Locks and lock cylinders in perfect mechanical condition.
All tests made against vehicle ground.
Tests on plug connections should be made on both sides of plug.
Tests made with BMW service tester or digital tester II.
Check installed position (see print) of control unit/impact switch.

1. Failure of Entire System: Locking is not possible from the driver's door, passenger's door or trunk lid with the central locking system unlocked.

Does pin 3 of control unit have voltage (red/black)? With connected plug U > 11 V. — no → Is there voltage in socket no. 15 (red/black) of driver's door/body plug? U > 11 V. — yes → Repair wire harness.

yes

no

yes

no

Is there voltage in socket no. 3 (red/black) of driver's door/body plug?
U > 11 V.

yes → Repair wire harness of driver's door. Also refer to driver's door/body plug connection (corrosion, no connection).

no

Check wire harness up to fuse box for breaks.

Does pin 4 (brown) of control unit have ground?
Ω ≈ 0.

no → Check socket no. 4 wire (brown) on control unit plug for breaks – repairing if necessary. Also refer to ground supply on central ground point behind the instrument panel at bottom left.

yes

Replace control unit.

2. No Function When Operating Driver's Door Lock (Unlocking – Locking)
– See Test Requirements –

Linkage connected – drive adjusted correctly and mounted – plug connected on drive? — no → Connect linkage, adjust/mount drive, connect plug. See 51 26 000.

yes

Pull off plug on drive. Supply car ground to socket no. 4 wire (green/blue) or socket no. 3 wire (yellow/blue). Does system unlock or lock? — no → Make connection between pin no. 6 (green/blue) or pin bo. 7 (yellow/blue) on control unit with connected plug and ground. Does system unlock or lock? — no → Break in wire (blue or white) to drive – repair.

yes

yes

Break in (green/blue) or (yellow/blue) wire – repair. Also refer to driver's door/body plug socket no. 12 and 11 (corrosion/no connection).

Check socket no 5 (brown) on plug for driver's door drive against car ground. Resistance ≈ 0 Ω ? — no → Break in drive ground supply – repair. Also refer to driver's door/body plug socket no. 2 (brown) (corrosion/no connection).

yes

Does drive switch through ground? — no → Replace drive.

1. Betw. pin 5 (brown) and pin 4 (green/blue).
   Eye pulled out Ω ≈ 0
   Pushed into drive Ω ≈ ∞
2. Betw. pin 5 (brown) and pin 3 (yellow/blue)
   Eye pulled out Ω ≈ ∞
   Pushed into drive Ω ≈ 0

3. No Function When Operating Passenger's Door Lock
   – See Test Requirements

   A. Unlocking Not Possible

Linkage connected/moves – drive adjusted correctly and mounted – plug connected on drive correctly?
- no → Connect/repair linkage –adjust/mount drive – connect plug/check contact. See 51 26 000.
- yes ↓

Pull off plug on drive. Supply vehicle ground to socket no. 4 wire (green/blue). Does system unlock?
- no → Make connection between pin 6 (green/blue) on control unit with connected plug and vehicle ground. Does system unlock?
  - no → Break in (blue) or (white) wire to drive – repair.
  - yes ↓ Break in (green/blue) wire – repair. Also refer to passenger's door/body plug socket no. 12 (corrosion/no connection).
- yes ↓

Check socket no. 5 (brown) on plug for passenger's door drive against car ground. Resistance ≈ 0 Ω ?
- no → Break in ground supply to drive – repair. Also refer to passenger's door/body plug socket no. 4 (brown) (corrosion/no connection).
- yes ↓

Does drive switch through ground? Between pin 5 (brown) and pin 4 (green/blue).
System unlocked Ω ≈ 0
System locked Ω ≈ ∞
- no → Replace drive.

B. Locking Not Possible

Is microswitch activated – is microswitch plug connection okay?
- no → Assembly view: Microswitch – see 51 26 000.
- yes ↓

Pull off plug on microswitch and supply vehicle ground to wire end socket no. 2 (yellow/blue). Does system lock?
- no → Make connection between pin 7 (yellow/blue) on control unit with connected plug and vehicle ground. Does system lock?
  - no → Break in (blue) or (white) wire to drive – repair.
  - yes ↓ Break in (yellow/blue) wire – repair. Also refer to passenger's door/body plug socket no. 11 (corrosion/no connection).
- yes ↓

Check socket no. 1 (brown) on microswitch plug against ground. Resistance ≈ 0 Ω ?
- no → Break in ground to microswitch – repair. Also refer to passenger's door/body plug socket no. 4 (brown) (corrosion/no connection).
- yes ↓

Does microswitch switch through ground? Between pin 1 (brown) and pin 2 (yellow/blue).
Switch pressed Ω ≈ 0 ?
Switch open Ω ≈ ∞ ?
- no → Replace microswitch.

4. No Function When Operating Trunk Lid Lock (Unlocking – Locking)
– See Test Requirements –

Linkage connected – drive adjusted correctly and mounted – plug connected on drive correctly?
— no → Connect linkage – adjust/mount drive – connect plug. See 51 26 020.

yes

Pull off plug on drive. Supply vehicle ground to socket no. 4 wire (green/black) or socket no. 3 wire (yellow/black). Does system unlock or lock?
— no → Make connection between pin 8 (green/black) or pin 9 (yellow/black) on control unit with connected plug and ground. Does system unlock or lock?
— no → Replace control unit. If applicable, check (blue) or (white) wire for breaks.

yes

Break in (green/black) or (yellow/black) wire – repair.

yes

Check socket no. 5 (brown) on plug for trunk lid drive against vehicle ground. Resistance ≈ 0 Ω ?
— no → Break in ground to drive – repair. Also refer to connection on central ground point behind instrument panel at bottom left.

yes

Does drive switch through ground?
— no → Replace drive.

1. Between pin 5 (brown) and pin 4 (green/black).
   Eye pulled out Ω ≈ 0
   Eye pushed into drive Ω ≈ ∞
2. Between pin 5 (brown) and pin 3 (yellow/black).
   Eye pulled out Ω ≈ ∞
   Eye pushed into drive Ω ≈ 0

5. No Function of One or Both Rear Doors (Unlocking – Locking – Arresting)
– See Test Requirements –

Linkage connected – drive adjusted correctly and mounted – plug connected on drive correctly?

no → Connect linkage – adjust/mount drive – connect plug. See 51 26 010.

yes ↓

Pull off plug on drive. Measure voltage:
Wire (blue) while locking briefly > 9 V.
Wire (white) while unlocking briefly > 9 V.
Wire (black) while arresting briefly ≈ 1 V.
Voltage values correct?

no → Pull off plug on control unit and check wires (blue/white and black) for breaks. Ω ≈ 0 ?

no → Repair wires.

yes ↓

Replace drive.

6. No Function When Operating the Unlocking Arrest
– See Test Requirements –

Is microswitch of driver's door operated? —— no ——→ Repair – also refer to 51 21 140.

yes

1. Unlocking – locking function: —— no ——→ Replace control unit, if applicable.
Voltage measured on control unit pin 10 (red/brown) > 9 V ?
2. Unlocking Arrest Operated:
Voltage measured on control unit pin 10 (red/brown) ≈ 0 V ?

yes

Pull off plug on microswitch and measure switch end. —— no ——→ Replace microswitch.
Switch opened betw. 1 and 2 ≈ ∞ Ω ?
Switch pressed betw. 1 and 2 ≈ 0 Ω ?

yes

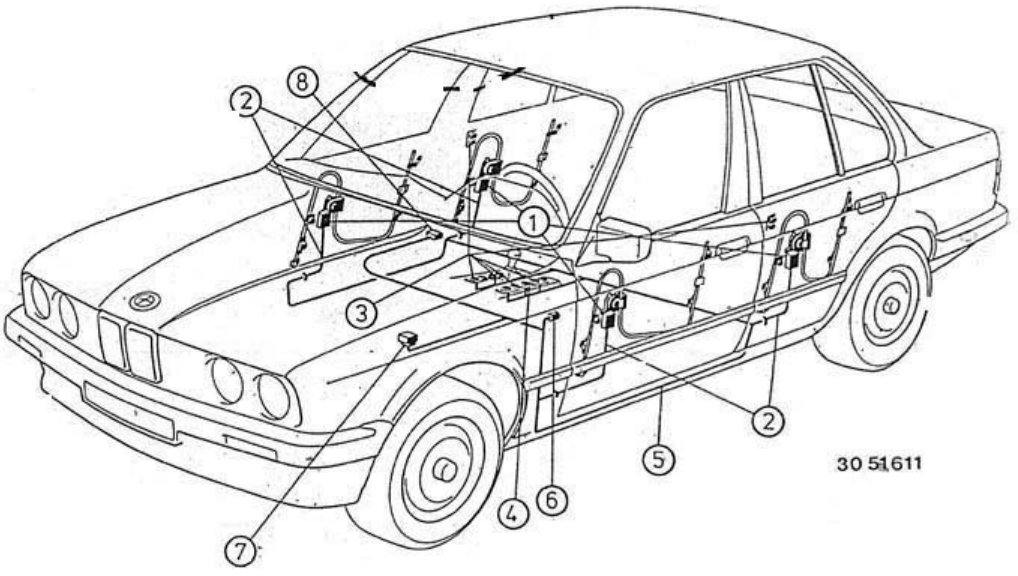
Check power flow in wires between socket no. 2 on microswitch plug wire end and socket no. 10 on control unit plug (red/brown wire). —— no ——→ Repair wires, if necessary. Also refer to driver's door/body plug socket no. 17 (corrosion/no connection).
Ω ≈ ∞ ?

yes

Check power flow in plug on microswitch wire end in socket no. 1 (white). —— no ——→ Break in ground supply wires – repair. Also refer to driver's door/body plug socket no. 10 (corrosion/no connection).
Ω ≈ 0 ?

POWER WINDOWS – DESCRIPTION AND TROUBLESHOOTING

1 Window motor
2 Door wire harness
3 Control switch
4 Child safety lock
5 Main wire harness
6 Connection on special equipment plug
7 Relay K 5 in fuse box or behind instrument panel at bottom left in case of service installation of holder on special equipment plug.
8 Safety switch



Power windows can be operated with the

a) push buttons in the center console or

b) push buttons in the trim panels of rear doors.

Operation with the push buttons in the trim panels of rear doors can be stopped by pressing the "child safety lock" push button in the center console.

The system is protected against excessive loads by a safety switch in the instrument panel.

TROUBLESHOOTING POWER WINDOWS

Test Requirements:
Battery charged with at least 11.5 V, fuse no. 17 okay? — no → Check other connected electric equipment. Sun roof – relay K 5.

yes

Only if function is not possible with driver's door open (comfort circuit). Fuse no. 28 okay? — no → Check other connected electric equipment (cigar lighter, automatic antenna, parked car heater).

yes

Power windows in perfect mechanical condition.
All tests made against car ground.
Plug connection tests made on both sides of plug.
Tests made with BMW service tester or BMW digital tester II.

1. Failure of Entire System
– See Test Requirements –

Does automatic cutout have voltage? > 11.5 V — no → Check (green/gray) wire to special equipment plug, power flow test if necessary.

yes

Does pin 3 (green/gray) of push buttons have voltage? > 11.5 V — no → Check wire harness for breaks, repairing if necessary.

yes

yes

Do pins 4 and 5 (brown) of push buttons have ground?
Ω ≈ 0 — no → Break in ground supply.
Power flow test:
Also check ground connection on central ground point behind instrument panel at bottom left.

2. No Function When Operating Power Window Push Button for Driver's Door
– See Test Requirements –

Does pin 3 (green/gray) of driver's door window push button have voltage?
> 11.5 V — no → Check wire harness for breaks, repairing if necessary.
Check plug connection on push button, repairing if necessary.
Check push button, replacing if necessary.

yes

Do pins 4 and 5 (brown) of driver's door window push button have ground?
Ω ≈ 0 — no → Check wire harness for breaks, repairing if necessary.
Also check central ground connection behind instrument panel at bottom left.

yes

Do pin 1 (black/white) and pin 8 (violet) have voltage or does pin 1 (black/white) have ground on the driver's door window push button while opening and closing the window? — no → Push button not switching voltage or ground through.
Check push button, replacing if necessary.

yes

yes

Is there voltage or ground in sockets 13 and 14 of the plug connection between the door wire harness and body when operating the driver's door push button? — no → Check wire harness for breaks, repairing if necessary.

yes

Is there voltage or ground in sockets 2 and 1 of plug connection between door wire harness and window motor when operating the driver's door push button? — no → Check door wire harness for breaks, repairing if necessary.

yes

Check window motor, replacing if necessary.

3. No Function When Operating Left Rear Door Window Push Button
– See Test Requirements –

Does pin 3 (green/gray) of left rear door window push button have voltage?
> 11.5 V — no → Check wire harness for breaks, repairing if necessary.
Check plug connection on push button, repairing if necessary.
Check push button, replacing if necessary.

yes

yes

Do pins 4 and 5 (brown) of left rear door window push button have ground?
Ω 0

no → Check wire harness for breaks, repairing if necessary. Also check central ground connection behind instrument panel at bottom left.

yes

Is there voltage on pin 1 (blue/green) and pin 8 (black/yellow) or ground on pin 1 (blue/yellow) of left rear door window push button while opening and closing?

no → Push button not switching voltage or ground through. Check push button, replacing if necessary.

yes

Is there voltage or ground in sockets 1 or 5 of plug connection between power window and body in the left B pillar while operating the left rear door window push button?

no → Check wire harness for breaks, repairing if necessary.

yes

Is there power flow between pins 4 and 1 or pins 5 and 8 of the left rear door window push button (not pressed)?

no → Check push button, replacing if necessary.

yes

yes

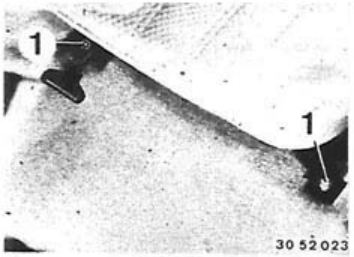
Is there voltage or ground in sockets 2 or 3 of the plug connection between left rear door wire harness and power window motor while operating the push button? — no → Check door wire harness for breaks, repairing if necessary.

yes

Check power window motor, replacing if necessary.

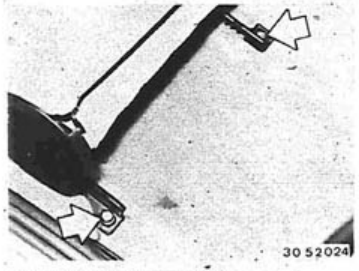
52 Seats

52 10 000	Front seat – remove and install	52- 1
100	Rail (outer or inner) on front seat – remove and install or replace	52- 1
210	Reclining mechanism on left or right front seat – remove and install or replace	52- 2
450	Backrest wall for left or right front seat – remove and install	52- 2a
52 20 000	Rear seat cushion and backrest – remove and install	52- 3
254	Lock for rear seat backrest, left or right – replace	52- 3

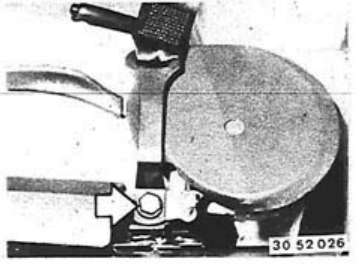


52 10 000 REMOVING AND INSTALLING FRONT SEAT

Push back seat.
Pull off caps.
Unscrew nuts (1).

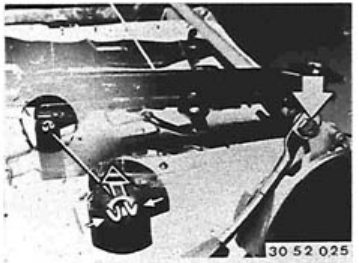


Push seat forward..
Pull off caps.
Unscrew nut and bolt.



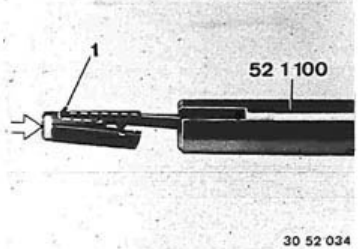
4 Doors:
Pull off cap.
Unscrew seat belt.
Installation:
Tightening torque*.

* See Specifications

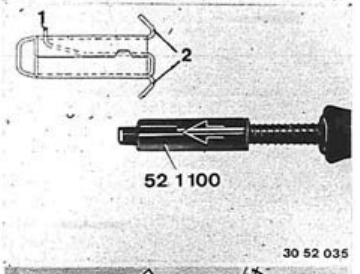


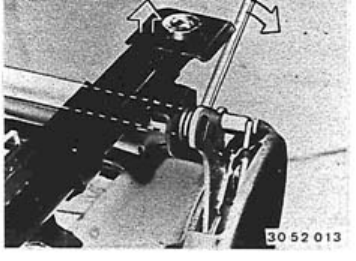
52 10 100 REMOVING AND INSTALLING OR REPLACING SEAT RAIL (OUTER OR INNER) ON LEFT OR RIGHT FRONT SEAT

Remove front seat – see 52 10 000.
Unscrew bolt.
Compress springs and pull out pin.
Installation:
Tightening torque*.
Always replace pin.



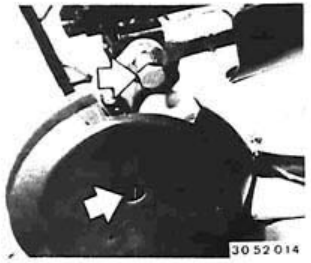
Saxionia Pin Shown Removed:
Guide in tongue of Special Tool 52 1 100 – arrest (1) is deactivated – add drive out pin.
Installation:
Always replace pin.
Drive in pin against stop with the special tool mandrel.
Check whether arrest (1) has engaged and stops (2) are not damaged.





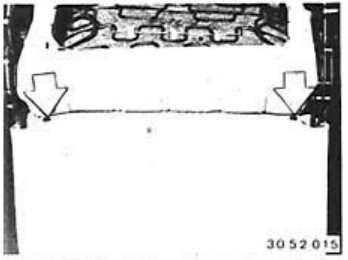
Disconnect linkage rod.
Lift connecting tube out of square hole in control lever with a screwdriver.

* See Specifications

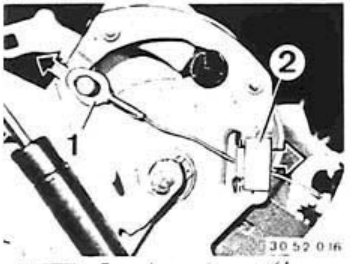


52 10 210 REMOVING AND INSTALLING OR REPLACING RECLINING MECHANISM ON LEFT OR RIGHT FRONT SEAT

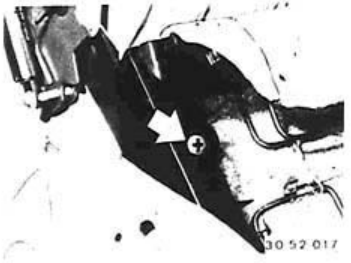
Remove front seat – see 52 10 000.
Remove seat rails – see 52 10 100.
Unscrew covers.



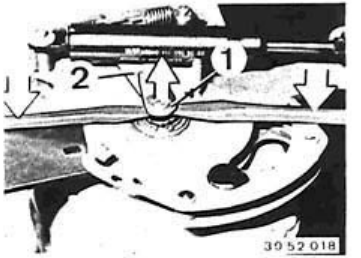
Unscrew screws and take off backrest trim panel.



Disconnect left and right cables (1) for backrest lock.
Press cable guides (2) out of holders.

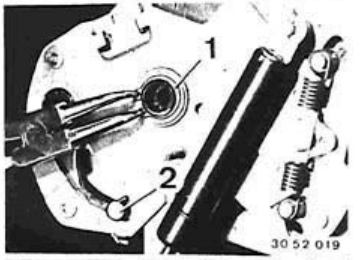


Disconnect seat cover partially.
Unscrew left and right bolts.
Take off backrest.

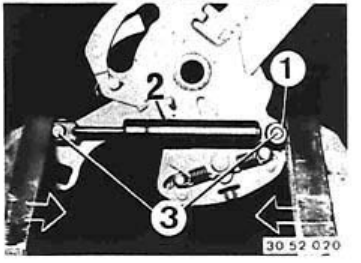


Lift out lever (1) with a screwdriver.

Installation:
Tab of lever (1) engages in lever (2).

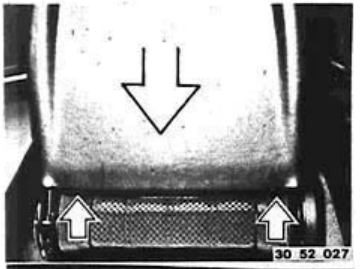


Remove circlip (1).
Unlock backrest with lever (2) and remove the reclining mechanism.



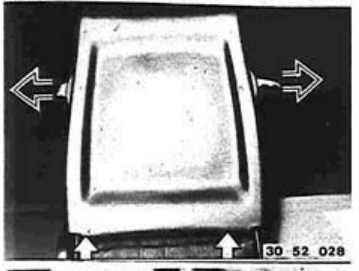
Pull off retainer (1).

Installation:
Connect gas pressure spring (2) with Special Tool 00 5 600 and secure with new retainers.

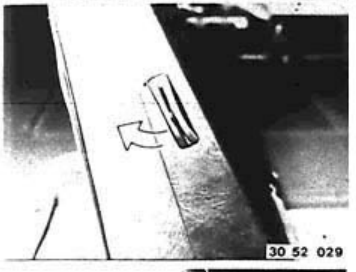


52 10 450 REMOVING AND INSTALLING PANEL ON BACK OF LEFT OR RIGHT FRONT SEAT BACK-REST

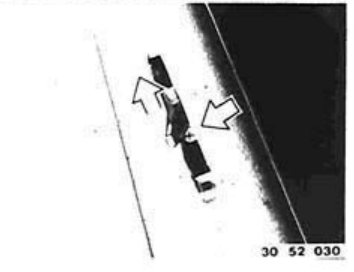
Unscrew screws and pull panel down.



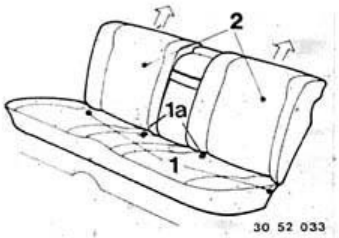
BMW Sport Seats:
Unscrew screws.
Pull off handles.



Lift out masks from underneath.



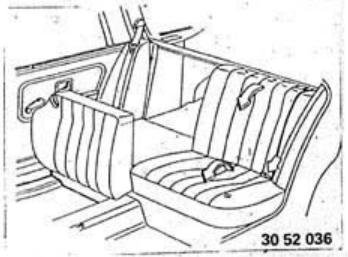
Inside Handle on Passenger's Side:
Unscrew screw and lift out holder upwards.
Push up panel and take it off over outside handle.



30 52 033

52 20 000 REMOVING AND INSTALLING REAR SEAT CUSHION AND BACKREST

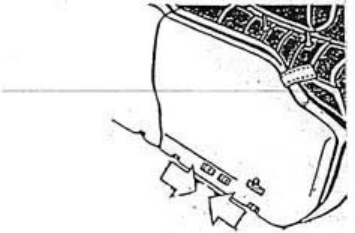
Lift out seat cushion.
Unscrew bolts (1), or (1a) for convertibles, and pull up backrest out of holders (2).



30 52 036

BMW Touring:

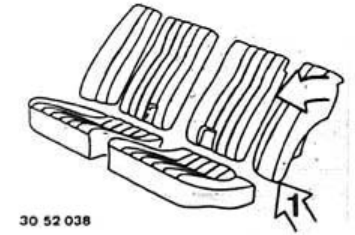
Split Rear Seat Cushion and Backrest:
Lift rear end of seat cushion on strap and tilt the cushion forward.



30 52 037

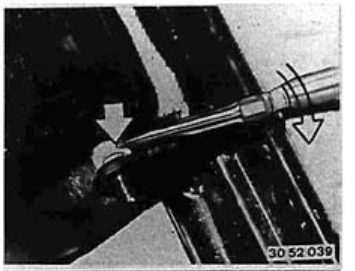
Push in both retainers and lift out both seat cushions separately.

Note:
Replacing Seat Cushion Covers:
Mount zipper with Special Tool 00 5 020.
Align the marks on the zipper to be opposite each other prior to installations.



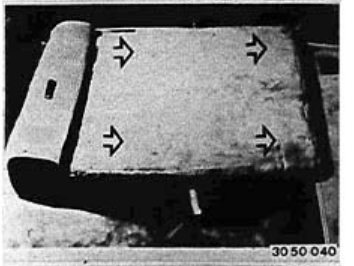
30 52 038

Removing Backrest:
Tilt the side backrest section forward for this purpose.
Unscrew bolt (1).
Lift out side backrest section.



30 52 039

Tilt backrest forward.
Push in retainers with a screwdriver.
Lift out backrest from the side.

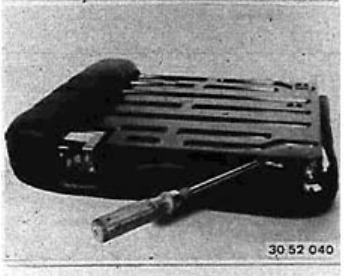


30 50 040

52 20 254 REPLACING LOCK FOR LEFT OR RIGHT REAR SEAT BACKREST

Slide off cover toward the rear.

Installation:
Install the backrest first and then the cover.



30 52 040

Pry off the backrest plate.

30 52 041

Unscrew lock bolts.
Disconnect linkage.
Remove backrest lock.

54 Hood, Sun Roof

54 12 004	Sun roof – adjust	54- 1
020	Sun roof winder – remove and install	54- 2
050	Sun roof winder recess plate – remove and install	54- 2
100	Sun roof lid – remove and install	54- 3
120	Sun roof lid seal – replace	54- 3
130	Sun roof lid liner frame – remove and install or replace	54- 3
230	Sun roof gearbox (manual) – remove and install or replace	54- 4
240	Sun roof drive cables (manual) – replace	54- 5
241	Sun roof drive cables (electric) – replace	54- 6
250	Sun roof gate, left or right – replace	54- 7
54 13 010	Sun roof motor / gear unit – remove and install or replace	54- 8
012	Motor / gearbox microswitch – replace	54- 8
	Sun roof – troubleshoot	54- 9
54 21 . . .	Hardtop – install	54- 14
	Hardtop – repair	54- 14/1
	Convertible top – general information	54- 15
54 31 020	Convertible top canvas – replace	54- 17
54 34 . . .	Electric / hydraulic convertible top	
	Description	54- 29
	Components	54- 30
	Fuses and relays	54- 35
	Convertible top assembly – remove	54- 36

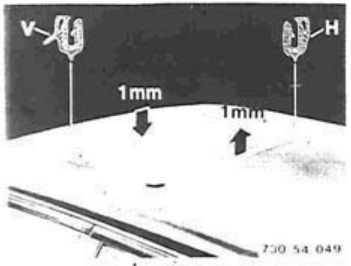
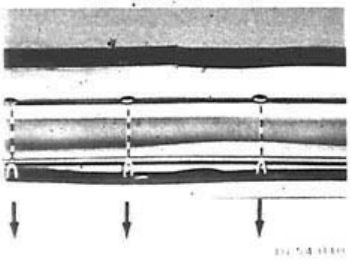
	EM top – control unit pin connections, fuses	54- 46
54 25 000	Electric top storage box lid drive – remove and install or replace	54- 47
001	Electric top storage box lid drive – adjust	54- 49
002	Linkage for top storage box lid drive – replace	54- 51
003	Top lid storage box lock, left / right – remove and install or replace	54- 52
005	Top storage box lid locks (both) – adjust	54- 52
006	Cable for left or right top storage box lid lock – remove and install or replace	54- 53
54 34 020	Electric top drive – remove and install or replace	54- 54
023	Electric top drive – adjust	54- 55
61 35 160	Control unit (EM top) – replace	54- 59
61 31 190	Microswitch (cow panel) – replace	54- 60
	Troubleshooting table for EM top microswitch	54- 61
61 90 . . .	Troubleshooting table for electric convertible top control unit	54- 64

54 12 004 ADJUSTING SUN ROOF

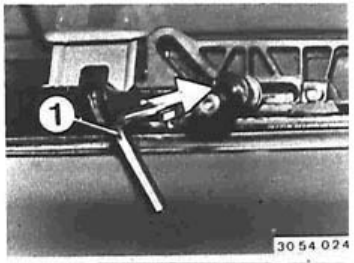
Description:
This sun roof can be operated as a
A) sliding roof and
B) lifting roof.
Switching to lift is only possible with the lid closed.
For electric sun roofs by way of a microswitch with the control switch in "close" position.
For manual sun roofs after overcoming a pressure point.



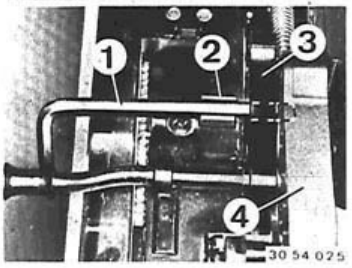
Ideal Sun Roof Lid Settings:
Heights:
Front = 1 mm (0.040") deeper than roof panel.
Rear = 1 mm (0.040") higher than roof panel.
Axial Setting:
Equal distance at front and rear between lid and roof – approx. 0.2 mm (0.008"), check with plastic gauge.
Check Velvet Strips:
V = Front with sealing lip
H = Rear without sealing lip



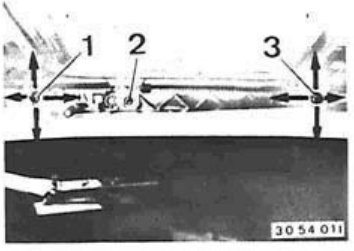
Open sun roof lid about 5 cm (2").
Press off front roof liner frame.
Close sun roof lid and slide back roof liner frame completely.
Installation:
Close sun roof lid.
Pull roof liner frame forward uniformly.
Open sun roof lid slightly, while holding roof liner frame by hand.
Press in holding clamps for front roof liner frame.



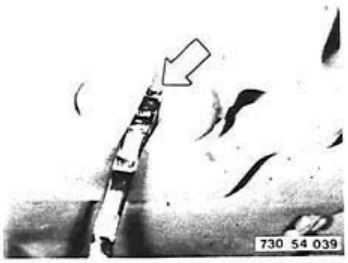
Sun roof closed = position 0.
Lock sun roof in position 0 on left and right sides with a 4 mm key (1).



Note:
Place key (1) in holder of guide pin (2) and insert in hole of operating lever (3) and gate (4).

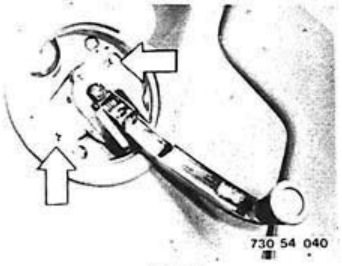


Loosen screws (1 ... 3) on left and right sides with Special Tools 00 2 102/103.
Slide and adjust sun roof in slots.
Note:
Replace self-locking screws.
Tightening torque: 3.5 Nm (2.5 ft. lbs.)

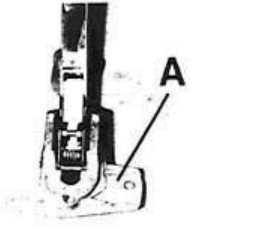


54 12 020 REMOVING AND INSTALLING SUN ROOF WINDER

Close sun roof lid to pressure point (do not lift lid).
Unscrew screw and take off escutcheon.

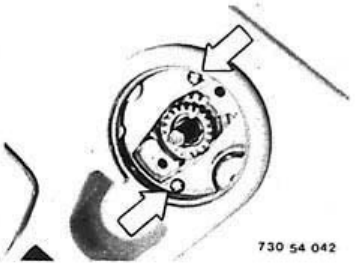


Unscrew screws and take off winder.



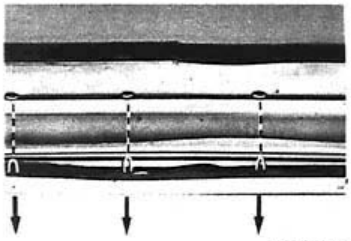
730 54 041

Installation:
Large opening (A) faces rear.



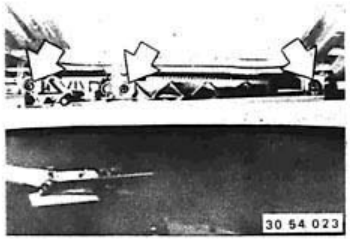
54 12 050 REMOVING AND INSTALLING SUN ROOF WINDER RECESS PLATE

Remove and install sun roof winder 54 12 020.
Unscrew screws and remove recess plate.

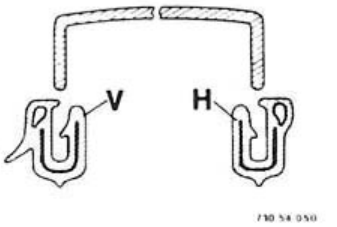


54 12 100 REMOVING AND INSTALLING SUN ROOF LID

Close sun roof lid but for about 5 cm (2").
Press off front roof liner frame.
Close sun roof lid and slide back roof liner frame completely.
Installation:
Close sun roof lid.
Pull roof liner frame forward uniformly.
Open sun roof lid slightly, while holding roof liner frame by hand.
Press in holding clamps for front roof liner frame.



Unscrew bolts on left and right sides with Special Tool 00 2 130.
Lift off sun roof lid.
Installation:
Adjust sun roof - see 54 12 004.
Replace self-locking bolts.

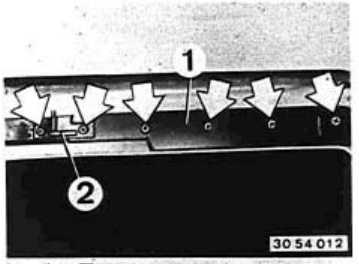


54 12 120 REPLACING SEAL FOR SUN ROOF LID

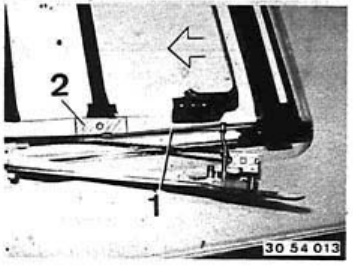
Remove sun roof lid - see 54 12 100.
Pull seal off of lid.
Installation:
Install seals with cement*.
V =Short front velvet strip (sealing lip faces forward)
H =Long rear velvet strip

54 12 130 REMOVING AND INSTALLING OR REPLACING ROOF LINER FRAME FOR SUN ROOF LID

Remove sun roof lid - see 54 12 100.



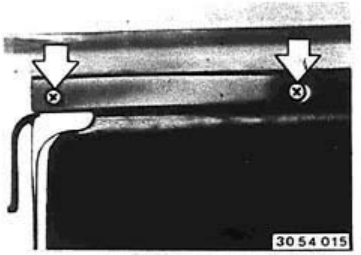
Unscrew screws on left and right sides.
Remove cover rails (1) and guide pins (2).
Guide pins (2) are marked with "L" for left or "R" for right.



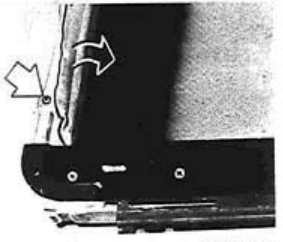
Pull cables out of guides.
Pull roof liner frame forward and remove.
If applicable, unrivet and rivet connecting rods (1).
Use a piece of tape on both sides in area of rivets (to avoid rattling noise).

* Source of Supply: HWB

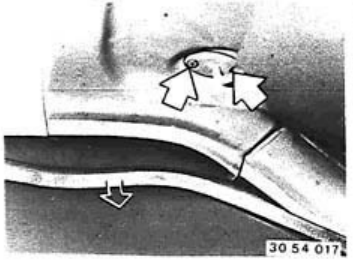
54 12 230 REMOVING AND INSTALLING OR REPLACING GEARBOX FOR MANUAL SUN ROOF



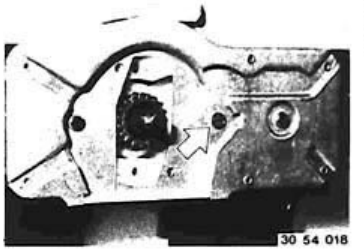
Unscrew clamping strip.



Pull off trim carefully.
Unscrew screws on left and right sides.
Installation:
Paste trim.



Close sun roof.
Remove and install winder recess plate 54 12 050.
Remove sun visors with holders.
Pull off edge guard partially.
Installation:
Insert rubber cover for inside mirror in plate.

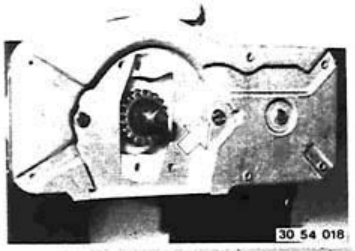


Unscrew bolt.
Remove gearbox.
Installation:
Set gearbox to position 0 (pressure point).

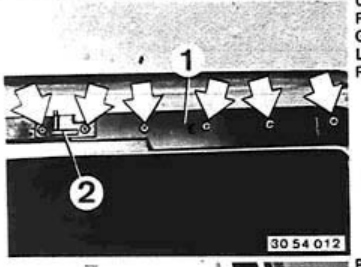
54 12 240 REPLACING BOTH DRIVE CABLES FOR MANUAL SUN ROOF LID

Remove and install sun roof lid 54 12 100.
Remove and install winder recess plate 54 12 050.

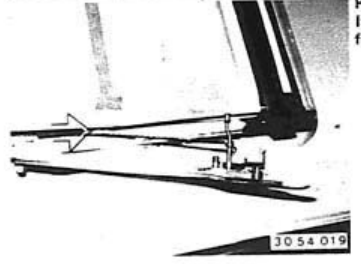
Loosen screw.

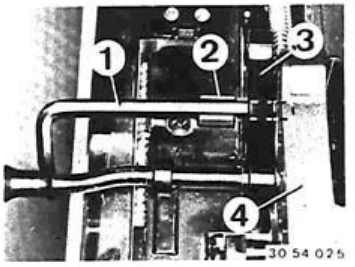


Unscrew screws on left and right sides.
Remove cover rails (1) and guidepins (2).
Guidepins (2) are marked with
L for left or
R for right.

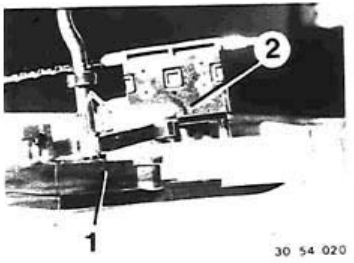


Pull drive cables out of guide tubes.
If necessary, loosen gearbox mounting screw further so that drive cables have free movement.





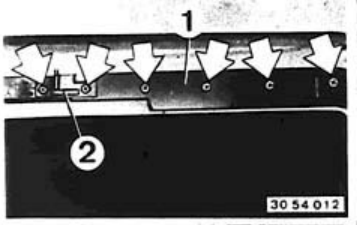
Installation:
Place 4 mm key (1) in holder of guidepin (2) on left and right sides and insert in holes of operating lever (3) and gate (4).
Set gearbox to position 0 (pressure point) and tighten screw.



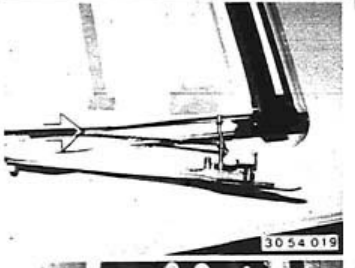
Press gate (1) off of drive cable (2).
Drive cables (2) are marked with
L for left or
R for right.

54 12 241 REPLACING BOTH DRIVE CABLES FOR ELECTRIC SUN ROOF LID

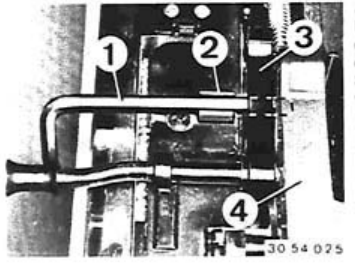
Remove and install sun roof lid 54 12 100.
Remove and install motor/gearbox unit for sun roof 54 13 010.



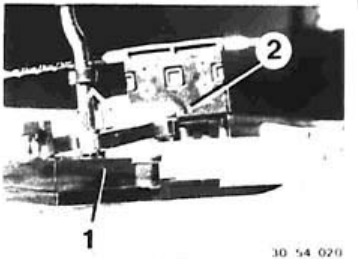
Unscrew screws on left and right sides.
Take off cover rails (1) and guidepins (2).
Guidepins (2) are marked with
L for left or
R for right.



Pull drive cables out of guide tubes.

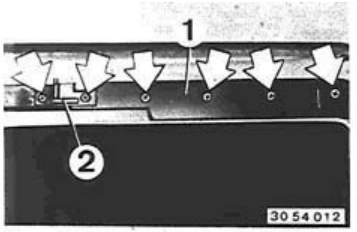


Installation:
Place 4 mm key (1) in holder of guidepin (2) on left and right sides and insert in holes of operating lever (3) and gate (4).
Set motor/gearbox unit to position 0 and tighten screw.

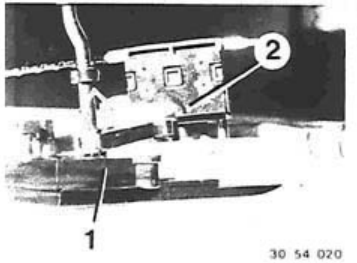


Press off gate (1) on drive cables (2).

54 12 250 REPLACING LEFT OR RIGHT GATE FOR SUN ROOF



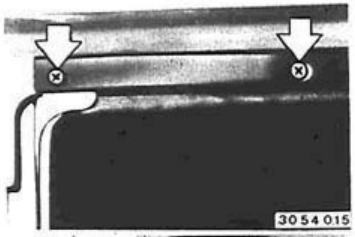
Remove sun roof lid – see 54 12 100.
Unscrew screws on left and right sides.
Take off cover rails (1) and guide pin (2).
Guide pin (2) is marked with
L for left or
R for right.



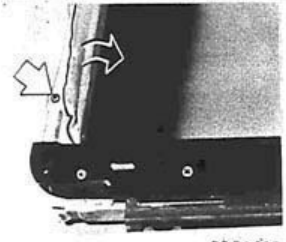
Pull cable out of guide.
Press gate (1) off of drive cable (2).
Transfer and lubricate slide with grease*.

* Source of Supply: HWB

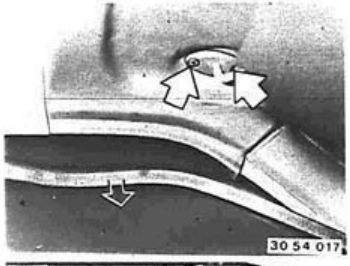
54 13 010 REMOVING AND INSTALLING OR REPLACING MOTOR/GEAR UNIT FOR SUN ROOF



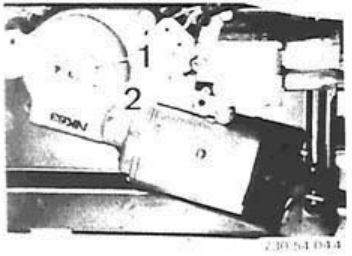
Detach clamping strip.



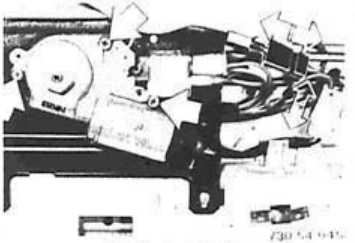
Pull off trim carefully.
Unscrew left and right bolts.
Installation:
Paste trim.



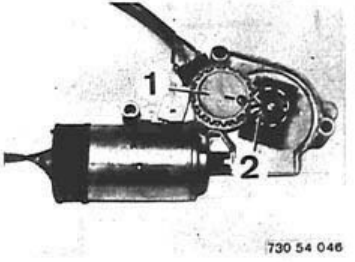
Remove control switch.
Remove sun visors with holders.
Pull off edge guard partially.



Close sun roof.
Manual Operation:
Unscrew nut (1) and turn drive shaft (2) with a socket wrench.
Close roof.

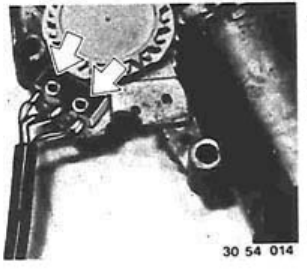


Disconnect plugs.
Unscrew bolts and remove motor/gear unit.



Installation:
Mark of switching gear (1) must be aligned with mark of control gear (2).
Lubricate teeth of pinion, control gear and switching gear with grease*.

Adjusting Motor/Gear Unit:
Unscrew nut (1) and adjust with socket wrench as described above.
Tighten nut to 450 ± 35 Nm (39 ± 3 in. lbs.).
Check function.



54 13 012 REPLACING MICROSWITCH FOR SUN ROOF MOTOR

Remove and install motor/gear unit 54 13 010
Drill out hollow rivets and rivet on new microswitch.

