrier.
Lift out trim panel.

51 47 . . . REMOVING AND INSTALLING LEFT OR RIGHT TRUNK TRIM PANEL

Open flap (1).
Unscrew screws.
Pull off radio speaker wires, if applicable.
Lift out trim panel.

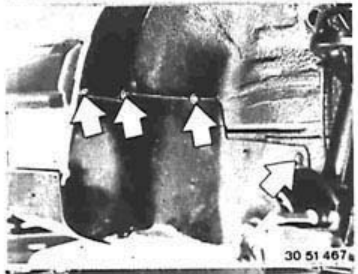
Installation:
Attach trim panel first on locking pin (2) of the seat cushion.



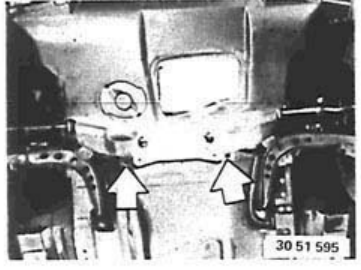


51 47 490 REMOVING AND INSTALLING OR REPLACING SPLASH GUARD FOR FRONT PANEL

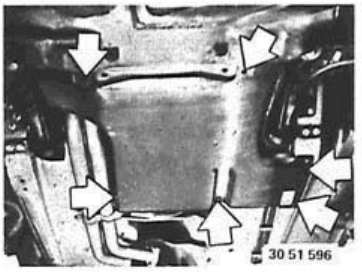
Unscrew screws on left and right sides.



Unscrew screws on left and right sides.
Remove engine compartment splash guard.

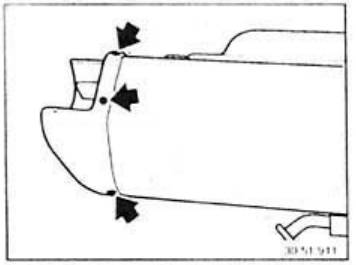


Additional for Diesels:
Unscrew screws.



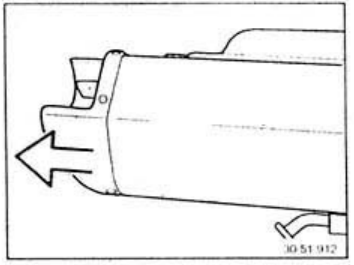
51 47 491 REMOVING AND INSTALLING REAR SPLASH GUARD FOR ENGINE COMPARTMENT

Unscrew screws.
Take off splash guard.

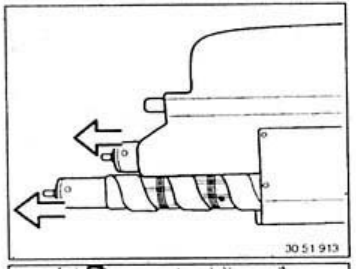


51 47 ... DISASSEMBLING AND ASSEMBLING COMBINATION SUN SHADE

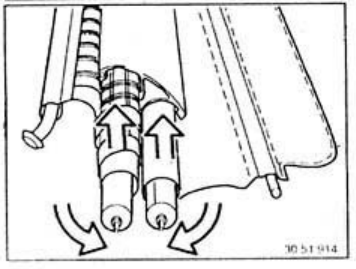
Disassembling:
Drill out rivets at left and right.



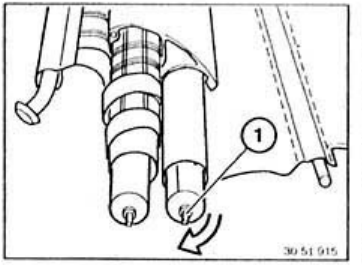
Pull off covers at left and right.



Pull out sun shade and partition net.



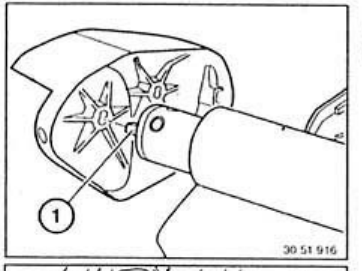
Assembling:
Wind up sun shade and partition net and slide into housing.



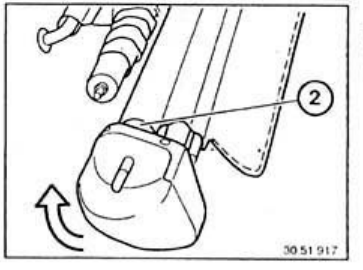
Important!
Check direction of rotation. Only tension spring in sun shade in clockwise direction. Turning in wrong direction would break spring.

Turn shaft end (1) of sun shade clockwise by hand until resistance is noticed.

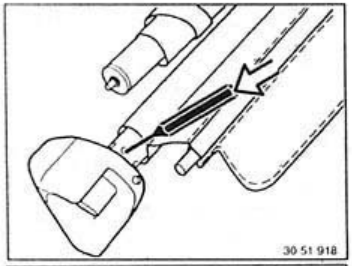
Note:
When released, shaft end must turn back slightly on its own.



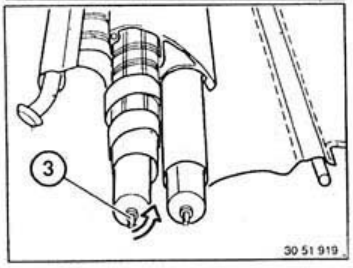
Place cover on shaft end (1) of sun shade.



Hold spring housing (2) firmly and tension spring by turning cover clockwise 6 times.



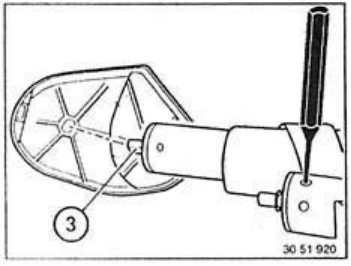
Insert mandrel (2 to 2.5 mm/0.079 to 0.098" dia.) in locking bore.
If necessary preload spring slightly until bore is accessible.
Take off cover.



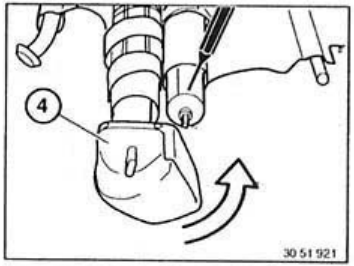
Important!
Check direction of rotation. Tension spring in partition net only counterclockwise. Turning in wrong direction would break spring.

Turn shaft end (3) on partition net counterclockwise by hand until resistance is noticed.

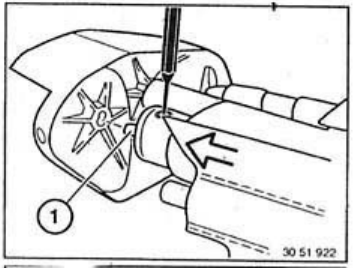
Note:
When released, shaft end must turn back slightly on its own.



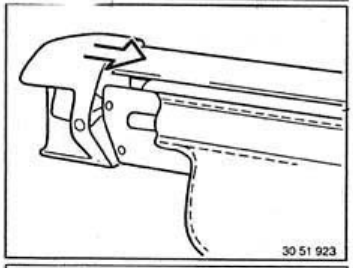
Place cover on shaft end (3) of partition net.



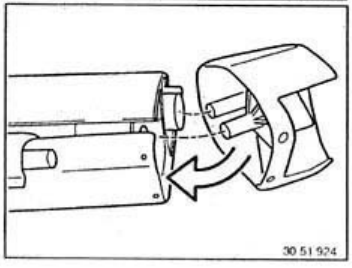
Hold spring housing (4) firmly and tension spring by turning cover counterclockwise 16 times.
Hold cover firmly.



Insert shaft end (1) of sun shade in cover.
Pull mandrel out of locking bore.



Slide sun shade and partition net into housing of combination sun shade completely until cover fits tight on housing.



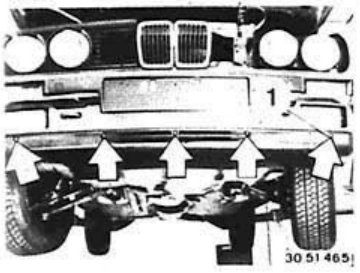
Install cover for other end of combination sun shade on shaft ends and housing.

Check function!

Rivet both covers with blind rivets (3.2 mm dia. x 5.6 mm).

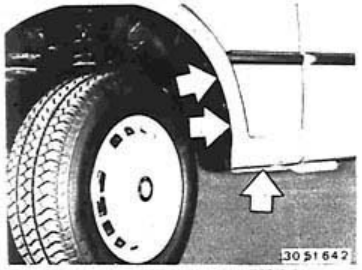
51 71 404 REMOVING AND INSTALLING FRONT SPOILER

Unscrew bolts on left and right sides.



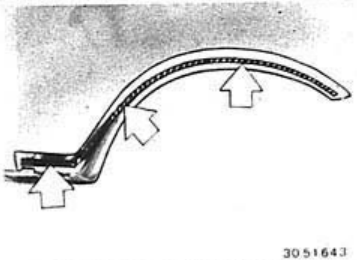
Unscrew bolts.
Take off spoiler.
If applicable, pull off temperature sensor (1).

Installation:
Tighten plastic nut on holding screw about two turns.
Slide in spoiler left and right.