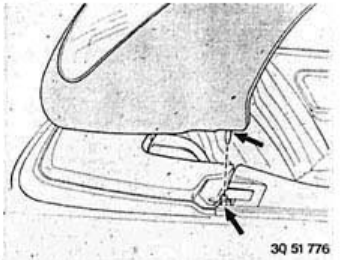
* Source of Supply: HWB

TROUBLESHOOTING SUN ROOF

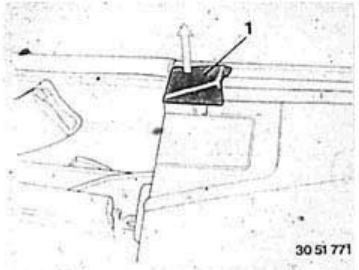
Condition	Cause	Correction
Rattling noise	a) Maladjusted	a) Adjust sun roof
	b) Guide tubes knocking against each other	b) Wrap tape around guide tubes
	c) Roof liner frame knocking against sun roof lid when open	c) Paste foam rubber on corners of sun roof frame
	d) Connector for water drain knocking on guide rail	d) Paste tape on rivets and guide linkage
	e) Excessive play of slides in guide rails as well as upper guide pins in gates	e) See Service Information 54 01 84 (298)
Sun roof can be lifted, but does not slide	a) Pins on gate holders bent	a) Replace gate holders
Sun roof lifts onesidedly	a) Drive cables maladjusted in position 0	a) Adjust drive cables in position 0
	b) Rear guide turns on drive cable	b) Lock drive cable in front of and behind guide with punch marks or by squeezing
Grinding noise when opening and closing	a) Sliding rails and plastic parts lubricated	a) Remove grease and/or replace slides
Grinding noise when lifting	a) Front seal dry	a) Lubricate seal with vaseline
	b) Contact force on front seal excessive	b) Adjust lid
Water leaking through roof liner area	a) Sun roof maladjusted in position 0	a) Adjust sun roof in position 0
	b) Seals loose/damaged	b) Paste/replace seals
	c) Wrong seal installed (front/rear seals different in shape)	c) Install original spare parts
	d) Drain hoses plugged	d) Clean drain hoses
	e) Guide rails and cover plates seal insufficiently on roof frame	e) Seal guide rails and cover plates
	f) Corners in rear roof opening leak	f) Seal corners
	g) Hose outlets plugged with sealing compound foam	g) Clean hoses

Condition	Cause	Correction
Exhaust odor in passenger compartment	a) Check flaps do not close	a) Service flaps
Whistling noise with sun roof closed	a) Excessive gap between roof and sun roof front or rear	a) Replace rubber seals or adjust sun roof lid
ELECTRIC SUN ROOF		
Drive motor does not run	a) Fuse blown b) Control switch defective c) Wire harness has a break d) Drive motor defective	a) Replace fuse b) Replace control switch c) Check or replace wire harness d) Replace drive motor
Drive motor runs, but sun roof lid does not move	a) Insufficient contact force of slip clutch	a) Adjust slip clutch
Sun roof does not lift	a) Relay defective b) Maladjusted	a) Replace relay b) Adjust position 0 of sun roof
Sun roof goes immediately to lift position when closed	a) Microswitch defective	a) Replace microswitch on drive motor

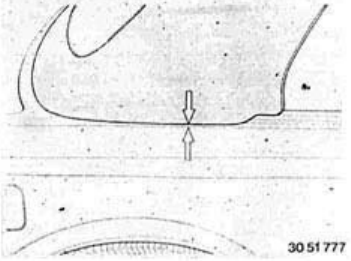
54 21 ... INSTALLING HARDTOP



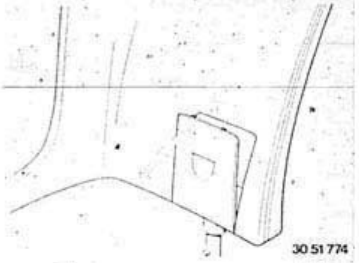
Mount hardtop with pins in the holders.



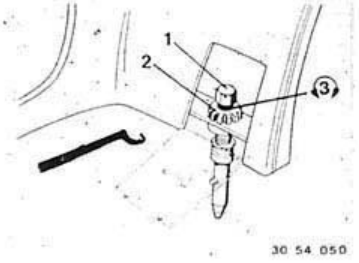
Wind down side windows completely.
Fold in the top.
Close the top lid.
Pull out plug (1).



Adjust spacing between hardtop and body to 5 ... 6 mm (0.197 to 0.236").
Turn locking screw with an open-end ring wrench until the lock is noticed to engage.
Engage the front locks.



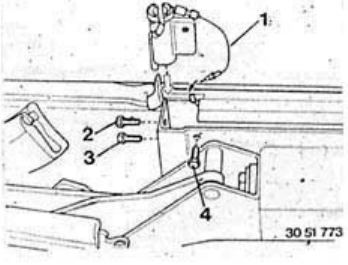
Fold down covers of rear fasteners on the hardtop.



1 Locking screw

2 Knurled nut for locking with special tool

3 Adjusting screw



Note for Hardtop Holders:
Connect rear window defogger lead (1).
Screw on left and right hardtop holders, each with three screws (2 ... 4).
Note:
Lock screws with Loctite.
Lubricate slip contacts with a light coat of contact grease.

INFORMATION FOR REPAIRING HARDTOPS

The conditions mentioned below for hardtop repairs conform with legislation in the Federal Republic of Germany. Always conform with the pertinent legislation of other countries.

This repair manual is provided for qualified workers and assumes their skill, conscientiousness and sense of responsibility. The instructions are limited to factory approved repairing methods as well as associated tips and measures to make the work easier. Only general working procedures are described in these instructions. The scope of work and order of procedures will always have to be adapted to the pertinent damage condition. Repairs are an economical solution so that optical deficiencies cannot be excluded. Consequently repairs should be carried out only with explicit approval of the customer.

Important!
Only such damage, which does not have influence on the strength and rigidness of the hardtop, may be repaired. The following types of damage may not be repaired on the honeycomb structure of the hardtop in the interest of safety.

- Damage on body mounting points.
- Damage in immediate vicinity of body mounting points.
- Ruptures.
- Cracks extending through the honeycomb structure with a length of more than 100 mm (4").
- Cracks in the surface of the honeycomb structure, which extend from corners and edges.
- Holes larger than 2500 mm^2 in size.
- Moisture must not have penetrated into the honeycomb structure.

A hardtop with this type of damage or similar must be replaced.

Required Materials and Equipment:

- Ultraviolet lamp*
- Ultraviolet light hardening fiber filler*
- Ultraviolet light hardening final filler*
- Sandpaper, grain size P 100 and P 220*
- Saddler's knife (standard tool)
- Rubber roller - approx. 25 mm dia., approx. 100 mm wide (standard tool)
- Gloves*
- Goggles*
- Mask*
- Repair patches* (match color of hardtop skin)
- Cement TIVO 3433/26*
- Hardener TIVOCUR bc 80 11*
- Plastisol*, colorless
- Glass rod*
- Satin-finished clear lacquer*

* Source of Supply: HWB

SAFETY PRECAUTIONS!!

Protective Measures:

- Wear workclothes to cover bare skin.
- Extract grinding abrasion.
- Wear goggles and mask while grinding.
- Work only in well ventilated rooms.
- Wash hands frequently.
- Keep food stored separately.
- Do not eat, drink or smoke while working.
- Do not inhale vapors.

First Aid:

Take off dirty clothes immediately. If dust has gotten in eyes, rinse out with plenty of water and go to a physician. Tab coated skin and wash with plenty of water. If great amounts of vapors are inhaled, go outdoors in the fresh air and, if necessary, visit a physician.

Information on Toxicology:

Systems containing styrene will irritate eyes, skin and the respiratory trck. No injurious effects are known,as long as handling is correct.

Measures in Case of Fire:

Fire extinguishing agents: water mist (no water stream), powders, foam, CO_2 and halon.

Scrapping:

Never let it get into drink water systems.
It can be brought to the normal refuse station after hardening.

Procedures:

1. Place repair patches on the damaged surface and hold them in position with adhesive tape. Cut out patches and roof skin together with a saddler's knife (at right angles to the surface being repaired).

2. Remove old cement and clean the repair surface.

3. Repair damaged point in the honeycomb structure with a fiber filler and harden with an ultraviolet light. In case of deeper damage apply the filler in layers and then harden with an ultraviolet light. Then apply a coat of final filler and harden with an ultraviolet light.

4. Grind and clean repair surface.

5. Mix cement and hardener in ratio of 15 to 1.

6. Apply a thin coat of the mixed cement on the repair surface and back of patches.

7. Allow about 15 minutes drying time for the cement.

8. Apply patches (edges butted) and press on firmly with a rubber roller.

   Important!
   If applicable, remove any cement squeezed out on the sides (don't smear it!).

9. Dip a glass rod in Plastisol and coat the butt edges thoroughly.

10. Allow about 15 minutes drying time for the butt edges.

11. Clean part of or the entire hardtop with an alcoholic solution (2 %) or watery solution on soap basis.

12. Paint part of or the entire hardtop with clear lacquer.

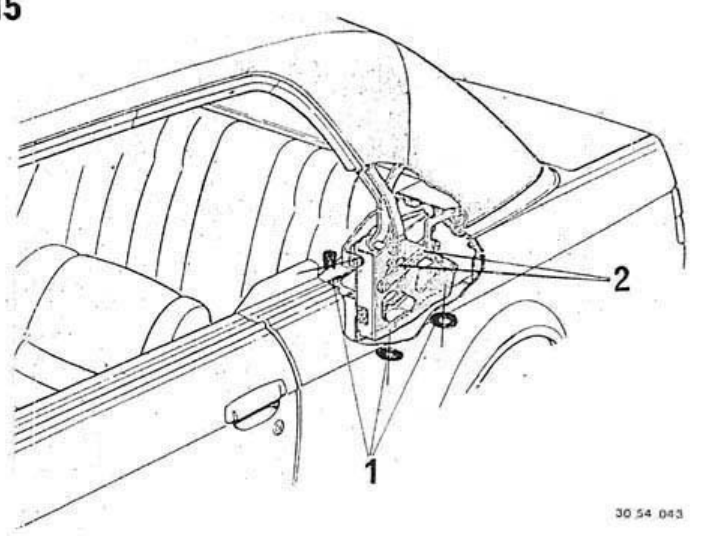
CONVERTIBLE TOP – GENERAL INFORMATION

Rear Window
- It is integrated in the top and cannot be replaced.
- Light scratching and smearing can sometimes be eliminated by heating the rear window to max. 90° C (195° F) with a hot air blower or heater.

Top
- Can only be replace complete.
- Use a convertible top cleaner for cleaning.

Frame
- Can only be replaced complete. Straightening is not approved.
- Replace gas pressure props when customer complains that top is too difficult to close (lift out of the top box).
- The joints of frame do not require servicing.
- Lubricate guides (2) with grease*.

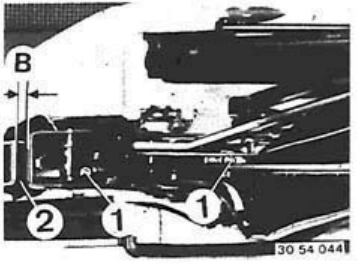
Seals
- Rubber seals must be coated with a lubricant*, if necessary.



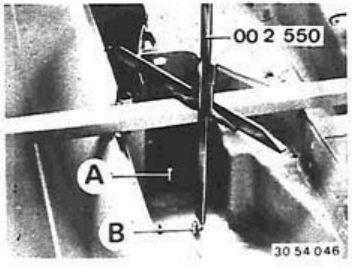
1 = Shims for top adjustment
2 = Lubricating points

* Source of Supply: HWB

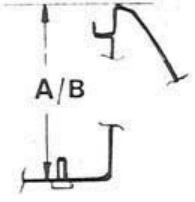
Adjusting Top:
Place rails on left and right side panels.
Rails must bear on metal – pull off the rubber partially.



Hold top with nuts (1) – it must still be possible to move the top.
Close the top and adjust distance (B) on the front mounting points with shims (2), which are available in thicknesses of 1 mm (0.039").
Tighten top nuts.

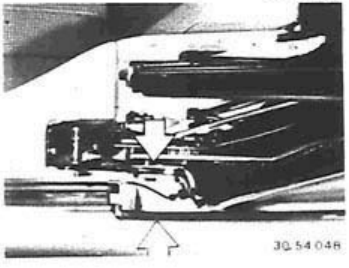


Measure distance from side panel (lower edge of rail) to bearing surface of top console at both threaded pins with Special Tool 00 2 550.



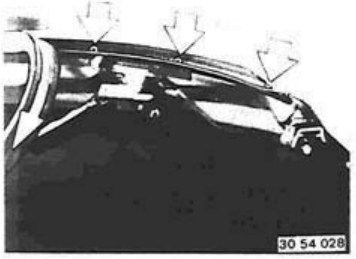
Adjust distance
A = 181 mm (7.126") - front threaded pin
B = 159 mm (6.260") - rear threaded pin
with shims which are available 1 mm (0.039") thick.

30 54 047

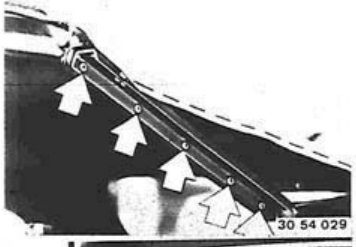


Center top to the side panels.

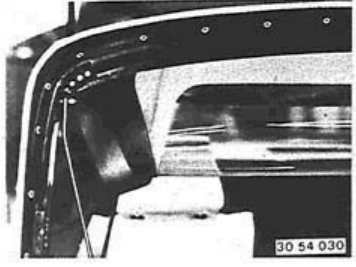
54 31 020 REPLACING TOP (CANVAS)



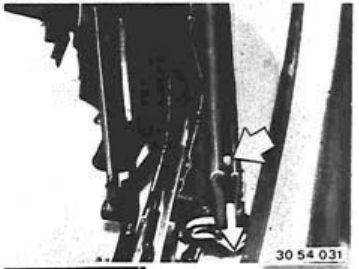
Pull off rubber seal.
Unscrew rail.



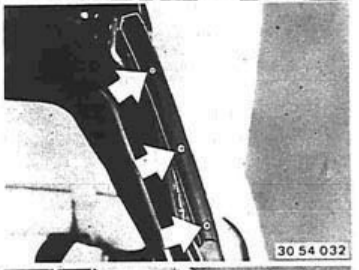
Unscrew rail – remains on cable.
Installation:
Replace screws.



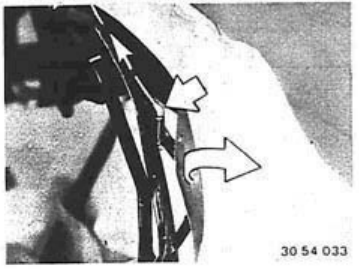
Pull off rubber seal.
Unscrew rail.



Drill out rivets and pull off window guide.



Remove rail.
Installation:
Replace screws.

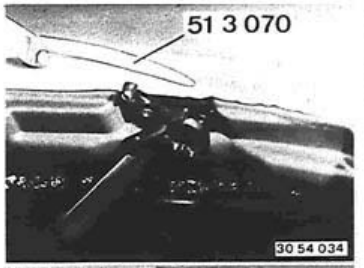


Pull top off of frame.
Disconnect cable and pull it out together with the rail forward.

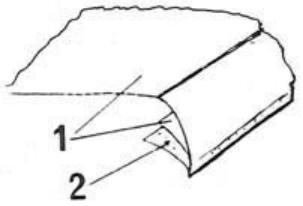
Pull top off of frame and hoopsticks.
Clean frame and hoopsticks with a solvent* to remove residual adhesive.

* Source of Supply: HWB

Note:
Secure window protection on inside and outside with masking tape.
Refer to instructions for application of cement*.

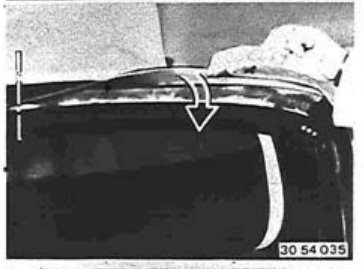


Press on top without folds with Special Tool 51 3 070.
Apply sealing compound* along the rail and on corners.
Mount rail and pull on rubber part.

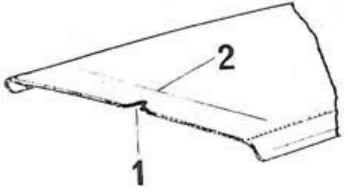


30 54 026

The control banners (2) permit alignment of top edges and must only be cemented after top (1) has been cemented on the frame.

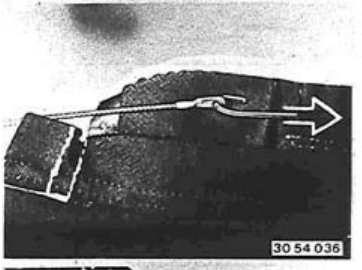


Cement top on frame at rear.
Check center mark and proceed from the center.

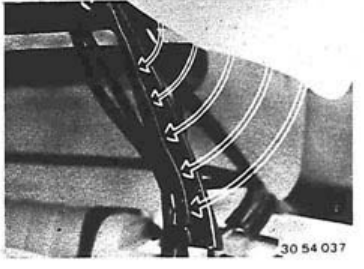


30 54 027

Cement the top, beginning at center (1).
Mark (2) must run precisely along the front frame edge.



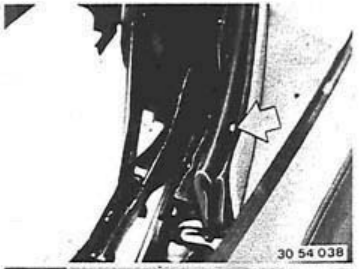
Pull in cable with a piece of welding wire and connect it on the spring.



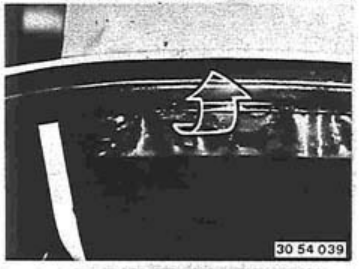
Cement the t

* Source of Supply: HWB

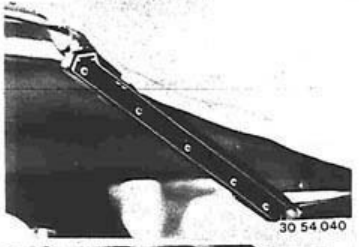
* Source of Supply: HWB



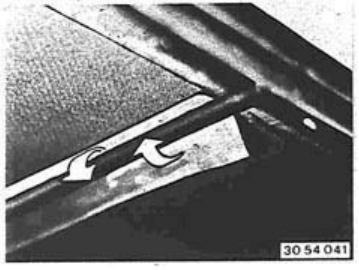
Mount rail.
Slide window guide into rail, using a special lubricant*.
Secure with a rivet and cement side on frame.



Cement the banner.
Mount rail and pull in rubber seal.



Mount rail and pull in rubber seal (use special lubricant*).



Close top.
Cement top on hoopsticks – beginning with short banner.

* Source of Supply: HWB

ELECTRIC / HYDRAULIC CONVERTIBLE TOP

Description:

It is only possible to operate the top in a stopped car and with the ignition on, and operation lasts only as long as the operating switch in the dashboard is pressed.
The switch is illuminated when lights are switched on.
All windows must be wound down and the trunk lid closed.
If the car is moved off with an unlocked top, the top will be run back into the top box (not when the top lid is already locked).

A Opening Top

1) Unlock and lift top past the TDC point	(manual)
2) Operate top switch in "open" direction (until opening movement is completed)	
3) Fold up tensioning bar	(automatic)
4) Unlock top lid	(automatic)
5) Open top lid	(automatic)
6) Lower tensioning bar	(automatic)
7) Run in top	(automatic)
8) Close top lid	(automatic)
9) Lock top lid	(automatic)

B Closing Top

1) Operate top switch in "close" direction (until closing movement is completed)	
2) Unlock top lid	(automatic)
3) Open top lid	(automatic)
4) Run out top	(automatic)
5) Fold up tensioning bar	(automatic)
6) Close top lid	(automatic)
7) Lock top lid	(automatic)
8) Lower tensioning bar	(automatic)
9) Pull top past the TDC point and lock	(automatic)

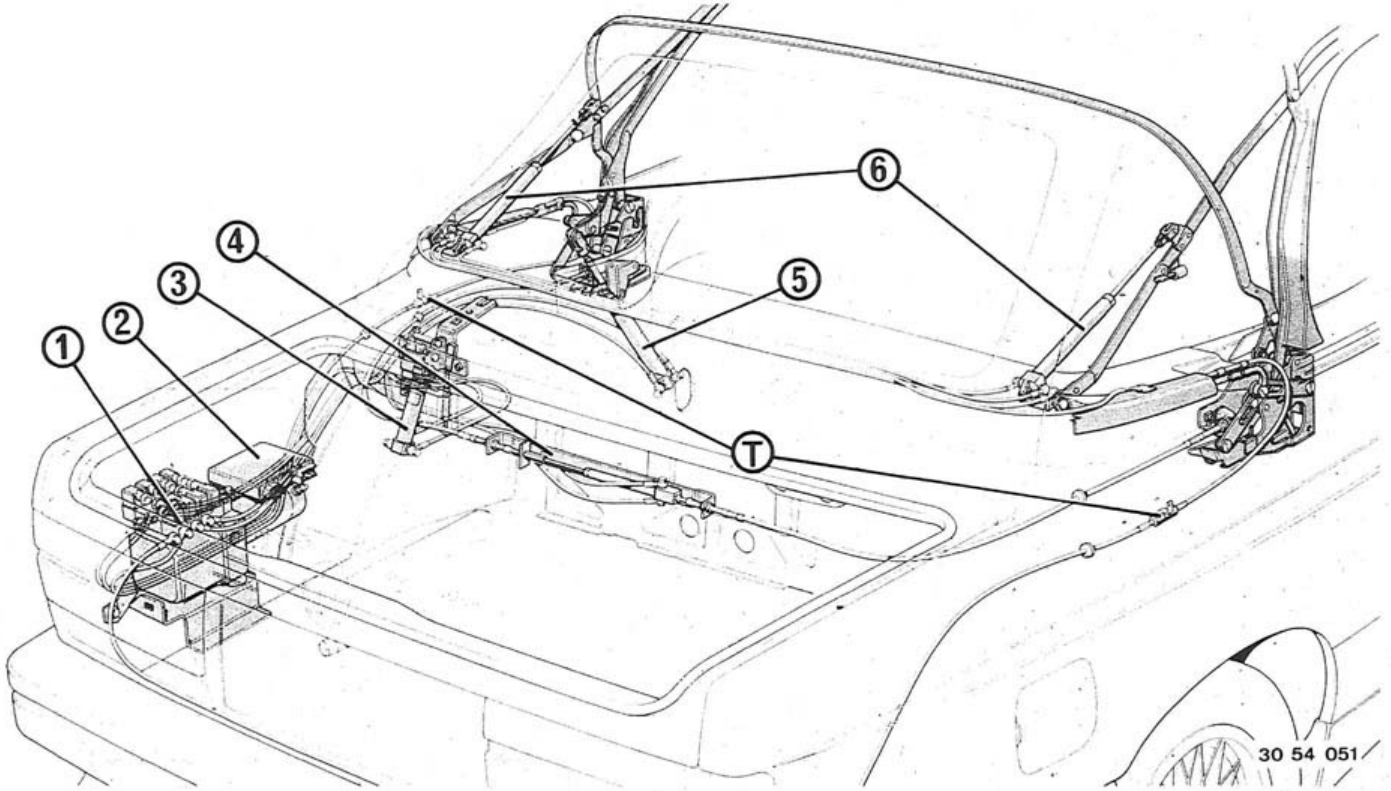
Pump and valves are operated by the electronic control unit in accordance with operation and position of the top. Pressure is built up in the operating cylinders, piston rods are run out or in and move the top or top lid via cinematics.

An indicator lamp in the instrument clouster sends information to the driver with the ignition turned on.

1) On Continuously:	During top operation ((switch pressed - top moving)
2) Continuous Flashing:	Don't move off! The final locked position of the top has not been reached (locking lever on cowl panel and/or top lid not closed).
3) Off:	One of the top's final locked positions has been reached (locked or top lid closed).

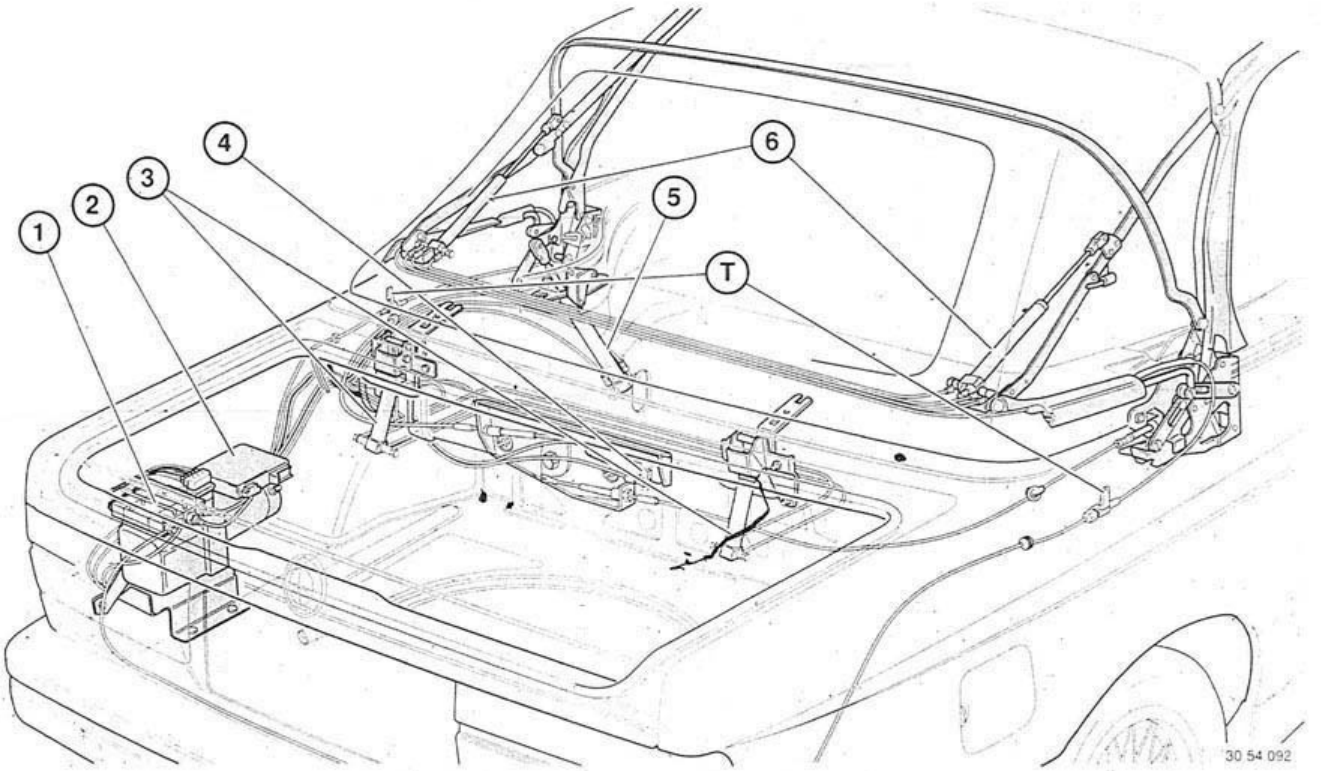
ELECTRIC/HYDRAULIC CONVERTIBLE TOP COMPONENTS – 1988 MODEL

1 Hydraulic control unit
2 Electronic control unit
3 Hydr. cylinder for top box lid
4 Hydr. cylinder for top box lid lock
5 Hydr. cylinder for top
6 Hydr. cylinders for tensioners
T Connection points of pipes for hydr. cylinders of tensioners



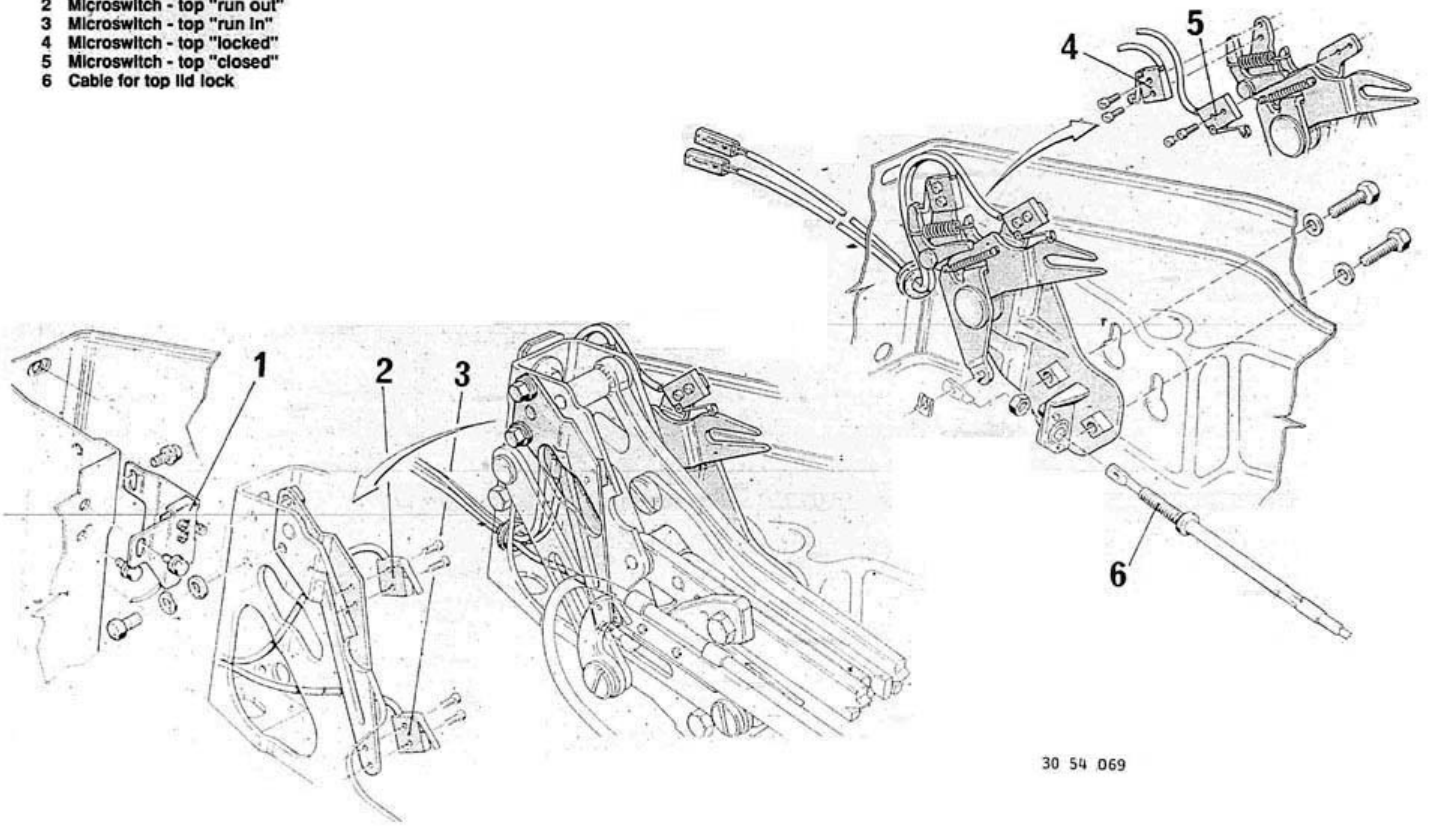
ELECTRIC/HYDRAULIC CONVERTIBLE TOP COMPONENTS – 1989 MODELS ON

1 Hydraulic control unit
2 Electronic control unit
3 Hydr. cylinder for top box lid
4 Hydr. cylinder for top box lid lock
5 Hydr. cylinder for top
6 Hydr. cylinders for tensioners
T Connection points of pipes for hydr. cylinders of tensioners



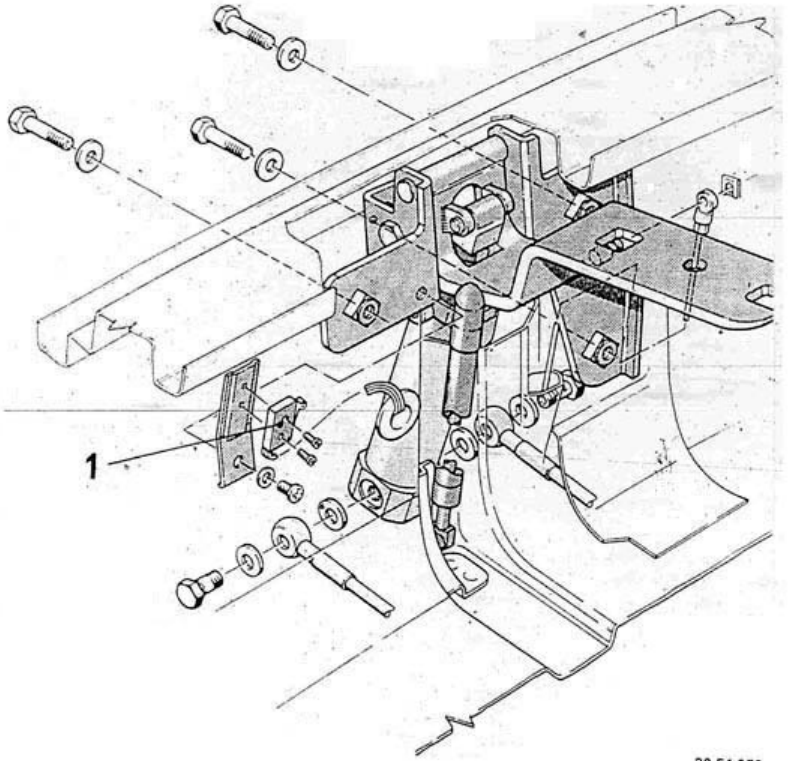
LEFT MAIN MOUNT ASSEMBLY

1 Microswitch - tensioning bar "up"
2 Microswitch - top "run out"
3 Microswitch - top "run in"
4 Microswitch - top "locked"
5 Microswitch - top "closed"
6 Cable for top lid lock



TOP LID ASSEMBLY

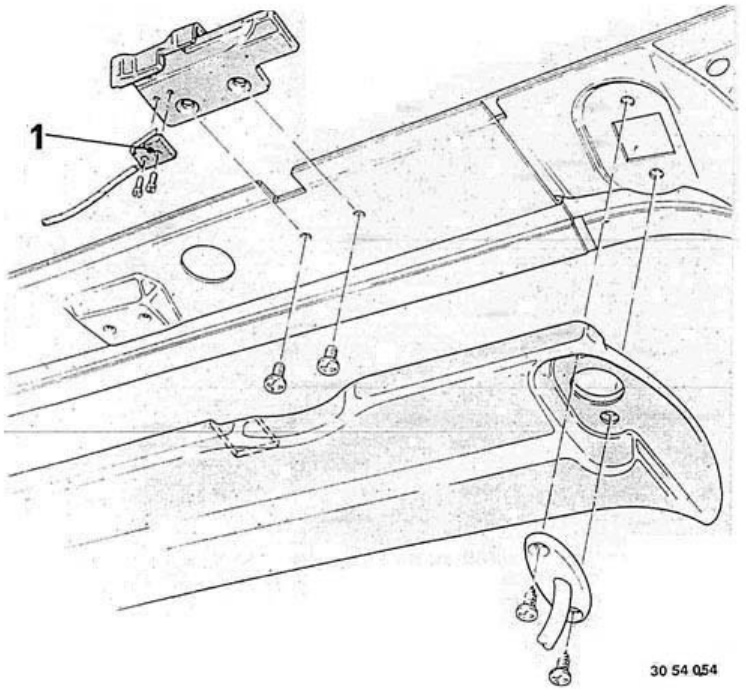
1 Microswitch - top lid "opened"



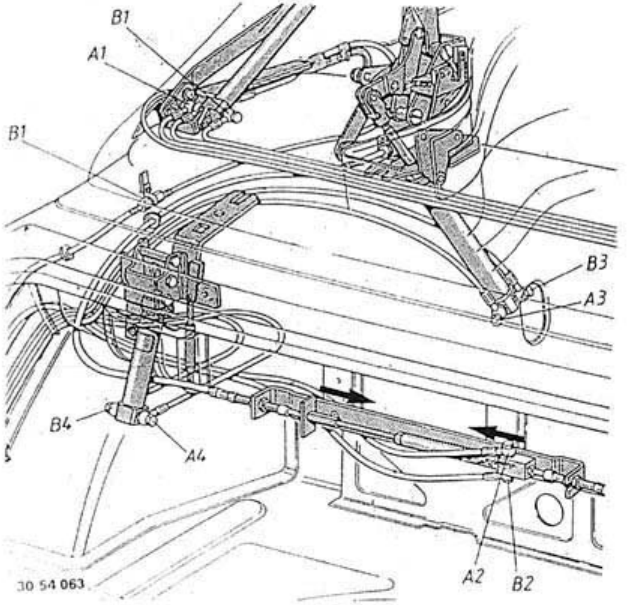
30 54 053

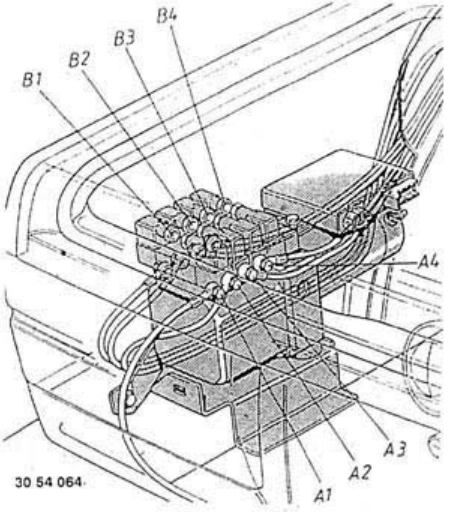
COWL PANEL LOCKING SWITCH

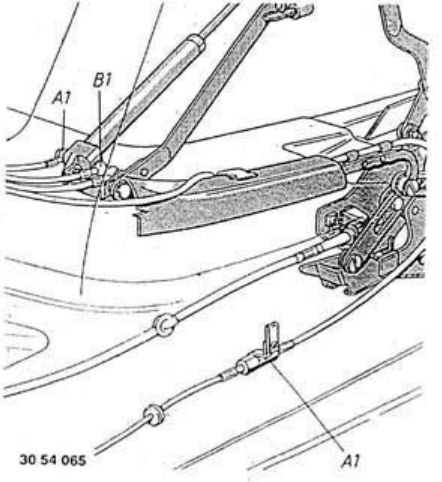
1 Microswitch

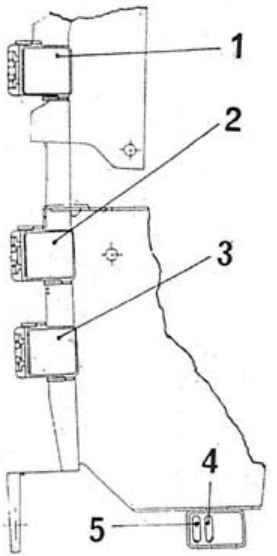


Hydraulic pipes/hoses and connections for hydraulic elements are marked. Conformance with the layout is mandatory.
Always replace seals. Tightening torque for coupling bolts = 7 to 9 Nm (5.0 to 6.5 ft. lbs.).
The top lid can be unlocked manually by pushing the piston back into the hydraulic element A2, B2.









30 54 055

Installation of Fuses and Relays on Carrier of Hydraulic Control Unit:

1 Relay (yellow) for terminal 15

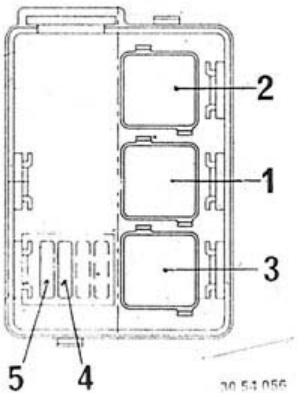
2 Relay (yellow) for additional fuse of top box lid

3 Relay (yellow) for pump motor

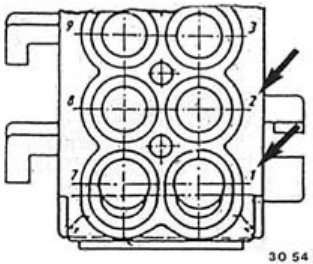
4 Fuse 25 A for pump motor

5 Fuse 10 A for electronics and valves

M 3:
Relay box in engine compartment – see explanation for numbers above.



30 54 056



30 54 068

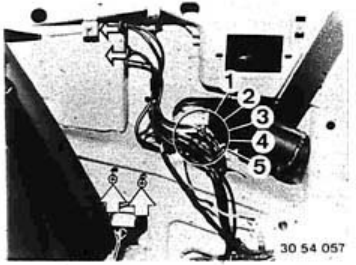
Pin Connections of Plug for Valves / Wire Harness (pin number is located on the pin receptacle):

Lead (Colors)	From Valve	In Pin No.
green/black	1	8
	2	11
	3	2
	4	5
brown/white	1	7
	2	10
	3	3
	4	6
brown/yellow	1	9
	2	12
	3	1
	4	4

Valve No.	For Hydraulic Cylinder
1	Tensioners
2	Top box lid lock
3	Top
4	Top box lid

54 34 . . . REMOVING COMPLETE CONVERTIBLE TOP

Remove both rear side trim panels – see 51 43 000.
Open the top.

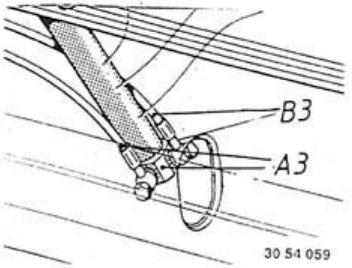


30 54 057

Disconnect plugs of microswitches and insert them through the rubber grommets.
Unscrew the light bulb tester for Check Control.

Installation:
Only connect plugs with the same numbers.

1 Top box lid closed (left)
2 Top box lid locked
3 Top run in
4 Top run out
5 Tensioner up
6 Top box lid closed (right)

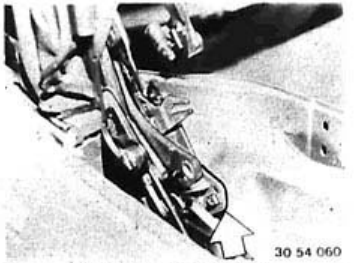


30 54 059

Unscrew hydraulic pipes.

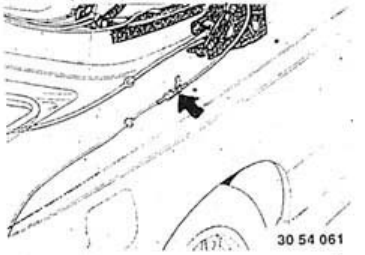
Installation:
Replace gaskets.
Pipes and connections on the hydraulic element are marked.
Tightening torque*.

* See Specifications



30 54 060

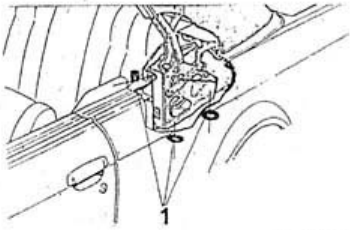
Mark location of top box lid locks on the body.
Unscrew locks.



30 54 061

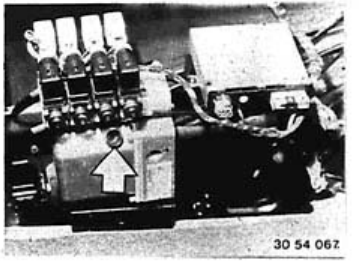
Disconnect left and right hydraulic pipes.

Installation:
Tightening torque*.



30 54 062

Unscrew bolts and take off top.
The top is aligned with the body – don't mix up washers (1).

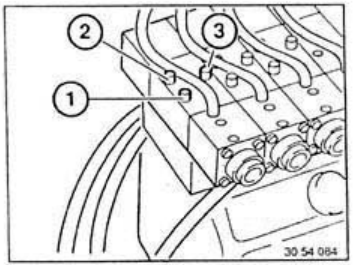


30 54 067

Close the top, supporting top motion by hand, after finishing installation.
Correct the oil level.
Oil grade: CHF 7.1 (Pentosin).

Open and close the top several times to bleed the hydraulic system.

* See Specifications

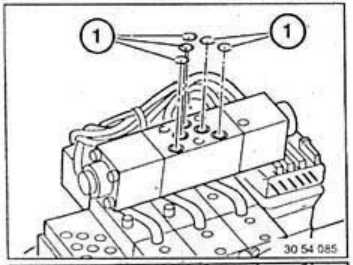


54 34 ... REMOVING AND INSTALLING CHECK VALVE

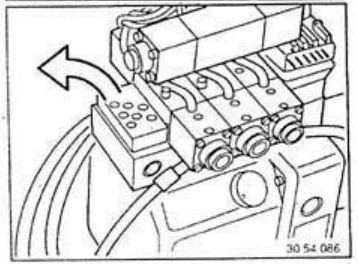
Absolute cleanliness is necessary for work on the hydraulic control unit.
Unscrew screws (1 ... 3).

Installation:
Tightening torque*.

Lift off valve from above.

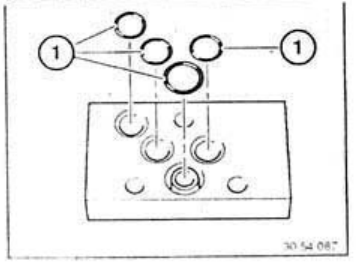


Installation:
Always replace seals (1).
Check for correct seating of seals.



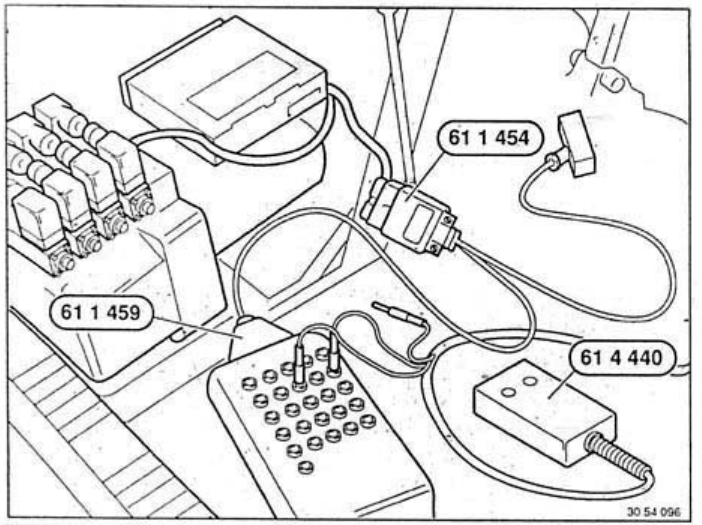
Lift off plate (check valve).

Installation:
Check the installed direction (gasket surface faces down).



Installation:
Always replace seals (1).
Check for correct seating of seals.

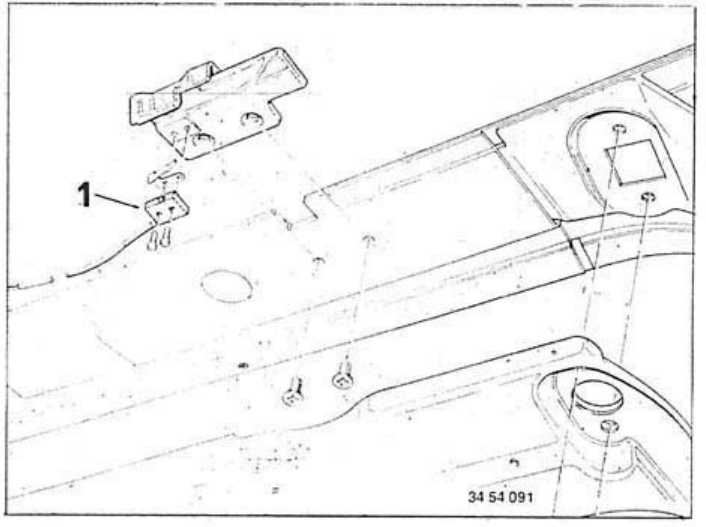
See Specifications



ADJUSTING ELECTRIC/HYDRAULIC CONVERTIBLE TOP

Pull off 26-pin plug on control unit and connect on Special Tool 61 1 459 (testbox) with Special Tool 61 1 454 (adapter).
Connect red/black terminals of Special Tool 61 4 440 (microswitch tester) on the car's battery. Connect blue, yellow and green plugs on the testbox.

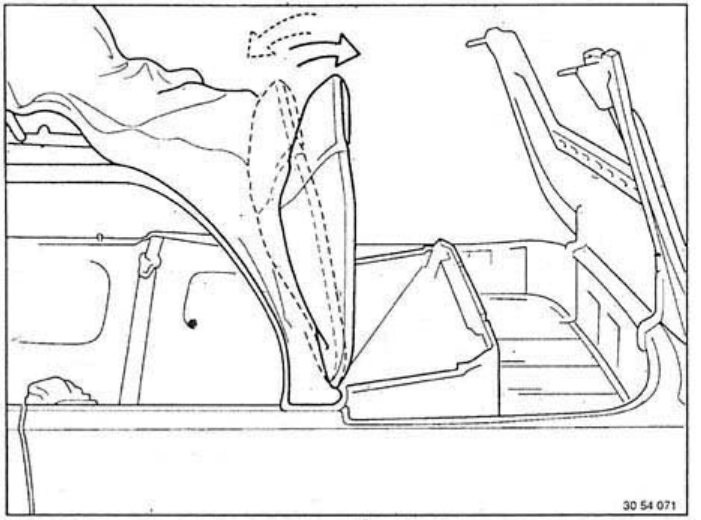
Blue	**pin 12 (requirement: control lamp in instrument cluster is okay)**
Blue	**car ground (when control lamp in instrument cluster is not okay)**
Yellow	**pin 8**
Green	**not connected presently**

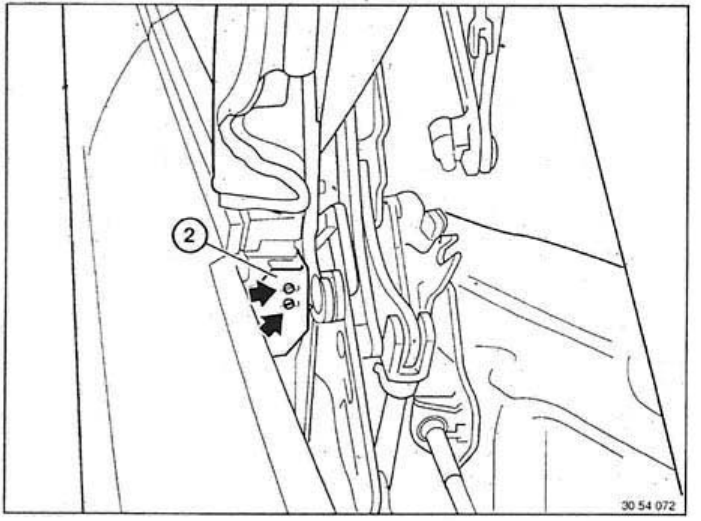


1. Microswitch - Cowl Panel "Up"

Connect yellow plug on pin 8.
Close and lock the top.
Adjust microswitch (1) on the plate from underneath until the yellow LED lights up.

Important!
Don't bend the tongue of the microswitch!





2. Microswitch - Tensioner "Up"

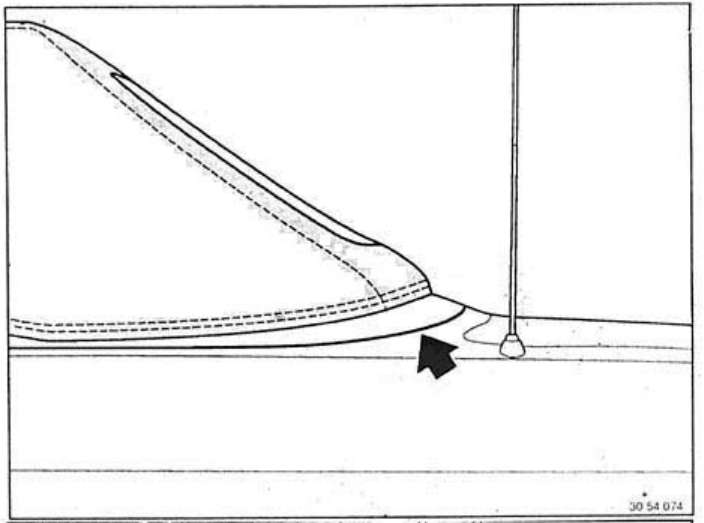
Connect yellow plug on pin 5.

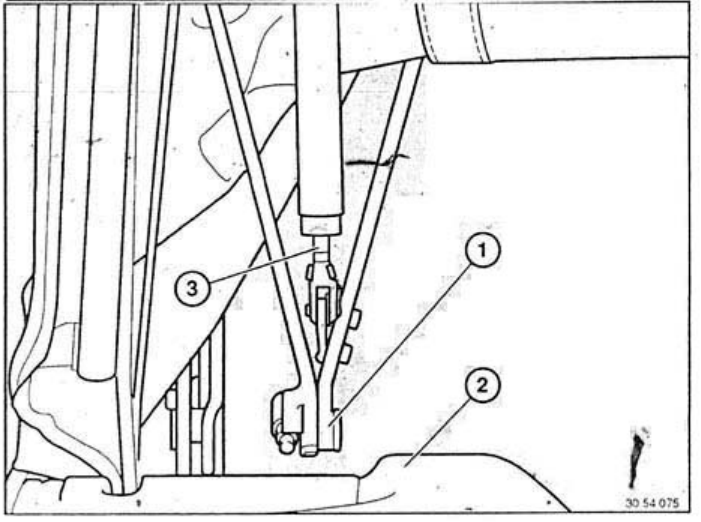
1988 Models (Check Valve Not Installed):
Pull up tensioner by hand up to the stop and then release it. Tensioner will then spring back slightly. Unlock and open the top box lid by hand. Adjust microswitch (2) in such a manner that the yellow LED still lights up after the tensioner springs back.

1989 Models (Check Valve Installed):
Pull up tensioner by hand up to the stop. Unlock the convertible top box lid by turning the unlocking hexagon with max. 50 Nm (36 ft. lbs.) (torque wrench) and open the lid by hand. Press the tensioner against the stop and adjust microswitch (2) in such a manner that the yellow LED lights up.

Important!
Set back microswitch (2) only enough, that the convertible top box lid does not scrape on the tensioner when opened.

Note:
The convertible top storage box lid will only open when microswitch (2) has been adjusted correctly.



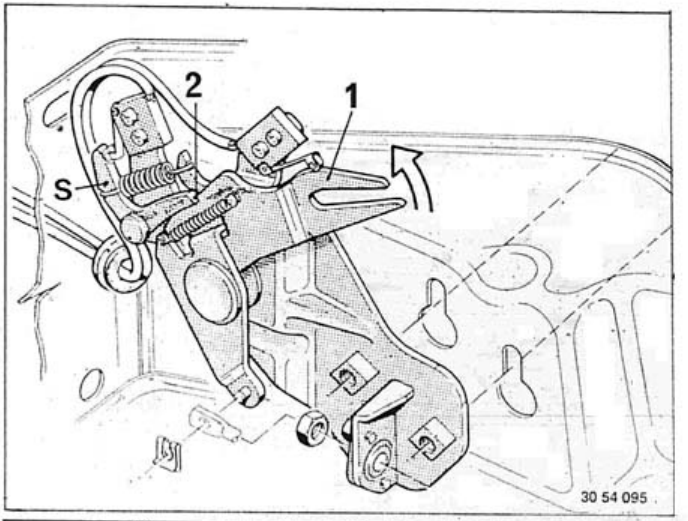


Corrective Measures When Top Box Lid Scrapes on Tensioner:

a. Inspect check valve in the hydraulic control unit for dirt / replace (1989 models) or convert (1988 models) – see 54 34 . . ..

b. Check / make sure that the convertible storage box lid is installed as far back as possible, without that the rubber seal on the top box is "clamped" when closing the top box lid. (This is necessary only after removal/replacement of the convertible top storage box lid. Otherwsie keep to the factory adjustment.)

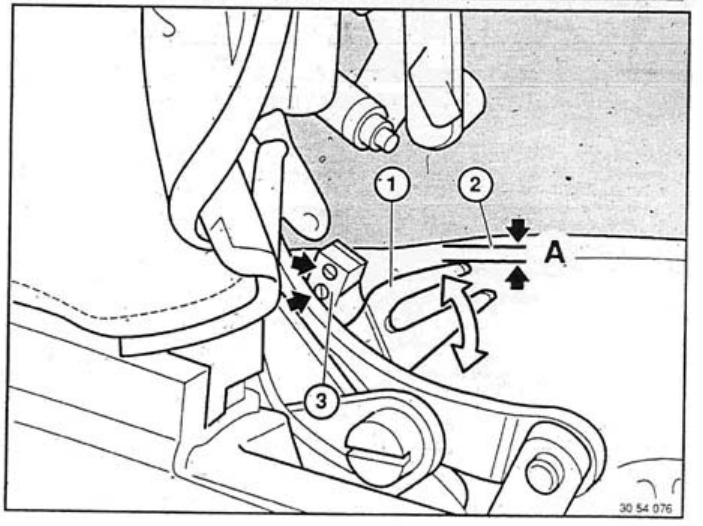
c. Check / make sure that the cylinder on the tensioner does not "pull excessively". Cylinder "pulls excessively" when tensioning rod hinge (1) scrapes on top box lid (2). If applicable, disconnect piston rod (2) and install a low height = approx. 3 mm (0.118") hexagon nut. Lock threads with Loctite.



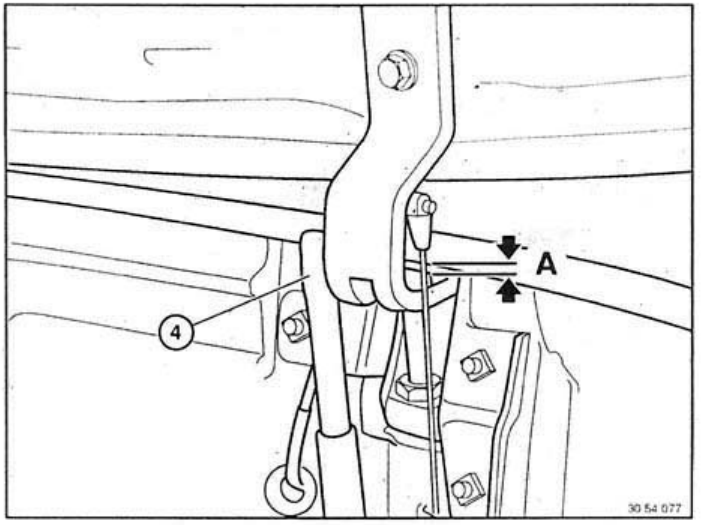
3. Microswitch - Convertible Top Box Lid "Closed"

Connect yellow plug on pin 4.
Pull up rotary catch (1) up to stop (2) of locking pawl (S) on left and right sides of the car.

Note:
If stop (2) of locking pawl (S) is not reached, check/correct the adjustment of the cables for the convertible top box lid locks (point 9).

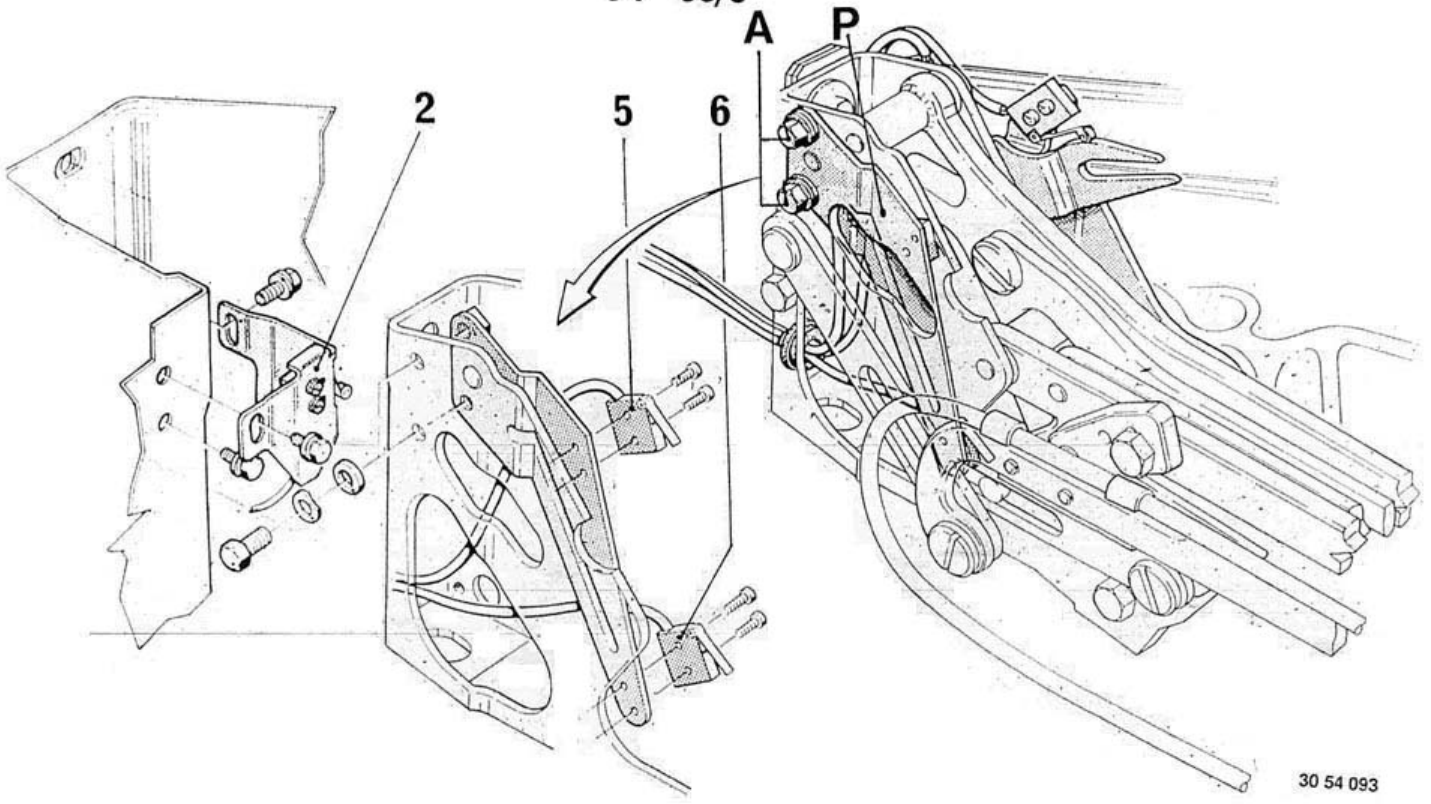


Press down rotary catch (1) on left and right sides of the car until distance A = 2 mm (0.079").
Adjust microswitch (3) by bending the tongue in such a manner that the yellow LED lights up (switching point).



4. Microswitch - Convertible Top Box Lid "Opened"

Connect yellow plug on pin 3.
Open convertible top box lid by hand up to the stop. Close top box lid again until a distance A of 5 mm (0.197") is reached.
Adjust the microswitch in such a manner that the yellow LED lights up.

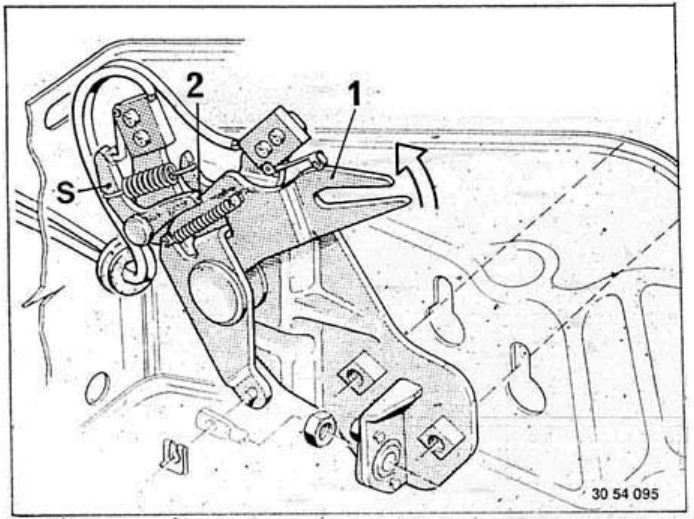


5. Microswitch - Convertible Top "Run Out"
(Only 1988 Models)

Connect yellow plug on pin 5 and green plug on pin 7 (both LEDs light up). Lift front end of top on the cowl panel hoopstick and fold it back into the storage box slowly. Microswitch (2) for tensioner "up" must switch prior to microswitch (5) for convertible top "run out" when folding in the convertible top, the microswitches are adjusted correctly if the yellow LED goes out first and then the green LED. If applicable, adjust microswitch (5) by bending up the tongue.
Pull plug out of the testbox.

6. Microswitch - Convertible Top "Run In"

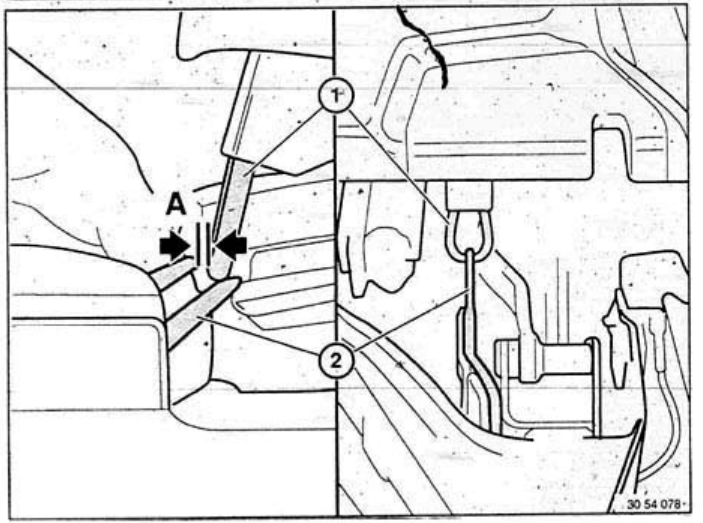
Connect yellow plug on pin 6.
Fold back the convertible top completely into the storage box.
Adjust microswitch (6) in such a manner that the yellow LED lights up, but the tongue of microswitch (6) does not bear on the housing. Remove the rear side trim panel (see Group 51) to adjust microswitch (6). Loosen screws (A) and adjust plate (P). Always check / correct the adjustment of microswitch (5) after adjustment of microswitch (6).



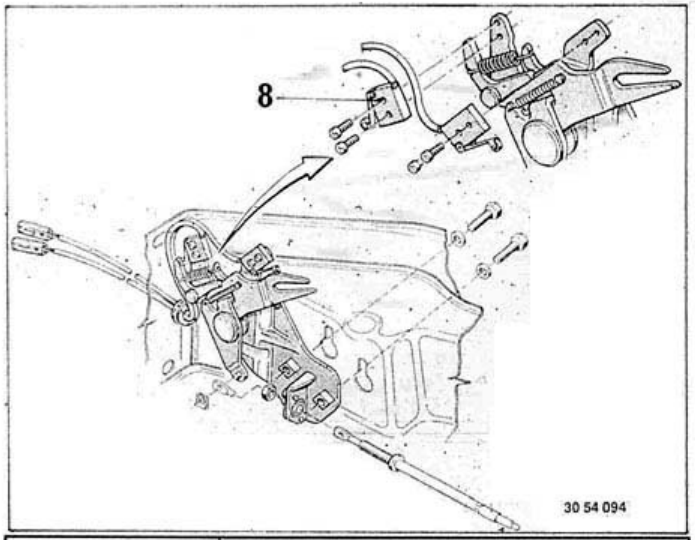
7. Adjusting Lock Shackle:

Pull up rotary catch (1) up to stop (2) of locking pawl (S) on left and right sides of the car.

Note:
If stop (2) of locking pawl (S) is not reached, check / correct the adjustment of cables for the convertible top box lid locks (point 9).



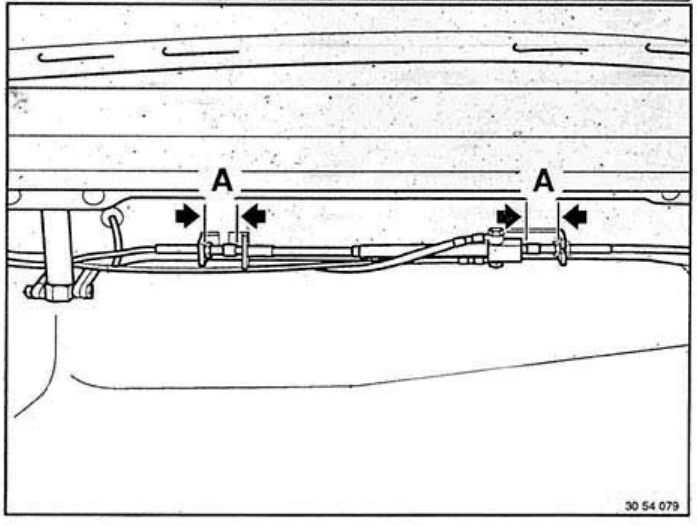
Close the top box lid only so far that lock shackle (1) is immediately before rotary catches (2). Adjust lock shackle (1) in such a manner that there is distance A = approx. 1.5 mm (0.059") on the left and right sides and that rotary catches (2) engage in the middle of lock shackle (1).



8. Microswitch - Convertible Top Box Lid "Locked"

Connect yellow plug on pin 9.
Press down rotary catch on left side of the car until the lock engages.
Adjust microswitch (8) by bending the tongue until the yellow LED lights up.

Note:
Leads must not be routed between the microswitch and locking pawl.

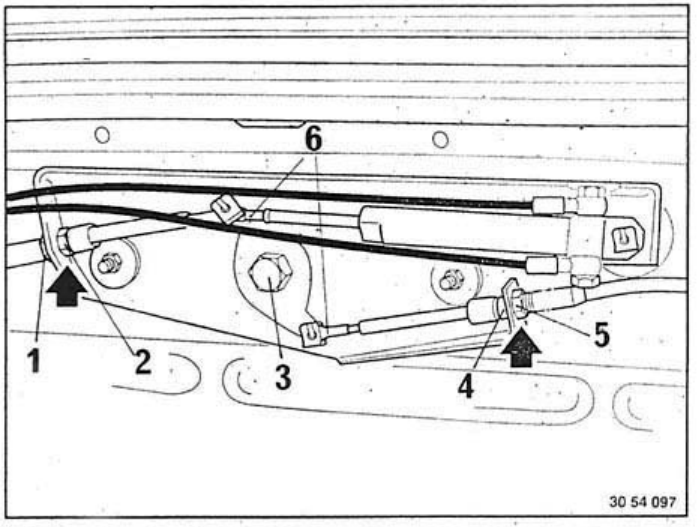


9. Adjusting Cables for Convertible Top Box Lid Lock

Open the top box lid and press down on the left and right rotary catches until both (left/right) locks are locked.

Version with "Flying" Cylinder:

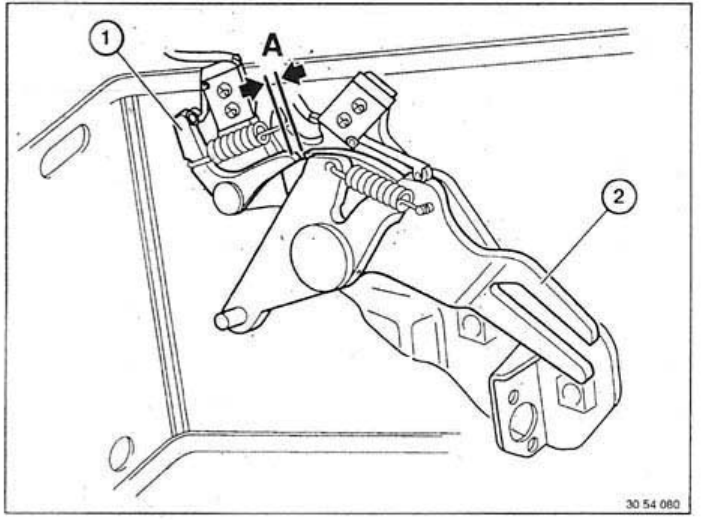
Adjust distance A = 40 mm (1.575") on both cables.



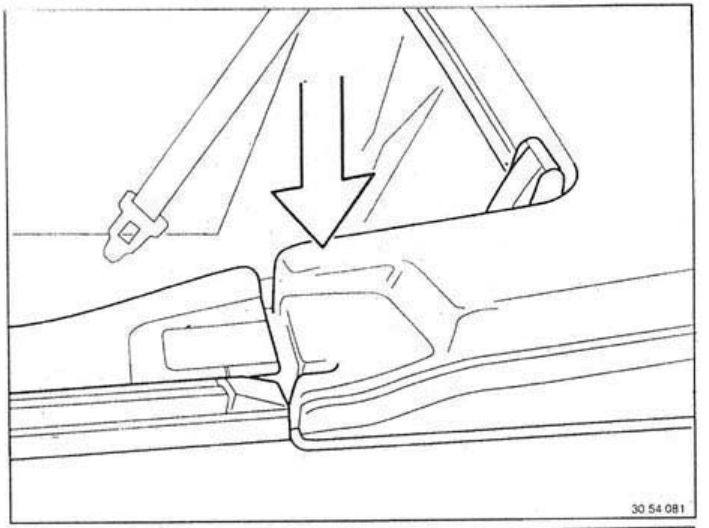
Version With Stationary Cylinder:

Important!
Max. torque on locking hexagon (3) = 50 Nm (36 ft. lbs.).
Don't install the cables twisted.
All tongues (6) on cables and hydraulic cylinder must be screwed in against the stop and may not be changed.
When replacing cables, install the cables without tension and only with locked locks.

Open the top box lid. Loosen nuts (1 and 5). Press down on the left and right rotary catches until both (left/right) locks are locked.
Screw on nut (2) up to the stop and lock by tightening nut (1).

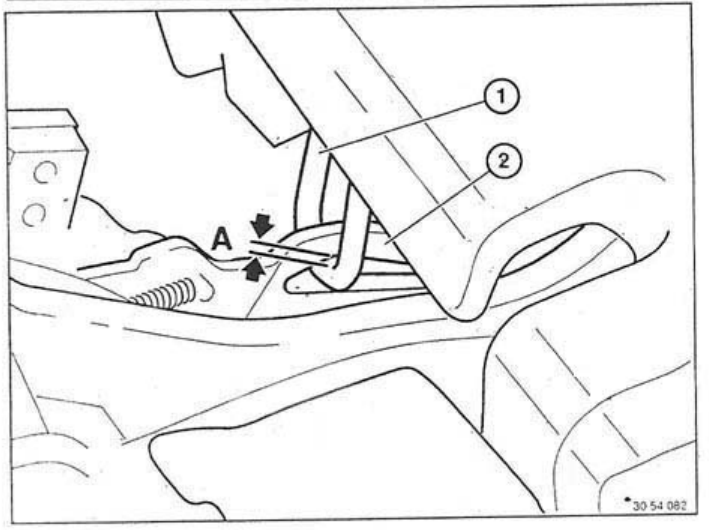


Turn locking hexagon (3) counterclockwise up to the stop – max. 50 Nm (36 ft. lbs.). Adjust the cables with nut (4) in such a manner that there is play A = 0.5 to 1 mm (0.020 to 0.039") on the left and right locks between locking pawls (1) and rotary catches (2), and that the right lock locks first when locking the top box lid.

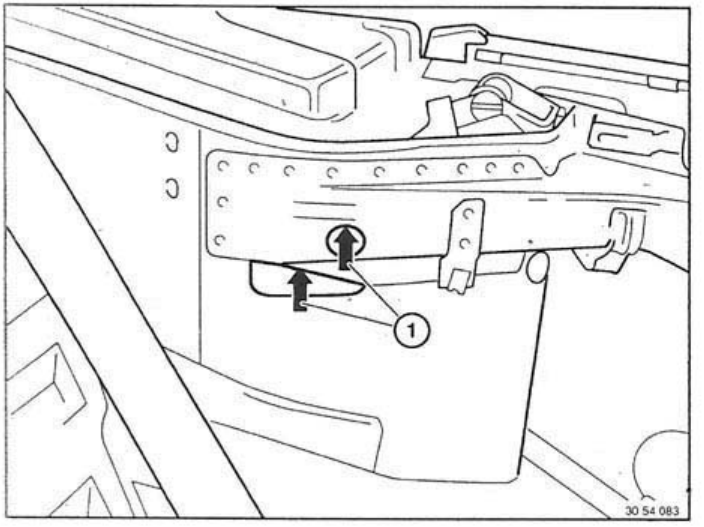


10. Adjusting Convertible Top Box Lid / Locks

Close and lock the convertible top storage box lid.
Press down on the top box lid lightly (don't damage the rubber seal).



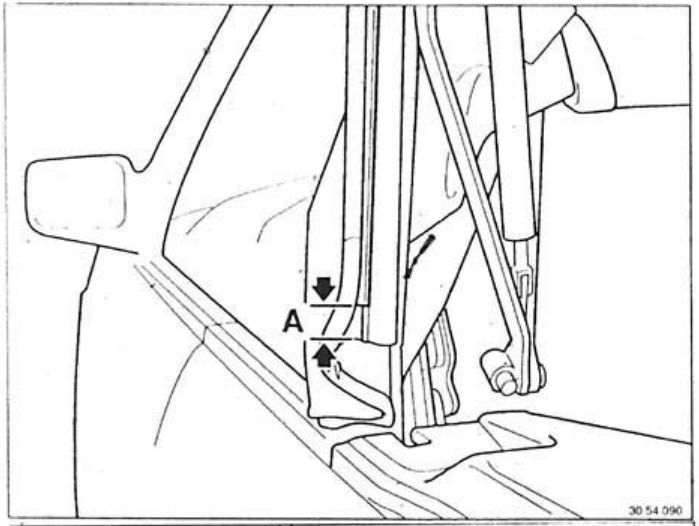
There must be distance A = 1 to 2 mm (0.039 to 0.079") between lock shackle (1) and the highest point of rotary catch (2).

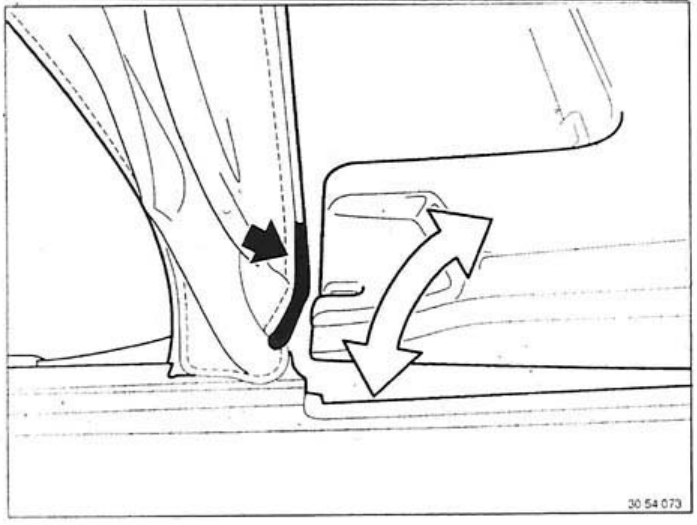


If applicable, remove the inside side trim panel – see Group 51. Loosen screws (1) and correct the lock adjustment.

Note:
Incorrectly adjusted top box lids / locks will rattle when driving the car on rough roads with the convertible top lowered.

Remove the testbox and reconnect the control unit.
Reinstall all removed parts.
Perform a trial run.





TROUBLESHOOTING ELECTRIC/HYDRAULIC CONVERTIBLE TOP

Fault: wind noise in area of top box / rear side window.

Cause / Correction:
Protrusion A = 20 to 30 mm (0.787 to 1.181") of seal not sufficient / pull out seal carefully (protrusion distance A) and cement with Loctite No. 309.

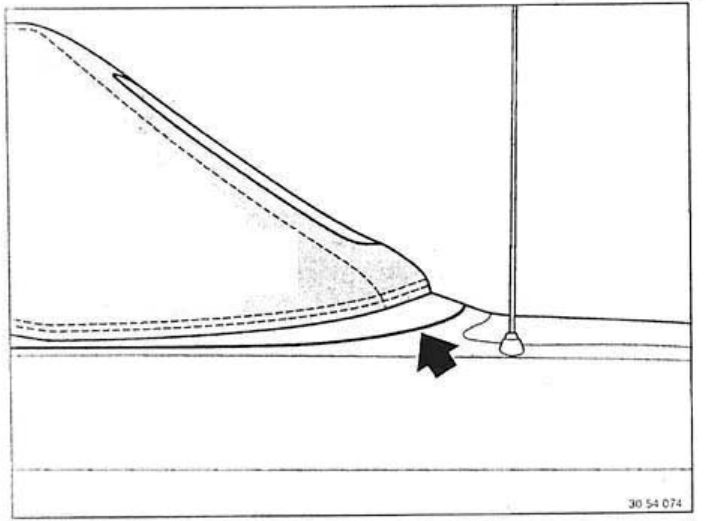
Fault: convertible top opens / closes too slow.

Cause / Correction:
Power supply not sufficient / correct; correct oil level in hydraulic control unit; hydraulic control unit faulty or restrictors and valves dirty (pressure test) / repair or replace as necessary; hydraulic pipes bent or dirty etc. / repair or replace; hydraulic cylinder faulty (pressure test) / replace if necessary.

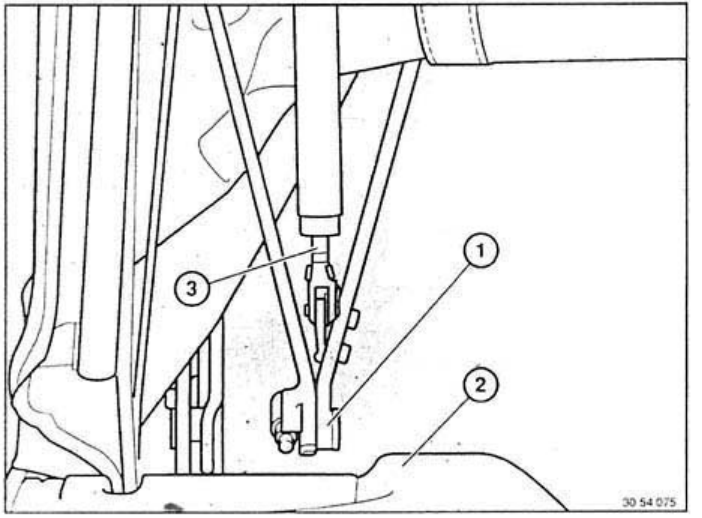
Fault: top box lid scrapes on tensioner.

Cause / Correction:
Check valve in hydraulic control unit dirty / inspect and replace (1989 models) or convert (1988 models) – see 54 34 . . ..

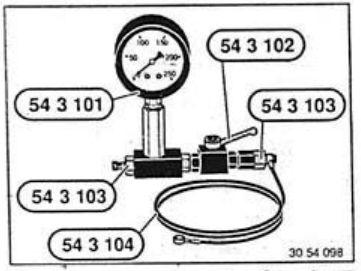
Adjustment of "tensioner up" microswitch incorrect / correct.



Cause / Correction:
Adjustment of top box lid incorrect / check and make sure that top box lid is installed as far back as possible without that the rubber seal on the top box is "clamped" when closing the top box lid (this is necessary only after removal / replacement of the top box lid; otherwise keep to the factory adjustment).



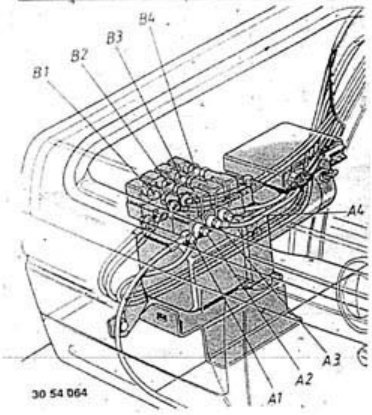
Cause / Correction:
Tensioner cylinder "pulls excessively". The cylinder "pulls excessively", if tensioning rod hinge (1) scrapes on top box lid (2). If applicable, loosen piston rod (3) and install a lower height = approx. 3 mm (0.118") hexagon nut. Coat the threads with Loctite.



54 34 ... PRESSURE TEST

Prepare the tester.
Connect adapters and pressure hose.

Fold back convertible top into the storage box completely.



Connect tester on the hydraulic control unit, on hose A 3.
Tightening torque*.
Open the top box lid.

Checking Hydraulic Control Unit:
Close shutoff valve on tester.
The hydraulic control unit is okay, if the pressure rises to about 160 bar (2275 psi).
Open shutoff valve on tester.

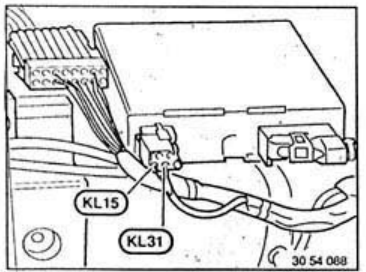
Checking Hydraulic Cylinder (Top):
Hold the convertible top tight and operate it.
The hydraulic cylinder is okay, if the pressure again rises to about 160 bar (2275 psi).

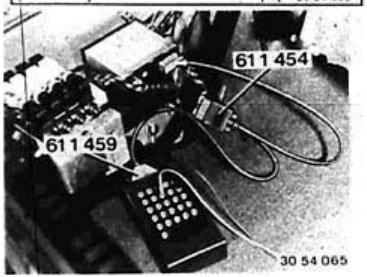
Remove the tester and reconnect the hose.
Tightening torque*.

* See Specifications

TROUBLESHOOTING ELECTRIC/HYDRAULIC CONVERTIBLE TOP

Requirements:
Battery voltage at least 11.5 V.
Fuse for pump motor and valves/electronics okay.
Hydraulic fluid tank filled.
Convertible top in perfect mechanical condition.
Tests performed with a BMW Service.Tester or Mutlimeter.





Turn on ignition.

Do terminals 15 and 31 on control unit have voltage or ground? — **no** — **Repair ground/power supply wiring diagram.**

yes

Connect adapter lead 61 1 454 with test box 61 1 459.
Is there flow to vehicle ground
on pin 1 = "open" and
on pin 2 = "close" of the test box with the operating switch pressed? — **no** — **Check/repair operating switch and wires.**

yes

Measure voltage on pin 23 - is there battery voltage? — **no** — **Check power supply lead and relay.**

yes

Press operating switch - does the voltage drop to < 1.5 V? — **no** — **Replace control unit.**

yes

Check function of microswitches. Operate convertible top manually.
Measure flow to vehicle ground on pins of test box.

- = ∞ ohms
x = flow

Pin 1 with cowl panel	unlocked	-
	locked	x
Pin 5 with tensioning bar	down	-
	up	x
Pin 6 with convertible top	run out	-
	run in	x
Pin 7 with convertible top	run in	-
	run out	x
Pin 9 with top lid	unlocked	-
	locked	x
Pin 4 with top lid	opened	-
	closed	x
Pin 3 with top lid	closed	-
	opened	x

Do microswitches operate correctly? — no — Adjust or replace pertinent switch, repair wire if applicable.

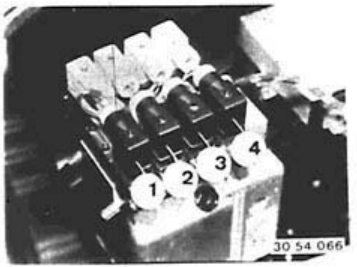
yes

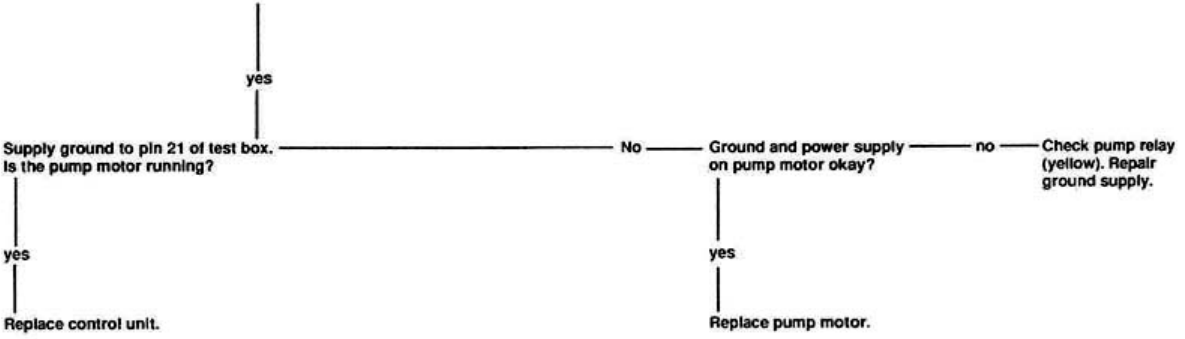
Check valves. Pull plug off of control unit. Supply ground to pins of test box - valves should operate. Place finger on pertinent valve. "Clicking" is felt when valve switches.

Pin 13 = valve 2	Pin 17 = valve 1
Pin 14 = valve 2	Pin 18 = valve 1
Pin 15 = valve 3	Pin 19 = valve 4
Pin 16 = valve 3	Pin 20 = valve 4

Are valves operating correctly? — no — Replace pertinent valve(s).

yes





yes
Supply ground to pin 21 of test box.
Is the pump motor running?
No
Ground and power supply
on pump motor okay?
no
Check pump relay
(yellow). Repair
ground supply.
yes
Replace control unit.
yes
Replace pump motor.

ELECTROMECHANICAL TOP

General Information

Removal of complete top is identical with procedures for removal of mechanical top, whereby additionally top push rod and push rod for top tensioning bow must be detached on top drive.

Top drive must be adjusted, refer to 54 34 023, after removal and installation of complete top or alteration of top adjustment.

If top cannot be lifted out of top box by hand in spite of correctly disengaged top drive, check top adjustment – refer to 54 34 023.

Lubricate surface between drive lever and trailing lever on top drive lightly with Polylub GLY 801* when necessary.

Lock joint head bolting of top push rod to top with Loctite No. 638; tightening torque = 25 Nm (18 ft. lbs.).

If power supply to control unit is interrupted (disconnection of battery/control unit) at an intermediate position between top opened and closed, restoring operation requires disengaging drives and moving top to a "defined" position. Refer to page 54-44 for information about restoring operation.

Description of Operation

Opening Top

Turn ignition key to "R" position.
Unlock top on cowl panel and lift above dead center.
Cowl panel switch switches ground lead of top operating switch to continuity. Operate top operating switch in open direction and keep it pressed in during entire opening action. Top motor receives power, top tensioning bow is run up and top motor is switched off when top tensioning bow reaches top dead center. Top storage box lid motor receives power, top storage box lid locks are unlocked and top storage box lid is opened. Top motor now moves top tensioning bow down and stores top in storage box. Top storage box lid motor closes storage box lid.

Closing Top

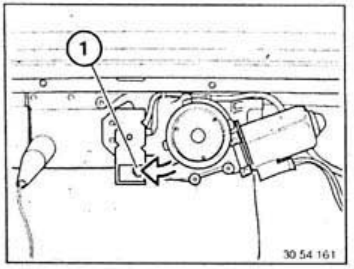
Turn ignition key to "R" position.
Operate top operating switch in close direction and keep it pressed in during entire closing action. Top storage box lid motor receives power and moves top out of storage box. Top tensioning bow is run up. Top storage box lid motor receives power to close and lock storage box lid. Top motor receives power and runs top tensioning bow down. Top must be pulled down manually over dead center to cowl panel and locked on cowl panel.

Note:
Entire top operation is controlled by microswitches mounted on gearboxes of top storage box lid motor and top motor. Two microswitches are mounted on each gearbox. Microswitches report instantaneous top position to control unit.

Top operation is not possible, if
- battery voltage is < 10.5 V (engine should be running to prevent battery voltage from dropping below 10.5 V during top operation),
- vehicle rolls (speedometer A signal received),
- ignition key is in "0" position or
- top is not unlocked.

Top operation is locked for 15 minutes if there is seizure or blocking three times during top opening or closing action. Lock can be eliminated by switching ignition on and off.

* Source of Supply: HWB



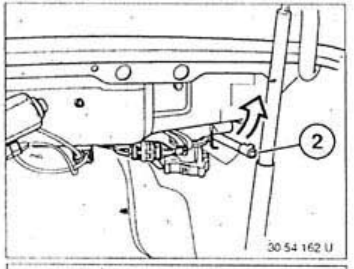
ELECTROMECHANICAL TOP

Emergency Operation (Closing Top) If Electric Operation Fails:

Note:
Figures drawn with trunk trim panels removed.

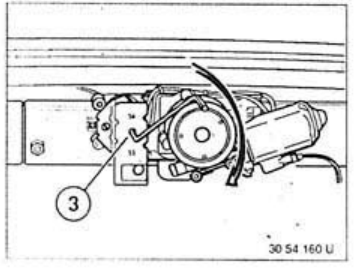
Raise trunk lid.
Insert centering pin (toolbox) in bore (1), press to left and unlock top storage box lid drive.

Insert centering pin in bore (2), press up and unlock top drive.

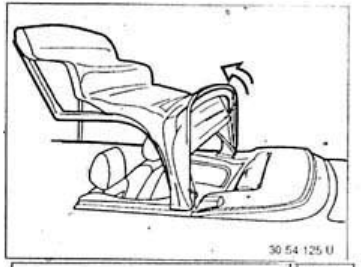


Insert hexagon key through bore (3) in hexagon socket, turn clockwise and unlock top storage box.

Open top storage box lid.
Lift top out of storage box.
Position top tensioning bow upright.
Close top storage box lid.
Lower top tensioning bow.
Pull down top at front and lock on cowl panel.



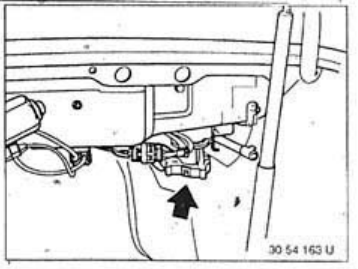
Note:
If top cannot be lifted out of top storage box in spite of correctly disengaged top drive, adjust top drive – refer to 54 34 023.



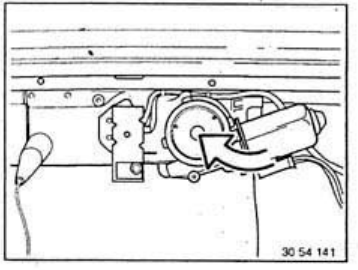
Restoring Operation After Fault Elimination:

Requirement:
Trunk trim panels removed.