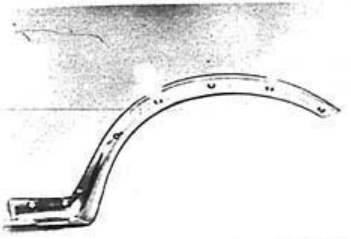


51 71 434 REPLACING ORNAMENT ON FRONT SIDE PANEL

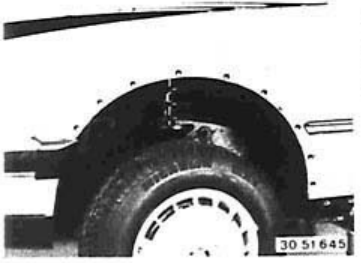
Unscrew screws.
Pull off ornament.
Installation:
Use new screws and self-tapping nuts.



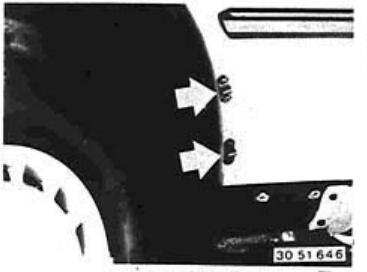
Pull off sealing tape.
Installation:
Pull new sealing tape into the trim panel.



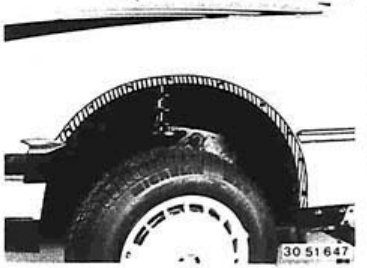
Lift out plugs.
Installation:
Insert new plugs in trim panel.
(round = side member area)
(square = wheel house)



Lift out grommets.
Installation:
Insert new grommets.
Grommets must be softened in water for a certain time prior to installation.

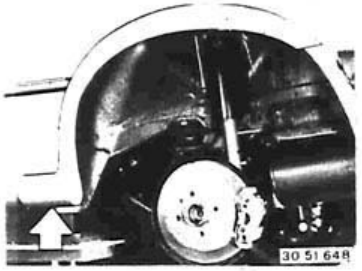


Lift out holder.
Installation:
Insert new holder.
Press in expander rivets.

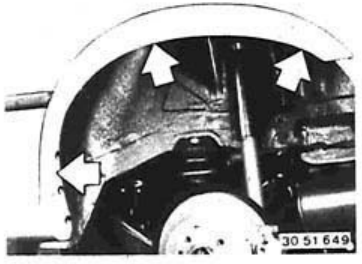


Installation:
When replacing the front side panel the mounting holes must be produced prior to painting.
Apply drilling template on edge and paste down along the wheel house contour.
Punch mark centers of holes, drill 9 mm (0.354") dia. holes, deburr and coat edges of holes with zinc dust paint.
Pull off drilling template.

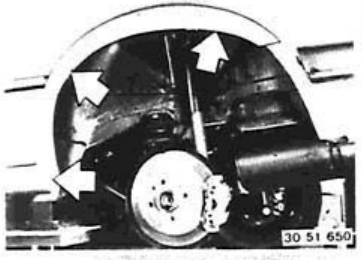
51 71 440 REPLACING ORNAMENT ON REAR SIDE PANEL



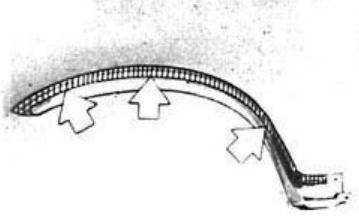
Unscrew screw.
Installation:
Use new screw and self-tapping nut.



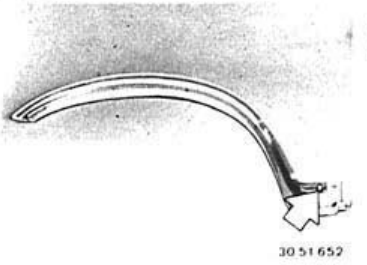
Lift out plastic rivets in wheel house.
Installation:
Install plastic rivets with Special Tool



Pull off ornament.
Installation:
Clip in and align the ornament.

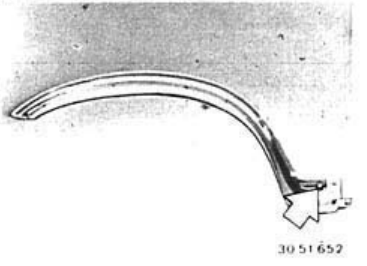


Pull off sealing tape.
Installation:
Pull new sealing tape into the ornament.



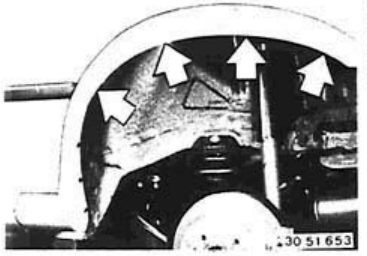
Lift out plugs.
Installation:
Insert new plugs in side panel.

Lift out grommet.
Installation:
Insert new grommet.
Grommets must be softened in water several minutes prior to installation.

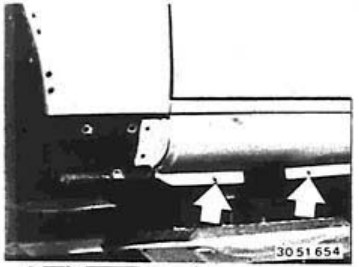


Installation:
Mounting holes must be produced when replacing the side panel.
Insert plug in ornament.

Insert grommet in side member.
Installation:
Grommets must be softened in water several minutes prior to installation.

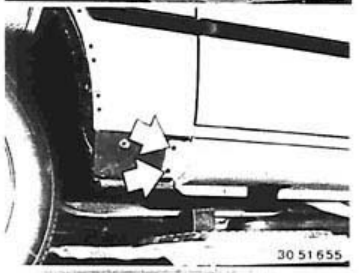


Clip in and align side trim panel.
Mark centers of holes.
Punch centers, drill 6.2 mm (0.244") dia. holes, deburr and coat edges of holes with zinc dust paint.

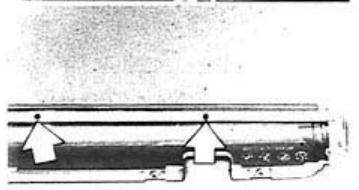


51 71 446 REPLACING TRIM PANEL FOR COVER ON SIDE MEMBER

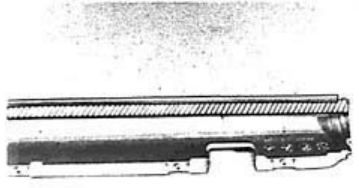
Remove ornament on front side panel – see 51 71 434.
Remove ornament on rear side panel – see 51 71 440.
Unscrew clamps.



Lift out expander rivets at front and rear.
Pull off trim panel.
Installation:
Pull off protective sheet on sealing tape.

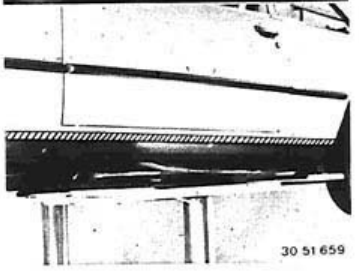


Lift out plugs.
Installation:
Insert new plugs in trim panel.

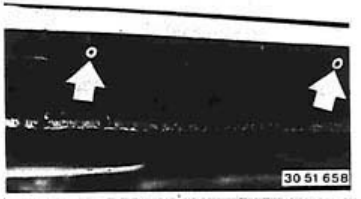


Pull off sealing tape.
Installation:
Pull new sealing tape into trim panel (two layers).

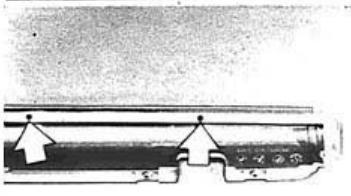
Lift out grommets.
Installation:
Insert new grommets.
Grommets must be softened in water several minutes prior to installation.



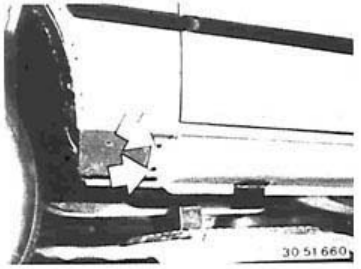
Installation:
Mounting holes must be produced prior to painting when replacing the side member.
Center drilling template at front and rear to same distance and paste down along edge.
Punch centers, drill 9 mm (0.354") dia. holes, deburr and coat edges of holes with zinc dust paint.
Pull off drilling template.



Insert grommets in side member.
Installation:
Grommets must be softened in water several minutes prior to installation.

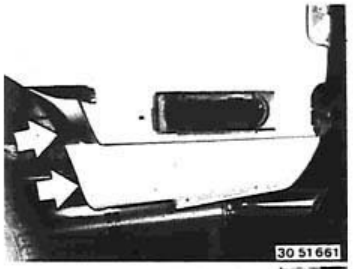


Insert plugs in trim panel.

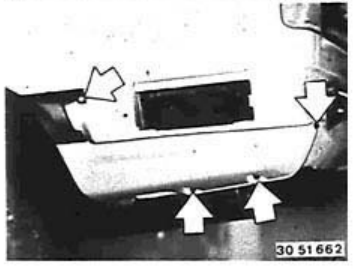


Clip in and align trim panel.
Mark centers of holes at front and rear.
Take off trim panel.
Punch centers, drill 6.5 mm (0.256") dia. holes, deburr and coat edges of holes with zinc dust paint.

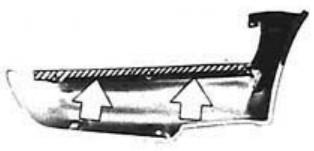
51 71 456 REPLACING REAR STONE PROTECTION TRIM PANEL



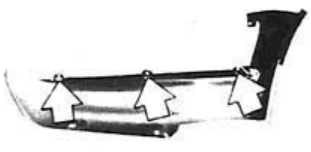
Remove rear bumper – see 51 12 000.
Lift out plastic rivets in wheel house.
Installation:
Install plastic rivets with Special Tool



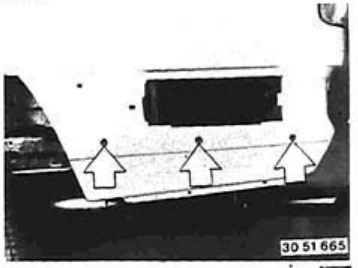
Lift out expander rivets.
Pull off trim panel.
Lift out grommets for expander rivets.
Installation:
Use new grommets and expander rivets.



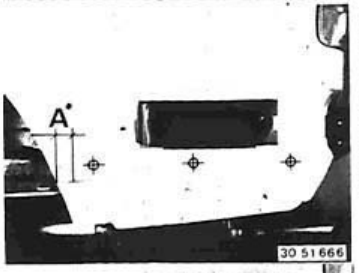
Pull off sealing tape.
Installation:
Pull new sealing tape into trim panel.



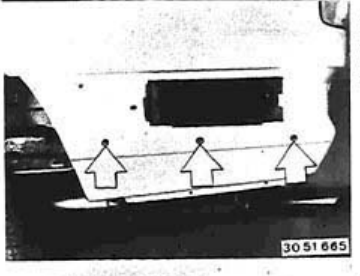
Lift out plugs.
Installation:
Insert new plugs in trim panel.
Insert seal.



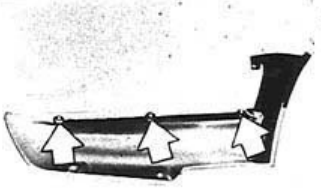
Lift out grommets.
Installation:
Insert new grommets.
Grommets must be softened in water several minutes prior to installation.



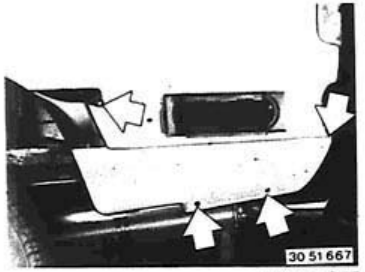
Installation:
Mounting holes must be produced prior to painting when replacing the rear side panel.
Tape down the drilling template along the edge.
Distance A = 29.5 mm (1.161").
Punch centers, drill 9 mm (0.354") dia. holes, deburr and coat edges of holes with zinc dust paint.
Pull off the drilling template.



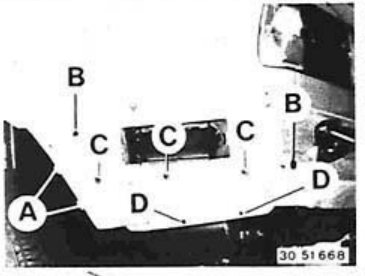
Insert grommets in side panel.
Installation:
Grommets must be softened in water several minutes prior to installation.



Insert plugs in stone protection trim panel.



Fit in stone protection trim panel and mark location of holes.



Punch centers and drill holes:
A = 6.2 mm (0.244") dia.
B = 8.5 mm (0.335") dia.
C = 9.0 mm (0.354") dia.
D = 6.5 mm (0.256") dia.
Deburr and coat edges of holes with zinc dust paint.

If applicable, install plug with a seal.

51 71 394 INSTALLING FRONT SPOILER (M-SYSTEM)

Painting:
The front spoiler is supplied with a prime coat and substructure paint, so that only the final coat of paint has to be sprayed on.

Procedures: BMW plastic part painting (see BMW Paint Brochure).

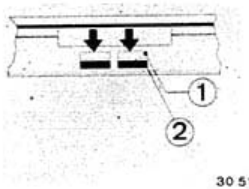
BMW acrylic paint + 20 % BMW softface additive.

Caution!
Maximum enamel baking temperature: 50° C (122° F).

Pertinent cooling air openings must be cut out prior to painting the front spoiler.
Cars Until 09/85.

1 = Open

2 = Closed



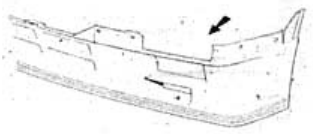
30 51 845

316 – 324 d Since 09/85:

Terminal	= Air Conditioner
1	= 316
2	= 318 i
3	= 325 e / 320 i*
4	= 325 i
5	= 325 iX
6	= 324 d

30 51 846

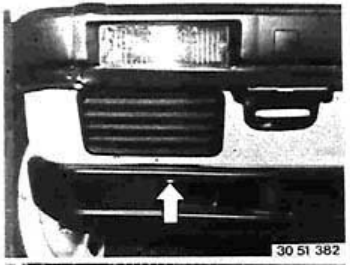
Opening in front spoiler must be made for the installation of front fog lamps.
Openings are marked with ribs on the back of a spoiler and can be cut out with a compass saw.
Edges must be filed smooth afterwards.
Important!
The prime coat must be touched up around the openings to guarantee adhesion of the final paint coat.
Paint front spoiler (refer to "Painting").



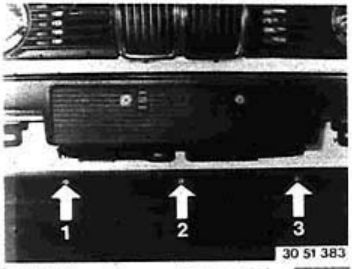
30 51 501

Disassemble front plastic panel (cars before 09/85).
Unscrew self-tapping screw (1) with an 8 mm wrench on the side panel.

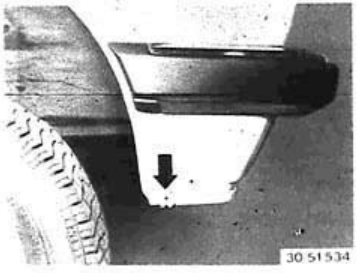
30 51 533



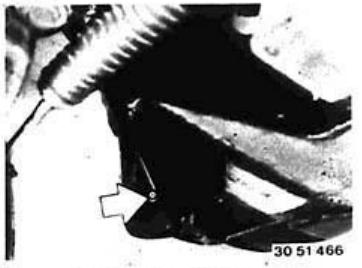
Remove phillips screws on left and right sides.



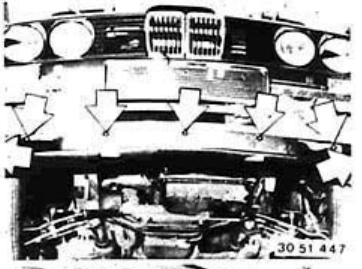
Unscrew self-tapping screws (1 ... 3).
Take off trim panel.



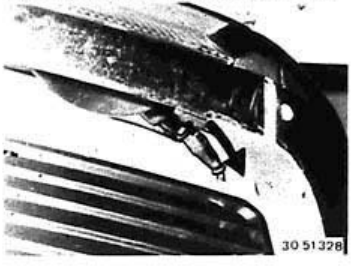
Pull self-tapping nuts off of plastic trim panel and mount on body.
Mount wheel house shells on sides.



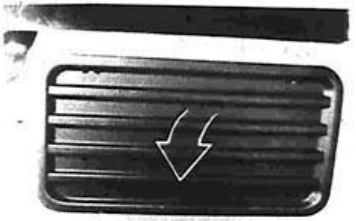
Cars Since 09/85:
Unscrew screws on left and right sides.



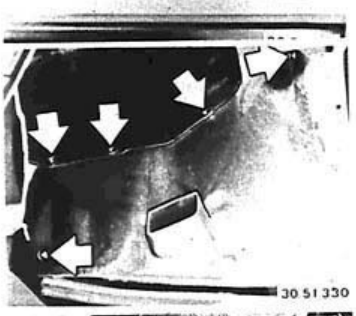
Unscrew front screws.
Take off trim panel.



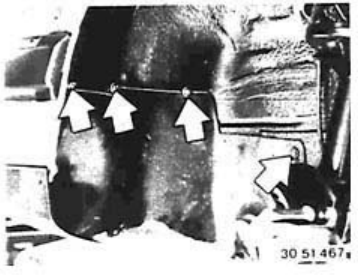
Unscrew front bumper.
Disconnect plugs on left and right turn signals.
Installation:
Check for correct fit of rubber grommets.



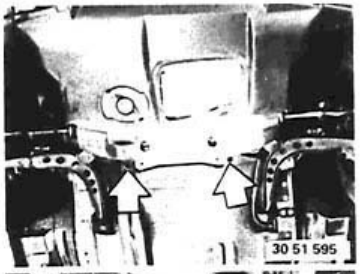
Cars Without Front Fog Lamps:
Lift out left and right covers.