Position top tensioning bow upright.
Close top storage box lid.
Raise trunk lid.

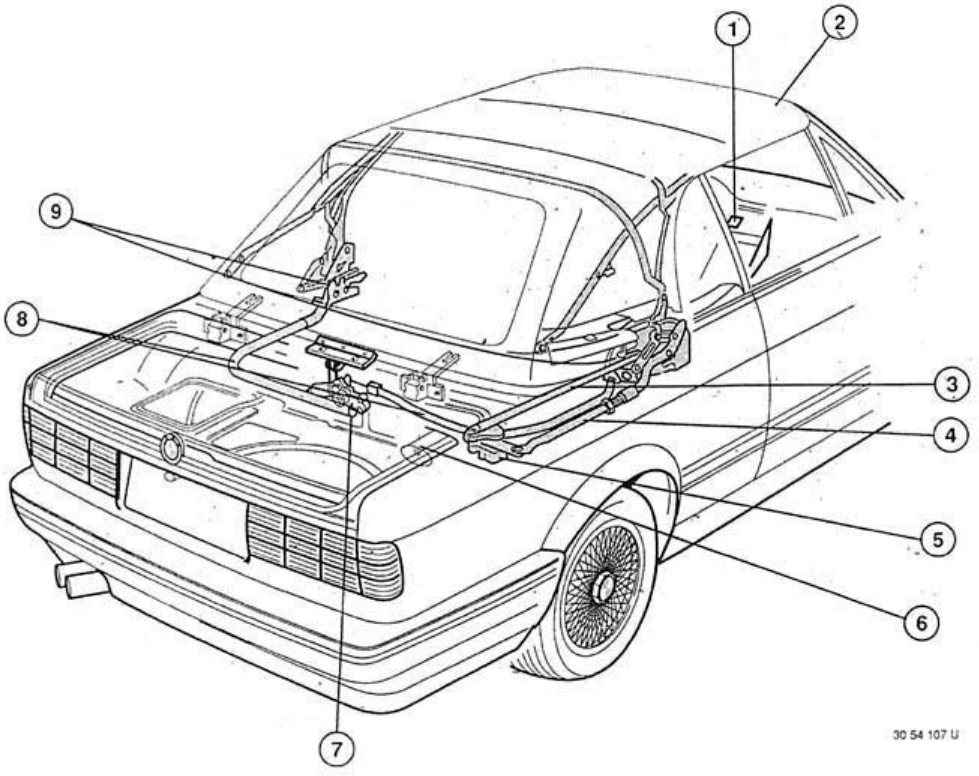


Move top tensioning bow back and forth slightly and press up top drive motor until it engages.



Move top storage box lid up and down slightly and press top storage box lid drive motor forward until it engages.

Install trunk trim panels.



ELECTROMECHANICAL TOP

Components

1 Operating switch
2 Cowl panel microswitch
3 Top push rod
4 Top tensioning bow push rod
5 Top drive
6 Control unit
7 Top storage box lid drive
8 Cables for top storage box lid locks
9 Top storage box lid locks

ELECTROMECHANICAL TOP

Control Unit Pin Connections

Pin	Description	Designation
1	Top storage box lid motor	K1
2	Top storage box lid motor	K2
3	Terminal 30, B+	30P
4	Top storage box lid microswitch (locked open)	S4

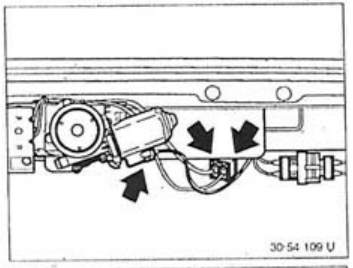
54 25 000 REMOVING AND INSTALLING OR REPLACING ELECTRIC TOP STORAGE BOX LID DRIVE

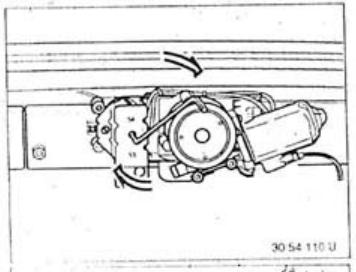
Turn ignition key to "0" position.
Raise trunk lid.
Loosen clips (1) and lower trunk trim panel.

Installation:
Adjust top storage box lid drive – see 54 25 001.

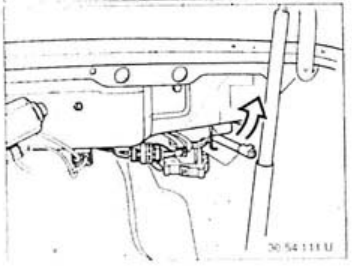


Disconnect plugs.

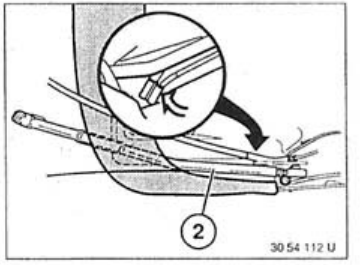
Gray plug – microswitch S3
Yellow plug – microswitch S4
White plug – power supply



Disengage top storage box lid drive and unlock top storage box lid.



Disengage top drive.

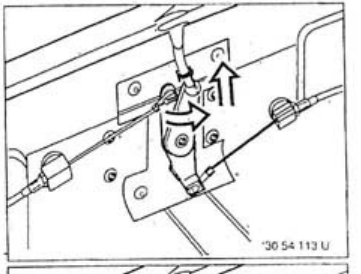


Shut trunk lid.

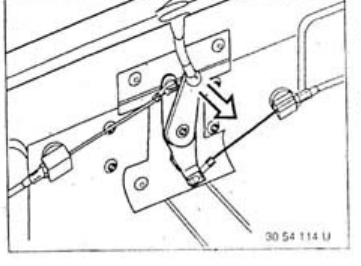
Top Closed:
Unlock top on cowl panel and lift at front end.
Position top tensioning bow upright and open top storage box lid.

Top Opened:
Open top storage box lid and lift top out of top storage box.
Position top tensioning bow upright.

Note:
If top cannot be lifted out of top storage box, engage top drive and run top out of storage box electrically.
If electric operation is not possible, press top into storage box completely and press out top push rod (2) firmly.
Check top adjustment – see 54 34 023.

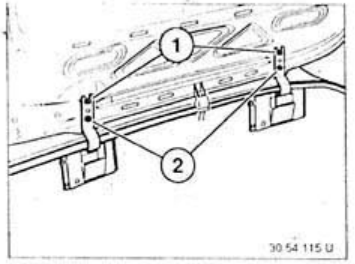


Disengage and pull out retainer from above.

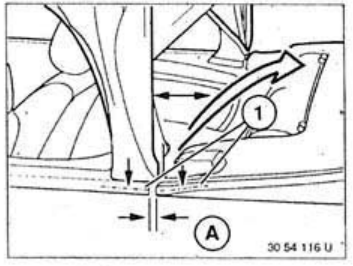


Pull linkage off ball head.

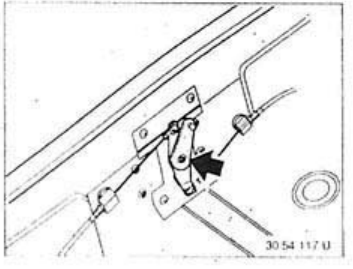
Installation:
Adjust length of linkage – see 54 25 001.



Loosen screws (1).
Unscrew screws (2).
Take off top storage box lid.



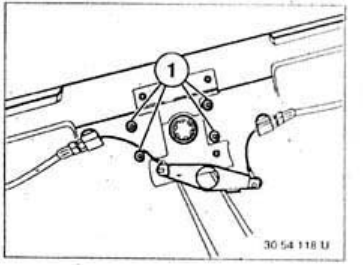
Installation:
Align top storage box lid in such a manner that when closed ornamental strips (1) are lined up, gap (A) between ornamental strips and lid is uniform on left and right sides and there is sufficient clearance to tensioning bow during movement of top storage box lid.



Unscrew screw and pull out drive lever forward.

Installation:
Drive lever can be inserted only in one position (splined shaft is asymmetric). Keep trying in different position until drive lever can be inserted easily.
Lock screw with Loctite No. 270*.
Tightening torque = 5 Nm (3.5 ft. lbs.).

* Source of Supply: HWB



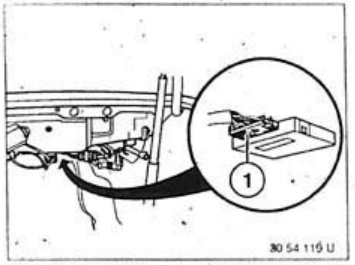
Raise trunk lid.
Hold drive tight in trunk and unscrew screws (1).

Installation:
Lock screws with Loctite No. 270*.
Tightening torque = 10 Nm (7 ft. lbs.).

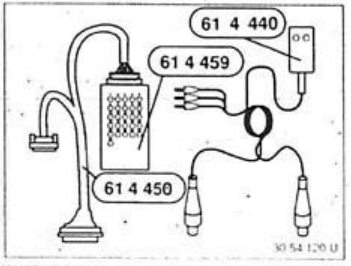
* Source of Supply: HWB

54 25 001 ADJUSTING ELECTRIC TOP STORAGE BOX LID DRIVE

Turn ignition key to "0" position.
Raise trunk lid.
Loosen clips (1) and lower trunk trim panel.



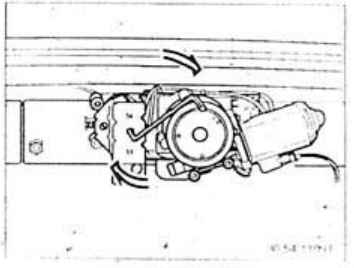
Disconnect plug (1).



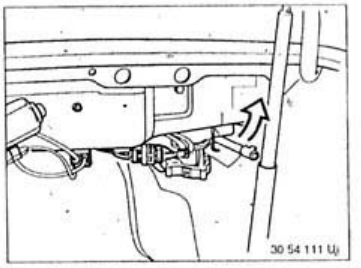
Connect plug (1) on test box 61 1 459 with help of adapter 61 4 450.
Don't connect control unit!
Connect microswitch test box 61 4 440 on test box.

Red plug	– B+ or pin 19
Black plug	– ground
Blue plug	– pin 20
Yellow plug	– pin 4 (microswitch S4)
Green plug	– pin 13 (microswitch S3)

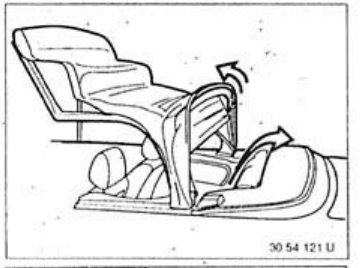
Turn ignition key to "R" position.



Disengage top storage box lid drive and unlock top storage box lid.



Disengage top drive.

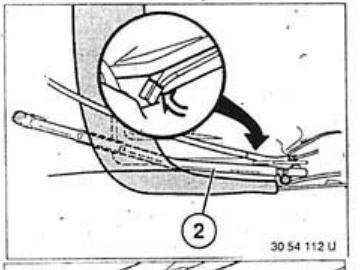


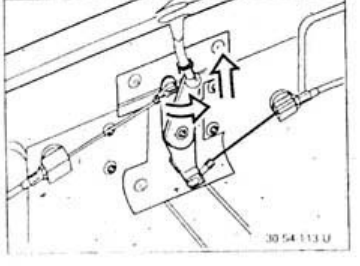
Take microswitch test box out of trunk and shut trunk lid.

Top Closed:
Unlock top on cowl panel and lift at front end.
Position top tensioning bow upright and open top storage box lid.

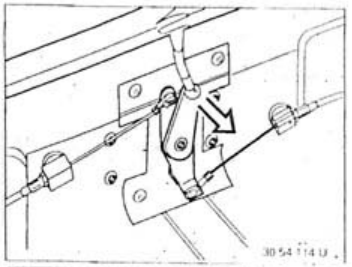
Top Opened:
Open top storage box lid and lift top out of storage box.
Position top tensioning bow upright.

Note:
If top cannot be lifted out of top storage box, engage top drive and run top out of storage box electrically.
If electric operation is not possible, press top in storage box completely and press out push rod (2) firmly.
Check top adjustment – see 54 34 023.

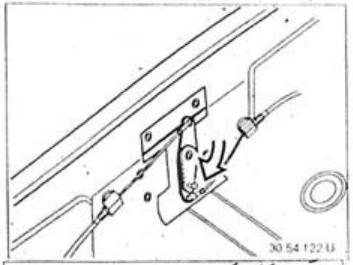




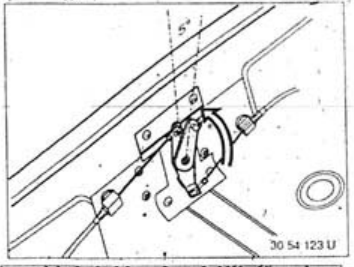
Disengage and pull out retainer from above.



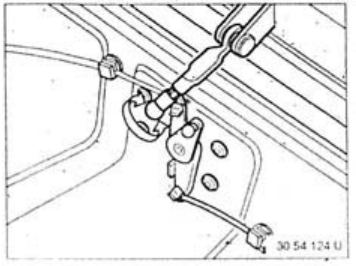
Pull linkage off ball head.



Turn drive lever clockwise until top storage box lid locks are locked.
Yellow LED must go out; if necessary, adjust cables longer uniformly until LED goes out (switch point S4).

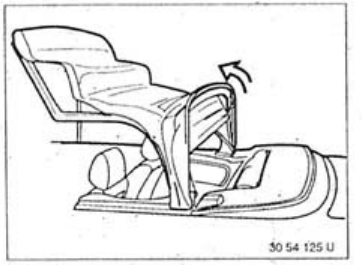


Turn drive lever counterclockwise until green LED just goes out (switch point S3).
Position = 5° after TDC (in clockwise direction).

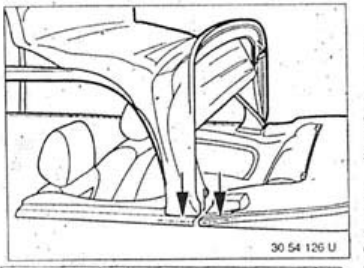


Adjust length of lid linkage by turning ball socket until linkage can be connected on ball head without tension.
Lock ball socket on lid linkage with Loctite No. 270*.
Mount ball head and insert retainer.

* Source of Supply: HWB



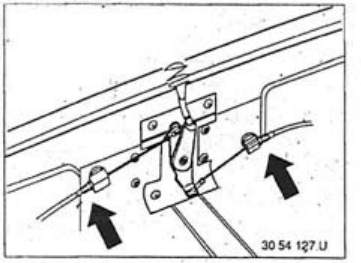
Shut top storage box lid.
Raise trunk lid.
Connect control unit.
Position top tensioning bow upright.

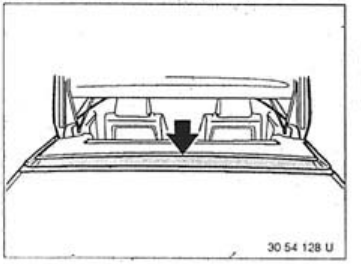


Engage top and top storage box lid drives.
Make trial operation.
Check whether top storage box lid closes correctly and locks.
If necessary, correct adjustment of top storage box lid locks – see 54 25 005.

Note:
If top tensioning bow does not fold down while closing top, switch point of microswitch S4 will not be reached (does not switch).

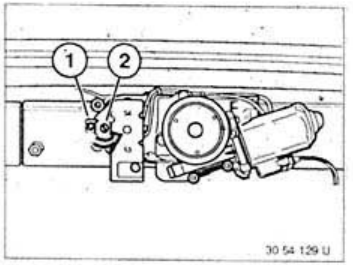
Remedy:
Adjust cables longer until switch point of microswitch "S4" is reached.
Recheck whether top storage box lid closes correctly and locks.
If necessary, correct adjustment of top storage box locks – see 54 25 005.





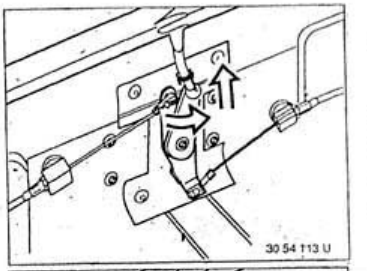
Open top and lock top storage box lid.
Check whether top storage box lid bulges up in area of top storage box drive.

Important!
Adjustment of microswitches "S3 / S4" may only be changed when there is evident bulging up of top storage box lid.



Loosen lockscrew (1).
Turn adjusting screw (2) counterclockwise slightly.
Tighten lockscrew (1).
Change length of top storage box lid linkage to new switch point "S3" with top storage box lid opened.
Position = < 5° after TDC (in clockwise direction).

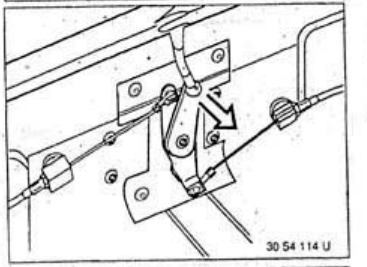
Repeat these procedures until top storage box lid no longer bulges up, whereby switch point "S3" may not be in TDC.
Afterwards check top storage box lid locking, correcting length of cables for top storage box lid locks if necessary.



54 25 002 ADJUSTING LINKAGE FOR TOP STORAGE BOX LID DRIVE

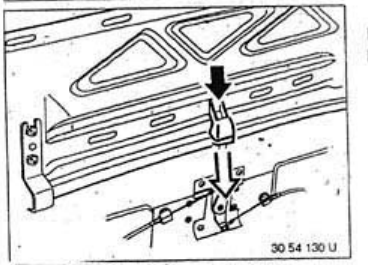
Run top out of top storage box until top tensioning bow is positioned upright.

Loosen and pull out retainer from above.

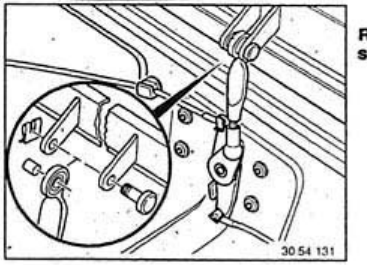


Hold top storage box lid tight and pull linkage off ball head.

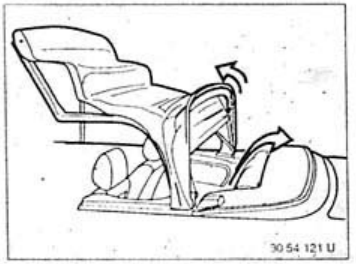
Installation:
Adjust top drive – see 54 25 001.



Disconnect catch strap and pull down protective sleeve.



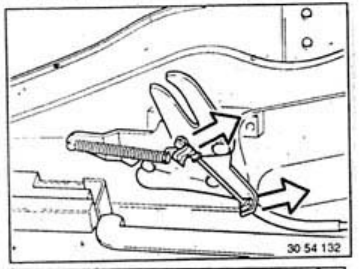
Remove retainer and pull out pin from side.



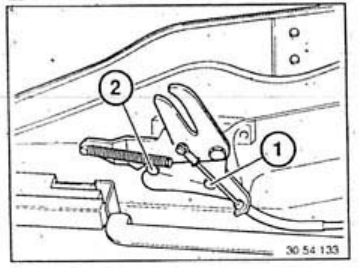
54 25 003 REMOVING AND INSTALLING OR REPLACING LEFT OR RIGHT TOP STORAGE BOX LID LOCK

Remove rear side trim panel – see 51 43 000.

Run top out of storage box until top tensioning bow is positioned upright and top storage box lid is opened.



Remove retainers and disconnect cable.



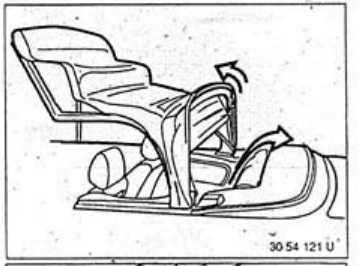
Caution!
Threaded plate can fall into cavity.

Hold threaded plate tight from behind. Unscrew screw (1) and loosen screw (2).
Take off top storage box lid lock.

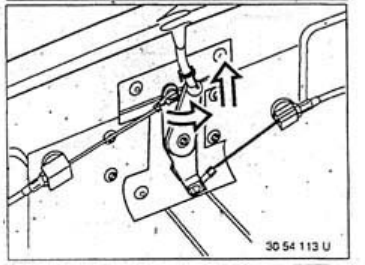
Installation:
Adjust top storage box lid lock – see 54 25 005.

54 25 005 ADJUSTING BOTH TOP STORAGE BOX LID LOCKS

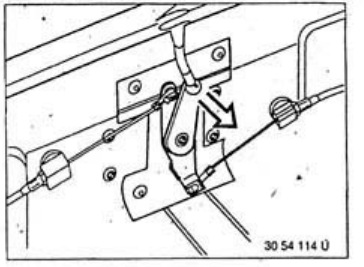
Requirement:
Top storage box lid adjusted correctly – see 54 25 000.



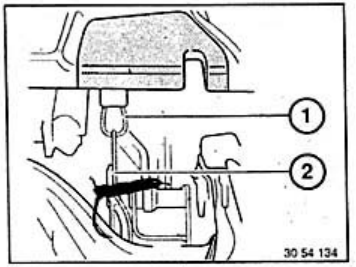
Run top out of storage box until top tensioning bow is positioned upright and top storage box lid is opened.



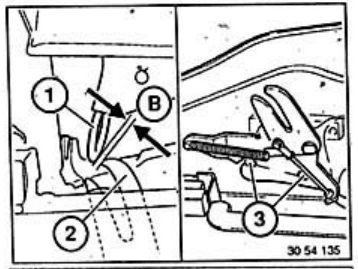
Loosen and pull out retainer from above.



Hold top storage box lid tight and pull linkage off ball head.

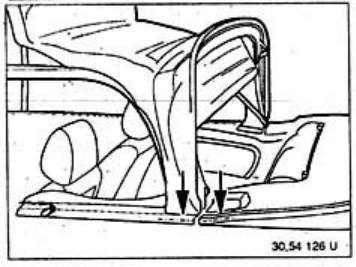


Lower top storage box lid on locks and adjust left/right locking bar (1) that left/right striker (2) engages in middle of locking bar (1).

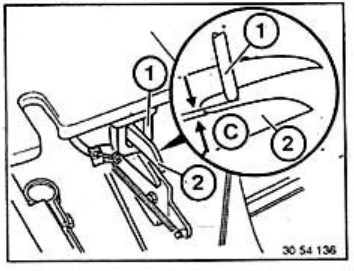


Loosen screws (3) and move top storage box lid locks forward or back so far that locking bars (1) emerge in strikers (2) by distance (B).

Distance B = approx. 3 mm (0.118").

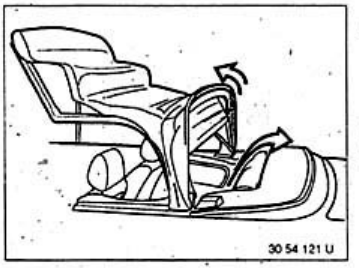


Shut top storage box lid and press down so far until ornamental strips are aligned.



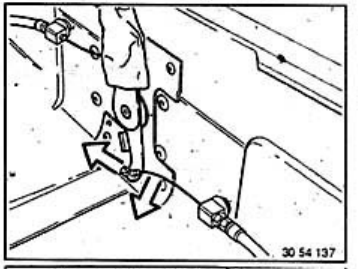
Press top storage box lid locks down so far that there is distance (C) between locking bars (1) and strikers (2) at bottom.
Tighten screws.

Distance C = approx. 3 mm (0.118").



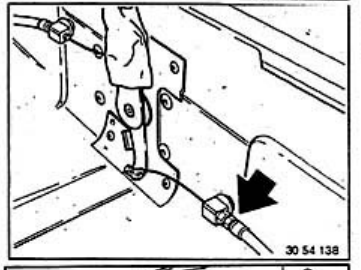
54 25 006 REMOVING AND INSTALLING OR REPLACING CABLE FOR LEFT OR RIGHT TOP STORAGE BOX LID LOCK

Open top storage box lid.
Run top out of storage box until top tensioning bow is positioned upright.

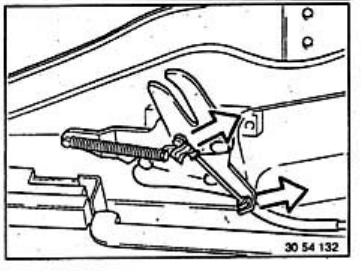


Remove retainer and disconnect cable.

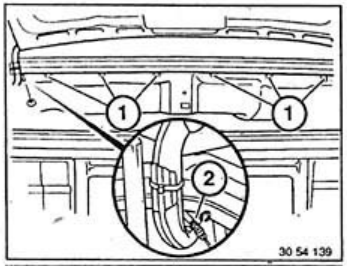
Installation:
Adjust top storage box lid drive – see 54 25 001.



Unscrew locknut and loosen adjusting screw completely.

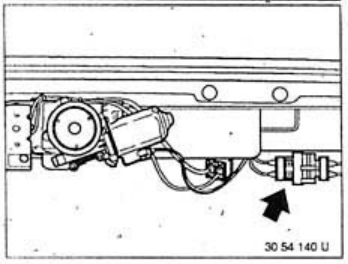


Remove retainers and disconnect cable.
Guide cable through holder on floor of top storage box and remove.



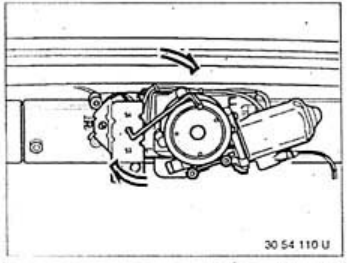
54 34 020 REMOVING AND INSTALLING OR REPLACING ELECTRIC TOP DRIVE

Remove trun lid – see Group 41.
Turn ignition key to "0" position.
Disengage clips (1) and retainer (2).
Disconnect cable and remove trunk trim panel.
Remove control unit – see 61 35 160.

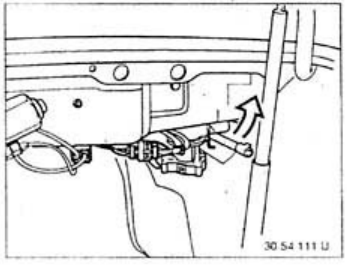


Disconnect plugs.

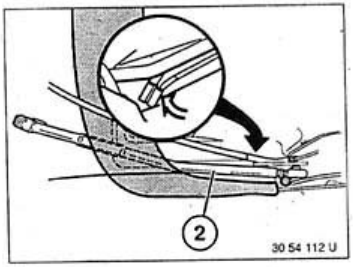
Black plug – microswitch S1
White plug – microswitch S2
Black plug – power supply



Disengage top storage box lid drive and unlock top storage box lid.



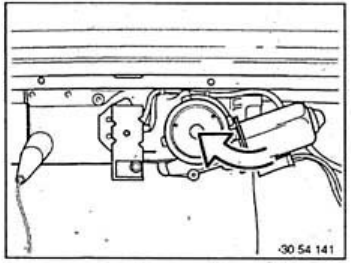
Disengage top drive.



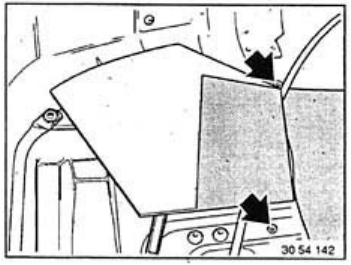
Top Closed:
Unlock top on cowl panel and lift at front end.
Position top tensioning bow upright and open top storage box lid.

Top Opened:
Open top storage box lid and lift top out of top storage box.
Position top tensioning bow upright.

Note:
If top cannot be lifted out of top storage box, engage top drive and run top out of storage box electrically.
If electric operation is not possible, press top in storage box completely and press out push rod (2) firmly.
Check top adjustment – see 54 34 023.



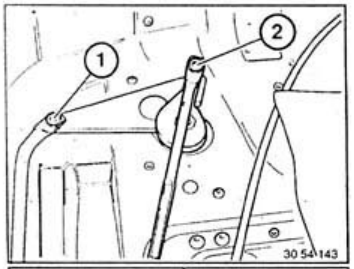
Open top storage box lid and re-engage top storage box lid motor.



Unscrew screws and take off cover.

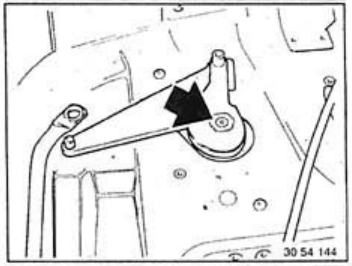
Installation:
Lock screws with Loctite No. 270*.
Tightening torque = 10 Nm (7 ft. lbs.).

* Source of Supply: HWB



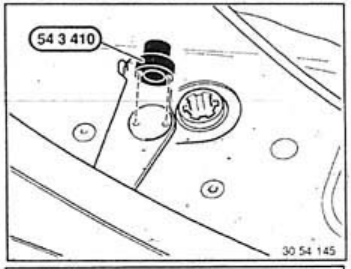
Unscrew screws (1 and 2).
Remove linkage from above.

Installation:
Lock screws with Loctite No. 270*.
Connect plugs for microswitches S1 and S2.
Adjust top drive – see 54 34 023.



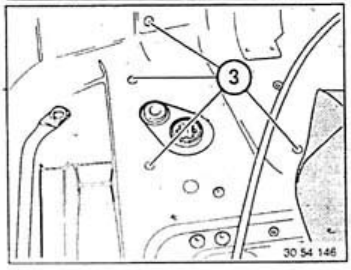
Unscrew screw and lift out drive lever from above.

Installation:
Drive lever can be inserted only in one position (splined shaft asymmetric).
Keep trying in different positions until drive lever can be inserted easily.
Lock screw with Loctite No. 270*.
Tightening torque = 5 Nm (3.5 ft. lbs.).



Unscrew screw with Special Tool 54 3 410 and take off trailing lever.

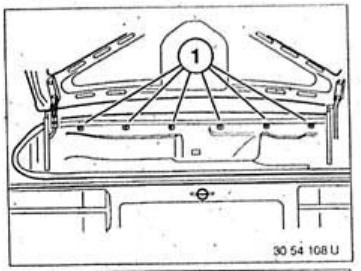
Installation:
Lock screw with Loctite No. 270*.
Tightening torque = 5 Nm (3.5 ft. lbs.).
Lubricate surface between drive lever and trailing lever lightly with Polylub GLY 801*.



Hold drive tight in trunk and unscrew screws (3).

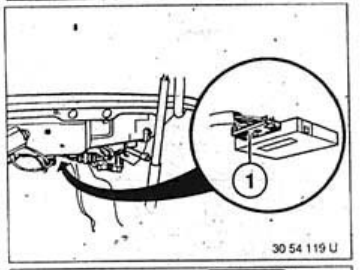
Installation:
Lock screws with Loctite No. 270*.
Tightening torque = 5 Nm (3.5 ft. lbs.).

* Source of Supply: HWB

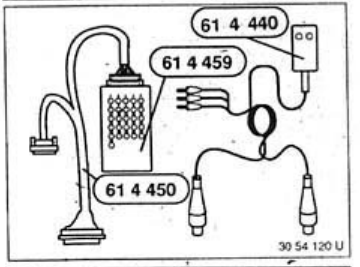


54 34 023 ADJUSTING ELECTRIC TOP DRIVE

Turn ignition key to "0" position.
Raise trunk lid.
Unclip clips (1) and lower trunk trim panel.



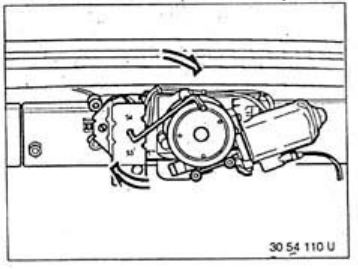
Disconnect plug (1).



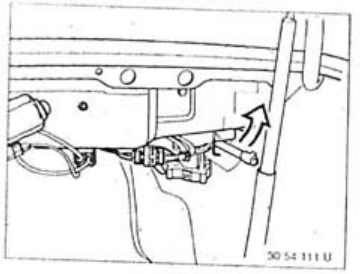
Connect plug (1) on test box 61 1 459 with help of adapter 61 4 450.
Don't connect control unit!
Connect microswitch test box 61 4 440 on test box.

Red plug	– B+ or pin 19
Black plug	– ground
Blue plug	– pin 20
Yellow plug	– pin 5 (microswitch S1)
Green plug	– pin 6 (microswitch S2)

Turn ignition key to "R" position.



Disengage top storage box lid drive and unlock top storage box lid.

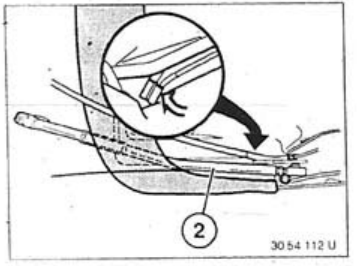


Disengage top drive.

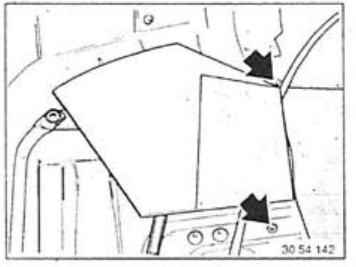
Take microswitch test box out of trunk and shut trunk lid.

Top Closed:
Unlock top on cowl panel and lift at front end.
Position top tensioning bow upright and open top storage box lid.

Top Opened:
Open top storage box lid and lift top out of top storage box.
Position top tensioning bow upright.



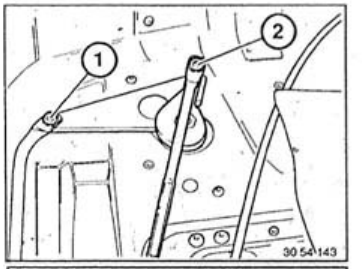
Note:
If top cannot be lifted out of top storage box, reconnect control unit, engage top drive and run top out of storage box electrically.
If electric operation is not possible, press top in top storage box completely and press out top push rod (2) firmly.



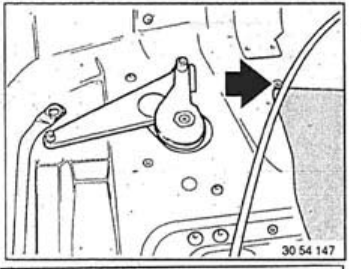
Unscrew screws and take off cover.

Installation:
Lock screws with Loctite No. 270*.
Tightening torque = 10 Nm (7 ft. lbs.).

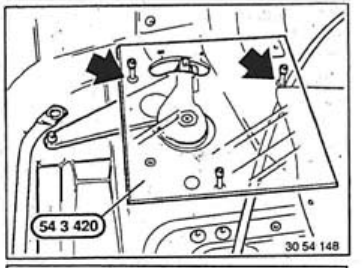
* Source of Supply: HWB



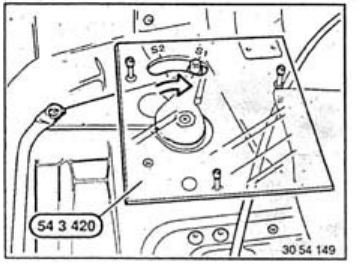
Unscrew screws (1 and 2).
Remove linkage from above.



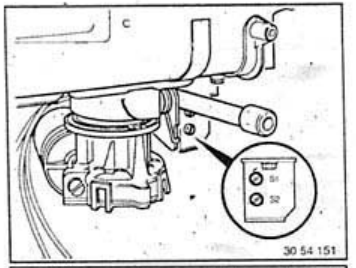
Screw in screw.



Apply Special Tool 54 3 420 on screws.

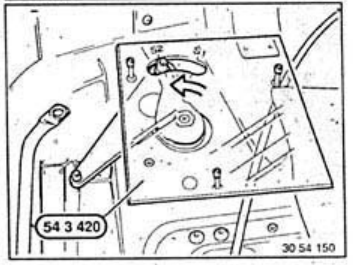


Turn drive lever (1) clockwise to "S1" position.
Center of bore (2) and notch (3) must be aligned.

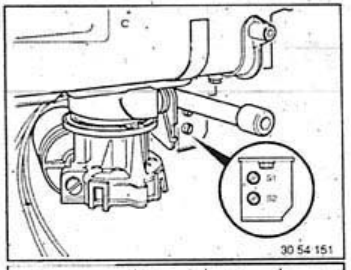


Adjust microswitch S1 with a long screwdriver (30 cm long, 5 mm tip width) until yellow LED just lights up.

Note:
Turning clockwise = LED begins to light up.
Turning counterclockwise = LED goes out.

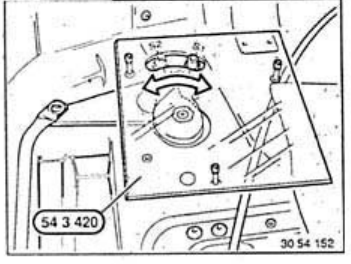


Turn drive lever (1) counterclockwise to "S2" position.

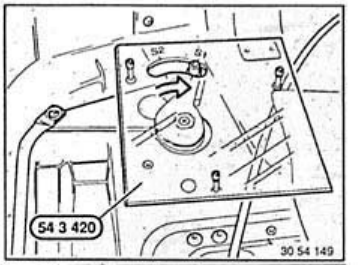


Adjust microswitch S2 until green LED just goes out.

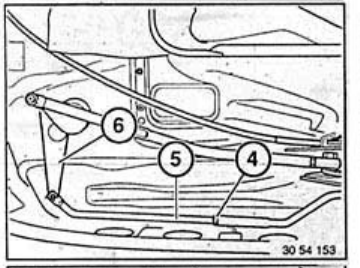
Note:
Turning clockwise = LED goes out.
Turning counterclockwise = LED begins to light up.



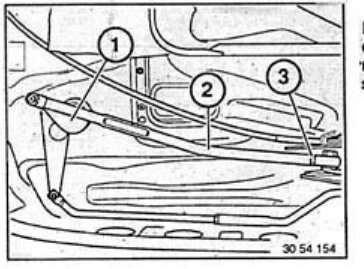
Turn drive lever (1) to positions "S1" and "S2", and check adjustment of microswitches.



Turn drive lever (1) to "S1" position. Remove Special Tool 51 3 420.



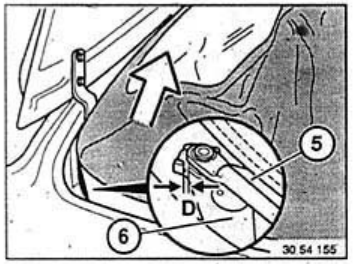
Position top tensioning bow upright. Loosen locknut (4) and adjust length of push rod for top tensioning bow (5) that it can be connected on trailing lever (6) without tension.
Tighten locknut (4).
Screw in and lock lockscrew for push rod (5) with Loctite No. 270*.



Loosen locknut (3) and adjust length of top push rod (2) that it can be connected on drive lever (1) without tension.

Take off top push rod (2) and then shorten by one complete turn.
Turn drive lever (1) counterclockwise until top push rod (2) can be connected. Screw in and lock lockscrew for top push rod (2) with Loctite No. 270*.

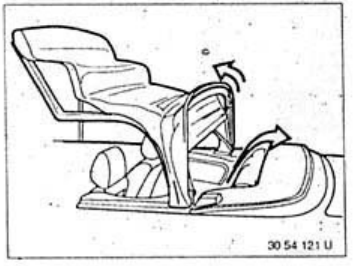
* Source of Supply: HWB



Place top in storage box by hand.
Lift out top again slowly and check distance (D) between drive lever (1) and trailing lever (6).

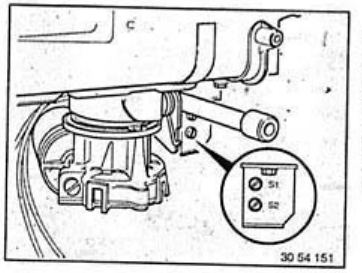
Distance D = at least 3 mm (0.118").

If necessary, shorten push rod for top tensioning bow slightly.



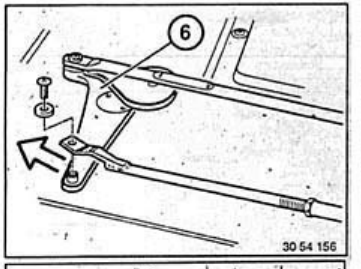
Close top until top tensioning bow is upright.
Engage top drive and top storage box lid drive.
Connect control unit.
Check function.
Run top into storage box completely.
Disengage top storage box lid drive and top drive.
Open top storage box lid and check whether top can be lifted out of storage box by hand.

Important!
Deviating adjustment of microswitch "S1" is permitted only when top cannot be lifted out of storage box by hand in spite of correctly disengaged drive.



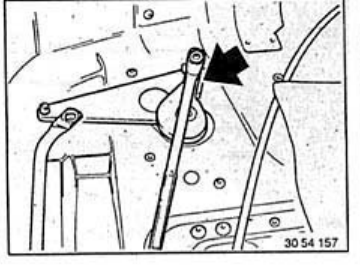
Turn adjusting screw for microswitch "S1" counterclockwise one half turn.
Engage top drive and run top out of and back in storage box electrically.
Disengage top drive and check whether top can be lifted out of storage box by hand.
Repeat these procedures until top can be lifted out of storage box by hand.

Close top electrically until top storage box lid begins to close.
Detach push rod to top tensioning bow in this position.



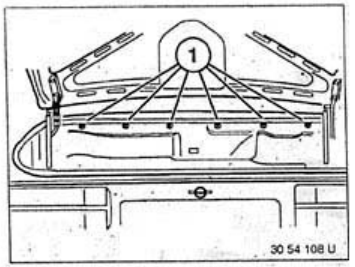
Check whether trailing arm (6) can still be turned clockwise (i.e. no self restriction between drive lever and trailing lever).
If trailing lever can no longer be moved (self restriction), exchange drive lever, trailing lever and, if applicable, top drive.

Installation:
Lubricate surface between drive lever and trailing lever lightly with Polylub GLY 801*.



Install cover and lock screws with Loctite No. 270*.
Position top tensioning bow upright.
Engage top and top storage box lid drives.
Install trunk trim panel.

* Source of Supply: HWB

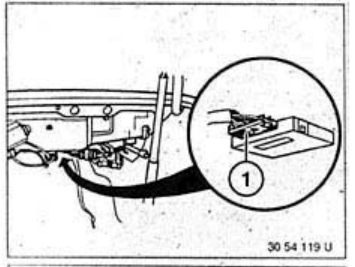


61 35 160 REPLACING CONTROL UNIT (EM TOP)

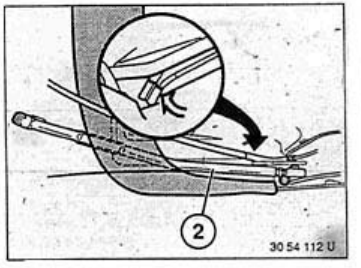
Turn ignition key to "0" position.
Raise trunk lid.
Unclip clips (1) and lower trunk trim panel.

Top Closed:
Unlock top on cowl panel and lift at front end.
Position top tensioning bow upright and open top storage box lid.

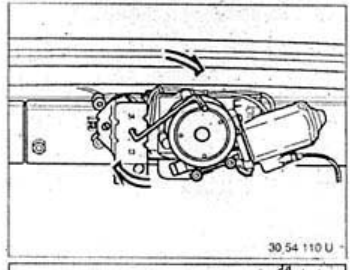
Top Opened:
Open top storage box lid and lift top out of top storage box.
Position top tensioning bow upright.



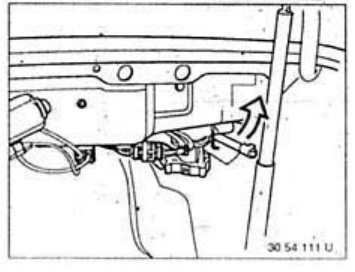
Disconnect plug (1).



Note:
If top cannot be lifted out of top storage box, engage top drive and run top out of storage box electrically.
If electric operation is not possible, press top in storage box completely and press out push rod (2) firmly.
Check top adjustment – see 54 34 023.

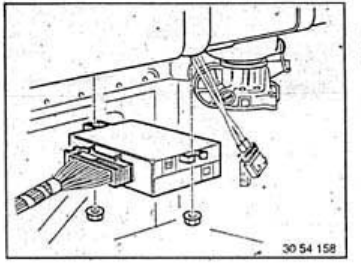


Disengage top storage box lid drive and unlock top storage box lid.

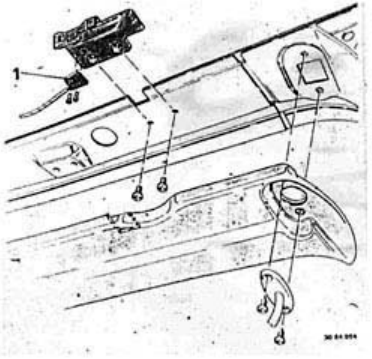


Disengage top drive.

Installation:
Position top tensioning bow upright.
Engage top drive and top storage box lid drive.



Unscrew screws and take out control unit.



61 31 190 REPLACING MICROSWITCH (Cowl Panel)

Pull edge off A-pillar partially.
Remove sun visors with holders.
If applicable, remove check control.
Take off cowl panel plate.
Unscrew screws and disconnect plug.

TROUBLESHOOTING TABLE FOR EM TOP MICROSWITCHES

Opening Top

	S 1	S 2	S 3	S 4	Top Switch on Cowl Panel
Top closed and locked	opened (no continuity)	opened (no continuity)	closed (continuity)	opened (no continuity)	opened (no continuity)

TROUBLESHOOTING EM TOP

Condition	Cause	Correction
Top does not open or close	a) Battery voltage < 10.5 V	a) Charge battery, let engine run
	b) Terminal R not switched on	b) Switch on terminal R, check terminal R fuse
	c) Top not unlocked and lifted above dead center	c) Open top as specified
	d) Vehicle rolling	d) Stop vehicle
	e) Microswitch in cowl panel faulty	e) Refer to page 54-61
	f) Microswitch maladjusted	f) Refer to page 54-61
	g) Fuses faulty	g) Refer to fuse connection plan
	h) Breaks in electric wires	h) Refer to page 54-64
	i) Breaks in plug connections	i) Repair plug connections
	k) Control unit faulty	k) Refer to page 54-64

61 90 ... TROUBLESHOOTING CONTROL UNIT FOR ELECTRIC CONVERTIBLE TOP

Test Requirements:
Wiring diagram – refer to General Car Electrical System for 3 Series E 30.
Adapter 61 4 450 connected on 26-pin test box.
Microswitch test box 61 4 440.
Multimeter.
Battery charged (control switches off drives when battery voltage drops below 10.5 V).
Fuses OK.
Terminal R switched on continuously.
Microswitches of drives adjusted as specified.