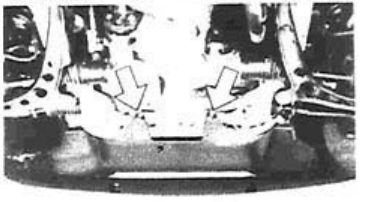
Cars With Front Fog Lamps Before 09/85:
Remove left and right wheel house panels.



Removing Splash Guard (316, 318 i, 320 i, 325 e, 325 i Since 09/85):
Unscrew left and right bolts.
Remove splash guard for engine.

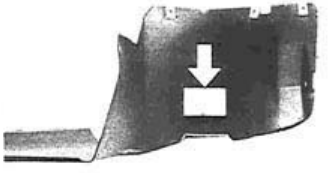


Additional for BMW 324 d:
Unscrew bolts.



Additional for BMW 325 iX:
Unscrew bolts.

30 51 602



Only Cars Since 09/85:
Make openings for air ducts along the lines provided in the splash guard for the engine.

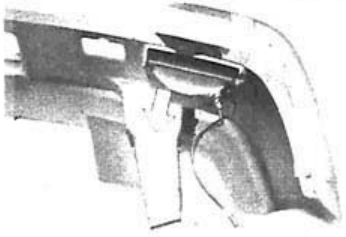
30 51 605

30 51 606

Produce 7 mm (0.275") dia. holes in the ventilation necks.

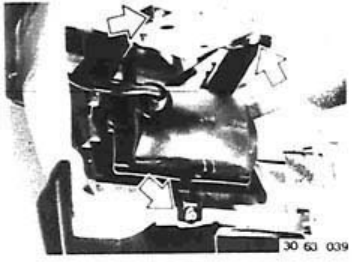
A = 57 mm (2.244")
a = 15 mm (0.590")

Note:
Check part numbers.
51 71 1 942 967 = left
51 71 1 942 968 = right
Part numbers must face down!



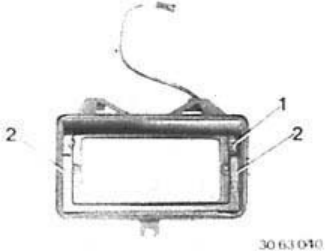
30 51 607

Mount ventilation necks on front spoiler, drill through holes and secure necks with expansion rivets.



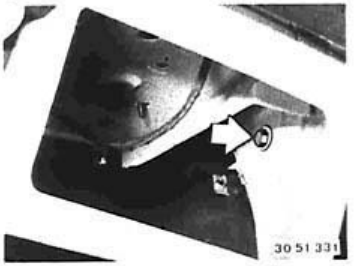
30 63 039

Removing Front Fog Lamps:
Pull off plugs on front fog lamps.
Unscrew screws and take off front fog lamps with housings.



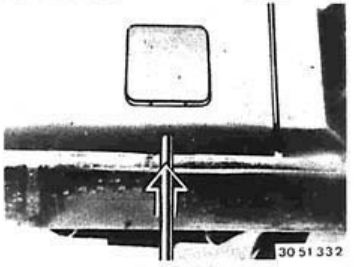
30 63 040

Taking Front Fog Lamps Out Of Holders:
Unscrew adjusting screw (1).
Remove covers (2).
Unclip front fog lamps in holders.



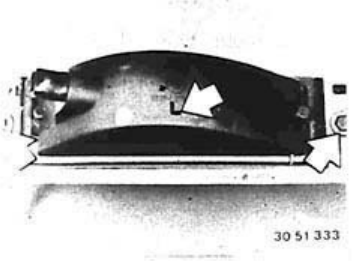
30 51 331

Removing Bumper:
Unscrew left and right bolts.
Installation:
Tightening torque: 6 to 9 Nm (4.5 to 6.5 ft. lbs.



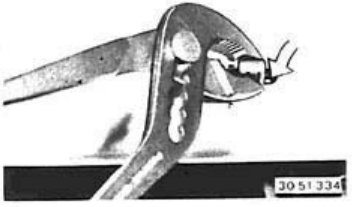
30 51 332

Lift out left and right covers with a screwdriver.
Unscrew left and right nuts.
Take off bumper.
Installation:
Tightening torque: 22 to 25 Nm (16 to 18 ft. lbs.).
Arrows on back of covers face up.



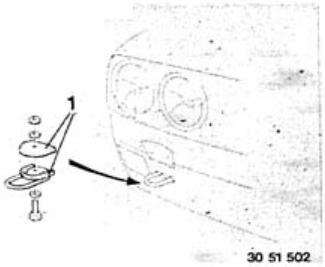
30 51 333

Unscrew and remove left and right turn signals.
Installation:
Turn signals are marked with
L for left or
R for right.



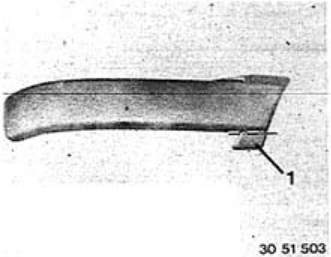
30 51 334

Removing Rubber Guard:
Compress and push out locking hooks of all rubber guard clips.



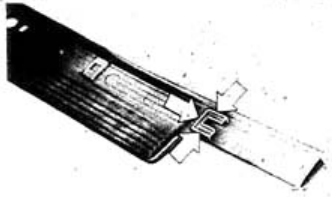
30 51 502

Extend the right towing eye with supplied adapter (1).
The left towing eye of cars since 09/85 must be cut off and the cut edges coated with zinc dust paint to prevent corrosion.
Installation:
Align towing eye in middle of opening when mounting the front spoiler.
Paint adapter to match color of car.



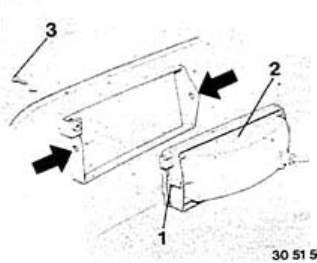
30 51 503

Cut side rubber guard sections to size as shown.



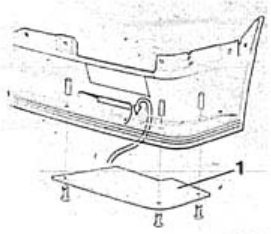
30 51 504

Grind off webs on license plate carrier.



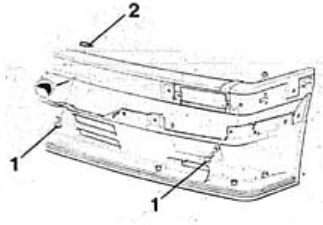
30 51 505

Mounting Front Fog Lamps on Front Spoiler:
Engage pins (1) of housing (2) in tabs of the trim panel provided for this purpose.
Screw in adjusting screw (3).



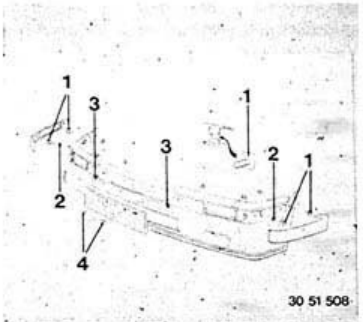
30 51 506

Rivet air guide plates (1) on front spoiler from the inside each with 3 expansion rivets.

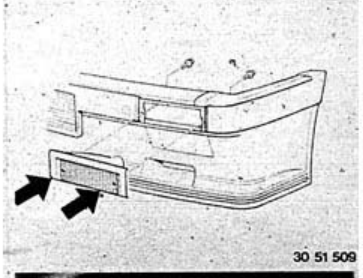


30 51 507

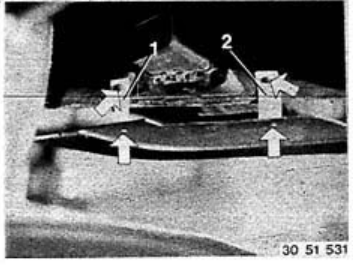
Mount front spoiler on bumper with 3 screws (1).
This requires drilling a 7 mm (0.275") dia. hole in the middle of the bumper (use spoiler as a template). Afterwards coat edges of hole with zinc dust paint to prevent corrosion.
Insert self-tapping nut (2) and tighten screws.



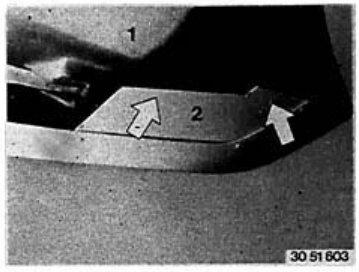
Screw on side rubber guard sections with screws (1) and spacers (2).
Mount license plate carrier with screws (3) and clips (4).



Screw on left and right turn signals.
Mount bumper complate with spoiler on body.
Important!
Check aiming if front fog lamps are mounted!
Installation:
Check for clearance between front spoiler and body (rubbing spots!).