Testing:
Front trunk trim panel removed.
Terminal R switched on continuously.
Adapter 61 4 450 connected on 26-pin test box 61 1 459.
Control unit plug disconnected.
26-pin test box connected on wire harness.
Control unit remains disconnected.
Multimeter used.

Test Step 1:

Terminal R Signal Test

Measure voltage on test box betw. pin 19 and vehicle ground.
Specification: approx. battery voltage.

no → Repair electric wire from ignition lock to control unit.

yes ↓

Continue with Test Step 2.

Test Step 2:

Electronic Power Supply Test

Measure voltage between pin 11 and vehicle ground.
Specification:
approx. battery voltage.

no → Repair positive electric wire to control unit.

yes ↓

Measure voltage between pin 11 and pin 12.
Specification:
approx. battery voltage.

no → Repair negative electric wire of control unit.

yes ↓

Continue with Test Step 3.

Test Step 3:

Load Circuit Power Supply Test

Measure voltage between pin 20 and vehicle ground.
Specification:
approx. battery voltage.

no → Repair positive electric wire to control unit.

yes ↓

Measure voltage between pin 20 and pin 3.
Specification:
approx. battery voltage.

no → Repair negative electric wire of control unit.

yes ↓

Continue with Test Step 4.

Test Step 4:

Test of Switch Signals on Wire Harness End to Control Unit.

Unlock and lift top above dead center.
Connect microswitch test box 61 4 440 on 26-pin test box 61 1 459.
Black terminal on vehicle ground.
Red terminal on test box pin 19.
Blue plug on test box pin 20.
Yellow plug on test box pin 7 (open signal from switch).
Green plug on test box pin 8 (close signal from switch).

Operate switch in dashboard in open direction.
Does green LED on test box light up?

no → Continue with Test Step 5.

yes ↓

Operate switch in dashboard in close direction.
Does yellow LED on test box light up?

no → Continue with Test Step 5.

yes ↓

Switch in dashboard and cowl panel switch are OK.

Test Step 5:

Cowl Panel Switch Test

Cowl panel switch interrupts ground electric lead of top switch when top is closed.
Top must be taken out of cowl panel.
Remove check control or cowl panel plate.
Disconnect plug of microswitch in cowl panel (above mirror).

Bridge plug in wire harness direction of brown/white wire and brown wire .
Operate top switch in open direction.
Does green LED light up?

no → Continue with Test Step 6.

yes ↓

Bridge plug in wire harness direction of brown/white wire and brown wire.
Operate top switch in open direction.
Does yellow LED light up?

no → Continue with Test Step 6.

yes ↓

Cowl panel switch is faulty.

Test Step 6:

Top Switch Test

Remove radio.
Remove top switch.
Disconnect plug from top switch.

Operate switch in open direction.
Measure resistance between pin 5 and pin 1.
Specification:
approx. 0.2 ... 1 ohm.

no → Top switch is faulty.

yes ↓

Operate switch in close direction.
Measure resistance between pin 5 and pin 4.
Specification:
approx. 0.2 ... 1 ohm.

no → Top switch is faulty.

yes ↓

Continue with Test Step 7.

Test Step 7

Drive Motor Test

Same testing sequence for top storage box lid motor and top motor.
Disconnect 2-pin motor plugs.
Disengage motors.

Supply approx. 12 V power on plug in direction of motor.
Does motor run?

no → Motor is faulty.

yes

Continue with Test Step 8.

Test Step 8:

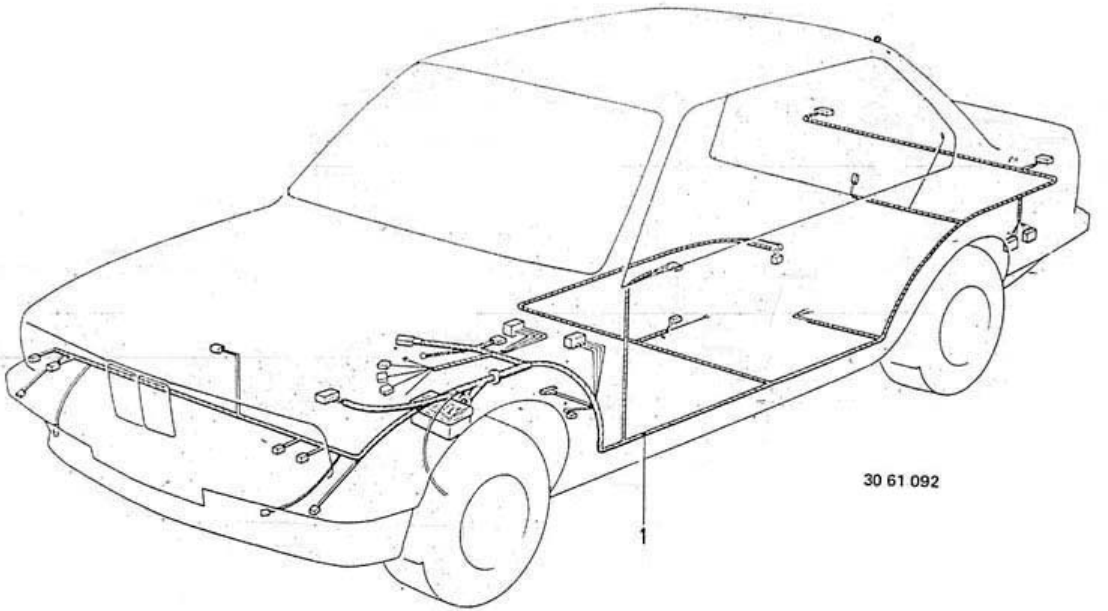
Control Unit Test

Replace control unit, if all of the above mentioned test steps have been carried out and top does not work in spite of correctly adjusted microswitches.

61 Electrical System

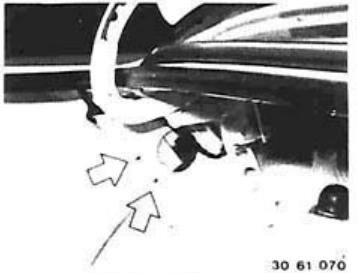
61 10 . . .	Main wire harness – layout	61- 0/1
100	Main wire harness - replace	61- 0/2
61 13 . . .	Plug connectors – remove and install	61- 0/4
. . .	12 pin plug receptacle	61- 0/4
. . .	20-pin round male plug	61- 0/5
. . .	8-pin round male plug	61- 0/5
. . .	35 and 55-pin coupling	61- 0/6
021	Fuse box for power distributor – replace	61- 1
61	Relay survey	61- 1b
61 21 010	Battery – remove and install	61- 2
015	Degassing tank – remove and install or replace	61- 2
61 31 016	Turn signal / headlight dimmer switch – replace	61- 3
018	Cruise control selector switch – replace	61- 3
020	Steering lock / ignition switch – remove and install	61- 3
028	Light switch – remove and install	61- 4
040	Windshield wiper switch – remove and install	61- 4
045	Intensive cleaning control unit – replace	61- 5
051	Heater (blower) switch – remove and install	61- 5
060	Rear window defogger switch – remove and install	61- 5
070	Front and rear fog light switch – remove and install	61- 5
080	Hazard light switch – remove and install	61- 5
085	Air conditioner switch – remove and install	61- 5
095	Door lock heating control unit – remove and install or replace	61- 6
105	Power window automatic cut-out – replace	61- 6
115	Power window switch – replace	61- 6
205	Central lock impact switch – replace	61- 6
210	Door contact switch, left or right – remove and install	61- 6
250	Trunk light contact switch – remove and install	61- 7
255	Outside power mirror switch – replace	61- 7
260	Transmission switch – replace	61- 7
265	Program switch for automatic transmission control (EH) – replace	61- 7
270	Backup light switch – replace	61- 8
280	Oil pressure switch – remove and install	61- 8
282	Engine oil level switch – replace	61- 9
310	Stop light switch – replace	61- 9
313	Brake pad wear sensor – replace	61- 10
315	Brake fluid level switch – replace	61- 10
320	Parking brake control lamp switch – replace	61- 10
330	Glove box light switch – remove and install	61- 11
360	Flasher (relay) for turn signals / hazard lights – remove and install	61- 11
370	Wipe / wash control unit – replace	61- 11
382	Coolant level switch – replace	61- 11
390	Bulb tester (tall and stop lights) for check control – replace	61- 12
475	Switchover relay for power sun roof – replace	61- 12
492	Windshield washing fluid level switch – replace	61- 12
. . .	Relays in power distributor – replace	61- 12
61 33 040	Two-tone horn, left or right – remove and install	61- 13
61 61 270	Windshield wiper console – remove and install	61- 14
61	Rear window wiper – replace (touring)	61- 15
61 71 504	Windshield spray nozzles – aim	61- 15

MAIN WIRE HARNESS LAYOUT DRAWING

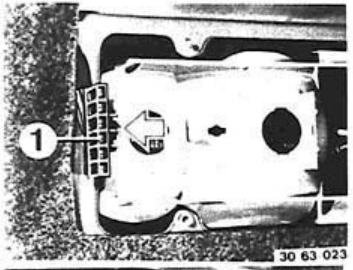


61 10 100 REPLACING MAIN WIRE HARNESS

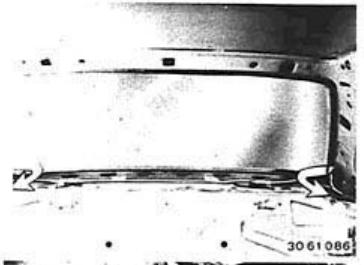
Remove windshield, front roof liner plate, center console, instrument carrier, front seats, rear seat cushion and backrest, rear side trim panels as applicable, all radiator grill sections and both entrance cover strips. Loosen and attach carpets and insulation sheets.



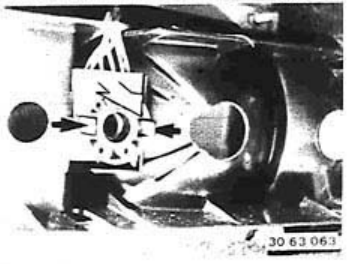
If applicable, pull off plug on bulb tester.



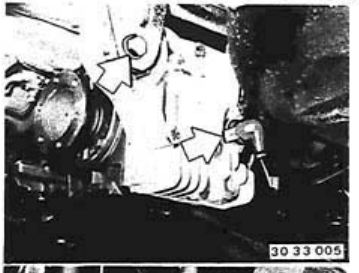
Lift off tail light covers on left and right side and pull off plugs.



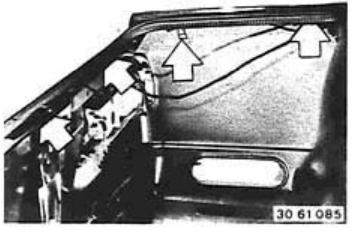
Pull off rear window defogger wires on left and right sides and lead back to the main wire harness.



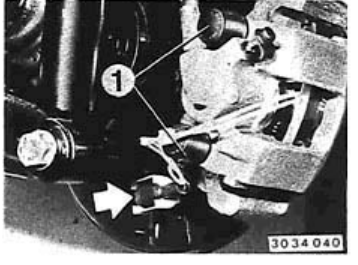
1988 Models On:
Unscrew covers on left and right sides. Compress clips and pull out plugs.



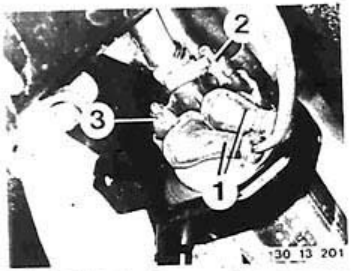
Pull off wires on pulse sender for the speedometer, loosen clips and guide wires into the passenger compartment.



Lift out plugs on license plate lights. Bend open all metal holders and pull wire harness into the passenger compartment.

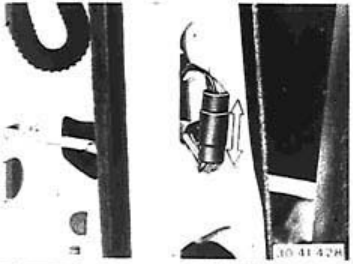


If applicable, disconnect brake pad wear indicator plug on the right-hand side and pull in wires.

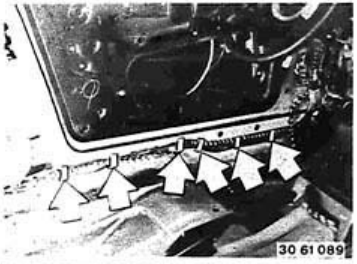


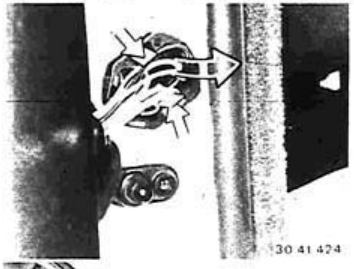
Disconnect wires on electric fuel pump and run in.

Loosen all clips and lift wire harness out of side member.

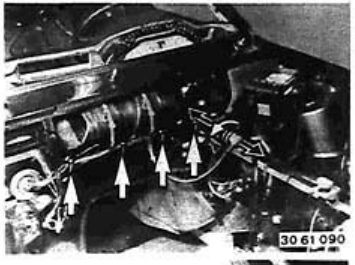


Four Door Cars:
If applicable, disconnect wires for power windows or central locks in the B pillar and lift wires out of left and right B pillars.

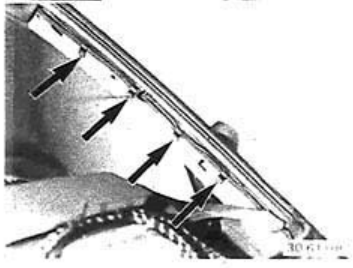




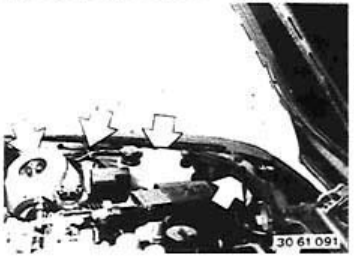
Disconnect plugs in left and right A pillars and lift wires out of A pillars.



Loosen straps.
Disconnect engine wire harness on main wire harness.
Loosen positive lead up to the power distributor.

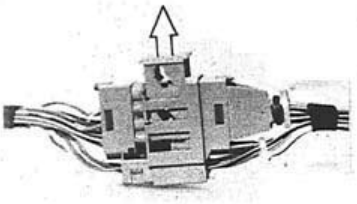


If applicable, loosen clips and run wires for check control into the left footwell.



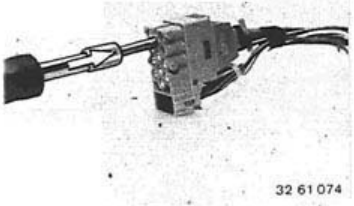
Disconnect wires on turn signals, headlights, coolant level switch and brake fluid level switch.
Loosen straps and lead wire harness to the power distributor.

61 13 . . . REMOVING AND INSTALLING PLUG CONNECTORS



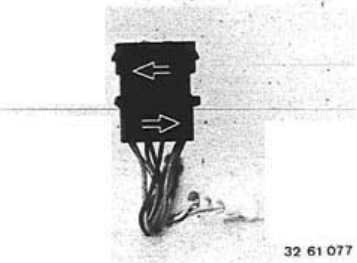
32 61 073

Pull locking lever and disconnect plug.



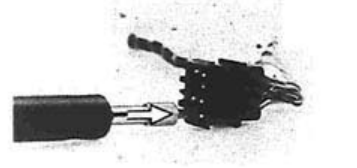
32 61 074

Push back lockpins with special tool and press out contact sleeve or pin.



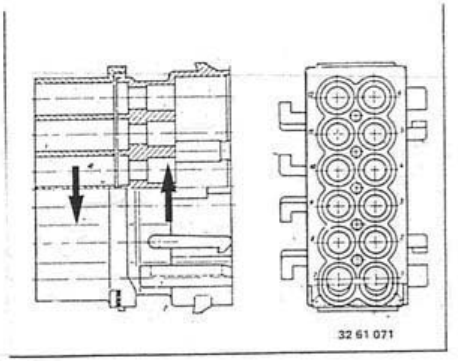
32 61 077

Push plug upper and lower sections against each other and press out contact pin or sleeve with special tool.



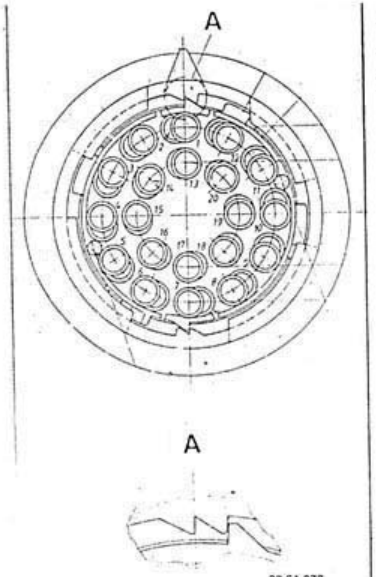
32 61 078

61 13 . . . 12 PIN PLUG RECEPTACLE



32 61 071

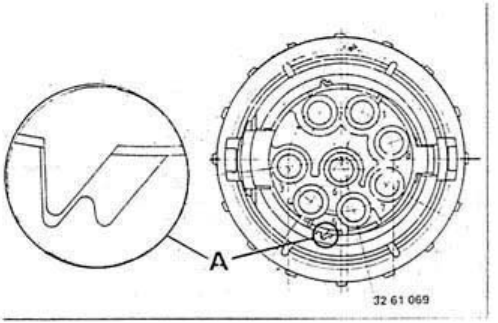
Push plug upper and lower sections against each other and press out contact pin or sleeve with special tool.



61 13 . . . 20 PIN ROUND MALE PLUG

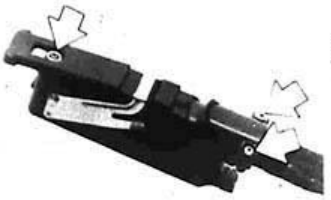
Turn plug to final catch position A and press out contact pin or sleeve with special tool.

61 13 . . . 8 PIN ROUND MALE PLUG



Turn plug to final catch position A and press out contact pin or sleeve with special tool.

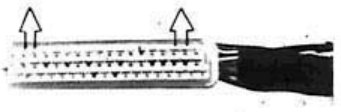
61 13 . . . 35 AND 55 PIN PLUG COUPLING



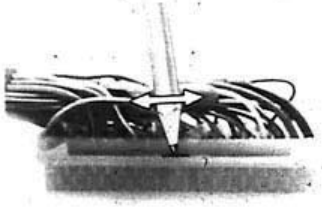
32 61 079

Unscrew screws and lift out contact carrier with seal forward.

Push locking plate to the side and unlock.

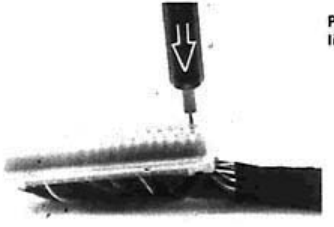


32 61 080



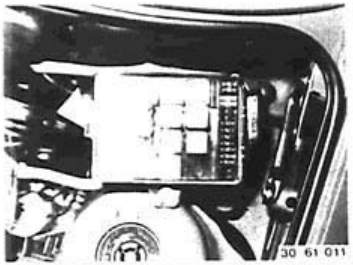
32 61 081

Connection numbers are on the edge of the contact carrier and can be made vissible by rubbing over them with a pencil.



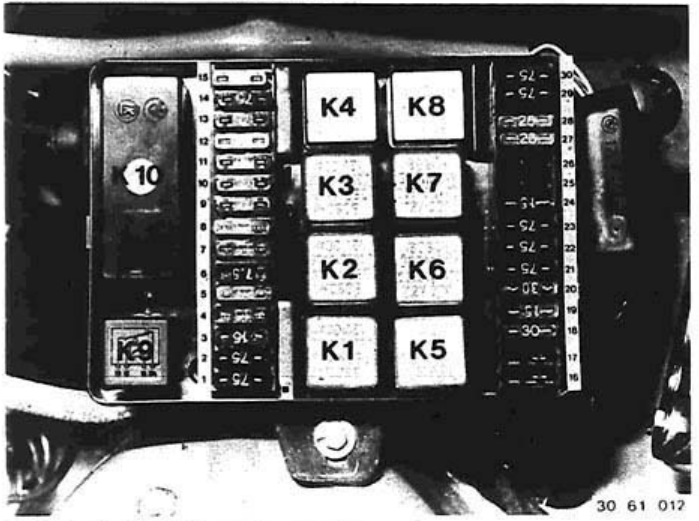
32 61 082

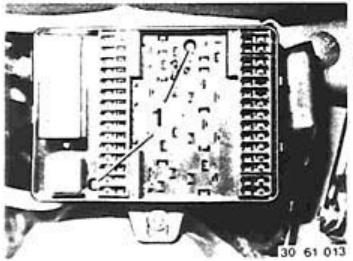
Push back contact lock with special tool and lift out wires.



61 13 021 REPLACING FUSE / RELAY PLATE

Disconnect battery ground lead.
Take off cover.
Pull out all relays and fuses.





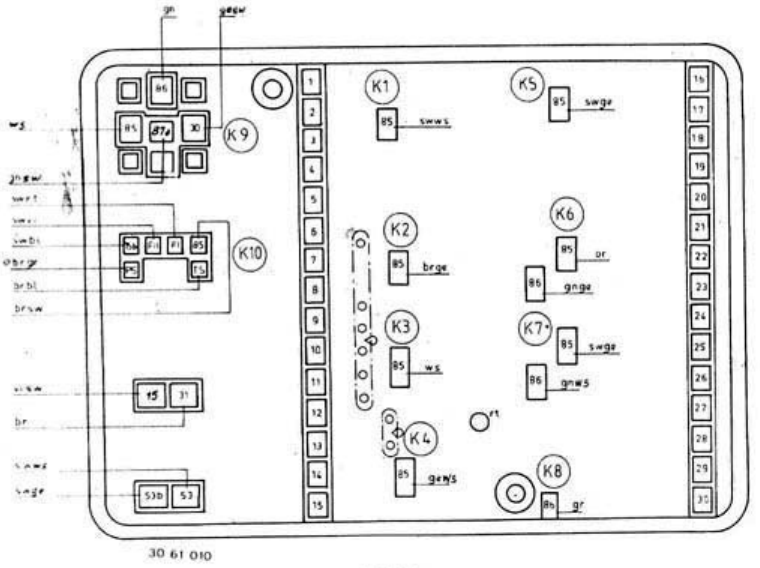
Unscrew bolts (1).
Lift fuse/relay plate.
Disconnect all wires.
Installation:
See wiring diagram for connections.

Fuse No.	Current (A)	Description
1	7.5	High beam left
2	7.5	High beam right
3	15	Extra fan 91° C (air conditioner)
4	15	Turn signal indicator
5	30	Wipe/wash, headlight cleaning and intensive cleaning systems
6	7.5	Brake lights, electronic cruise control
7	15	Two-tone horns
8	20	Rear window defogger
9	15	Engine electrics, backup lights before 9/84, range ind. for autom. transm.
10	7.5	Instruments, on-board computer, backup lights since 9/84
11	15	Fuel transfer pump
12	7.5	Radio, check control and instruments
13	7.5	Low beam left
14	7.5	Low beam right
15	7.5	Rear fog light
16	15	Seat heating
17	30	Sun roof, power windows
18	30	Extra fan 99° C (air conditioner)
19	7.5	Mirror operating and heating
20	30	Heater blower, air conditioner
21	7.5	Inside light, glove box light, trunk light, handlamp, clock, radio memory, on-board computer
22	7.5	Overnight, tail and parking lights left
23	7.5	Overnight, tail and parking lights right, license plate and instrument lights
24	15	Hazard lights
25	–	–
26	–	–
27	30	Central locks, door lock heating, burglar alarm, on-board computer horn
28	30	Cigar lighter, automatic antenna
29	7.5	Front fog lamp left
30	7.5	Front fog lamp right

Relay*	Description	Spare Fuse (In Cover):
K 1	Extra fan speed I	1 x 7.5 A
K 2	Two-tone horns	1 x 15 A
K 3	High beams	2 x 30 A
K 4	Low beams, rear fog light	
K 5	Seat heating, sun roof, power windows	
K 6	Extra fan speed II	
K 7	Heater blower, rear window defogger, power mirrors	
K 8	Front fog lamps	
K 9	Rear fog light (F, CH)	
K 10	Intensive cleaning control unit	

* Stamped in cover

FUSE / RELAY CONNECTIONS



30 61 010

Relays:

K 1	Extra fan speed I
K 2	Two-tone horns
K 3	High beams
K 4	Low beams, rear fog light
K 5	Seat heating, sun roof, power windows
K 6	Extra fan speed II
K 7	Heater blower, rear window defogger, power mirrors
K 8	Front fog lamps
K 9	Rear fog light (F, CH)
K 10	Intensive cleaning control unit

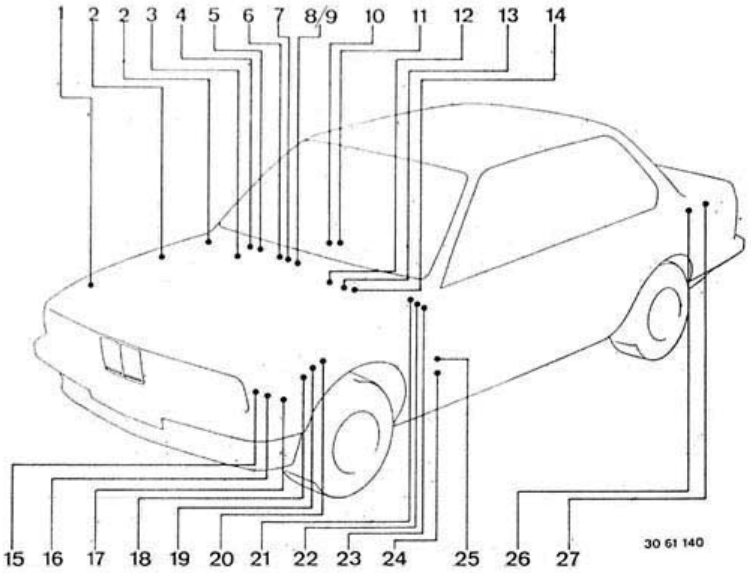
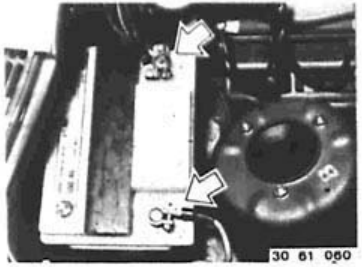
SURVEY OF RELAYS AND CONTROL UNITS OUTSIDE OF POWER DISTRIBUTOR



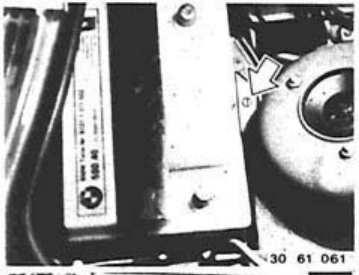
1 Relay for headlight cleaners (in engine compartment right)
2 Relay for intensive cleaning (on washing fluid tank or depending on version)
3 Control unit DME/LE-Jetronic (in glove box top)
4 Control unit for cruise control (above glove box)
5 Control unit for idle speed control (in glove box top)
6 Solenoid for ignition advance control (on firewall)
7 Ignition control unit (on firewall)
8 Electric fuel pump relay (on firewall) for M 40
9 Oxygen sensor heating relay (on firewall) since 1988 models
10 AC relay for blower (behind center console)
11 AC relay (behind center console)
12 Flashing relay (above steering column left)
13 ABS overvoltage relay (underneath instrument carrier)
14 ABS control unit (underneath instrument carrier)
15 Hydraulic control unit (in engine compartment left)
16 Valve relay (in engine compartment left)
17 Motor relay (in engine compartment left)
18 Ignition advance control relay for 318 i Cat. (on inside of left wheel house) omitted since 1988 models
19 Idle stabilization or EIIP relay for DME (on inside of left wheel house) for M 10 and M 20
20 L-Jetronic master relay or 2 BE carburetor relay or oxygen sensor heating relay (on left wheel house) until 1987 models
21 DWA control unit/relay box (underneath instrument carrier left)
22 Power window relay (underneath instrument carrier left)
23 Starter interlocking relay (underneath instrument carrier left)
24 ZV control unit (A pillar behind radio speaker left)
25 Inside light delayer (A pillar behind radio speaker left)
26 Bulb tester for check control (in trunk top left)
27 AEGS control unit (in trunk top left)

ABS	Antiblock system
AC	Air conditioner (automatic climate)
AEGS	Independent electronic transmission control
BC	On-board computer
DME	Digital motor electronics
DWA	Burglar alarm system
SA	Special equipment
Stgt	Control unit
ZV	Central locks

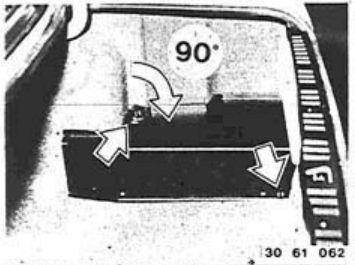


61 21 010 REMOVING AND INSTALLING BATTERY

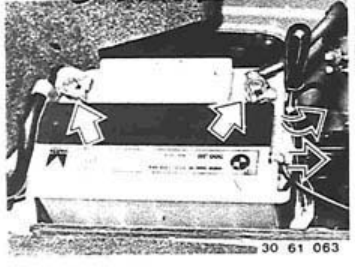
a) Located in Engine Compartment:
Disconnect ground lead.
Remove cap on positive pole.
Disconnect positive lead.



Unscrew bolt.
Remove holder and lift out battery.



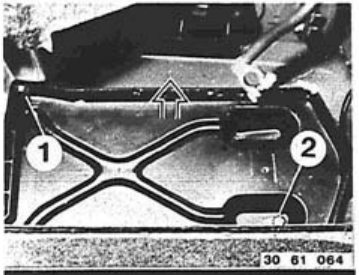
b) Located in Trunk:
Turn fasteners 90° and lift out trim panel.



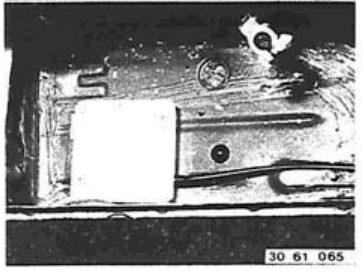
Disconnect negative and positive leads.
Unscrew holder.
Pull off vent hose.
Lift out battery.

61 21 015 REMOVING AND INSTALLING OR REPLACING DEGASING TANK

Remove battery – see b) in 61 21 010.



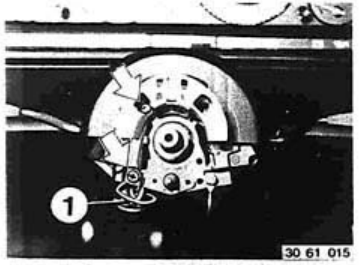
Unscrew bolt (1) and remove with nut and washer.
Unscrew nut (2) and remove with washer.
Lift out connecting plate.



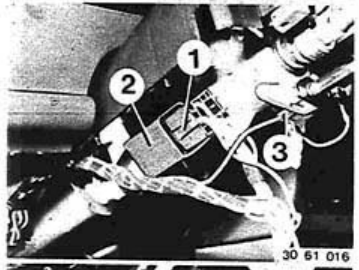
Lift out degasing tank.
Caution!
Degasing tank contains battery acid.

61 31 016 REPLACING TURN SIGNAL/ HEADLIGHT DIMMER SWITCH

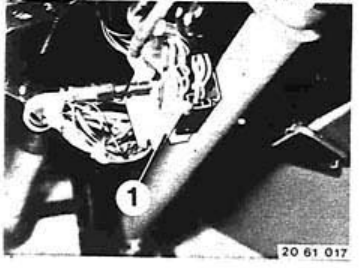
Disconnect battery ground lead.
Remove steering wheel 32 33 000.
Remove instrument panel trim at bottom left 51 45 180.
Remove steering column casing lower section 32 31 020.



Unscrew screws.
Remove turn signal/headlight dimmer switch.
Note:
Check ground wire (1).



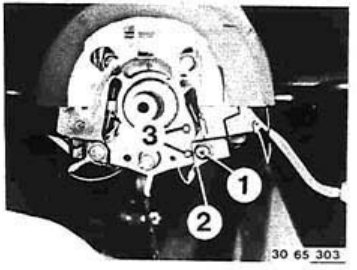
Lift out plug (1) with flasher relay (2).
Pull relay off of plug.
Pull off plug on wire (3) for two-tone horns.



Disconnect wire straps.
Disconnect plug (1).

61 31 018 REPLACING CRUISE CONTROL SELECTOR SWITCH

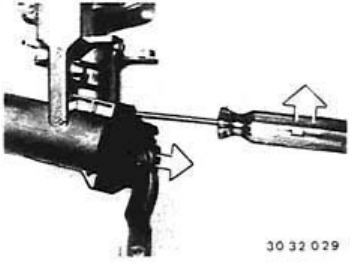
Disconnect battery ground lead.
Remove steering wheel 32 33 000.
Remove instrument panel trim at bottom left 51 45 180.
Remove steering column casing lower section 32 31 020.



Unscrew screw (1) and lift out selector switch.
Cut open wire strap and disconnect plug.
Installation:
Also mount ground wire (2).
Both retainers must engage in bores (3).

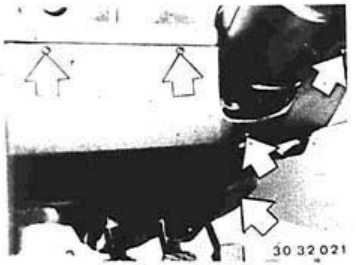
61 31 020 REMOVING AND INSTALLING STEERING LOCK / IGNITION SWITCH

Disconnect battery ground lead.
Remove steering wheel 32 33 000.
Remove instrument panel trim at bottom left 51 45 180.
Remove steering column casing lower section 32 31 020.



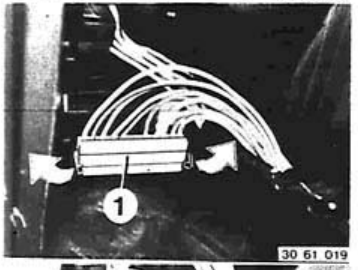
Press in locks on both sides toward ignition switch and pull out ignition switch.
Installation:
Check position of ignition switch – steering wheel lock!

61 31 028 REMOVING AND INSTALLING LIGHT SWITCH

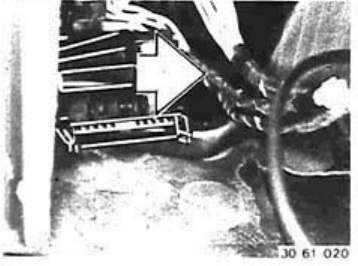


Disconnect battery ground lead.
Remove trim panel.

Unscrew control knob

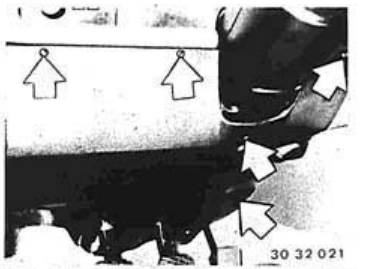


Pull off plug (1).

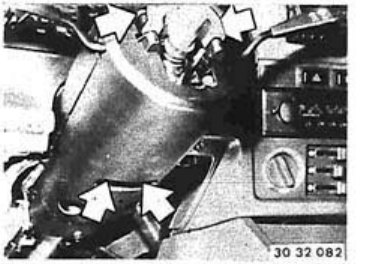


Pull out light switch.

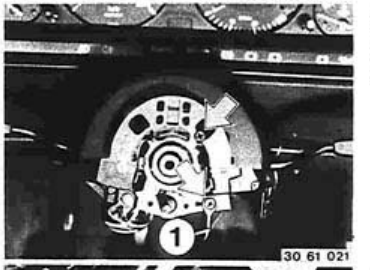
61 31 040 REMOVING AND INSTALLING WIPER SWITCH



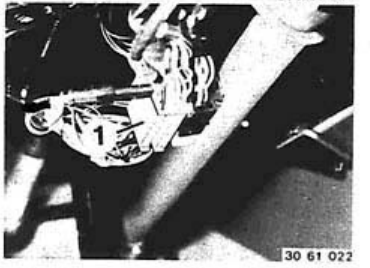
Disconnect battery ground lead.
Remove and install steering wheel 32 33 000.
Remove trim panel.



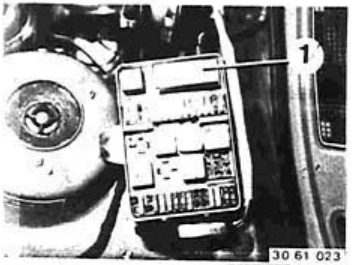
Remove trim.



Unscrew screws.
Remove wiper switch.
Installation:
Also mount ground wire (1).



Open wire straps.
Disconnect plug (1).



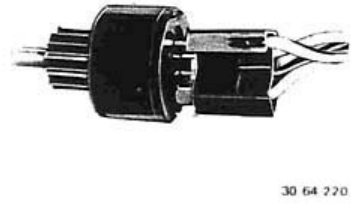
61 31 045 REPLACING INTENSIVE CLEANER CONTROL UNIT

Lift off cover on fuse/relay plate.
Pull out control unit (1).

61 31 051 REMOVING AND INSTALLING HEATER (BLOWER) SWITCH

Lift off radio opening mask or remove radio.
Pull off control knob.

Unscrew nut.



Remove transmission switch.
Pull off plug.

61 31 060 REMOVING AND INSTALLING REAR WINDOW DEFOGGER SWITCH

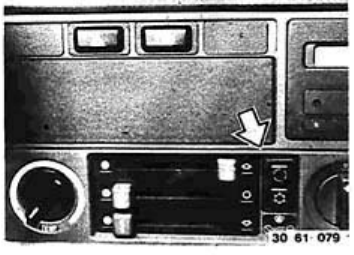
Lift out switch with a small screwdriver.
Pull off plug.

61 31 070 REMOVING AND INSTALLING FRONT AND REAR FOG LIGHT SWITCH

Lift out switch with a small screwdriver.
Pull off plug.

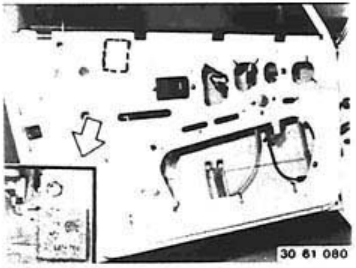
61 31 080 REMOVING AND INSTALLING HAZARD LIGHT SWITCH

Lift out switch with a small screwdriver.
Pull off plug.



61 31 085 REPLACING AIR CONDITIONER SWITCH

Lift out switch with a small screwdriver.
Pull off plug.

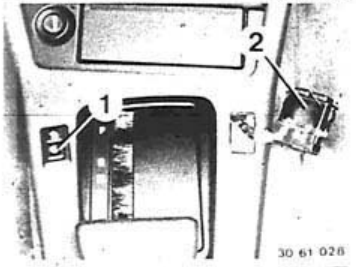


61 31 095 REMOVING AND INSTALLING OR REPLACING CONTROL UNIT FOR DOOR LOCK HEATING

Remove left front door trim panel 51 41 001.
Control unit is located in door at height of door handle.
Unscrew nut.
Disconnect plug.

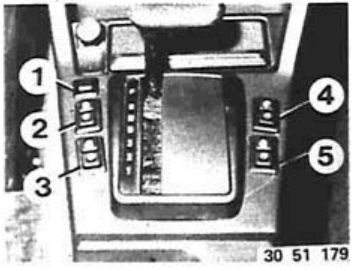
61 31 105 REPLACING ELECTRIC WINDOW AUTOMATIC CUTOUT

Lift switch with a small screwdriver.
Pull off plug.

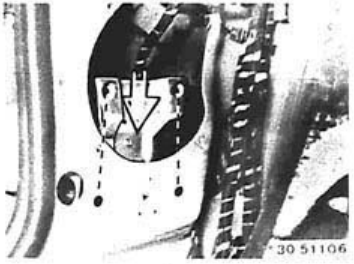


61 31 115 REPLACING ELECTRIC WINDOW SWITCH

Lift out switch with a small screwdriver.
Pull off plugs.
Two Door:
1 = Driver's door
2 = Passenger's door

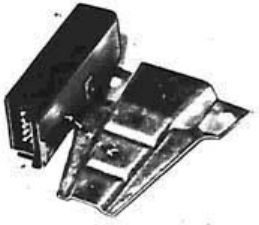


Four Door:
1 = Child safety lock
2 = Driver's door
3 = Rear door left
4 = Passenger's door
5 = Rear door right

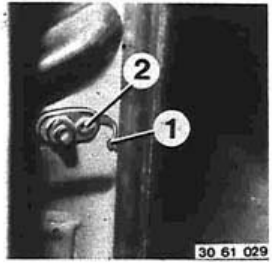


61 31 205 REPLACING IMPACT SWITCH FOR CENTRAL LOCKS

Testing procedures – see Group 51.
Take radio speaker out of left A pillar.
Pull off carpet.
Unscrew screws and remove impact switch with holder from radio speaker installation location.
Disconnect plug.

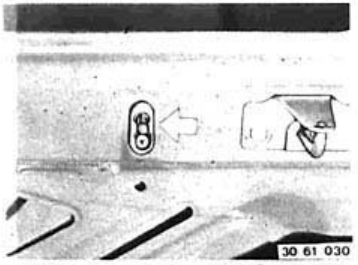


Unscrew screws.
Take impact switch off of holder.
Installation:
Retainer must protrude into bore of holder.



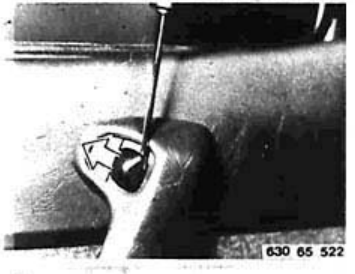
61 31 210 REMOVING AND INSTALLING LEFT OR RIGHT DOOR CONTACT SWITCH

Lift out cover (1).
Unscrew bolt (2).
Remove switch.
Pull off plug.



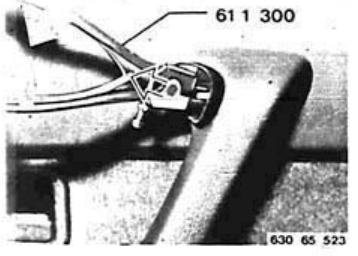
61 31 250 REMOVING AND INSTALLING TRUNK LIGHT CONTACT SWITCH

Unscrew screw.
Remove switch.
Pull off plug.



61 31 255 REPLACING OUTSIDE POWER MIRROR SWITCH

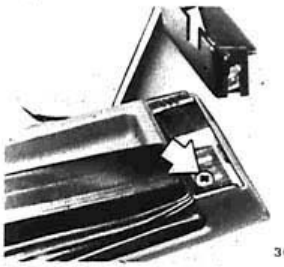
Pull off mirror adjusting button.



Lift out mirror switch with Special Tool 61 1 300.
Pull off plug.

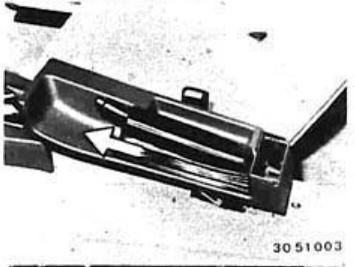
61 31 260 REPLACING TRANSMISSION SWITCH

See "Removing and Installing Selector Lever" – 25 16 080.

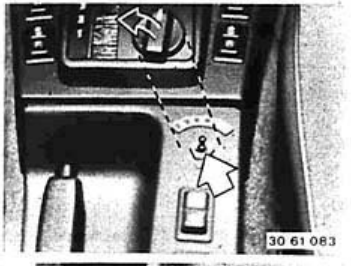


61 31 265 REPLACING PROGRAM SWITCH FOR AUTOMATIC TRANSMISSION CONTROL (EH)

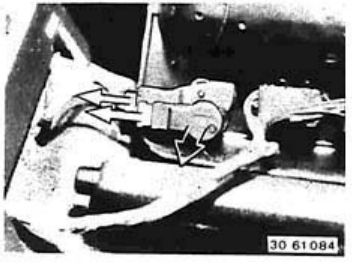
Pull out ashtray for rear seats.
Unscrew nut.



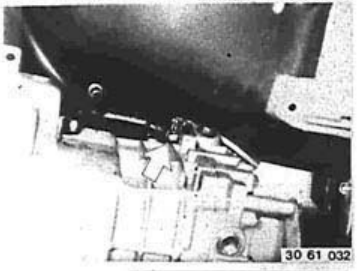
Lift off cover forward.
Pull off plug on program switch.
Pull out ashtray light.

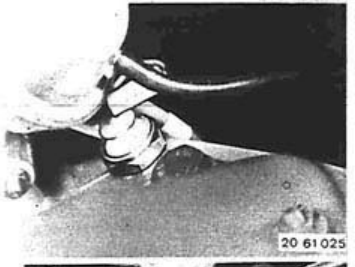


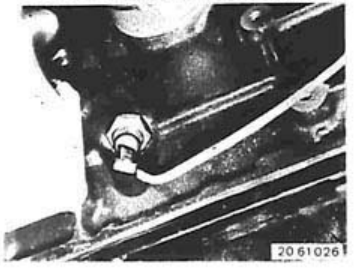
Pull off program switch knob from above.
Unscrew nut.



Pull off plug and lift out switch downward.







61 31 270 REPLACING BACKUP LIGHT SWITCH

Four Speed Manual Transmission:

Pull off plug.
Unscrew switch.

Five Speed Manual Transmission:

Pull off plug.
Unscrew switch.

Automatic Transmission:

Backup light switch is integrated in transmission switch.

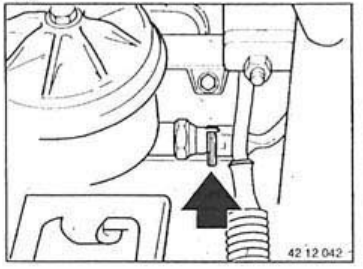
61 31 280 REMOVING AND INSTALLING OIL PRESSURE SWITCH

M 10 Engine:

Pull off plug.
Unscrew switch.

M 20 Engine:

Pull off plug.
Unscrew switch.

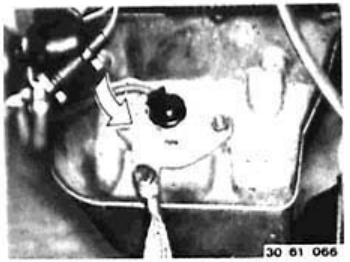


M 40 / M 42 Engine:

Oil pressure switch is located on base of oil filter.
Loosen oil filter cover to have oil in oil filter run back into oil pan.
Pull off plug.