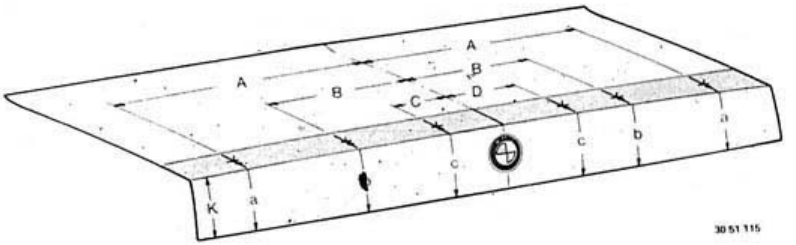
Only Cars Before 09/85:
Mount brackets on covers with expansion rivets.
Drill holes in wheel house shells and mount brackets (1 and 2) with expansion rivets.
Important!
Bracket (2) is bent stronger and must be mounted on the inside!



Only Cars Since 09/85:
Mount engine splash guard (1) and install left and right front spoiler covers (2) each with 2 expansion rivets.

51 71 412 INSTALLING REAR SPOILER

Install adhesive tape (approx. 30 mm (1.181") wide) at distance K to the trunk lid edge over the entire width. Mark center point of bore from the middle of the trunk lid and trunk lid edge (measuring tape), punch and drill (7.5 mm (0.295") diameter).



A	= 565 mm (22.244")	a	= 125 mm (4.921")
B	= 346 mm (13.622")	b	= 127 mm (5.000")
C	= 118 mm (4.646")	c	= 129 mm (5.079")
D	= 130 mm (5.118")		

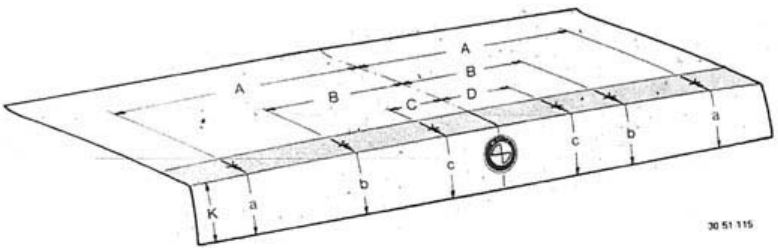
Pull off adhesive tape carefully. Deburr edges of holes and coat with zinc dust paint.
Screw on rear spoiler with the supplied cap nuts.

Painting Information:
Procedures for painting BMW plastic parts.

51 71 414 INSTALLING REAR SPOILER (M-SYSTEM)

Painting:
The panel of a rear spoiler is supplied with a prime coat and substructure paint coat, so that only the final paint coat has to be sprayed on.
Procedures: BMW Plastic Part Painting.
BMW Acrylic paint + 20 % BMW softface additive.
Important!
Maximum enamel baking temperature: 50° C (122° F) – higher temperature could lead to deformation.

Taping:
- Soak a clean cloth in washing gasoline or cold cleaner and wipe off surfaces to be taped.
- Position and press on the double-sided adhesive tape (heated hand warm prior to application!).
- Pull off protective backing and press on part at least 5 to 10 seconds. Initial adhesion can be improved by heating the body.

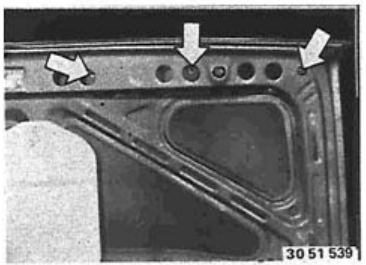


Drill holes in trunk lid of cars not having a standard rear spoiler. Install approximately 30 mm (1.181") wide adhesive tape across entire width of lid at distance K to lower edge of the trunk lid. Draw centerlines of holes from middle and lower edge of trunk lid (use measuring tape), punch and drill 7.5 mm (0.295") dia. holes.

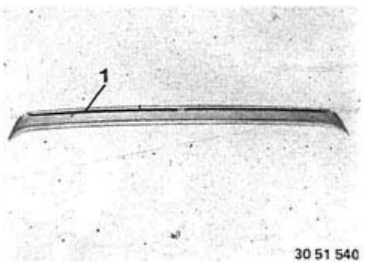
K = 110 mm (4.331")
A = 565 mm (22.244")
B = 346 mm (13.622")
C = 118 mm (4.646")
D = 130 mm (5.118")
a = 125 mm (4.921")
b = 127 mm (5.000")
c = 129 mm (5.079")

Pull off adhesive tape carefully. Deburr and coat edges of holes with zinc dust paint.

Cars With Standard Rear Spoiler:
Remove plastic nuts on inside of trunk lid and take off standard spoiler.



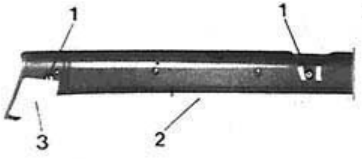
Paint the panel (refer to "Painting").
Install adhesive tape (1) (refer to "Taping").



Remove protective backing on adhesive tape and mount panel on rear spoiler.

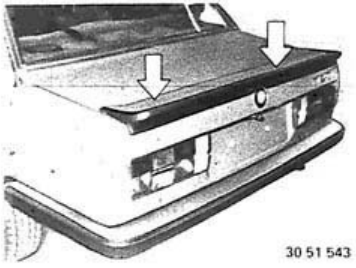
30 51 541

Screw on panel with three screws (1). Install adhesive strips (2) and adhesive molded parts (3).



30 51 542

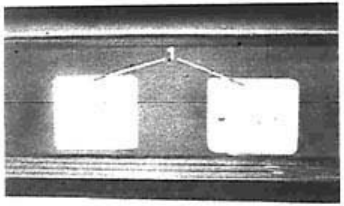
Pull off protective backing on adhesive tape, insert M-System rear spoiler in holes and screw on with plastic nuts and insulators.



30 51 543

51 71 423 INSTALLING TAIL PANEL (M-SYSTEM)

Painting:
The tail panel is supplied with a prime coat and substructure paint coats, so that only the final paint coat has to be sprayed on.
Procedures: BMW Plastic Part Painting.
BMW acrylic paint + 20 % BMW softface additive.
Caution!
Maximum enamel baking temperature: 50° C (122° F) – higher temperatures could lead to deformation.

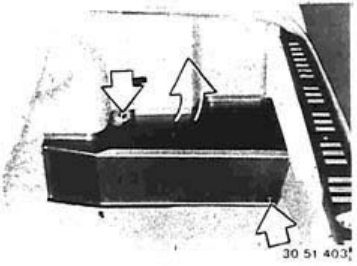


30 51 519

Cut out openings (1) in tail panel with a compass saw to take a trailer hitch as special equipment.
BMW 316, 318 i and 320 i:
Cut out tailpipe opening (2).
Afterwards smooth edges of openings with a file.
Openings are marked with ribs on back of panel (ribs remain!).
Important!
The prime coat must be touched up around openings to guarantee adhesion of the final paint coat.
Paint tail panel (see "Painting").

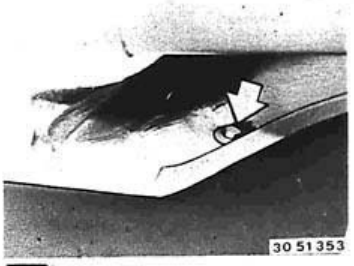
30 51 339

Removing Rear Bumper:
Uncover openings in side panels and unscrew left and right bolts.
Installation:
Tightening torque: 22 to 25 Nm (16 to 18 ft. lbs.).



30 51 403

If applicable, remove battery cover.

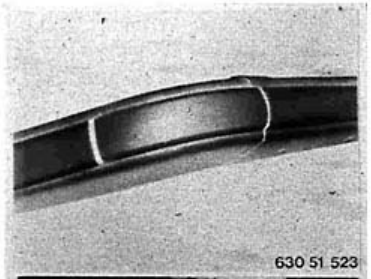


30 51 353

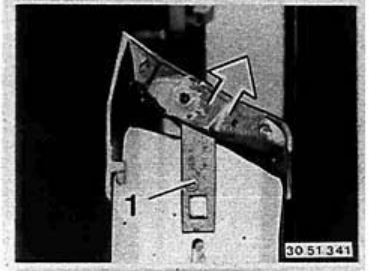
Unscrew left and right bolts.
Installation:
Coat bolts with body sealing compound.

30 51 340

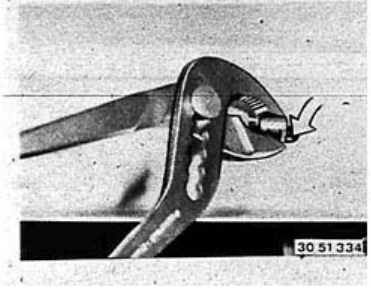
Unscrew left and right bolts.
Take off bumper.
Installation:
Tightening torque: 6 to 9 Nm (4.5 to 6.5 ft. lbs.).



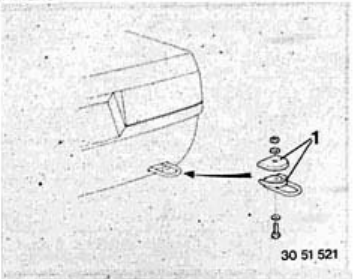
Mark radius inlet and outlet on rubber guard.



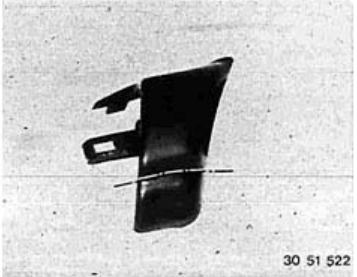
Lift tongue (1) and take off end piece.



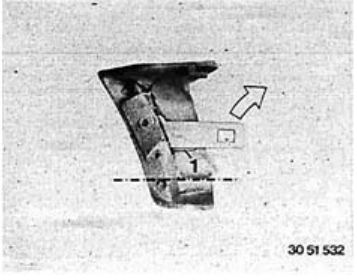
Compress and push through rubber guard clips.
Take off rubber guard.



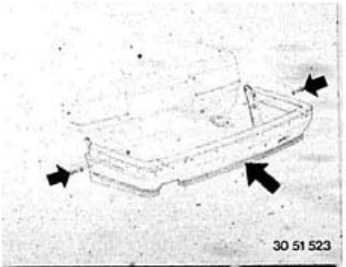
Extend the towing eye with supplied adapter (1).



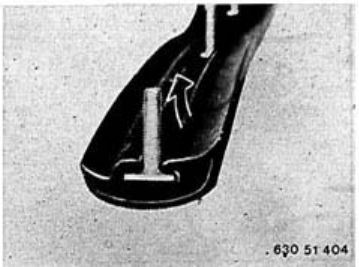
Cut off shoulders of rubber guard end pieces with an iron saw or grinder.



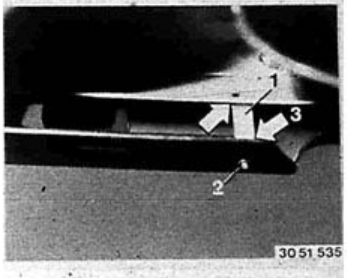
Cut rubber guard end pieces to size on inside as shown.
Leave outer tongue (1).
Coat metal insert with zinc dust paint to prevent corrosion.



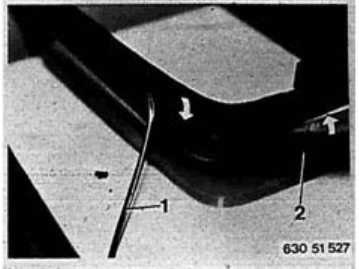
Mount bumper on body temporarily.
Mount, align and screw tail panel on bumper with two hexagon head screws provided for this purpose.



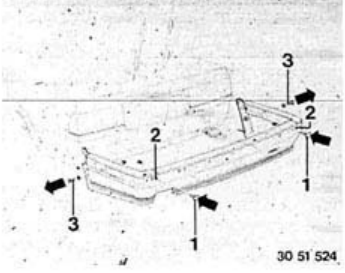
Slide screws into rubber guard and align with holes in bumper.



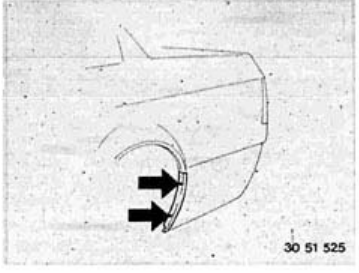
Screw bracket (1) on tail panel with self-tapping screws (2) and self-tapping nuts (3).
Mark location of 6 mm (0.236") dia. holes on tail panel and 5 mm (0.197") dia. holes on wheel house.



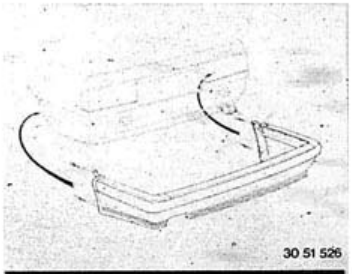
Install seal.
Screw on tail panel with rubber guard.
Note:
Knock on rubber guard, beginning at one side, with a rubber hammer lightly to guarantee good seating of the rubber guard and seal.
Cut off protruding seal, if necessary.



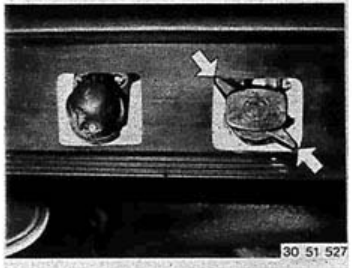
Remove bumper again.
Punch, drill and deburr edges of marked holes.
Coat edges of holes with zinc dust paint to prevent corrosion.
Insert screws (1) in holes (2) and tighten with hexagon nuts.
Remove hexagon head screws (3).



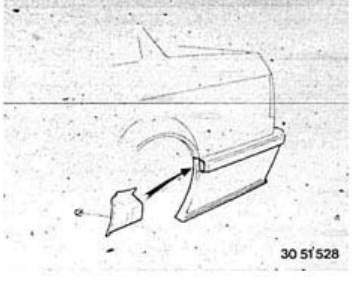
Paste plastic sheet on wheel housing opening and puncture holes.



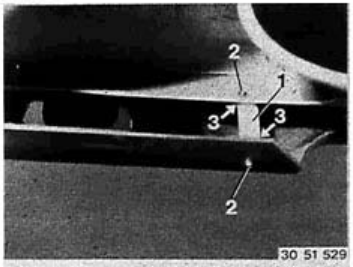
Mount bumper with tail panel on body.
Install blind rivets on wheel house opening.
Loosen wheel house shells.
Note:
It might be necessary to correct the height of the towing eye to avoid interference with the tail panel.



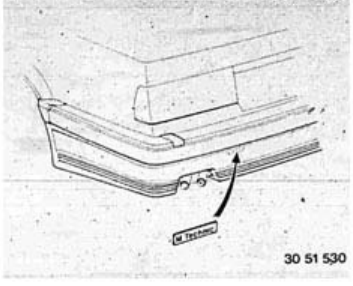
The locking bolt of a mounted trailer hitch, if applicable, must be diagonal to the opening in the tail panel, so that the bumper and tail panel can be installed.



Screw on rubber guard end pieces.



Screw bracket (1) on body with self-tapping screws (2) and self-tapping nuts (3).
Important!
Use a rubber washer between the mounting bracket and body!

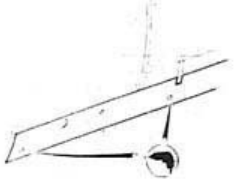


Install M-Technic label.

51 71 452 INSTALLING BOTH SIDE MEMBER COVER PANELS (M–SYSTEM)

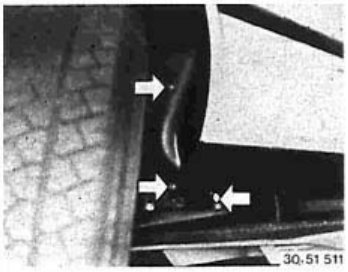
Painting:
The side member panels are supplied with a prime coat and substructure paint coats, so that only the final paint coat has to be sprayed on.
Procedures: BMW Plastic Part Painting.
BMW acrylic paint + 20 % BMW softface additive.
Caution!
Maximum enamel baking temperature: 50° C (122° F) – higher temperatures could lead to deformation.

Taping:
- Soak a clean cloth in washing gasoline or cold cleaner and wipe off the surface for adhesive tape.
- Position and press double-sided adhesive tape on side members (heat hand warm prior to application!).
- Pull off protective backing and mount the part, pressing on at least 5 to 10 seconds. The initial adhesion can be improved by warming the body.



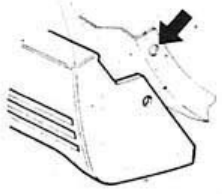
30 51 510

Paint side member panels (see "Painting").
Paste template on side members as shown and mark location of holes.
Punch centers and drill 9 mm (0.354") dia. holes with a spiral drill.
Deburr and coat edges of holes with zinc dust paint.
Treat side member cavities with a body cavity sealing compound to isolate any burrs from drilling which might have fallen in the side members.



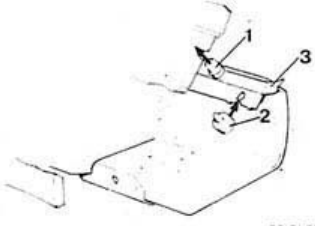
30 51 511

Remove screws on bottom of side panel.
Loosen wheel house shells.



30 51 512

Mount side member panel temporarily.
Mark location of holes on rear wheel house opening, punch centers and drill 5 mm (0.197") dia. holes.
Take off side member panel again.
Deburr and coat edges of holes with zinc dust paint.

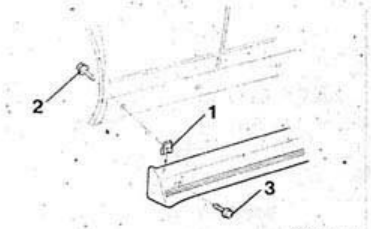


30 51 513

Install grommets (1) in side member.
Insert clips (2) in side member panel.
Install sealing tape (3).
Note:
Coat of PVC must be removed in area of holes for installation of grommets.

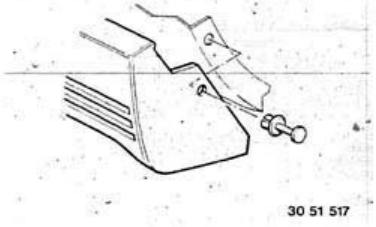
Paste plastic sheet on front and rear wheel house openings and puncture through holes.
Note:
Wrap and paste sheet around notched points.