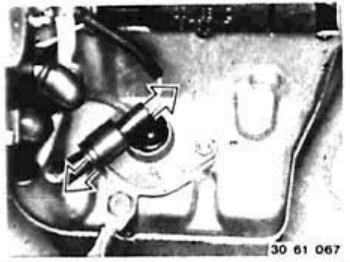
Unscrew switch.

Installation:
Tighten oil filter cover.
Install switch.
Add engine oil if necessary.

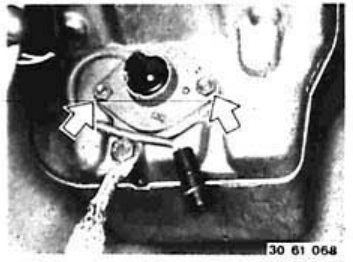


61 31 282 REPLACING ENGINE OIL LEVEL SWITCH

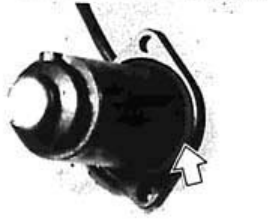
Air cleaner was removed for better presentation.
Pull plug out of holder.



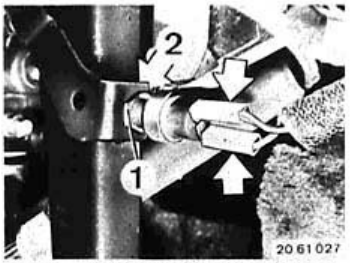
Disconnect plug.



Unscrew nuts.
Lift level switch and let oil flow out of switch back into the oil pan.

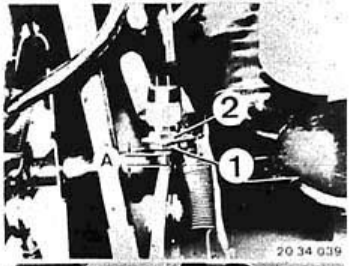


Check seal, replacing if necessary.

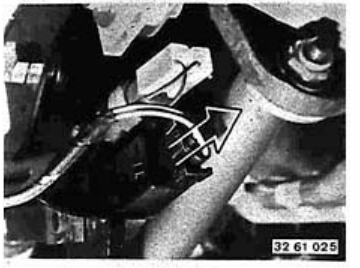


61 31 310 REPLACING STOP LIGHT SWITCH

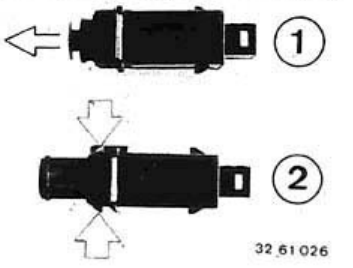
a)
Pull off plug.
Loosen lock nut (1).
Unscrew nut (2).



Adjusting:
Adjust stop light switch with nut (1) and lock nut (2) that distance A = 5 to 6 mm (0.197 to 0.236") of the contact button is visible when the brake pedal is released.



b)
Remove dashboard trim panel at left bottom – see 51 45 180.
Pull off electric lead plug.



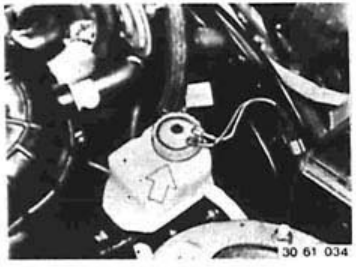
Floor the brake pedal.
1 =Pull plunger and sleeve forward the complete distance.
2 =Squeeze the retainers and pull switch back.

Installation:
Insert switch as shown in (2).
Adjustment is automatic.
Release pedal to neutral position slowly.

Important!
Adjustment of the switch could be changed when the brake pedal bounces back. Check function.

61 31 313 REPLACING ONE BRAKE PAD WEAR SENSOR

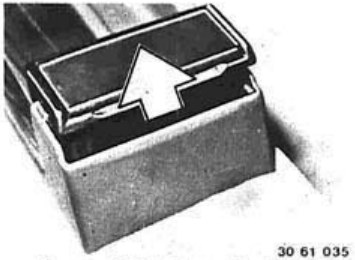
Refer to "Replacing Brake Pads" in 34 11 000.



30 61 034

61 31 315 REPLACING BRAKE FLUID LEVEL SWITCH

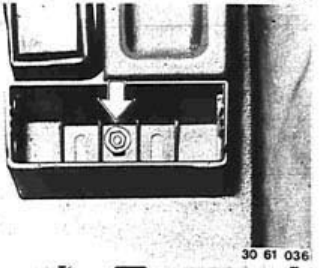
Pull off plug.
Unscrew cap with integrated switch.



30 61 035

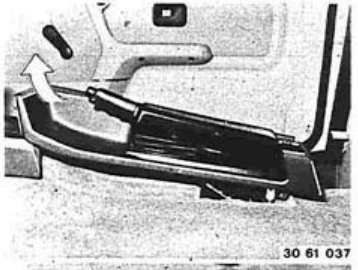
61 31 320 REPLACING PARKING BRAKE CONTROL LAMP SWITCH

Lift out ashtray.



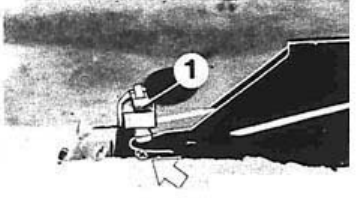
30 61 036

Unscrew nut.
Disconnect plug on ashtray light.



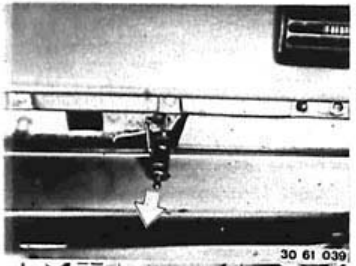
30 61 037

Pull up parking brake lever.
Lift console and push forward.



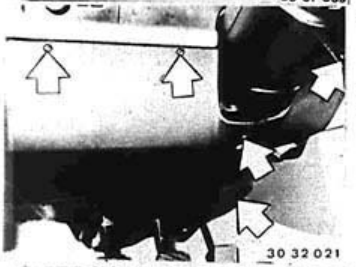
30 61 038

Push down spring (1) and pull out lead.
Unscrew screw.
Remove switch.



61 31 330 REMOVING AND INSTALLING GLOVE BOX LIGHT SWITCH

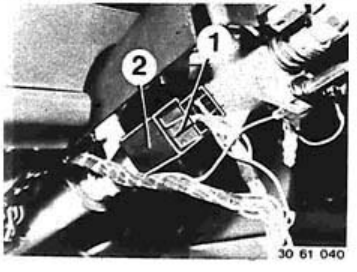
Open glove box.
Pull out switch.
Pull off plug.



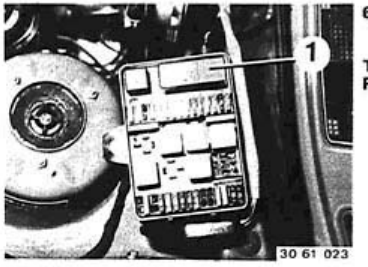
61 31 360 REMOVING AND INSTALLING TURN SIGNAL/HAZARD LIGHT FLASHER (RELAY)

Remove and install steering wheel 32 33 000.
Remove trim panel.

Remove trim

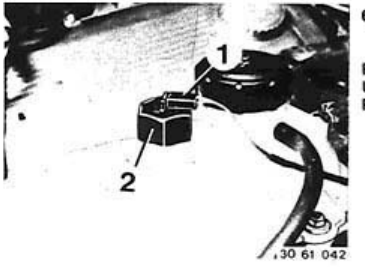


Pull off plug (1) with relay (2) on steering column.
Pull off relay on plug.



61 31 370 REPLACING WIPE/WASH ACTION RELAY

Take cover off of fuse/relay plate.
Pull out wipe/wash relay (1).

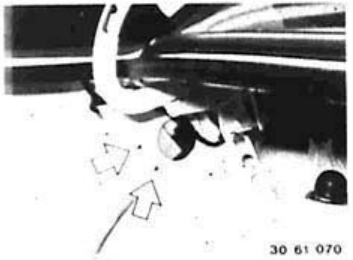


61 31 382 REPLACING COOLANT FLUID LEVEL SWITCH

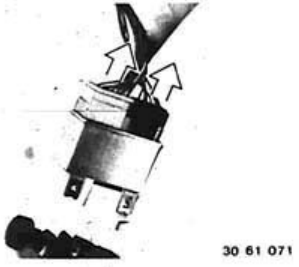
Pull off plug (1).
Unscrew coupling nut (2).
Pull out switch.

61 31 390 REPLACING TAIL AND BRAKE LIGHT BULB TESTER FOR CHECK CONTROL

Remove trunk trim panel on left side wall 51 47 210.

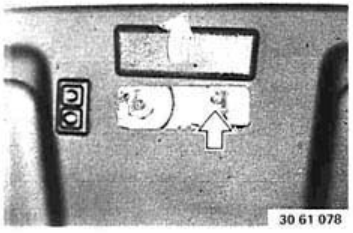


Unscrew screws.

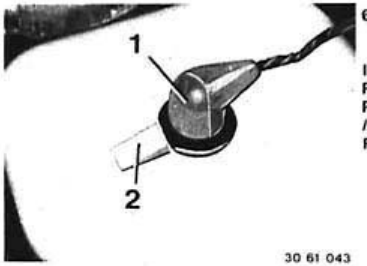


Pull off plugs on bulb tester and remove bulb tester.

61 31 475 REPLACING SUN ROOF RELAY

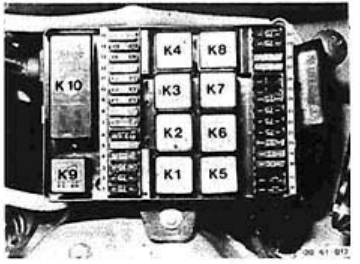


Lift off cover.
Unscrew screw and pull out relay.
Installation:
Connect wires that colors match.



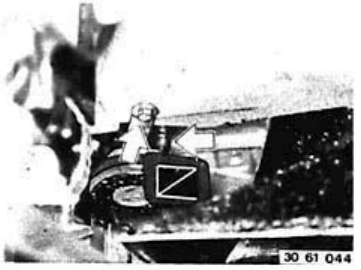
61 31 492 REPLACING WASHING FLUID LEVEL SWITCH

If full, remove washing fluid tank.
Pull off plug with protective cap (1).
Pull out level switch.
Installation:
Flat side faces tab (2).



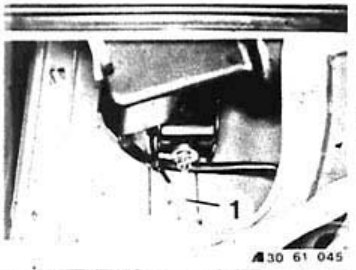
61 31 ... REPLACING RELAYS IN POWER DISTRIBUTOR

Relay As Stamped in Cover	Description
K 1	Extra fan speed I
K 2	Two-tone horns
K 3	High beams
K 4	Low beams, rear fog light
K 5	Seat heating, sun roof, power windows
K 6	Extra fan speed II
K 7	Heater blower, rear window defogger, power mirrors
K 8	Front fog lamps
K 9	Rear fog light (F, CH)
K 10	Intensive cleaning control unit



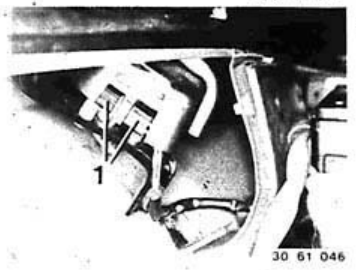
61 33 040 REMOVING AND INSTALLING LEFT AND RIGHT TWO-TONE HORNS

Remove front splash guard – see 51 47 490.
Pull off plug with protective cap.
Unscrew bolt.

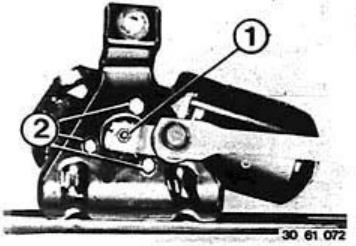


61 61 270 REMOVING AND INSTALLING CONSOLE FOR WINDSHIELD WIPERS COMPLETE WITH WIPER MOTOR

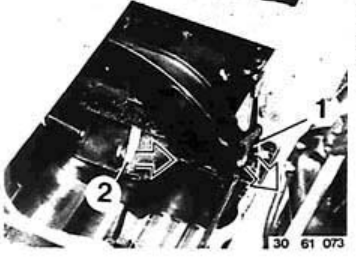
Remove heater motor 64 11 210.
Remove bracket (1).



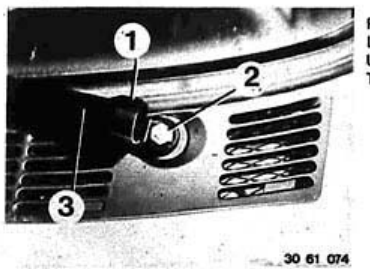
Disconnect plug (1).



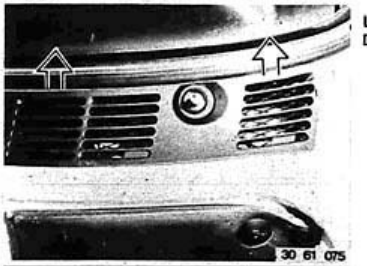
Installed in Car:
Unscrew nut (1) and pull off linkage.
Unscrew bolts (2) and lift out motor.



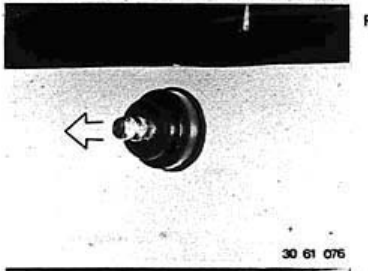
Open clamps (1) on front and rear, left and right sides of blower plate.
Disengage left and right air circulating flaps (2).
Lift out blower plate.



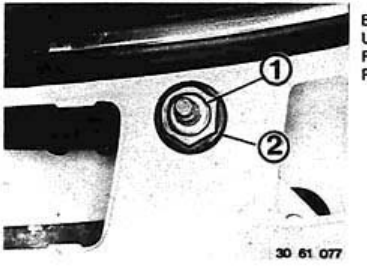
Removing Both Wiper Arms:
Lift off cover (1).
Unscrew nut (2).
Take off wiper arm (3).



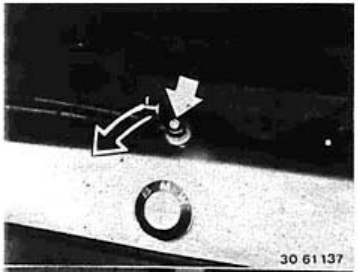
Lift out grill.
Disengage both links on left pivot mount.



Remove cover (1).



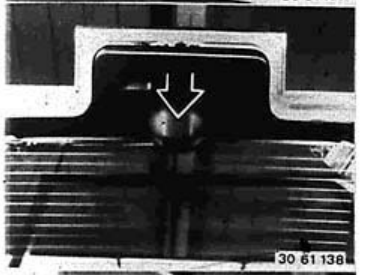
Both Pivot Mounts:
Unscrew nut (1).
Remove washer (2).
Remove console.



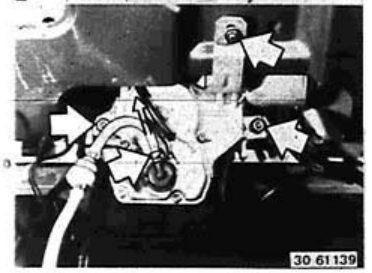
61 . . . . . REPLACING REAR WINDOW WIPER

Pull off cap on wiper arm.

Note:
Run the wiper motor into final position before mounting the wiper arm.



Pry off trunk lid trim panel.



Pinch off the hose clamp.
Pull off plug.
Unscrew nuts.
Lift out wiper motor.

61 71 504 ADJUSTING WINDSHIELD WASHING SPRAY JETS

The picture below shows the pertinent spraying range of both spray jets. First transfer distances 1 ... 8 to the windshield when aiming the spray jets. Mark the spraying ranges with a 30 mm (1.181") dia. dot and aim the sprayed water to the pertinent dot with a needle inserted in the spray jet.

Distance:

1 = 258 mm (10.157")
2 = 460 mm (18.110")
3 = 405 mm (15.945")
4 = 265 mm (10.433")
5 = 310 mm (12.205")
6 = 473 mm (18.622")
7 = 490 mm (19.291")
8 = 285 mm (11.220")

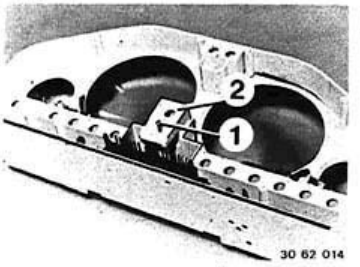
62 11 030 REPLACING PRINTED CIRCUIT BOARD FOR SERVICE INDICATOR

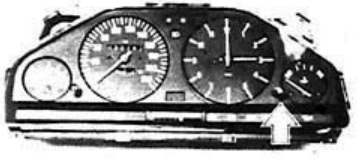
Remove instrument carrier assembly 62 21 000.



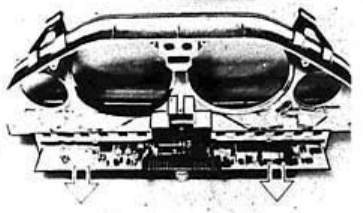
30 62 014

Unscrew screw (1).
Remove light duct (2).

Cars with Analog Clock:
Pull off reset button.

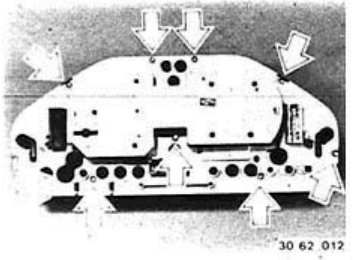


30 62 010



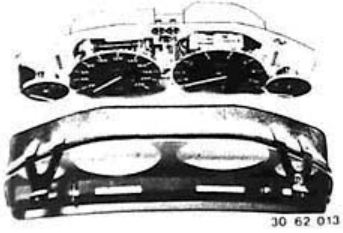
30 62 015

Pull printed circuit board out of housing.



30 62 012

Unscrew screws.



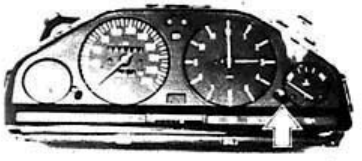
30 62 013

Take instruments and carrier plate out of housing.

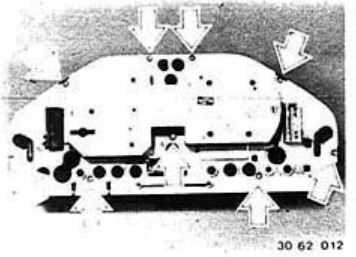
62 11 090 REMOVING AND INSTALLING/ REPLACING TEMPERATURE GAGE

Remove instrument carrier assembly – see 62 21 000.

Cars with Analog Clock:
Pull off reset button.



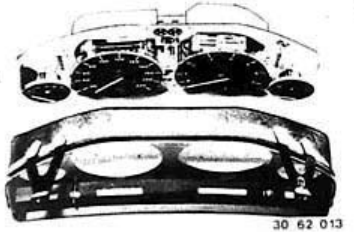
30 62 010



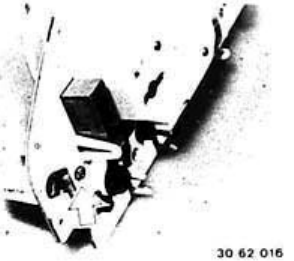
30 62 012

Unscrew screws.

Take instruments and carrier plate out of housing.



30 62 013

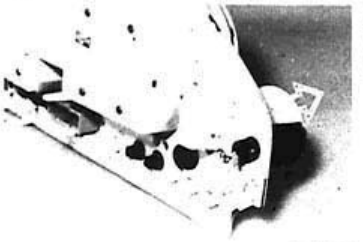


30 62 016

Unscrew nut.
Take out temperature gage.
Installation:
Insert temperature gage in lock.

62 11 130 REMOVING AND INSTALLING/ REPLACING FUEL GAGE

Remove instrument carrier assembly – see 62 21 000.

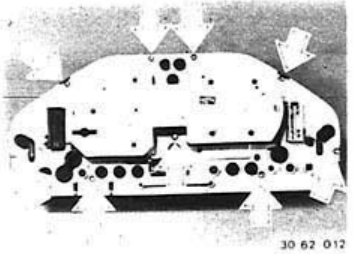


30 62 017

Unscrew nut.
Take out fuel gage.
Installation:
Insert fuel gage in lock.

Cars with Analog Clock:
Pull off reset button.

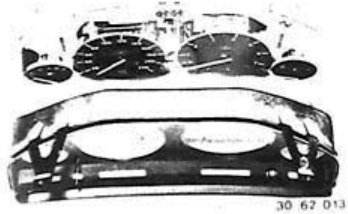
30 62 010



30 62 012

Unscrew screws.

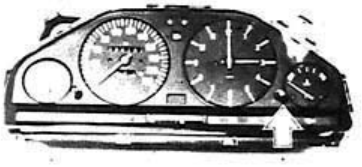
Take instruments and carrier plate out of housing.



30 62 013

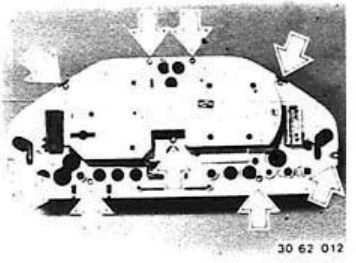
62 12 000 REMOVING AND INSTALLING SPEEDOMETER

Remove instrument carrier assembly – see 62 21 000.



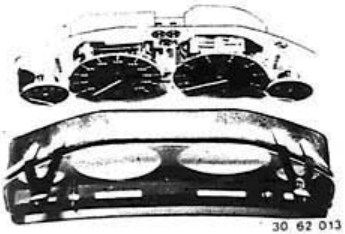
30 62 010

Cars with Analog Clock:
Pull off reset button.



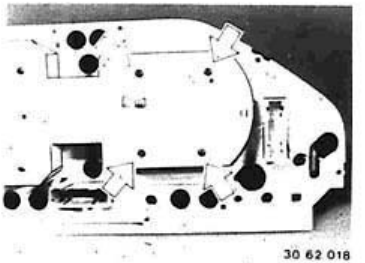
30 62 012

Unscrew screws.



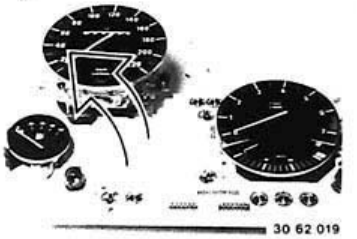
30 62 013

Take instruments and carrier plate out of housing.



30 62 018

Unscrew screw.

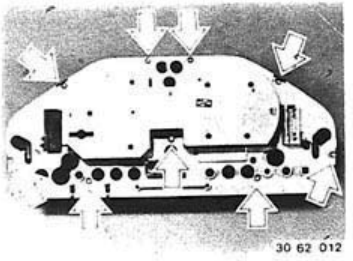


30 62 019

Take out speedometer.

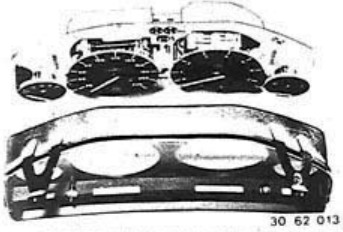
62 13 000 REMOVING AND INSTALLING TACHOMETER

Remove instrument carrier assembly – see 62 21 000.



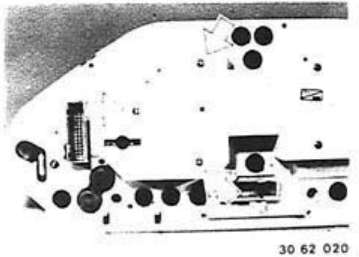
30 62 012

Unscrew screws.



30 62 013

Take instruments and carrier plate out of housing.



30 62 020

Unscrew screws.

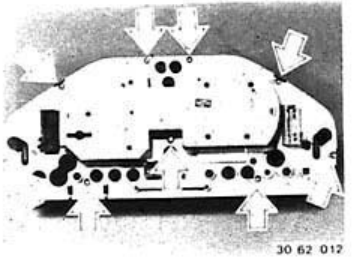
30 62 021

Take out tachometer.

62 13 050 REMOVING AND INSTALLING CLOCK

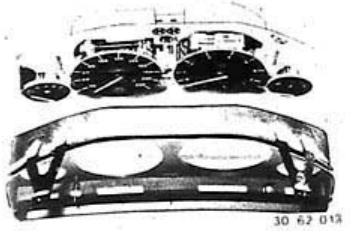
30 62 010

a) Clock in Instrument Carrier:
Remove instrument carrier assembly – see 61 21 000.
Pull off reset button.



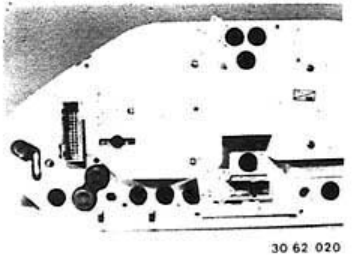
30 62 012

Unscrew screws.



30 62 013

Take instruments and carrier plate out of housing.

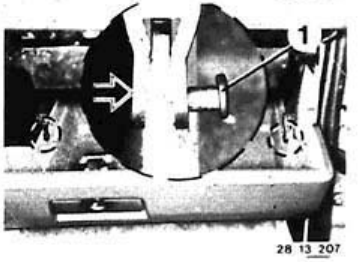


30 62 020

Unscrew screws.

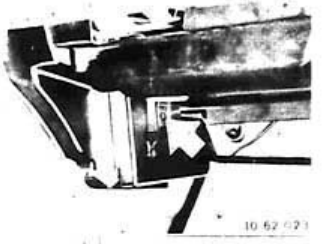
30 62 022

Take out clock.



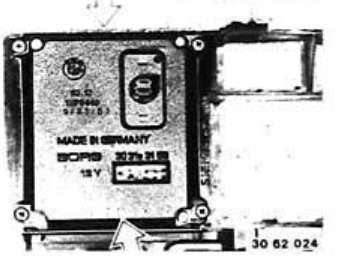
28 13 207

b) Clock Next to Radio Opening:
Open glove box.
Disconnect retaining straps.



10 62 021

Remove trim panel.

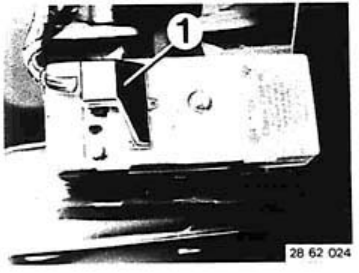


30 62 024

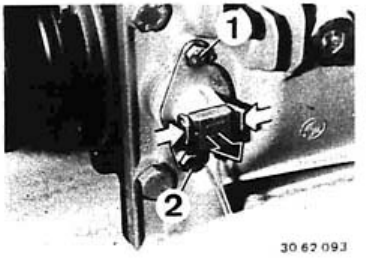
Pull off plug on clock.
Push in retainers at top and bottom.
Press out clock.

62 14 070 REMOVING AND INSTALLING OR REPLACING CHECK CONTROL

Lift check control out of plate.

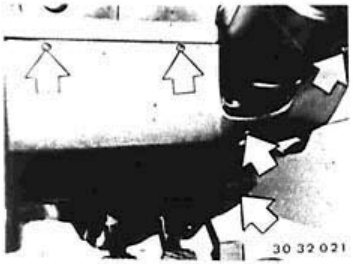


Pull off plug (1).



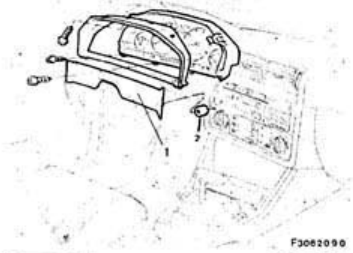
62 16 071 REPLACING SENDER FOR SPEEDOMETER

Pull off plug.
Unscrew screws (1 and 2).
Lift out sender.

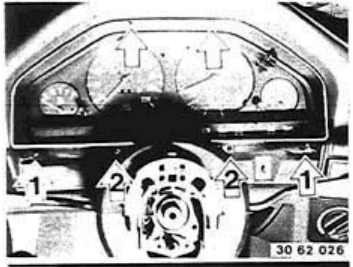


62 21 000 REMOVING AND INSTALLING INSTRUMENT CARRIER ASSY.

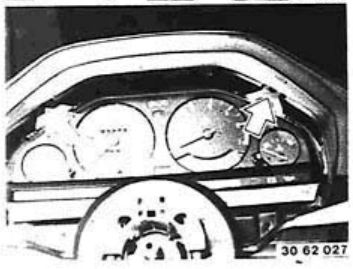
Turn screws 90°.
Take off trim panel.



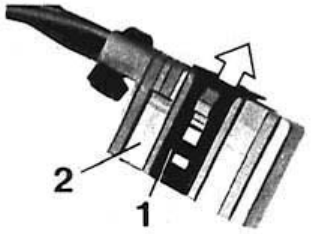
Unscrew mounting nuts for trim panel (1) from behind.
Lift out trim panel (1).



Unscrew screws.
Lift out trim panel.
Important!
The two inside screws (2) must not be mixed up with outside screws (1).
Max. length of screws (2) = 9.5 mm.

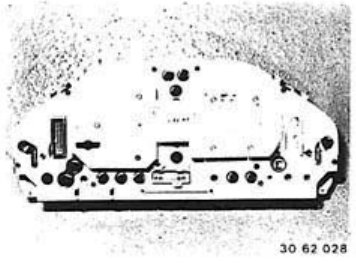


Unscrew screws.



733 62 019

Lift instrument carrier out of instrument panel.
Pull off all plugs.
Note:
First pull out slider (1) on combination plug (2) when pulling the combination plug off of the instrument carrier.



62 99 . . . REPLACING LIGHT BULBS IN INSTRUMENT CARRIER

Remove instrument carrier assembly – see 62 21 000.
Unscrew light bulbs (bayonet).

TROUBLESHOOTING SERVICE INTERVAL INDICATOR

CONDITION	CAUSE	CORRECTION
One or more LEDs do not light up, i.e. break in diode light assembly (ignition turned ON)	- LED faulty	- Replace diode light assembly of service indicator - see 62 11 040.
Green LEDs light up while engine is running or do not go out within two seconds after starting the engine	- Term. 15 interrupted briefly - Signal from term. 50 (starter) interrupted or too short - Engine push started (without starter)	- Check term. 15 or term. 50. - Check (blue) plug on instrument cluster. - Check plug connection inside of instrument cluster. - Repeat engine starting > 0.5 second. - Replace SI printed circuit board - see 62 11 030.
Undefined lighting up (flashing) of LEDs	- SI printed circuit board faults - Loose contact in instrument cluster or on plug connections	- Replace SI printed circuit board - see 62 11 030. - Check plug connections on inside and outside of instrument cluster.
1 yellow LED, 3 red LEDs, OIL SERVICE and INSPECTION signs light up suddenly	- SI printed circuit board faulty - Ground connections - Wrong relays installed - Z-diode in heater wire harness faulty (only E 30)	- Replace SI printed circuit board - see 62 11 030. - Exchange SI printed circuit board for clock/tachometer or economy control. - Check/clean central ground point on body (battery negative connection). - Check/clean central ground point underneath instrument carrier. - Horn relay, heater blower relay and dimmer relay must be diode relays. - Check Z-diode (in heater wire harness close to the water valve).

TROUBLESHOOTING SERVICE INTERVAL INDICATOR (Continued)

CONDITION	CAUSE	CORRECTION
Yellow LED, three red LEDs and OIL SERVICE sign light up	- Buffer batteries discharged excessively	- Check charging cycle: Replace SI printed circuit board - see 62 11 030 - If INSPECTION sign does not appear after one minute. If necessary, exchange SI printed circuit board for clock/tachometer or economy control.
Only INSPECTION sign on continuously	- Both buffer batteries were discharged - SI printed circuit board faulty	- Check charging cycle and reset SI - Replace SI printed circuit board - see 62 11 030. - Replace SI printed circuit board for clock/ tachometer or economy control.

Condition	Cause	Correction
Only 3 green LEDs and yellow LED come on	– SI printed circuit board defective	– Replace SI printed circuit board (62 11 030) – Replace SI printed circuit board for clock/tachometer or economy control
Inspection interval 24,000 km > 11 months	– Distance pulse process for tachometer – Coding plug wrong or missing – Time quartz on SI printed circuit board defective – Reset made erroneously too early	– Replace tachometer – Check coding plug* – Replace SI printed circuit board (62 11 030) – Refer to wrong reset
Oil service interval too short < 6,000 km	– Printed circuit board damaged	– Replace SI printed circuit board (62 11 030) – Replace SI printed circuit board for clock/tachometer or economy control
Inspection interval too short < 12,000 km	– Coding plug wrong or missing	– Check coding plug*
Resetting not possible	– SI resetter defective – Break in reset wire (engine plug, diagnosis plug, instrument cluster plug) – Tachometer defective	– Check connection 7 on diagnosis plug blue/white wire up to central electric board (5 volts, only check with multimeter) – Check connection 14 blue plug on instrument cluster – Replace tachometer

* See Specifications

Information On Service Interval Resetting:

a) Gasoline Engine:
After an oil service it is only possible to reset the previously put in wear signals, but not the previously put in time signals.

Examples:

1) If an oil service reset is made 10 months after the last inspection reset (no green LEDs or OIL SERVICE on), only 1 green LED will come on. After expiration of the 12th month this lamp goes out and it is time for the annual check.

2) If an oil service reset is made earlier (1 green LED still on) and the last inspection reset was 10 months ago, no additional green LED will come on. After expiration of the 12th month the lamp will go out and it is time for the annual check.

A modified instrument cluster is standard gradually since January, 1986. Its new Service Indicator has a clock symbol and now only one red LED. The load and time memories are activated separately.

Oil reset after an oil service causes cancellation of the Oil Service sign, yellow and red LEDs as well as activation of all five green LEDs.

Inspection reset after an inspection causes cancellation of the Inspection sign, yellow and red LEDs after a load-dependent display as well as activation of all five green LEDs. The lighted clock symbol will also be cancelled after a time-dependent display.

If load and time-dependent inspections happen to fall together, the inspection reset must be repeated after at least 10 seconds, in order to cancel the clock symbol and Inspection sign.

b) Diesel Engine:
Uncoupling the Time Factor

The time factor is uncoupled from the green LEDs. In other words the annual check is due, when the inspection sign comes on and the green LEDs have not yet gone out.

Oil Service

There are basically two oil services between the wear-dependent inspections and this is indicated by all five green LEDs going out and the Oil Service sign lighting up.

Oil reset after the 1st and 2nd oil service will cancel the oil service sign and activate all five green LEDs at the same time.

Inspection:

A. Wear factors have activated the inspection sign.
B. Time factor has activated the inspection sign.

A. Wear Dependent Inspection:

All five green LEDs off – inspection sign on.

Inspection reset will cancel the inspection sign and activate all five green LEDs.

B. Time Dependent Inspection:

One or more green LEDs still on – inspection sign on.

Inspection reset will cancel the inspection sign, but the green LEDs are not influenced and are subordinated to wear.

Special Case: wear and time factors simultaneously.

All five green LEDs off – inspection sign on.

2 x inspection reset!

The 1st inspection reset will cancel the inspection which was first in activating the "inspection" sign. This could have been either the wear dependent or time dependent inspection.

TROUBLESHOOTING ECONOMY CONTROL

– In neutral (car stopped – engine running) EC will always show the highest fuel consumption.

– In the coasting phase there will be no fuel injection and consequently EC shows zero consumption.

Condition	Cause	Correction
Unrealistic display (e.g. only 6 liters for wide open throttle in 4th gear)	– Coding plug wrong – Coding plug broken	– Check or replace coding plug*
EC display too high	– Temperature error on quartz – Coding plug wrong	– Tachometer with economy control – See coding plug table*
No display	– Injection signal missing – Loose plug connection – Measuring mechanism failure (mech. defect)	– Check injection signal on instrument cluster plug (blue) pin 2 – Check plug connection – Replace tachometer with economy control
Needle wanders in neutral	– Disturbances through term. 1	– Disconnect black wire of term. 1 on instrument cluster plug, pull wire out of wire harness and wrap it around the wire harness.
Needle wanders when using light switch or headlight flasher	– Disturbances through low beam relay	– Replace low beam relay (only install a diode relay, Part No. 61 31 1 373 154)

* See Specifications

TROUBLESHOOTING CHECK CONTROL

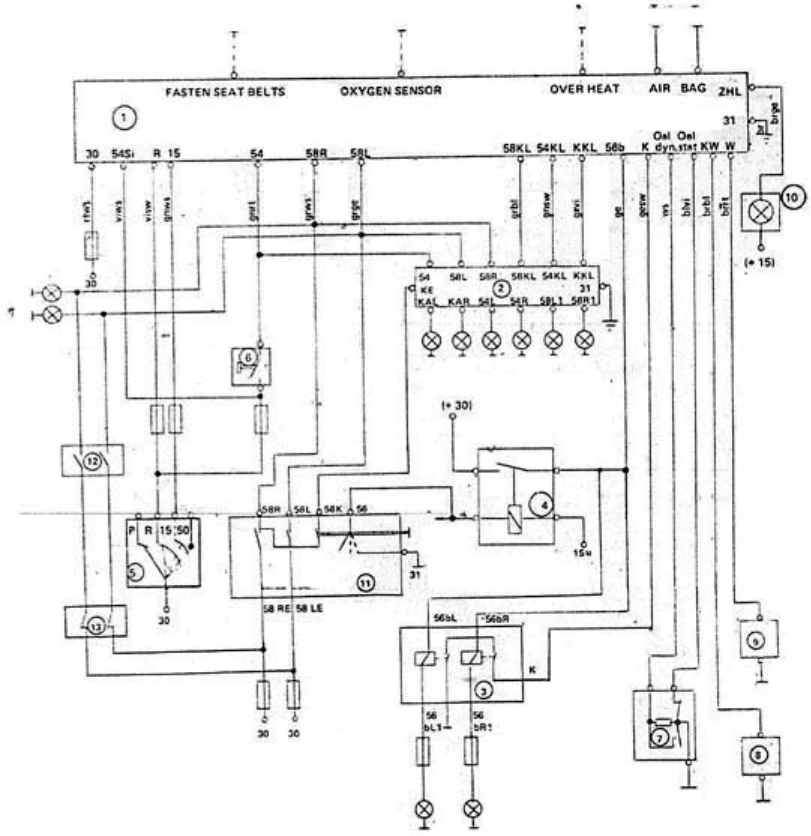
Checking Input Signals on Disconnected Plug of Check Control

Pin No.	Wire Colors	Function on Car	Input Signals Test Results with Multimeter Pin	Tester	Pin	Test Value
1 'R' Terminal 'R'	violet/gray	Ignition key in 'R'	1 (+)	voltmeter	9 (-)	= Battery voltage
2 'ZHL' Central warning lamp	brown/yellow	Ignition turned on	2 connected with 9 (-) = central warning lamp on continuously			
3 Not used						
4 '15' Terminal '15'	green/white	Ignition turned on	4 (+)	voltmeter	9 (-)	= Battery voltage
5 'OX' (USA) Oxygen sensor	blue/white	Ignition turned on	5 (-)	voltmeter	4 (+)	= Battery voltage
6 'AB' (USA) Airbag (+)			6 (+)	voltmeter	9 (-)	= Battery voltage
7 'AB' (USA) Airbag (-)			7 (-)	voltmeter	4 (+)	= Battery voltage
8 'FS (USA) Fasten Seat Belts	brown/violet	Ignition turned in	8 (-)	voltmeter	4 (+)	= Battery voltage
9 '31' Terminal 31	brown	Ground	9 (-)	voltmeter	15 (+)	= Battery voltage

Pin No. Designation	Wire Colors	Function on Car	Input Signals Test Results with Multimeter Pin Tester Pin Test Value
10 Not used	–	–	–
11 '58R' Tail lights right	gray/white	Tail lights on	11 (+) –voltmeter– 9 (–) = U_B
12 '58L' Tail lights left	gray/yellow	Tail lights on	12 (+) –voltmeter– 9 (–) = U_B
13 '58KL'	gray/blue	Tail lights on, bulb tester okay	13 –ohmmeter– 9 (–) = 4.7 ohms
14 Not used	–	–	
15 '30' Terminal '30'	red/white	Positive from term. 30 via fuse no.	15 (+) –voltmeter– 9 (–) = U_B
16 'Öl stat.' Oil level static	blue/violet	Max. oil level and transmitter okay	16 –ohmmeter– 9 (–) = approx. 0 ohm
17 'W' Washing fluid	brown/red	Washing fluid level and transmitter okay	17 –ohmmeter– 9 (–) = approx. 0 ohm
18 'KW' Coolant	brown/blue	Coolant level and transmitter okay	18 –ohmmeter– 9 (–) = approx. 0 ohm
19 Not used	–	–	–

Pin No. Designation	Wire Colors	Function on Car	Input Signals Test Results with Multimeter Pin Tester Pin Test Value
20 'Öl dyn. Oil level dynamic	white	Oil level + transm. okay Min. oil level and transmitter okay	20 –ohmmeter– 9 (–) = 1 k-ohm 20 –ohmmeter– 9 (–) = 0 ohm
21 '56b' Low beams	yellow	Low beams on	21 (+) –voltmeter– 9 (–) = U_B
22 'K' Low beam ind.	yellow/black	Low beams and bulb tester okay	22 –ohmmeter– 9 (–) = 0 ohm
23 '54Si' Fuse monitor	violet/white	Ignition key in 'R'	23 (+) –voltmeter– 9 (–) = U_B
24 '54KL' Stop light ind.	green/black	Stop lights and bulb tester okay	24 –ohmmeter– 9 (–) = 4.7 ohms
25 '54' Stop lights	green/red	Brakes applied, stop lights okay	25 (+) –voltmeter– 9 (–) = U_B
26 'KKL' License plate light indicator	gray/violet	License plate lights and bulb tester okay	26 –ohmmeter– 9 (–) = 4.7 ohms

CHECK CONTROL WIRING DIAGRAM – E 30



1 = Check control
2 = Bulb tester (stop, tail and license plate lights)
3 = Bulb tester (low beams)
4 = Low beam relay
5 = Ignition lock
6 = Stop light switch
7 = Oil level
8 = Coolant level
9 = Washing fluid level
10 = Central warning lamp in instrument cluster
11 = Light switch
12 = Parking light switch
13 = Ignition switch (parking lights)
KAL = License plate light outlet left
KAR = License plate light outlet right
KKL = Indicator lamp outlet, license pl. lights
K = Indicator lamp outlet, low beams

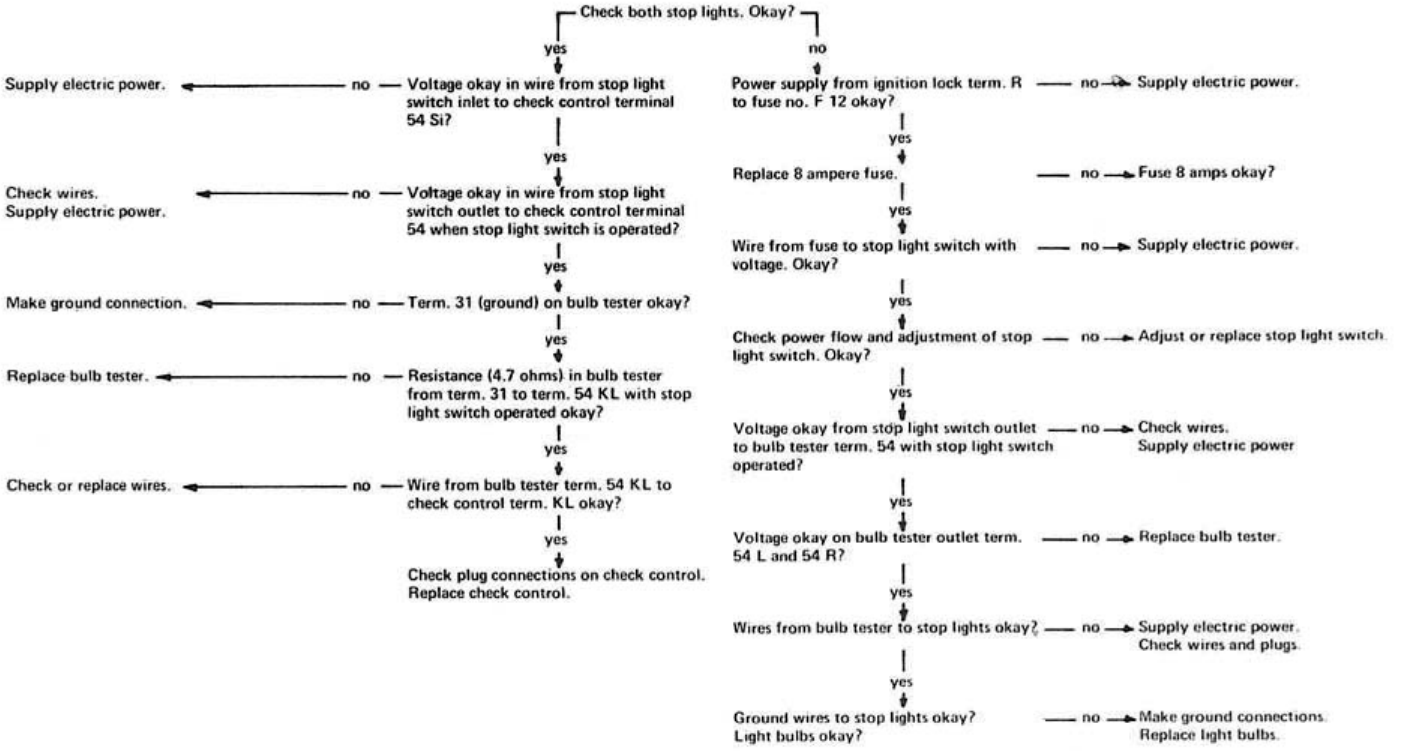
TEST: ENGINE OIL

Check engine oil level – okay? — no → Add oil.
↓ yes
Check transmitter in oil pan – static 0 ohm – dyn. 1 k-ohm – okay? — no → – Apply extra ground wire. – Replace transmitter
↓ yes
Transmitter wire plug connection okay? — no → Repair or replace transmitter.
↓ yes
Check power flow in wires from transmitter to check control static oil term. and dyn. oil terminal. Okay? — no → Repair or replace wires.
↓ yes
Check plug connections of check control. Replace check control.

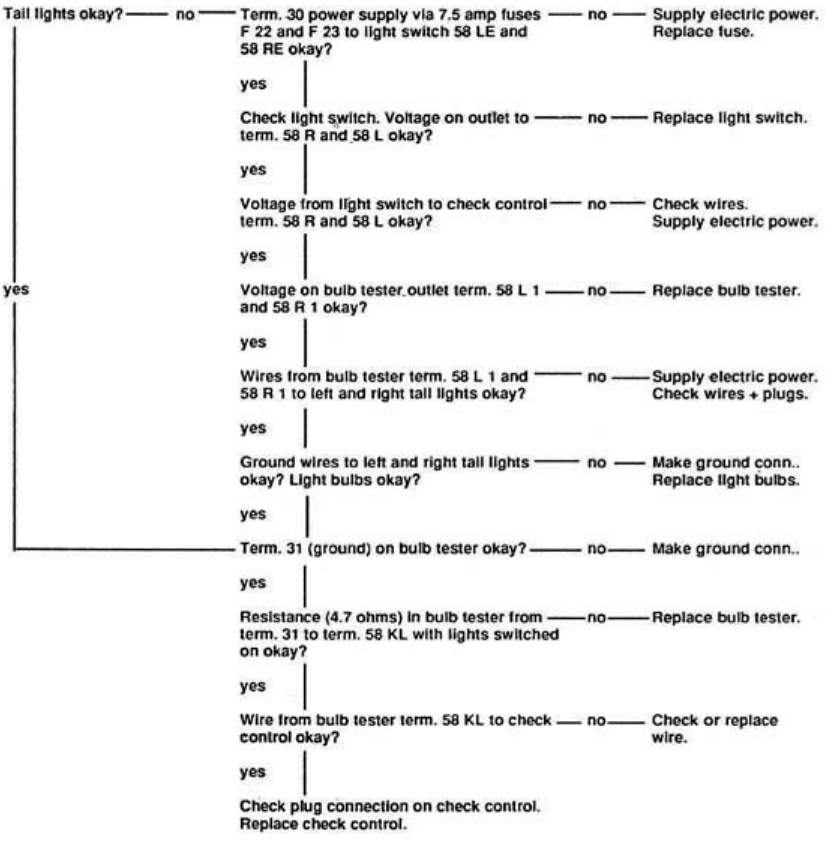
TEST: COOLANT AND WASHING FLUID

Coolant and washing fluid level okay? — no → Add coolant and/or washing fluid with pertinent antifreeze concentration.
↓ yes
Check coolant/washing fluid level transmitters with ohmmeter – 0 ohm. Okay? — no → Repair ground wire. Replace transmitters.
↓ yes
Plug connections on transmitters okay? — no → Repair or replace transmitters.
↓ yes
Wires from transmitters to check control term. KW and WW with power flow. Okay? — no → Repair or replace wires.
↓ yes
Check plug connections on check control. Replace check control.

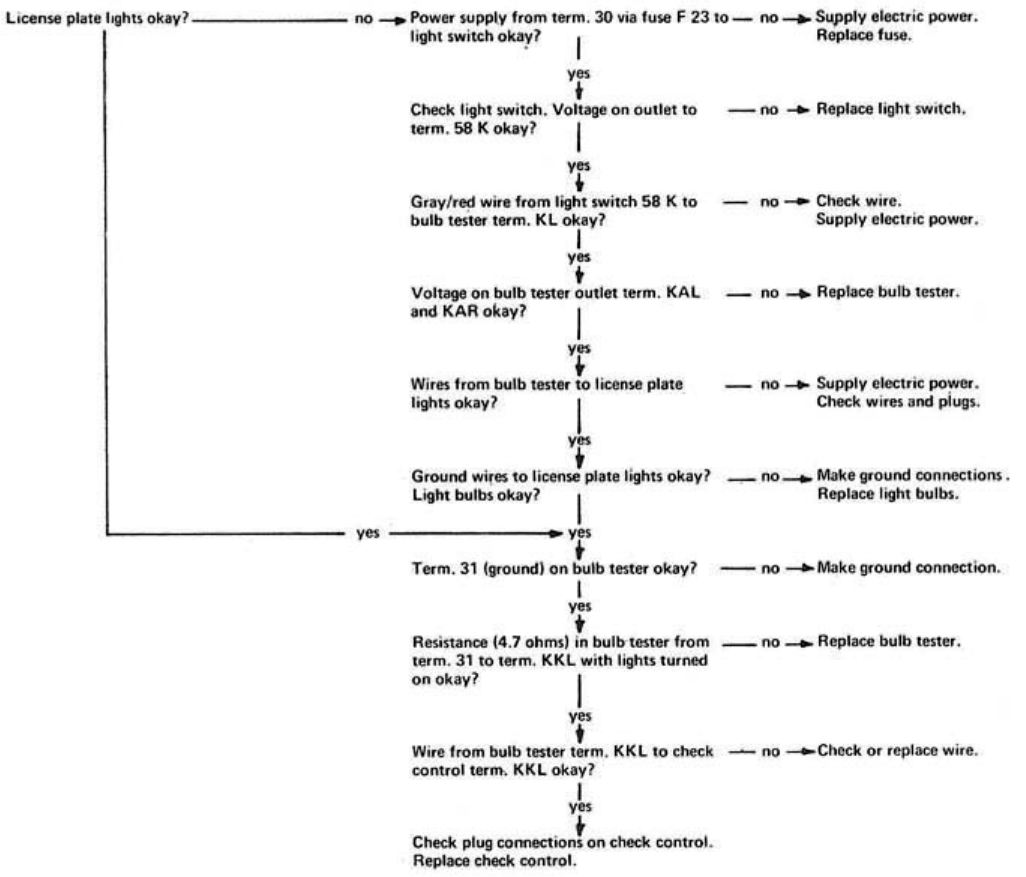
TEST: STOP LIGHTS



TEST: TAIL LIGHTS



TEST: LICENSE PLATE LIGHTS



TEST: LOW BEAM HEADLIGHTS

Check both headlights. Okay? — no → Check ground connection on light switch. Okay? — no → Make ground connection

yes

Check light switch. Ground on outlet to term. 56 with light switch turned on? — no → Replace light switch.

yes

Ground from light switch term. 56 to low beam relay term. 85 in yellow wire? — no → Make ground connection.

yes

Check low beam relay:
- Positive term. 30
- Positive term. 15
- Ground term. 85
- Positive term. 87

Okay? — no → Make positive or ground connections as required. Replace relay.

yes

Voltage of yellow wire 56 b to check control conn. 21 and to test point no. 3 (see figure)? — no → Check wire, supply power or replace central electric board.

yes

Voltage on fuse inlets for left and right low beams? — no → Check central elec. board.

yes

Left and right low beam fuse okay? Voltage on fuse outlet? — no → Replace fuse.

yes

Voltage from fuse outlet for left and right low beams to left and right low beam headlight wires "yellow/white" and "yellow/blue"? — no → Check wires. Supply electric power.

yes

Headlight ground connections and light bulbs okay? — no → Make ground connections. Replace light bulbs.

yes

Ground in term. 31 on bulb tester in centr. elec. board test point no. 1 (see figure) okay? — no → Check central electric board.

yes

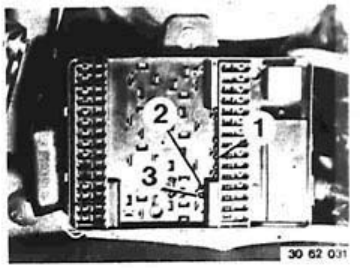
Connect conn. "K" on bulb tester in centr. elec. board test points no. 1 and 2 (see figure). 0 ohm. Okay? If necessary, install special low beam relay with BMW Part No. 61 31 1 366 058. — no → Replace central electric board.

yes

Check yellow/black wire from bulb tester in centr. elec. board conn. "K" to plug conn. check control conn. 22. 0 ohm. Okay? — no → Replace wire.

yes

Check contact of plug connection. Replace check control.



TEST: POWER SUPPLY AND OUTLET WIRES ON CHECK CONTROL

Term. 30 s electric power supply okay? — no → Check wire to fuse no. F 5.
Check fuse no. F 5, replacing with 8 amp fuse if necessary.
Check power rail in central electric board for fuse no. 5.

yes

Term. 15 electric power supply with ignition turned on okay? — no → Check wire to fuse no. F 6.
Check fuse no. F 6, replacing with 8 amp fuse if necessary.
Check wire from fuse no. F 6 to ignition lock term. 15.

yes

Term. R electric power supply with ignition key in "R" okay? — no → Check wire to fuse no. F 8.
Check fuse no. F 8, replacing with 8 amp fuse if necessary.
Check bridge between fuse no. F 8 and fuse no. F 11.
Check wire from fuse no. F 11 to ignition lock term. R.

yes

Term. 31 ground connection okay? — no → Check ground wire, replacing if necessary.

yes

Central warning lamp in instrument cluster okay? — no →
- Check wire from check control term. ZH to pin 9 of blue instrument cluster plug.
- With turn signal on a ground signal of 1 Hz can be measured on pin 9 of blue instrument cluster plug.

63 Lights

63 10 004	Headlights – aim	63- 1
63 12 100	Double headlight assembly, left or right – remove and install	63- 1.1
250	High beam lamp, left or right – remove and install	63- 2
280	Low beam lamp, left or right – remove and install (up to 1987 models)	63- 3
280	Low beam lamp, left or right – remove and install (since 1988 models)	63- 3.1
430	Headlight vertical aim control – replace	63- 3.2
63 13 150	Turn signal assembly, left or right – remove and install	63- 4
63 21 180	Tail light assembly, left or right – remove and install	63- 4
63 99 001	Halogen light bulb for high beam headlight, left or right – replace	63- 5
071	Halogen light bulb for low beam headlight, left or right – replace	63- 5
131	Light bulb of front parking light, left or right – replace	63- 6
201	Halogen light bulb for front fog lamp, left or right – replace	63- 6
271	Light bulb for turn signal, left or right – replace	63- 7
. . .	Light bulb for tail light, left or right – replace	63- 7
63 17 150	Front fog lamps – service install	63- 101

63 10 004 AIMING HEADLIGHTS

Testing Requirements:
Check/correct tire inflation pressure. Load down driver's seat with one person (about 75 kg/165 lbs.). Car's fuel tank full and additional weights in trunk. Car parked on level floor. Aimer aligned with car's longitudinal axis and parallel to contact surface. Marking line adjusted to distance e (presently 12 cm (4.724")/10 mtr. (32 feet)).

Adjusting Procedures:
The light/dark border of the low beam headlights must be aligned with the horizontal marking line of the aimer for the vertical adjustment. The inclined line must begin below the central mark on the horizontal marking line for the lateral adjustment.

Explanations:
e H - h = 12 cm (4.724")

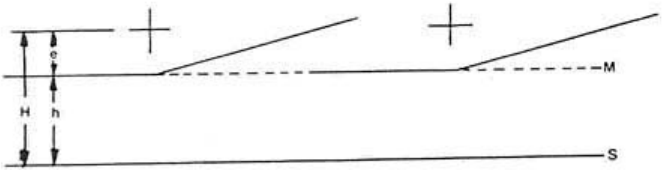
H Height of headlight center above wheel contact surface

h Height of marking line above wheel contact surface

\+ Central mark = middle of headlight

M Marking line

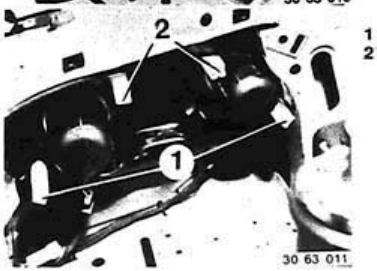
S Wheel contact surface



30 63 067

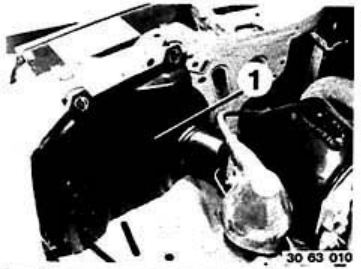
30 63 010

Correcting:
Remove headlight cover (1).



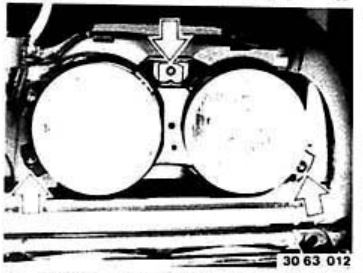
30 63 011

1 = Lateral adjustment
2 = Vertical adjustment

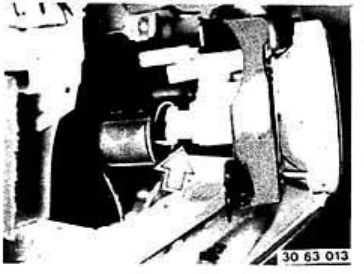


63 12 100 REMOVING AND INSTALLING LEFT OR RIGHT DOUBLE HEADLIGHT ASSEMBLY

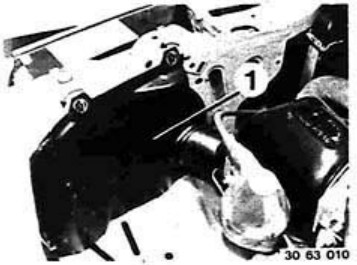
Remove side radiator grill section - see 51 13 040.
Remove headlight cover (1).



Unscrew screws.

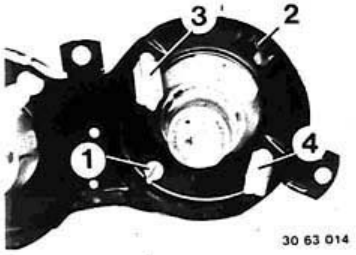


Remove caps and pull plugs off of headlight.

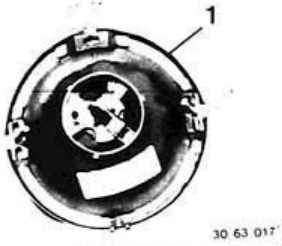


63 12 250 REMOVING AND INSTALLING LEFT OR RIGHT HIGH BEAM HEADLIGHT LAMP

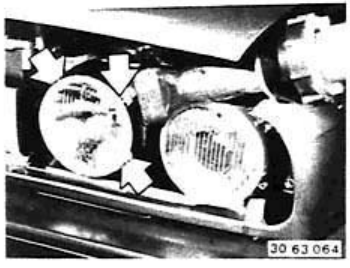
Remove side radiator grill section - see 51 13 040.
Lift off headlight cover (1).



Until 1987 Models:
Turn joint (1) 1/4th of a turn.
Disconnect spring (2).
Unscrew vertical control (3).
Unscrew lateral control (4).
Take headlight off of headlight carrier.

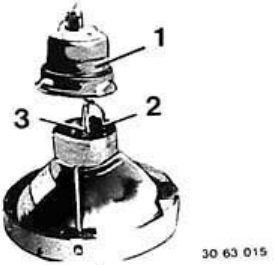


Lift off ornamental ring (1).

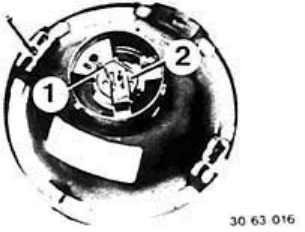


Since 1988 Models:
Heat clips with a hot air blower and lift out.

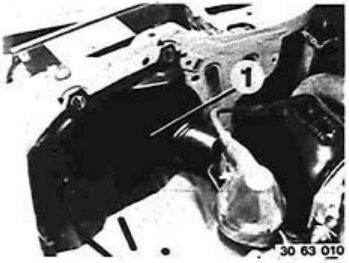
Installation:
First place clips on the ball-ended pins.
Press headlight lamp into clips.



Remove cap (1).
Pull off plugs (2 and 3).

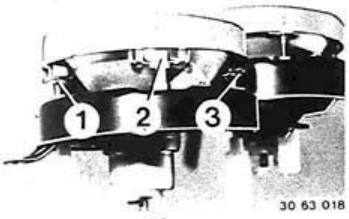


Lift out retainer (1).
Remove light bulb (2).

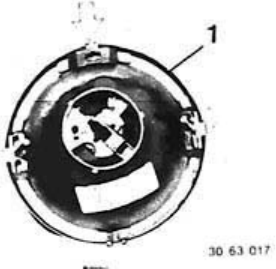


63 12 280 **REMOVING AND INSTALLING LEFT OR RIGHT LOW BEAM LAMP (Until 1987 Models)**

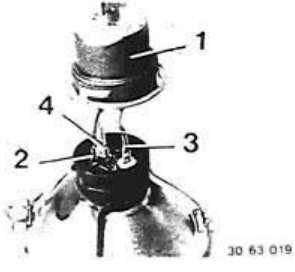
Remove side radiator grill section – see Group 51.
Lift out headlight cover (1).



Disconnect joints (1 ... 3).
Take headlight off headlight carrier.

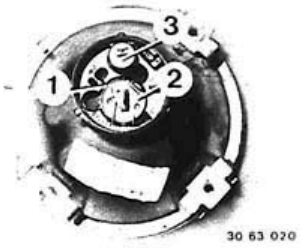


Lift out ornamental ring (1).

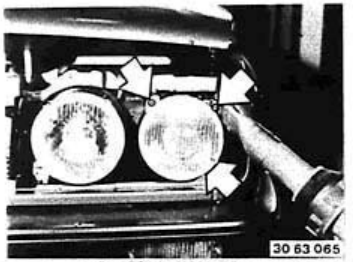


Unscrew cap (1).
Pull off plugs (2 ... 4).

2 = Brown wire, ground
3 = Gray wire, parking light bulb
4 = Yellow wire, low beam light bulb



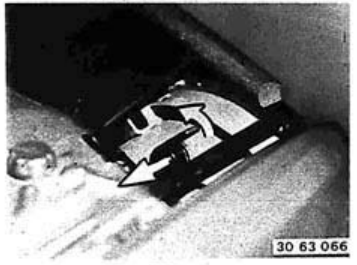
Lift out retainer (1).
Remove light bulb (2) for low beam.
Pull out light bulb (3) for parking light.



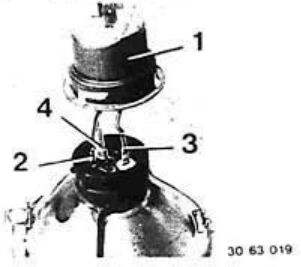
63 12 280 REMOVING AND INSTALLING LEFT OR RIGHT LOW BEAM LAMP (Since 1988 Models)

Destroy or heat with hot air blower and lift out clips.

Installation:
First place clips on ball-end pins and then press headlight lamp into clips.



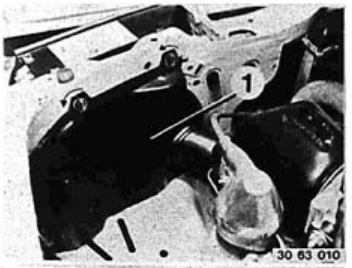
Turn lever about 90° and pull out light bulb holder for parking light.



Unscrew cap (1).
Pull off plugs (2 ... 4).

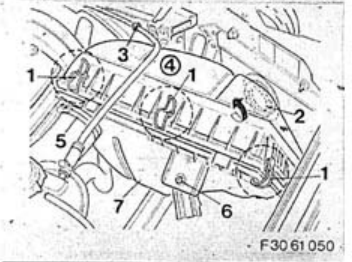
2 = Brown wire, ground
3 = Gray wire, parking light bulb
4 = Yellow wire, low beam light bulb

Lift out retainer (1).
Remove light bulb (2) for low beam.

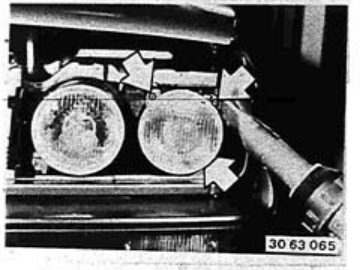


63 12 430 REPLACING VERTICAL HEADLIGHT AIM CONTROL

Remove all radiator grill sections – see Group 51.
Lift out headlight cover (1).

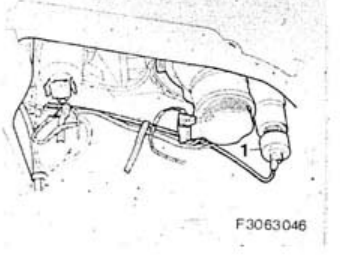


324 d, 324 td:
Remove air cleaner – see Group 13.

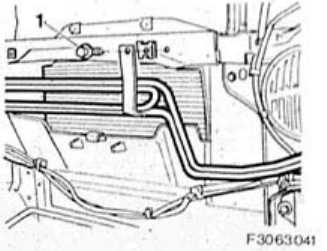


Destroy or heat with hot air blower and lift out clips.

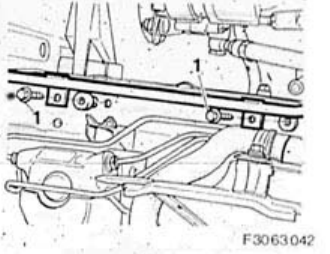
Installation:
First place clips on ball-end pins and press headlight lamp into clips.



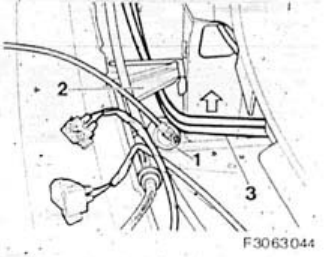
Turn vertical headlight aim control (1) to the right and left, and lift out.
Cut off wire strap.



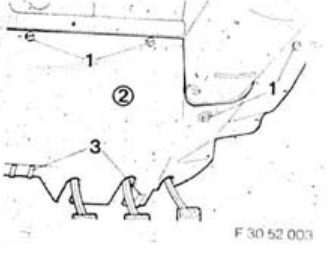
Cars with Cooling Pipe:
Unscrew screws (1).



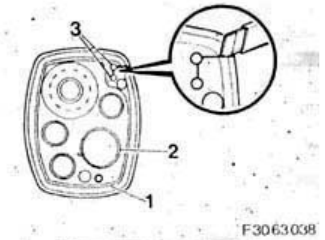
Unscrew screws (1).



Press cooling pipe (3) in direction of arrow and pull out vertical headlight aim control underneath metal strips (2).

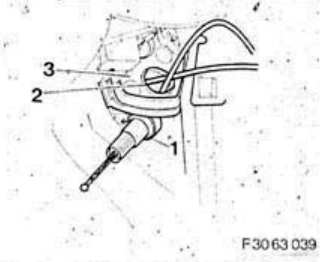


Turn screws (1) 90° and remove dashboard trim panel at bottom left.



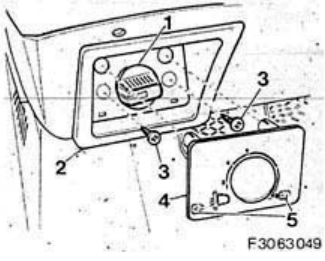
F3063038

Pull rubber grommet (1) on pedal console out of firewall.



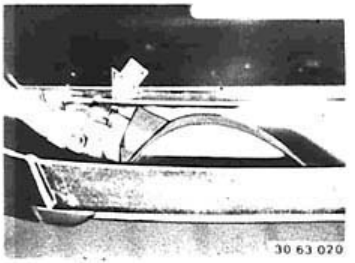
F3063039

Pull vertical headlight aim control through opening into inside of car.



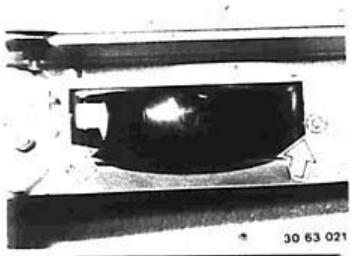
F3063049

Pry out mask (4) carefully.
Unscrew screws (3) and pull out control element.

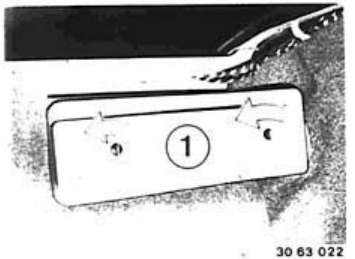


63 13 150 REMOVING AND INSTALLING LEFT OR RIGHT FRONT TURN SIGNAL ASSEMBLY

Pull off cap and plug.

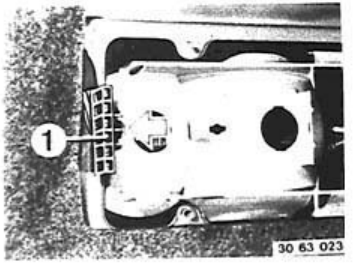


Unscrew screws.
Remove turn signal from bumper.
Beginning with 1988 Models:
First remove bumper – see Group 51.

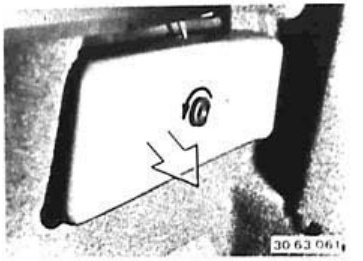


63 21 180 REMOVING AND INSTALLING LEFT OR RIGHT TAIL LIGHT ASSEMBLY

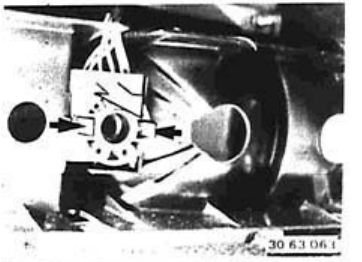
Until 1987 Models:
Remove cover (1).



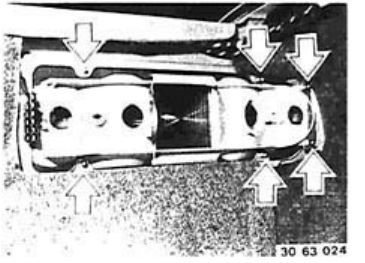
Lift off plug (1).



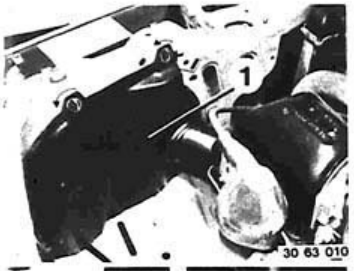
Since 1988 Models:
Loosen rotary lock and lift off cover.



Squeeze clips and lift out plug.

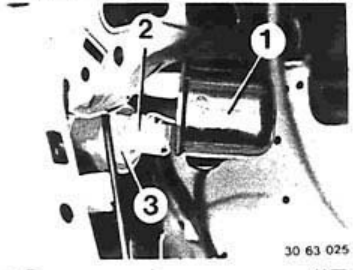


All Models:
Unscrew screws.
Take tail light assembly out of tail panel.

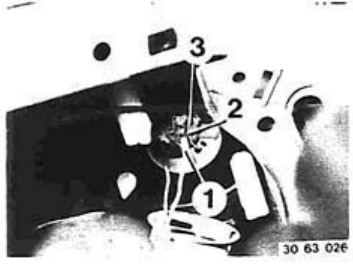


63 99 001 REPLACING HALOGEN LIGHT BULB FOR LEFT OR RIGHT HIGH BEAM HEADLIGHT

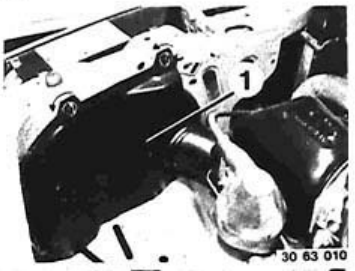
Lift out headlight cover (1).



Pull off cap (1) and plug (2).
Unscrew cap (3).

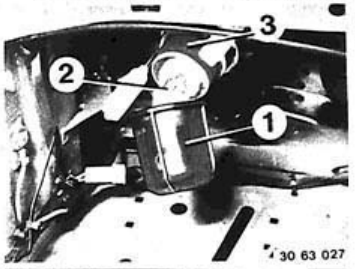


Pull off plug (1).
Lift out clamp (2).
Remove light bulb (3).

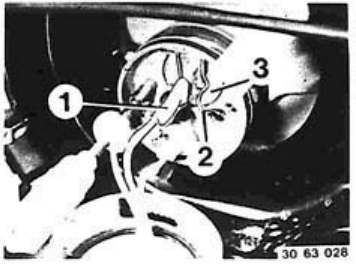


63 99 071 REPLACING HALOGEN LIGHT BULB FOR LEFT OR RIGHT LOW BEAM HEADLIGHT

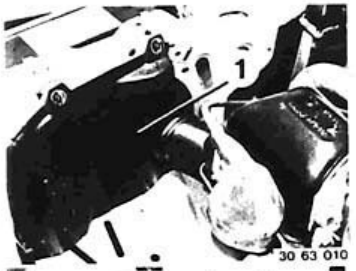
Remove headlight cover (1).



Pull off cap (1) and plug (2).
Unscrew cap (3).

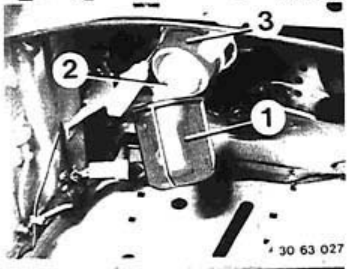


Pull off plug (1).
Lift out clamp (2).
Remove light bulb (3).
Note:
Never touch glass of light bulb with bare fingers.



63 99 131 REPLACING LIGHT BULB FOR LEFT OR RIGHT FRONT PARKING LIGHT

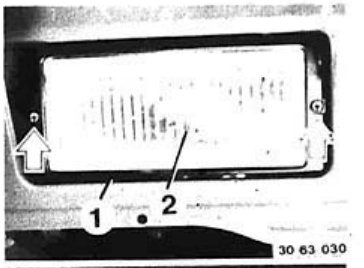
Until 1987 Models:
Remove headlight cover (1).



Pull off cap (1) and plug (2).
Unscrew cap (3).

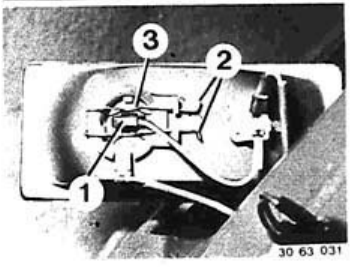
Pull out bulb holder (1).
Twist light bulb to remove from holder.

Since 1988 Models:
Turn bulb holder about 90° and lift out.
Twist light bulb to remove from holder.



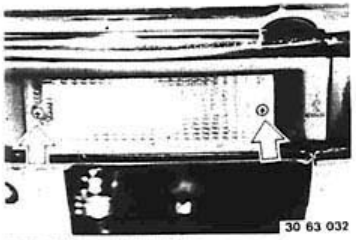
63 99 201 REPLACING HALOGEN LIGHT BULB FOR LEFT OR RIGHT FRONT FOG LAMP

Unscrew screws.
Remove holding frame (1) and headlight lamp (2).



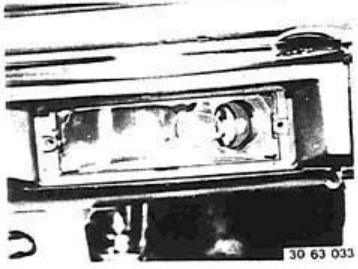
Pull out plug (1).
Lift out retainer (2).
Remove light bulb (3).

Note:
Never touch glass of light bulb with bare fingers.

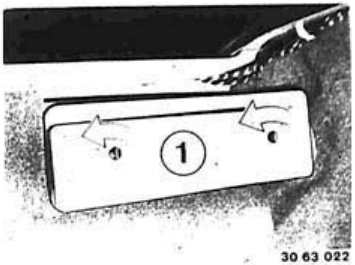


63 99 271 REPLACING LIGHT BULB FOR LEFT OR RIGHT FRONT TURN SIGNAL

Unscrew screw.
Take off lens.

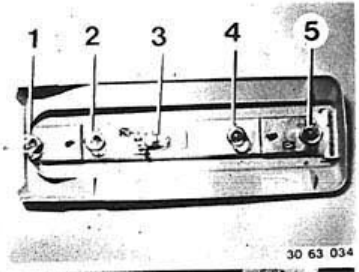


Unscrew light bulb in bulb holder.

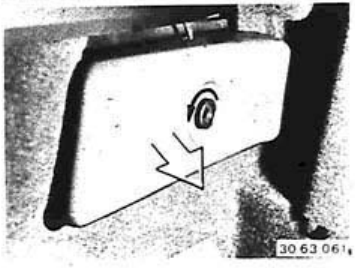


63 99 . . . REPLACING LIGHT BULB IN LEFT OR RIGHT TAIL LIGHTS

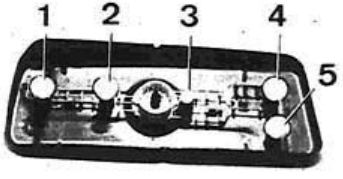
Remove cover (1).



Unscrew light bulb in bulb holder.
1 Turn signal
2 Rear fog light
3 Tail light
4 Stop light
5 Backup light

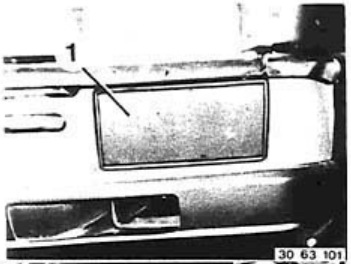


1988 Models On:
Open fastener and lift out cover.



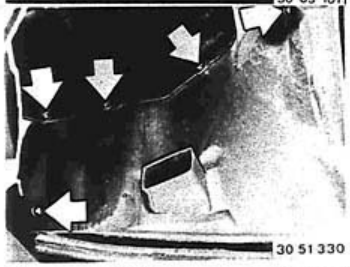
Unscrew light bulb in bulb holder
1 Turn signal
2 Stop light
3 Tail light
4 Backup light
5 Rear fog light

30 63 062

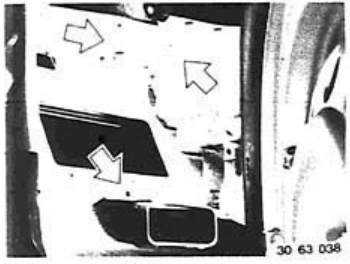


63 17 150 SERVICE INSTALLING FRONT FOG LAMPS

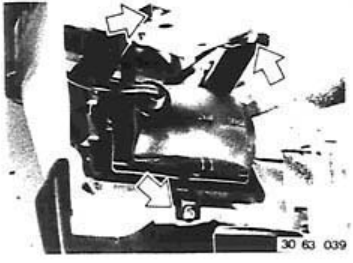
Left and Right Sides:
Before 9/85:
Lift out black cover (1).
Since 9/85:
Press in cover (painted in body color).



Before 9/85:
Unscrew bolts.
Remove splash guard.
Since 9/85:
Remove front spoiler 51 71 404.

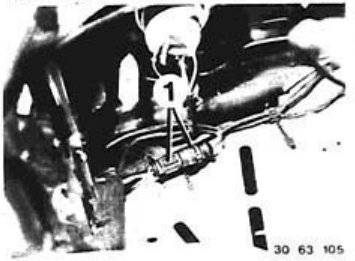


Insert spreader nuts.

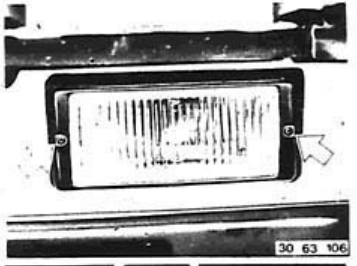


Mount fog lamp with three 4.8 x 13 mm self-tapping screws.
Note:
Left fog lamp is marked "links" (=left) and right fog lamp with "rechts" (= right).
Route wire from fog lamp to place of low and high beam headlight installation.

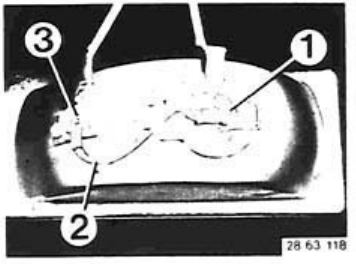
Remove headlight cover (1).



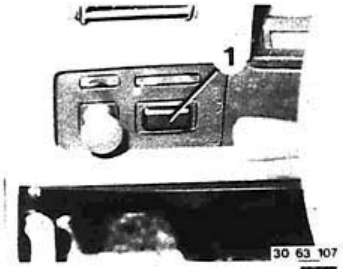
Connect plug from fog lamp with tied back plug receptacle (1).
Reinstall headlight cover.



Unscrew screws.
Lift out headlight lamp.

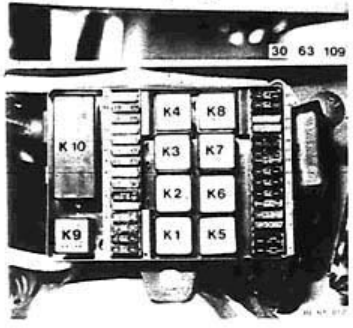


Install light bulb (1) from installation kit.
Insert wire (2) in wire connector (3).
Important!
Never touch glass of light bulb with bare fingers.
Note:
Only use YC 12 V 55 W light bulbs.

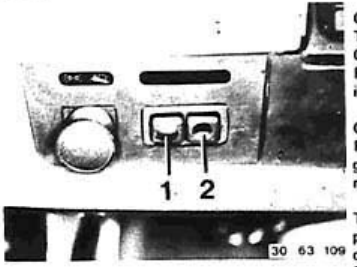


Lift out rear fog light switch (1) with a small screwdriver.
Pull off plug.

Connect switch from installation kit on plug and install.
Installed Position:
Fog light switch (1) with curvature must be on left side.
Rear fog light switch (2) with recess must be on right side.



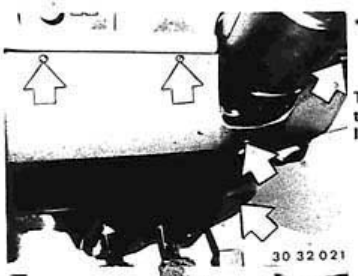
Take cover off of fuse box.
Install supplied 7.5 A fuses in fuse sockets 29 and 30.
Plug supplied relay in relay socket K 8.
Note:
Also install relay in relay socket K 9 of cars for Switzerland and France.



Checking Operation:
Turn on ignition and parked car lights.
Operate fog lamp switch (1).
Front fog lamps and green indicator lamp in instrument cluster should now be on.

Operate rear fog light switch (2).
Front fog lamps and rear fog light as well as green and yellow* indicator lamps in instrument cluster should now be on.

The rear fog light is only on with switched on parked car lights, if the fog lamps are switched on.
Front fog lamps and rear fog light may be switched on together with parked car lights, low beam and high beam headlights.
Note:
Check local legislation!



* If the yellow indicator lamp does not come on, it must be connected subsequentally as follows.

Turn screws 90° and remove instrument panel trim at bottom left.
Install supplied bulb holder (bayonet type).

Aiming Front Fog Lamps:
Check and correct tire inflation pressure.
Load down car to normal position**.
Check aiming of fog lamps with an optical aimer to instructions supplied with aimer.
Correcting:
Aim fog lamp with screw (1).

** See Specifications of Gr. 32

64 Heating and Air Conditioning

	Description	64- 0/1
	Components	64- 1
	Air flow layout	64- 2
64 11 071	Cable for footwell ventilation – replace	64- 3
081	Cable for window ventilation – replace	64- 4
161	Cable for temperature mixing flap – replace	64- 5
191	Cable for fresh air flap – replace	64- 6
205	Heater – remove and install	64- 7
210	Heater motor – remove and install	64- 9
220	Resistor plate for blower motor – remove and install	64- 11
271	Water valve for heater – replace	64- 12
365	Temperature switch (freezing prevention switch) – replace	64- 13a
311	Fresh air grill – remove and install	64- 13a
531	Heater core – remove and install	64- 14
. . .	Drive motor for fresh air / bypass air flap – remove and install or replace	64- 15
64 23 000	Rear window fan (convertible) – remove and install	64- 17
64 31 500	Microfilter for passenger compartment ventilator – replace	64- 18
	Refrigerant circuit	64- 50
	Discharging and charging station	64- 51
64 50 009	Air conditioner – discharge and charge	64- 52
	Air conditioner – check	64- 56
64 52 . . .	Valve core – remove and install	64- 56a
020	Compressor – remove and install	64- 57
64 51 050	Expansion valve – remove and install	64- 58
590	Evaporator – replace	64- 61
64 53 010	Drier – remove and install	64- 63
050	Condenser – remove and install	64- 64

Description of Integrated Heating and Air Conditioning System

The heating system is an air side controlled unit, i.e. the temperature is regulated by the mixing ratio of cold and warm air with help of the temperature mixing flap.
All outlets can be heated. Flaps are operated via cables. The water flow rate through the heater is regulated by an electromagnetic water valve in the water return circuit. It is switched on and off by the temperature control via a track circuit with loop contact. The valve will be closed when the temperature control is set to < 20° C (68° F). The valve is open without electric power.

With air conditioning the refrigerant is injected via an expansion valve, which is located in the housing on the right side.

A mechanical thermostat switch, located on left side of the unit, is applied for protection against freezing.

With air conditioning the fresh air/circulated air can be operated for extremely fast cooling of the passenger compartment or elimination of disturbing odors.

The flaps are located in front of both blowers and are operated by two positioning motors.

Air conditioning equipment includes an additional two-speed electric fan.

This fan always runs at least in first speed when the air conditioner is switched on.

Regardless of air conditioner operation 1st speed of extra fan is switched on as from a coolant temperature of 89 ... 93° C (192 ... 199° F) and switched off with a coolant temperature of 86 ... 82° C (187 ... 180° F).
Regardless of air conditioner operation 2nd speed of extra fan is switched on as from a coolant temperature of 97 ... 101° C (207 ... 214° F) and switched off with a coolant temperature of 94 ... 90° C (201 ... 194° F).

The drier has one high pressure and one low pressure safety switch.

The high pressure switch stops the compressor when reaching a coolant pressure of 25.5 ... 17.7 bar (363 ... 252 psi) and switches the compressor on again when coolant pressure drops to 22.5 ... 20 bar (320 ... 284 psi).

The low pressure switch stops the compressor when coolant pressure drops to 2.22 ... 1.72 bar (32 ... 24 psi) and switches the compressor on again when coolant pressure rises to 2.0 ... 2.4 bar (28 ... 34 psi).

These safety switches prevent damage in or on the air conditioning system.

Heating and Air Conditioning Controls

Consisting of:

Temperature Control

The temperature control regulates the temperature regulating flap via a cable and opens the water valve at an angle of > 20°.

Air Volume Control Switch

It switches the blower in 3 speeds via fixed resistors, which are located in the heater.

Air Up Control Lever

It operates via a cable the flap in the heater/air conditioner for air distribution to the windshield (defrost).

Air Center Control Lever

It operates via a cable the flap in the heater/air conditioner for air distribution out of the instrument panel nozzles (ventilation).

With air conditioning the control lever will also have a circuit breaking switch (track circuit) for the compressor. The compressor will be switched off with a flap opening of < 20 %, to avoid liquid knocks in the air conditioner which could destroy the compressor.

Air Down Control Lever

It operates via a cable the flap in the heater/air conditioner for air distribution down to the footwells.

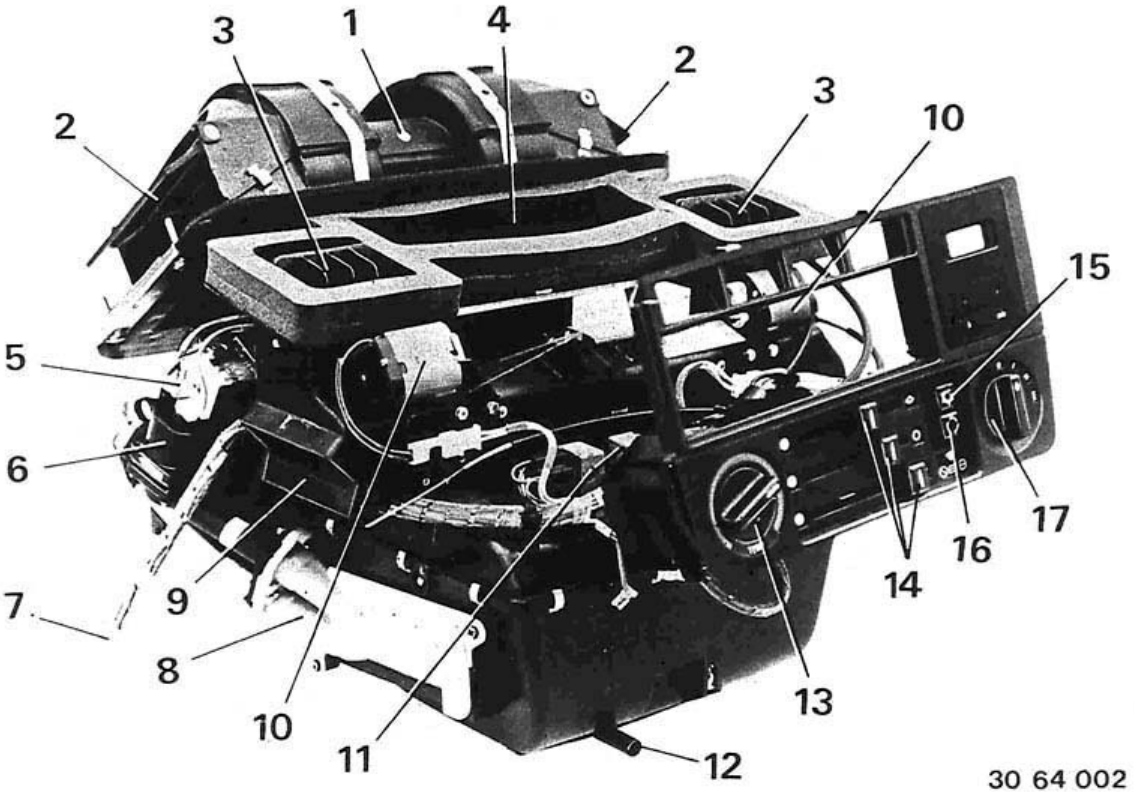
With air conditioning the control lever will have the same compressor circuit breaking switch as for the air center control lever.