30 51 514



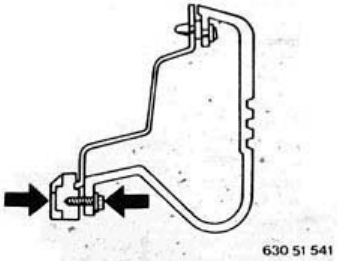
30 51 515

Install self-tapping nut (1).
Pull protective backing off of adhesive tape and mount side member panel again (refer to "Taping").
Screw in screws (2 and 3).



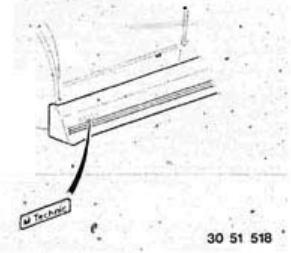
30 51 517

Install expansion rivets on rear wheel house opening.



630 51 541

Mount side member panel at bottom with clamps.
Note:
Remove PVC undercoat carefully in area of clamps.



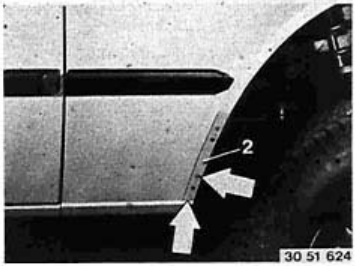
30 51 518

Install "M-Technic" label.

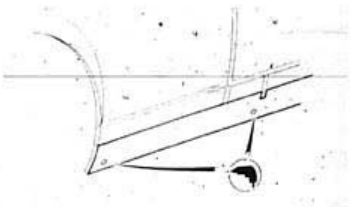
51 71 452 INSTALLING BOTH SIDE MEMBER COVER PANELS (M-SYSTEM VERSION II)

Painting:
Side member panels are supplied with a prime coat and substructure paint coats, so that only the final paint coat has to be sprayed on.
Procedures: BMW Plastic Part Painting (see BMW Paint Brochure).
BMW acrylic paint + 20 % BMW softface additive.
Caution!
Maximum enamel baking temperature: 50° C (122° F).

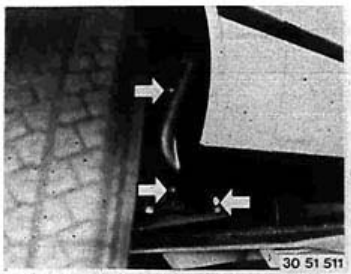
Taping:
- Clean surfaces for taping to remove grease.
- Install adhesive tape at room temperature. Heat parts being pasted to 40 ... 50° C (104 to 122° F) for sufficient adhesion and press on at least 5 to 10 seconds.



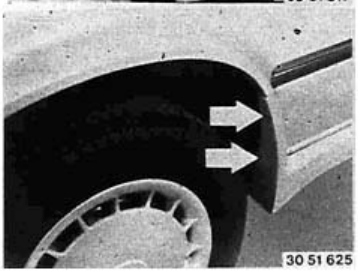
Paste template (2) along wheel housing opening (reference edges, see arrows), mark location of holes, punch centers and drill 5 mm (0.197") dia. holes with a spiral drill.
Open up holes to 9 mm (0.354") diameter with a 12 mm (0.472") dia. slicing drill.
Deburr and coat edges of holes with zinc dust paint.
Treat side member cavities with a body cavity sealing compound to neutralize any burrs from drilling which might have fallen in.



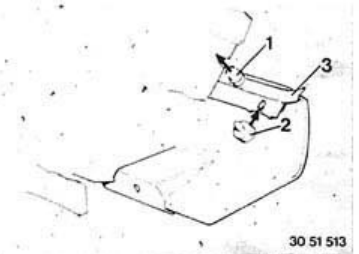
Paint side member panels (refer to "Painting").
Paste side member template (1) on side member as shown and mark location of holes.



Remove screws at bottom of side panels.

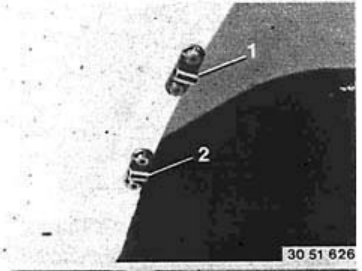


Mount side member panel temporarily.
Mark location of holes on rear wheel house opening, punch centers and drill 5 mm (0.197") dia. holes.
Take off side member panel again.
Deburr and coat edges of holes with zinc dust paint.
Important!
Press side member panel against wheel house opening firmly when marking location of holes.



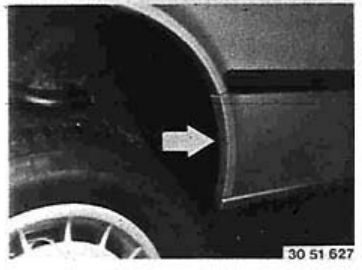
30 51 513

Install grommets (1) in side member.
Insert clips (2) in side member panel.
Install sealing tape (3).
Note:
Remove coat of PVC in area of holes for installation of grommets.



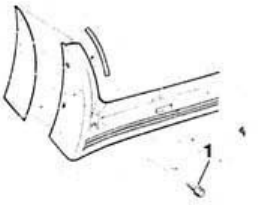
30 51 626

Install nuts (1 and 2) in front side panel.



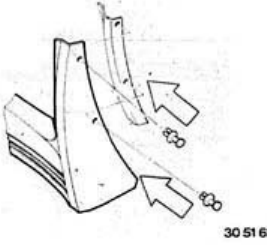
30 51 627

Paste plastic sheet on front and rear wheel house openings and puncture through holes.
Note:
Check part numbers:
1 952 343 = front left
1 952 344 = front right
1 952 341 = rear left
1 952 342 = rear right



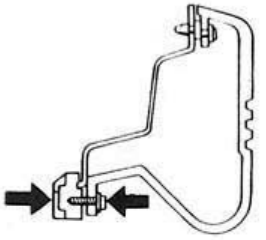
30 51 628

Pull protective backing off of adhesive tape and clip in the side member panel (refer to "Taping" instructions).
Screw in self-tapping screw (1).



30 51 629

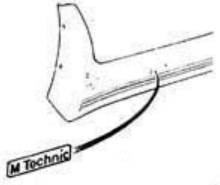
Install expansion rivets on rear wheel house opening.
Screw on front side member panel with self-tapping screws.



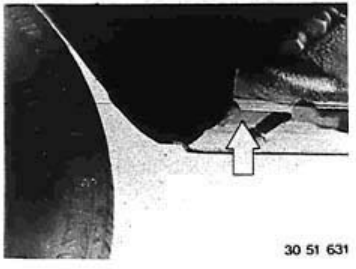
630 51 541

Mount bottom of side member panel with clamps.
Note:
Remove PVC undercoat carefully in area of clamps.

Install "M-Technic" label in recessed field.



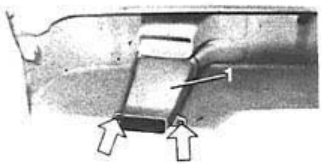
30 51 630



30 51 631

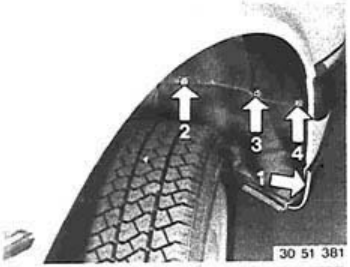
Important!
E 30 cars with mounted side member panels may only be lifted with 2-pillar lifting platforms at the front end on the suspension take-up points, and NOT on the car jack take-up points.

51 71 ... INSTALLING FRONT SPOILER (Until 1986 Models)



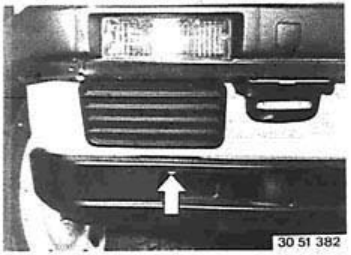
30 51 380

Rivet lower ventilation necks (1) on front spoiler.
Paint front spoiler.
Caution!
Maximum enamel baking temperature: 50° C (122° F) – higher temperature could lead to deformation.



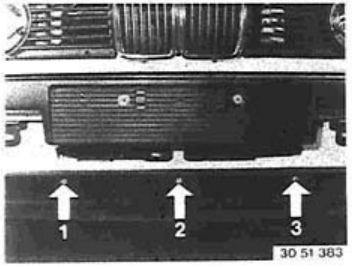
30 51 381

Removing Front Plastic Panel:
Unscrew self-tapping screws (1) on fenders with a 8 mm wrench and screws (2 ... 4) of plastic plates in wheel house on left and right sides.
Pull wheel house shells away to prevent damaging them when drilling holes.



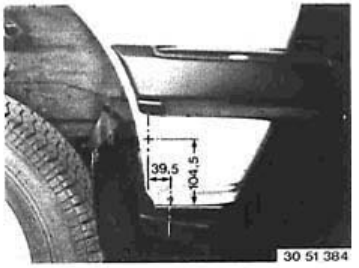
30 51 382

Remove phillips screws on left and right sides.



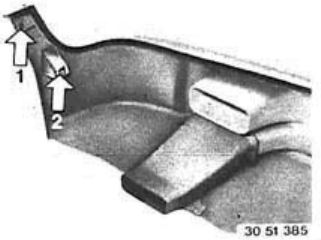
30 51 383

Unscrew self-tapping screws (1 ... 3) of front plastic panel.
Take off panel.



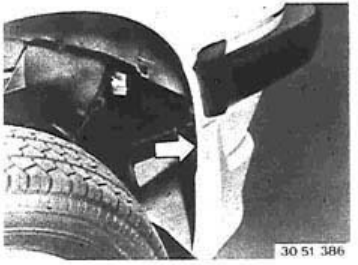
30 51 384

Install crepe tape on left and right fenders in area of holes.
Mark location of holes, punch centers and drill 9 mm (0.354") dia. holes.
Deburr and coat edges of holes with zinc dust paint.



30 51 385

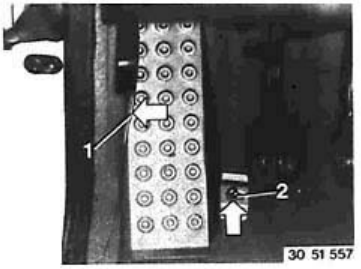
Install butyl tape on spoiler edge to seal.
Install self-tapping nuts (1 and 2) on left and right sides.



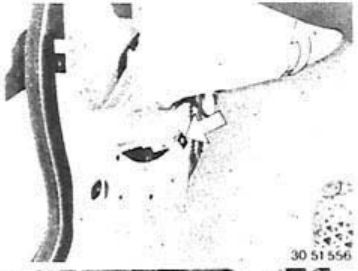
30 51 386

Mount spoiler, aligning slightly if necessary.
Note:
Both remaining screws must be screwed on the fenders before installation of the wheel house shells.

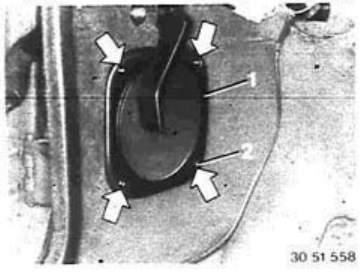
51 71 ... INSTALLING FOOTPROP (M-SYSTEM)



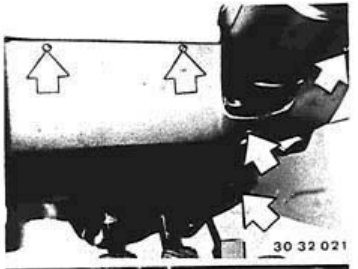
Push top of M-Technic footprop underneath the instrument panel trim.
Fit in footprop and mark location of mounting parts for rotating lock.
Puncture through carpet at this location with a punch and screw in the rotary lock.
Mount footprop with side screw (1) and rotary lock (2).
Place side carpet section over mounting bar of footprop.
Important!
It might be necessary to bend the bar slightly.



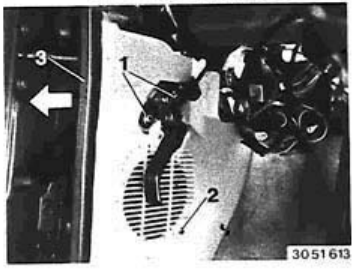
Cars Before 09/85 with Carpet and Without Front Radio Speakers:
Pull away side carpet section.
Install self-tapping nut.



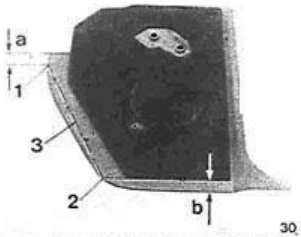
Cars Before 09/85 with Carpet and Front Radio Speakers:
Unscrew mask (1) and take out speaker.
Pull away side carpet section.
Slide holder of footprop underneath carpet and mount with screw (2).



Cars Since 09/85 with Plastic Side Panel:
Remove instrument panel trim – unscrew screws.

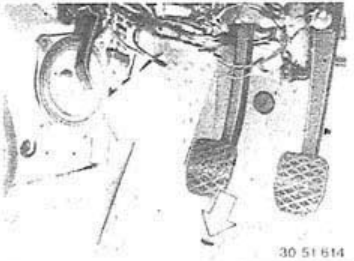


Removing Side Trim Panel:
Unscrew hexagon head screws (1) and self-tapping screw (2).
Pull off seal (3).
Take off engine hood release handle and side trim panel.



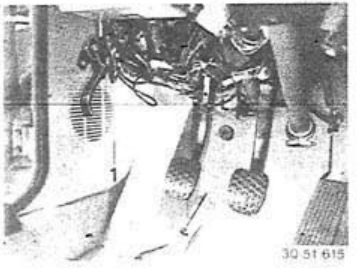
30 51 616

Cut out side trim panel as shown.
a = 30 mm (1.181")
b = 20 mm (0.787")
Mark points (1 and 2).
Draw cutting line (3), if not already available in form of a web, and cut side trim panel with a compass saw.
Smooth edges with a file, if necessary.



30 51 614

Cars with Front Radio Speakers:
Remove spacing clips.
Slide holder of footprop underneath speaker mount.
Mark location of puncturing point on carpet and puncture through carpet with a punch.

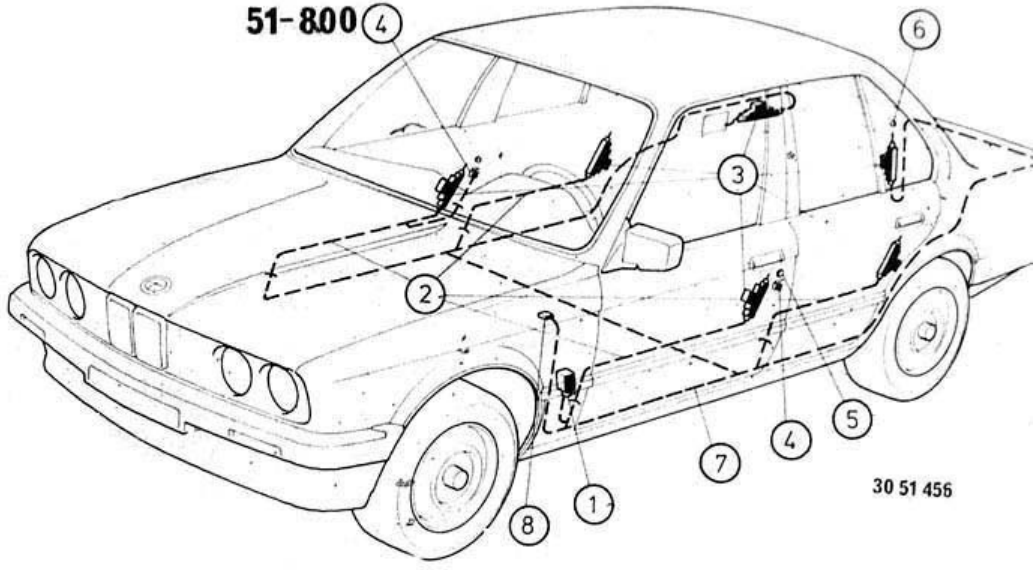


30 51 615

Install side trim panel and bolt down footprop with self-tapping screw (1).
Screw in rotary lock (2).
Install instrument panel trim.
It is recommended to cover the rotary lock with a BMW mat.

CENTRAL LOCKS WITH UNLOCKING ARREST – DESCRIPTION AND TROUBLESHOOTING –

1 Control unit / impact switch
2 Door wire harness
3 Drive for doors, trunk lid and tank flap
4 Microswitch - driver's/passenger's door
5 Lock cylinder - driver's door
6 Trunk lid lock
7 Main wire harness
8 Connection on special equipment plug

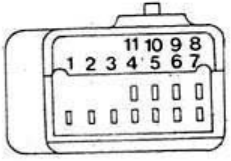


30 51 456

The locks of all doors, trunk lid and tank flap can be operated

a) with the driver's door lock (key turned 45°),
b) with the passenger's door lock,
c) with the trunk lid lock or
d) with the catch button on inside of the driver's door.

The unlocking arrest can only be operated via the driver's door lock (horizontal lock position). The locks cannot be unlocked with the unlocking buttons on the doors when the unlocking arrest is operated.
The trunk lid can still be unlocked and locked by turning the key clockwise even with the unlocking arrest operated.
The impact switch will unlock all locks automatically in case of a collision.
Note:
The tank flap can be unlocked manually by moving the locking rod (accessible from the trunk) in case of central locking system failure.
The central locking system is equipped with a multiple identifier (overload protector) since 9/85 models. Frequent operation of the locks within a brief period of time will activate the integrated overload protector, which switches off the system for a short time.



730 51 823

Control Unit/Impact Switch Connections:

Pin	Description		Wire Colors
1	Outlet LOCKED		blue
2	Outlet UNLOCKED		white
3	Battery +		red/black
4	Battery –		brown
5	Sensor +		green
6	Inlet I UNLOCKED	driver's and	green/blue
7	Inlet I LOCKED	passenger's door	yellow/blue
8	Inlet II LOCKED	trunk lid	green/black
9	Inlet II UNLOCKED	trunk lid	yellow/black
10	Inlet III LOCKED	unlocking arrest	red/brown
11	Outlet	unlocking arrest	black

TROUBLESHOOTING CENTRAL LOCKS

Test Requirements: Battery charged, at least 11 V, fuse no. 27 okay? — no → Check other connected electrical equipment: → On-board computer, burglar alarm, door lock heating.

yes