A/C Compressor Push Button Switch

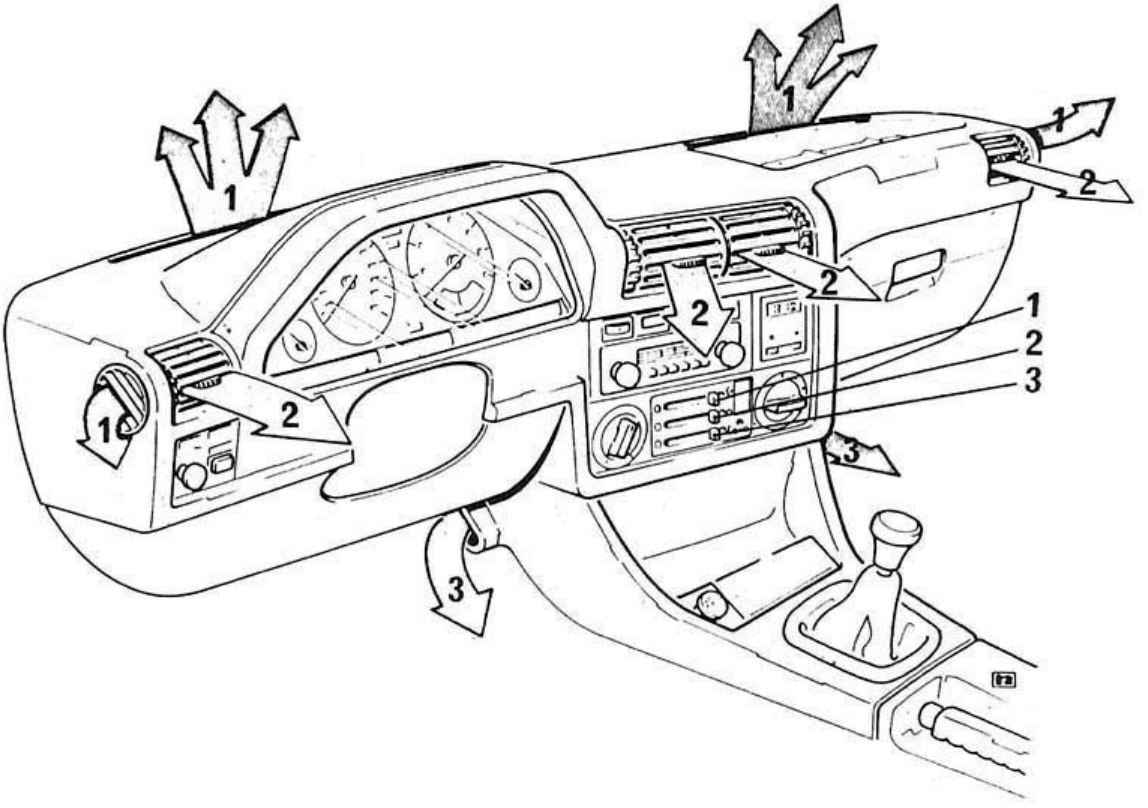
Air conditioner is switched on and off with this push button switch.
When air conditioning is switched on, the heater blower motor will always run in at least 1st speed.
When air conditioning is switched on, the additional fan will always run in at least 1st speed.

Fresh Air/Circulated Air Push Button Switch

When air conditioner is operated, it is used to switch fresh air or circulated air as desired.
In the circulated air switch position the heater blower motor will always run in at least 1st speed.



1 = Blower motor
2 = Bypass air flaps
3 = Fresh air flaps
4 = Window defrost flaps
5 = Freeze-protection switch
6 = Water valve
7 = Wire plug
8 = Heater core
9 = Footwell flaps
10 = Bypass flap motor
11 = Motor relay
12 = Condensation water drain
13 = Temperature control wheel
14 = Control lever
15 = Air conditioner switch
16 = Bypass air switch
17 = Blower switch



30 64 276

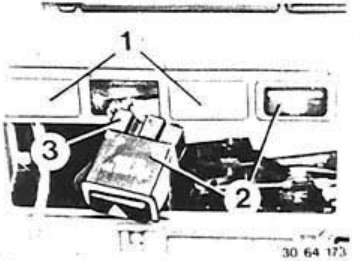
1 = Sliding control lever for air directed to windshield and front side windows

2 = Sliding control lever for air flowing out of center air grills (air slightly colder with heater on than in case of 1 and 3)

3 = Sliding control lever for air directed to footwells

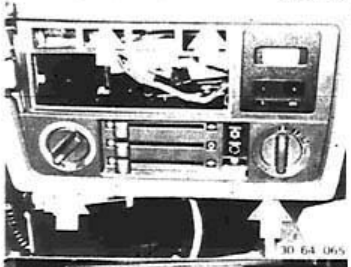
64 11 071 REPLACING CABLE FOR FOOTWELL VENTILATION

Disconnect battery ground lead.
Remove and install instrument panel trim on left side 51 45 180.
Remove and install tray 51 16 200.



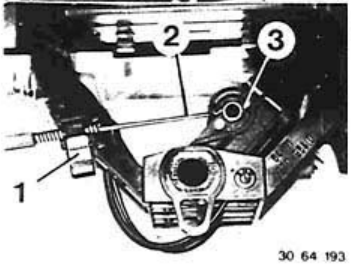
30 64 173

Remove radio opening mask or radio.
Pull opening covers (1) or switches (2) out of control panel.
Pull off plugs (3) on switches (2).



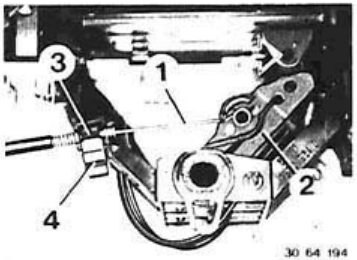
30 64 065

Unscrew screws.
Pull out control panel slightly.



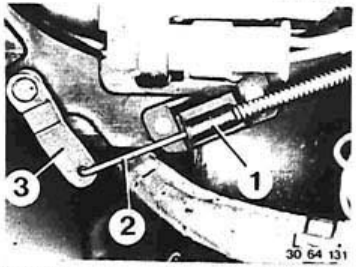
30 64 193

Lift out clamp (1).
Disconnect cable (2) on lever (3).



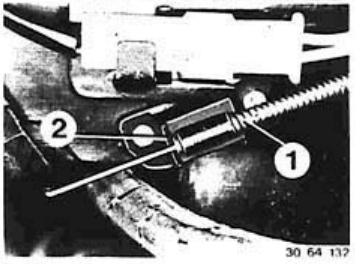
30 64 194

Installation:
Connect cable (1) in sliding control (2).
Push sliding control and air flap against stop.
Turn sleeve (3) enough until it can be placed in opening.
Secure cable with clamp (4).



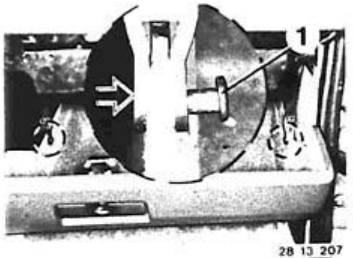
30 64 131

Pull out clamp (1).
Disconnect cable (2) on lever (3) and remove.



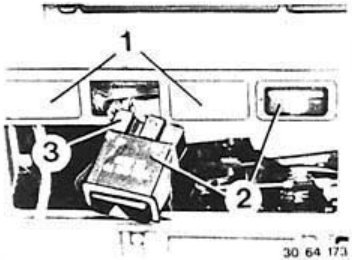
30 64 132

Installation:
Cable sleeve (1) must be flush with stop (2).

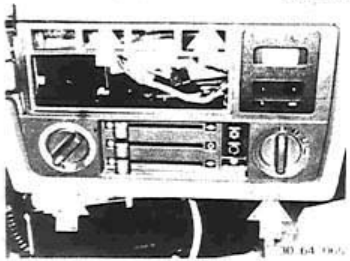


64 11 081 REPLACING CABLE FOR WINDOW VENTILATION

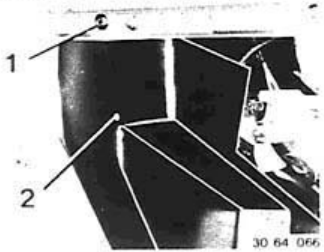
Disconnect battery ground lead.
Remove and install instrument panel trim on left side 51 45 180.
Remove and install tray 51 16 200.
Open glove box.
Disconnect pins (1) of both retaining straps.



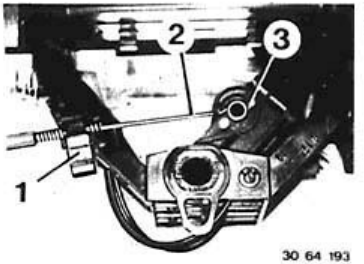
Remove radio opening mask or radio.
Pull opening covers (1) or switches (2) out of control panel.
Pull off plugs (3) on switches (2).



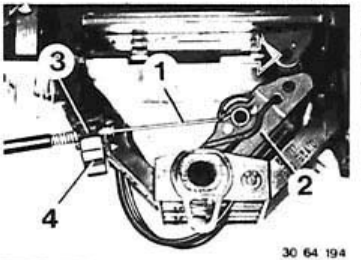
Unscrew screws.
Pull out control panel slightly.



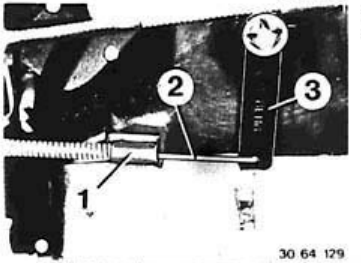
Unscrew screw (1).
Take off trim panel (2).



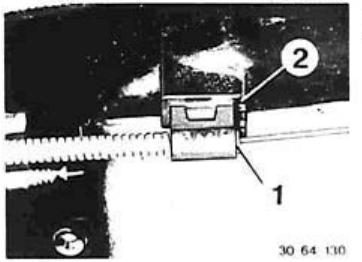
Lift out clamp (1).
Disconnect cable (2) on lever (3) and remove.



Installation:
Connect cable (1) in sliding control (2).
Push sliding control and air flap against stop.
Turn sleeve (3) enough until it can be placed in opening.
Secure cable with clamp (4).

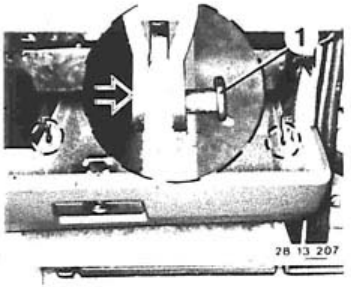


Pull out clamp (1).
Disconnect cable (2) on lever (3) and remove.

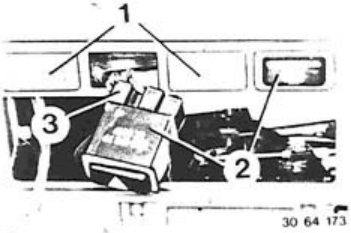


Installation:
Cable sleeve (1) must be flush with stop (2).

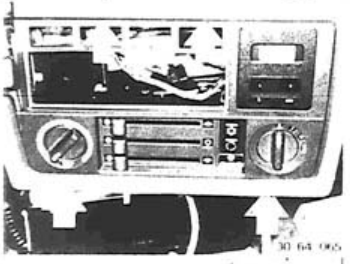
64 11 161 REPLACING CABLE FOR TEMPERATURE MIXING FLAP



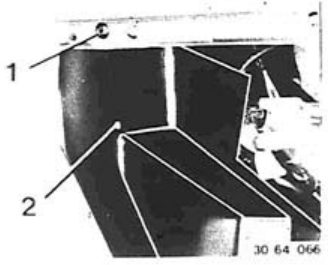
Disconnect battery ground lead.
Remove and install instrument panel trim on left side 51 45 180.
Remove and install tray 51 16 200.
Open glove box.
Disconnect pins (1) of both retaining straps.



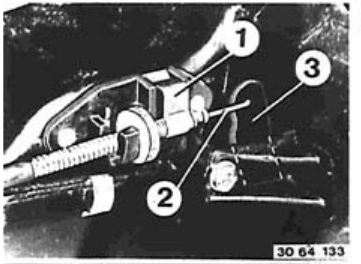
Remove radio opening mask or radio.
Pull opening covers (1) or switches (2) out of control panel.
Pull off plugs (3) on switches (2).



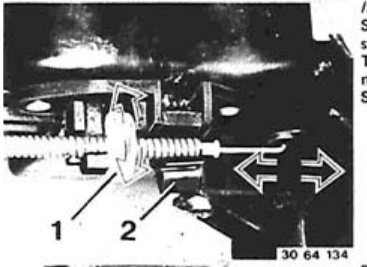
Unscrew screws.
Pull out control panel slightly.



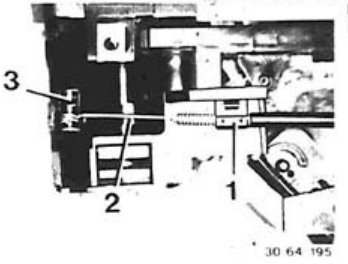
Unscrew screw (1).
Take off trim panel (2).



Lift out clamp (1).
Disconnect cable (2) on lever (3).

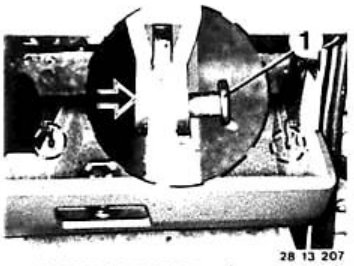


Installation:
Set temperature selection wheel to (cold or warm) stop.
Turn knurled nut (1) to also move temperature mixing flap to (cold or warm) stop.
Secure cable with clamp (2).

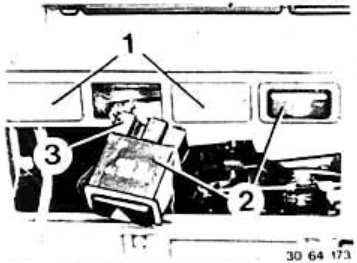


Pull out clamp (1).
Disconnect cable (2) on lever (3) and remove.

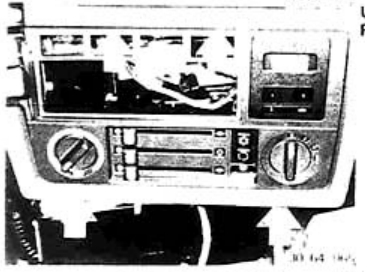
64 11 191 REPLACING CABLE FOR FRESH AIR FLAP



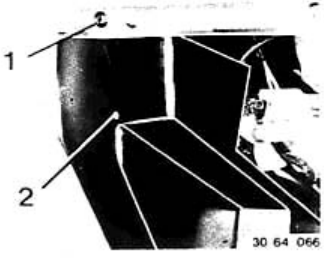
Disconnect battery ground lead.
Remove and install instrument panel trim on left side 51 45 180.
Remove and install tray 51 16 200.
Open glove box.
Disconnect pins (1) of both retaining straps.



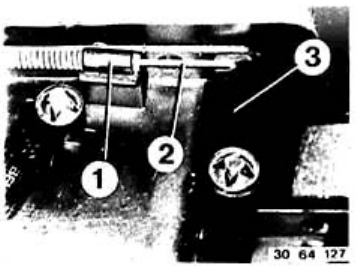
Remove radio opening mask or radio.
Pull opening covers (1) or switches (2) out of control panel.
Pull off plugs (3) on switches (2).



Unscrew screws.
Pull out control panel slightly.

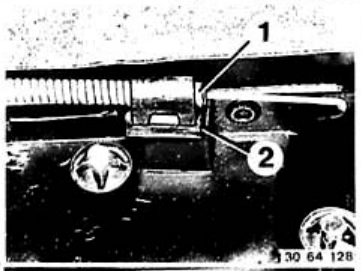


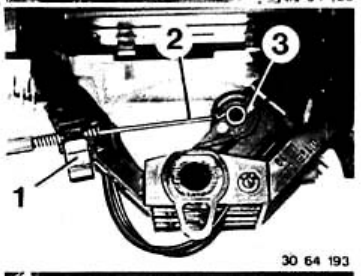
Unscrew screw (1).
Take off trim panel (2).



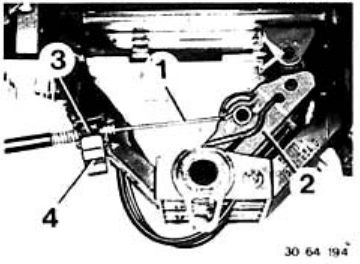
Pull out clamp (1).
Disconnect cable (2) on lever (3) and remove.

Installation:
Cable sleeve (1) must be flush with stop (2)

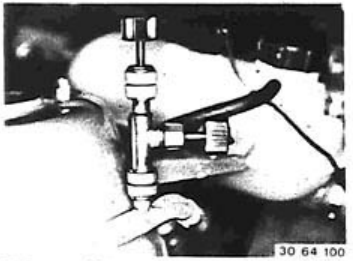




Lift out clamp (1).
Disconnect cable (2) on lever (3) and remove.



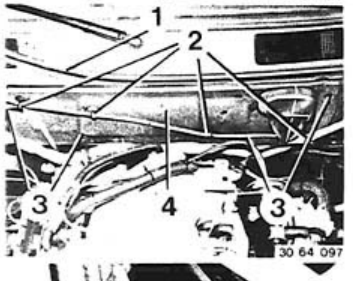
Installation:
Connect cable (1) in sliding control (2).
Push sliding control and air flap against stop.
Turn sleeve (3) enough until it can be placed in opening.
Secure cable with clamp (4).



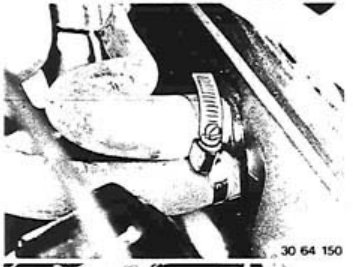
64 11 205 REMOVING AND INSTALLING HEATER

Remove dashboard trim panel – see 51 45 030.
Don't discharge refrigerant outdoors, but instead draw it out of system – refer to operating instructions supplied with equipment.

Installation:
Discharge, charge and check air conditioner for leaks after installation.



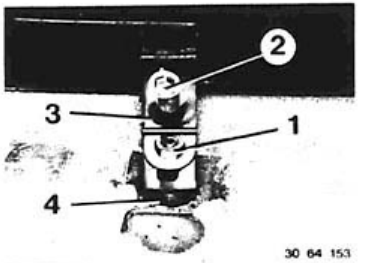
Disconnect battery ground lead.
Pull off rubber strip (1).
Cut off wire straps (2).
Unscrew bolts (3).
Place cover (4) aside.



Drain coolant.
Disconnect both water hoses.

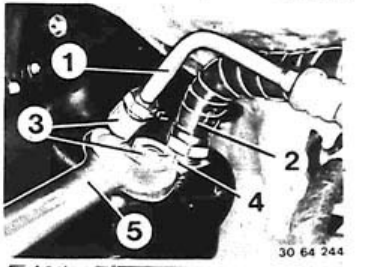
Installation:
Bleed cooling system.
Check coolant.

Disconnect plugs (1) connecting heater wire harness and car wire harness.



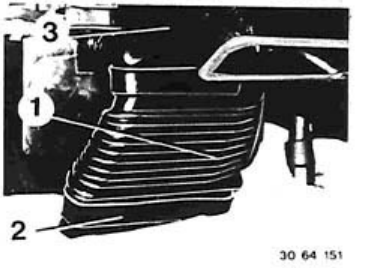
Unscrew nut (1) and bolt (2).
Take off bracket (3).

Installation:
Check rubber mount (4), replacing if necessary.



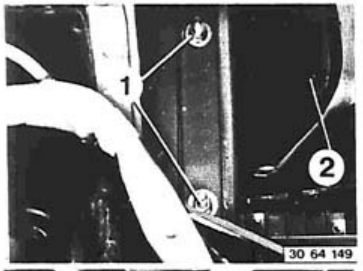
Only for Cars with Air Conditioner:
Unscrew pipes (1 and 2).
Insert plugs (3) in open connections immediately.
Counterhold on block valve (4) with wrench (5).

Installation:
Tightening torque*.
Replace seals.

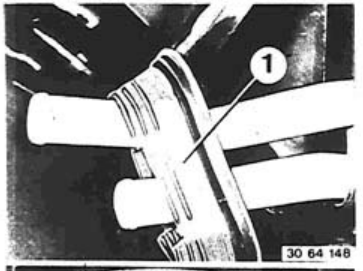


Remove connector (1) between heater (3) and rear area heater duct (2) on left and right sides.

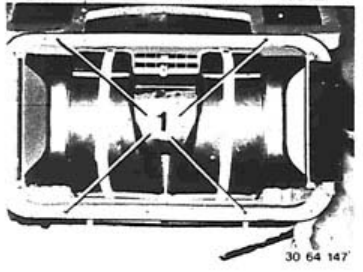
* See Specifications



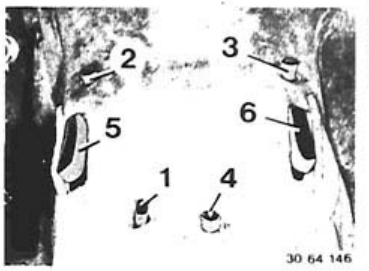
Unscrew nuts (1) on left and right sides.
Remove heater.
Note:
Close bypass air flaps (2) – heater can only be removed in this state.



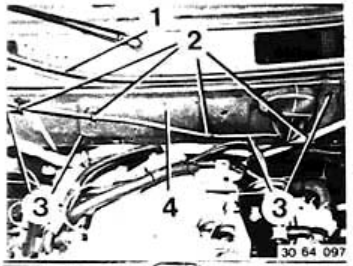
Installation:
Check for perfect fit of sleeve (1) in body wall.



Installation:
Check sealing frame (1), replacing if necessary.

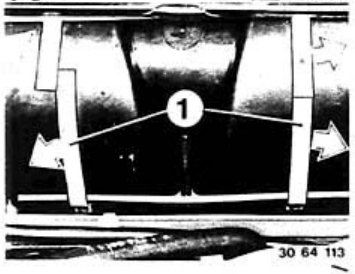


Installation
Condensation water drains (1 ... 3) must be connected with heater.
Check rubber mount (4), replacing if necessary
(5) and (6) are heater ducts for rear area of car



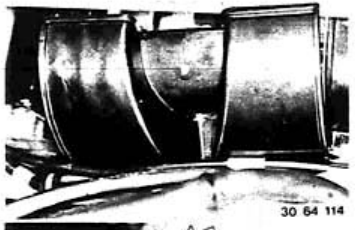
64 11 210 REMOVING AND INSTALLING HEATER MOTOR

Disconnect battery ground lead.
Pull off rubber strip (1).
Cut off wire strap (2).
Unscrew bolt (3).
Lay cover (4) aside.

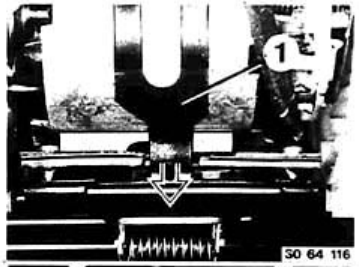


Open retaining straps (1) and swing aside..

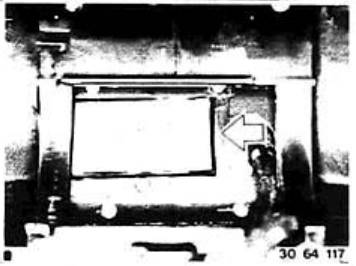
Remove cover.



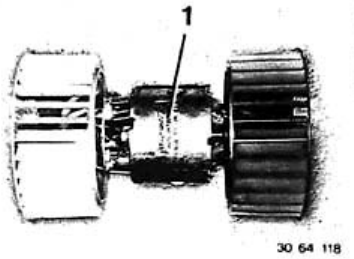
Pull off both wire plugs.



Disengage clamp (1).
Lift out fan motor with fan.

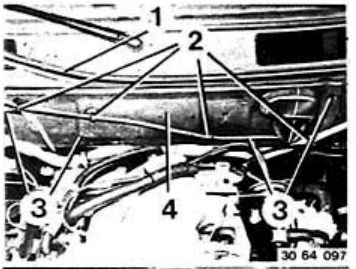


Important!
Be careful not to damage the air flap.



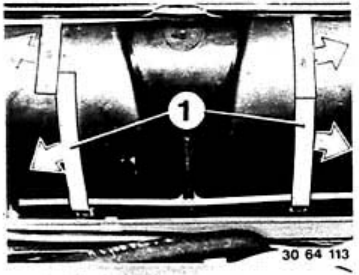
Installation:
Check code number (1)*.
Important!
Do not remove or turn fan wheels on motor shaft since motor and fan wheels were balanced in assembled state.

* See Specifications and Spare Part Microfilm



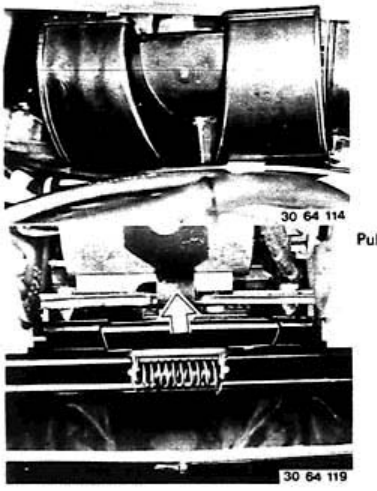
64 11 220 REMOVING AND INSTALLING RESISTOR PLATE FOR BLOWER MOTOR

Disconnect battery ground lead.
Pull off rubber strip (1).
Cut off wire strap (2).
Unscrew bolts (3).
Lay cover (4) aside.



Open retaining straps (1) and swing aside.

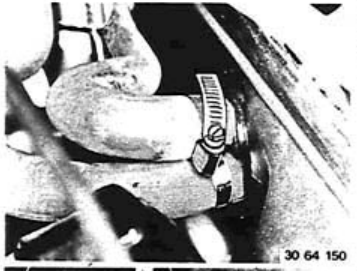
Remove cover.



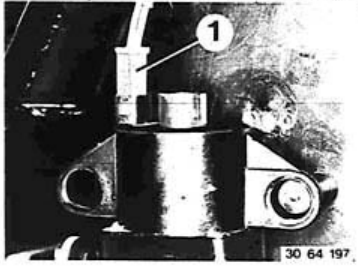
Pull off resistor plate.

64 11 271 REPLACING WATER VALVE FOR HEATER

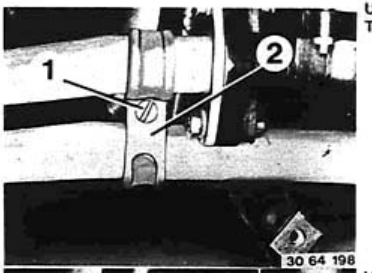
Disconnect battery ground lead.
Remove and install instrument panel trim on left side 51 45 180.
Remove and install tray 51 16 200.



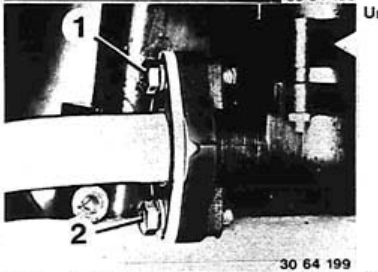
Drain coolant.
Disconnect both water hoses.
Installation:
Bleed cooling system.
Check coolant.



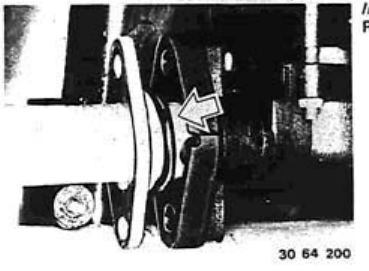
Pull off plug (1).



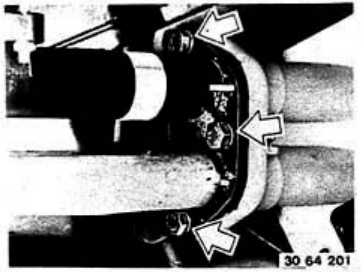
Unscrew bolt (1).
Take off clamp (2).



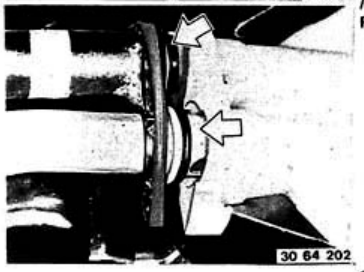
Unscrew bolts (1 and 2).



Installation:
Replace seal.



Unscrew bolts.
Take out water valve with pipes.

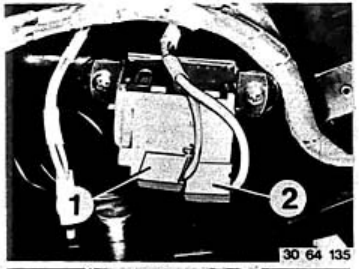


Installation:
Replace seals.

Checking Water Valve:
Water valve will be open when without electric power.
Water valve should be closed when applying battery voltage.

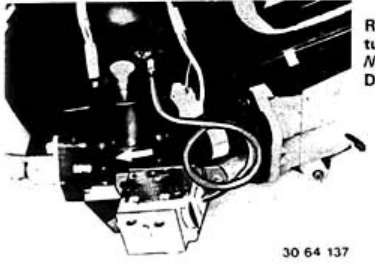
64 11 365 REPLACING ICING PREVENTION SWITCH

Disconnect battery ground lead.
Remove and install console 51 16 200.
Remove and install instrument panel trim at left 51 45 180.



Pull off plugs (1 and 2).

Unscrew screws.



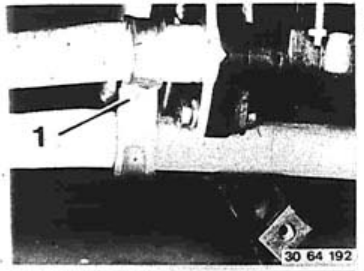
Remove temperature switch and pull temperature sensor out of housing at same time.
Note:
Don't bend the temperature sensor.

64 11 311 REMOVING AND INSTALLING FRESH AIR GRILL

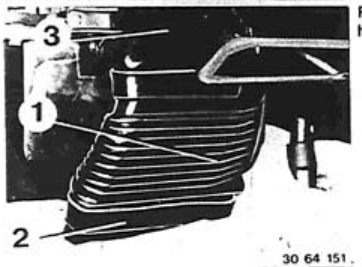
Fresh air grills are merely plugged in (lift out toward front).

64 11 531 REPLACING HEATER CORE

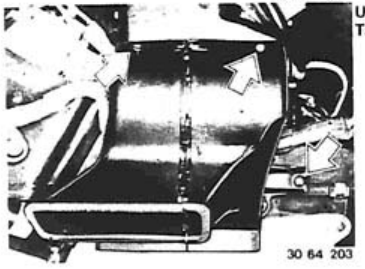
Disconnect battery ground lead.
Remove and install tray 51 16 200.
Remove and install instrument panel trim on left side 51 45 180.



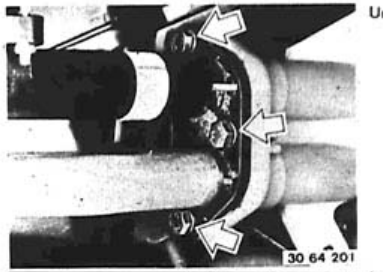
Drain coolant.
Loosen screw (1).



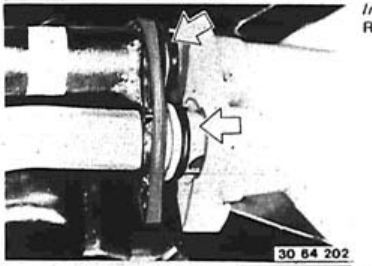
Remove connector (1) on left side between heater (3) and rear area heater duct (2).



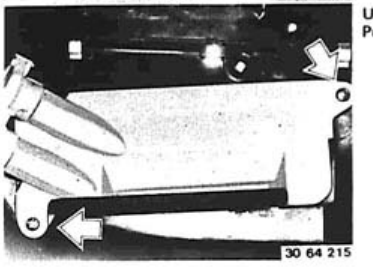
Unscrew screws.
Take off molded part.



Unscrew bolts.



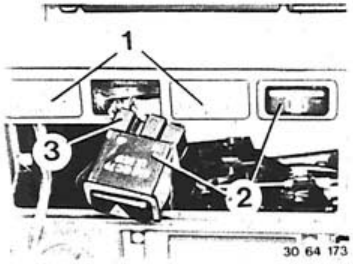
Installation:
Replace seals.



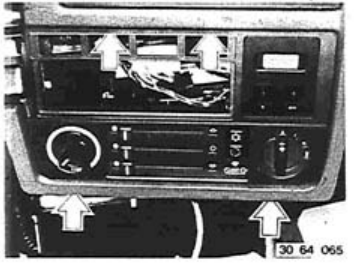
Unscrew bolts.
Pull heater core out of housing.

64 11 . . . REPLACING ONE OPERATING MOTOR FOR FRESH AIR / BYPASS AIR FLAP

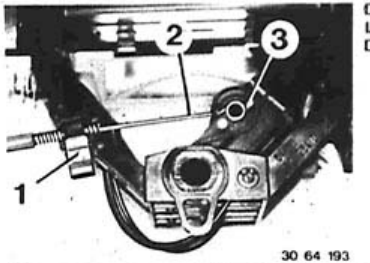
Disconnect battery ground lead.
Remove and install tray 51 16 200.
Remove and install instrument panel trim on left side 51 45 180.



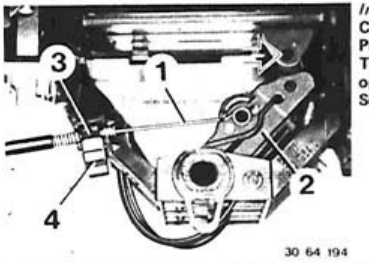
Remove radio opening mask or radio.
Pull opening covers (1) or switches (2) out of control panel.
Pull off plugs (3) on switches (2).



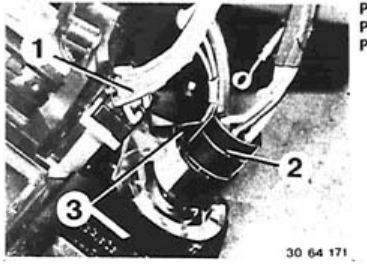
Unscrew screws.
Pull out control panel slightly.



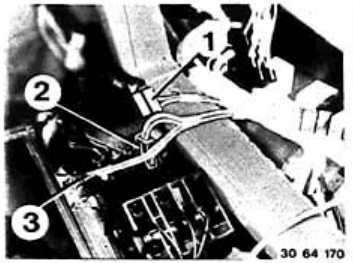
Disconnect all cables as described earlier.
Lift out clamp (1).
Disconnect cable (2) on lever (3).



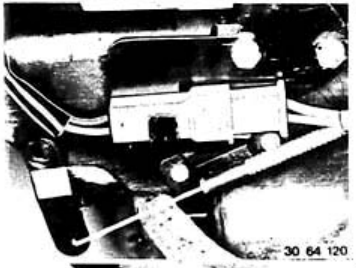
Installation:
Connect cable (1) in sliding control (2).
Push sliding control and air flap against stop.
Turn sleeve (3) enough until it can be placed in opening.
Secure cable with clamp (4).



Pull off plug (1) on air conditioner switch.
Pull off plug (2) on blower switch.
Pull off wire (3) with bulb holder.

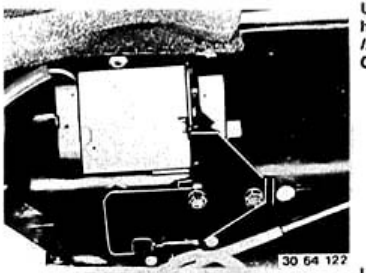


Pull off plug (1) on temperature control housing.
Pull off plug (2) on sliding control.
Pull off wire (3) with bulb holder.
Pull off plug on clock.
Place control unit aside.



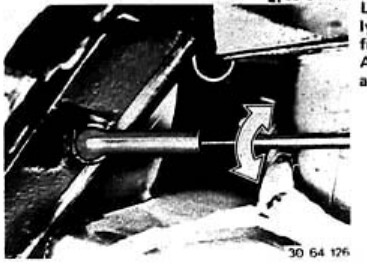
Disconnect plugs.

Disconnect operating rod.



Unscrew bolts and take off operating motor with holder.
Installation:
Connect holder in housing bar.

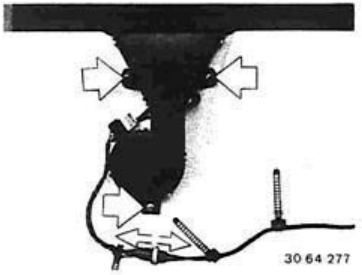
Unscrew bolts.
Take operating motor off of holder.



Length of operating rod must be adjusted correctly so that operating motor can open and close fresh air/bypass air flaps fully.
Adjust by disconnecting operating rod on motor and turning operating rod in ball socket joint.

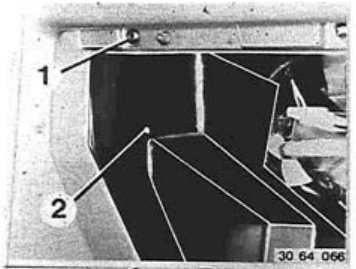
64 23 000 **REMOVING AND INSTALLING OR REPLACING REAR WINDOW VENTILATOR (Convertible)**

Remove rear seat cushion and backrest – see 52 20 000.



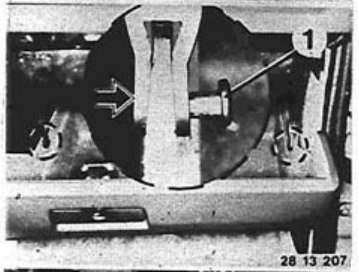
Disconnect plug.
Pull off relay.
Unscrew screws and take off fan.

Note:
Fan will only work with top closed (microswitch in top storage box on left side).

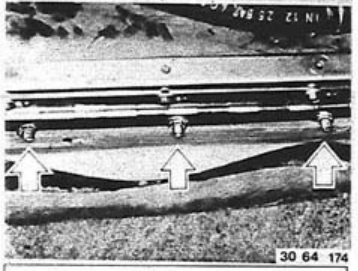


64 31 500 REPLACING MICROFILTER FOR INSIDE VENTILATOR

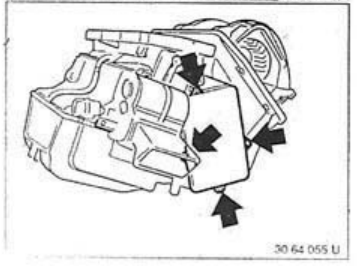
Open glove box.
Unscrew screw (1).
Take off trim (2).



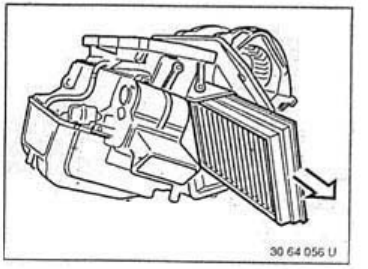
Disengage pins (1) of both retaining straps.



Loosen nuts and take out glove box.



Unscrew screws and take off cover.



Remove filter.

DESCRIPTION OF AIR CONDITIONING SYSTEM

Switching on the air conditioner activates electromagnetic coupling (1) of compressor (2). The compressor (2) is now driven by the running engine.

Compressor (2) increases the pressure of gaseous refrigerant (Frigen), which automatically causes the refrigerant temperature to also rise.

The refrigerant puts off heat in condenser (3), through which it is condensed (turns into a liquid).

Drier (4) removes residual water from the refrigerant and absorbs it.

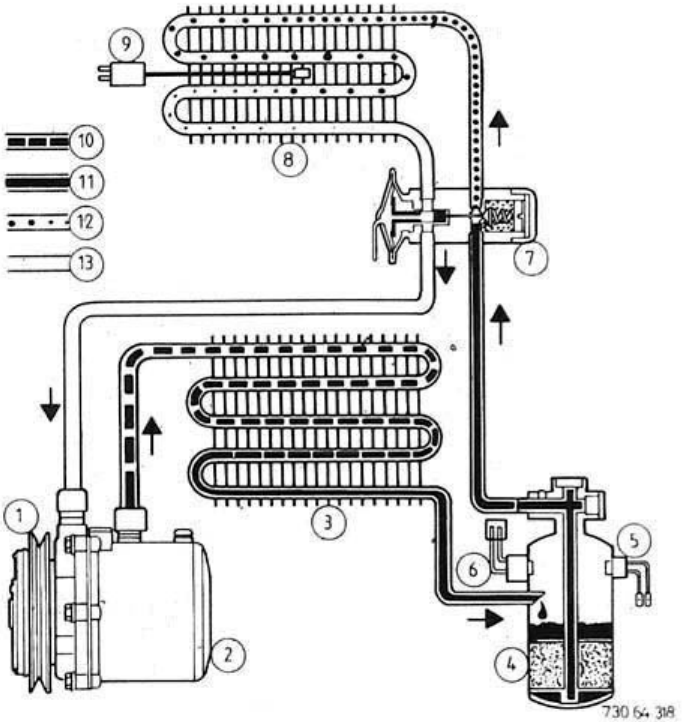
Safety switches (5 and 6) stop the compressor when pressure is too high or too low*. In this manner damage is prevented in the air conditioning system.

Expansion valve (7) meters the amount of refrigerant which is injected into evaporator (8). The amount of refrigerant will depend on the temperature and pressure of refrigerant at outlet of the evaporator.

The liquid refrigerant expands in evaporator (8) and is turned into gas. This change in state produces strong cooling off of the refrigerant and evaporator. The fresh air (or bypass circulation air) is cooled as it passes the evaporator.

Freezing prevention switch (9) switches the compressor to prevent the formation of ice on the evaporator. Ice formation would reduce the cross section opening size and impair cooling efficiency.

Moisture in the fresh air (or bypass circulation air) condenses on the evaporator and is discharged outside of car via lines on the transmission tunnel. This water is normal and not a sign of leakage.



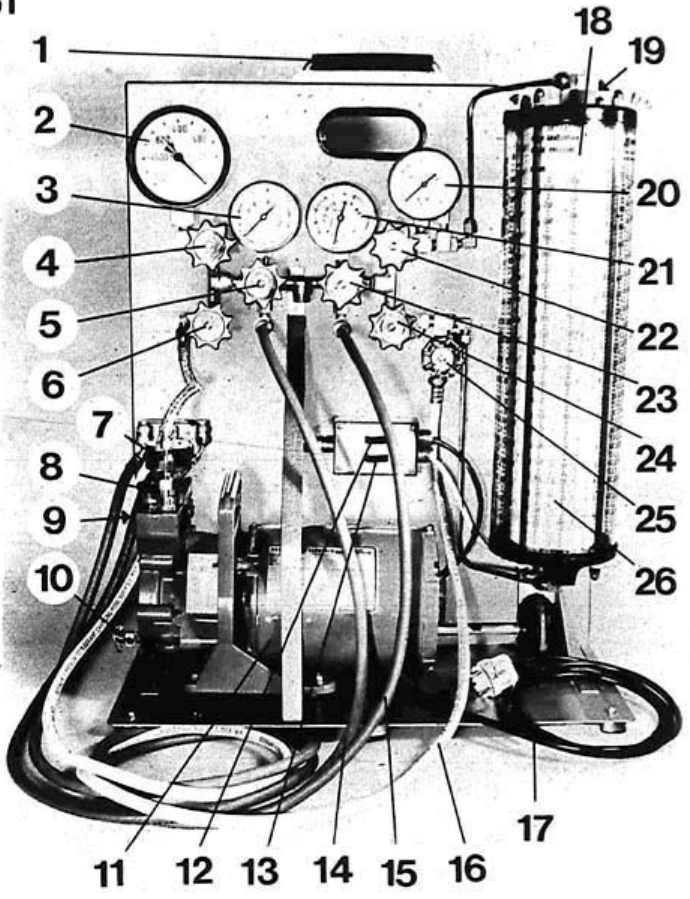
Main Components of Air Conditioner

1 = Pulley with electromagnetic coupling
2 = Compressor
3 = Condenser
4 = Drier
5 = Safety switch (low pressure pressostat)
6 = Safety switch (high pressure pressostat)
7 = Expansion valve
8 = Evaporator
9 = Freezing prevention switch
10 = High pressure – gas
11 = High pressure – liquid
12 = Low pressure – liquid
13 = Low pressure – gas

* See Specifications

DISCHARGING AND CHARGING STATION

1 = Pull-out carrying handle
2 = Pressure gage
3 = Low pressure gage
4 = Vacuum valve
5 = Charging valve "low pressure"
6 = Shut-off valve
7 = Filter
8 = Gas ballast valve
9 = Oil level sight glass
10 = Shut-off valve – compressor oil
11 = Vacuum pump
12 = Switch
13 = Switch
14 = Charging hose (blue) "low pressure"
15 = Charging hose (red) "high pressure"
16 = Charging hose (white)
17 = Power cord
18 = Volume scale
19 = Schrader valve
20 = Pressure gage "charging pressure"
21 = Pressure gage "high pressure"
22 = Charging valve "gas"
23 = Charging valve "high pressure"
24 = Charging valve "liquid"
25 = Charging valve "refrigerant"
26 = Charging cylinder



730 64 342

64 50 009 DISCHARGING AND CHARGING AIR CONDITIONER

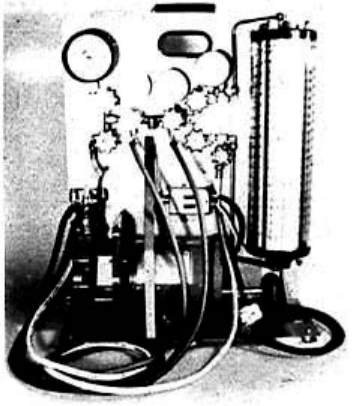
Safety Precautions for Handling Refrigerants:

The air conditioning system must be filled with a safety refrigerant (Frigen 12).
Although this refrigerant is non-toxic, non-flammable and non-explosive in any mixture ratio with air at normal temperatures, it can still be dangerous when appropriate safety precautions were not observed.

Avoid any contact with liquid or gaseous refrigerants. When working on the refrigerant circuit of an air conditioner protect hands with gloves and eyes with goggles.

Refrigerant on the skin will cause frostbite. Wash off pertinent parts of body with cold water thoroughly. If refrigerant gets in the eyes, also rinse out with water and then contact a physician immediately.

Refrigerants are heavier than air and therefore should not be discharged in closed rooms. Especially in working pits there would be an acute danger of asphyxiation, which would not be noticeable since the gas has no color or odor.
Turn on available air extraction systems.
Never perform welding work on a discharged air conditioner or in the vicinity. The pressure which would occur could lead to an explosion.
In addition, refrigerants decompose at high temperatures or when exposed to an open flame. The decomposed products are injurious to health.
Store full refrigerant cylinders that they are not subjected to direct sunshine or other sources of heat (max. temperature 45° C / 113° F).

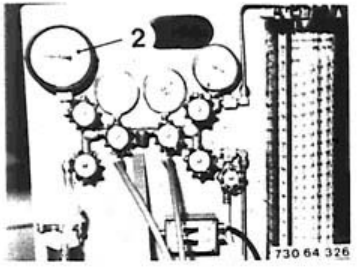


730 64 315

Discharging and Charging Air Conditioner:

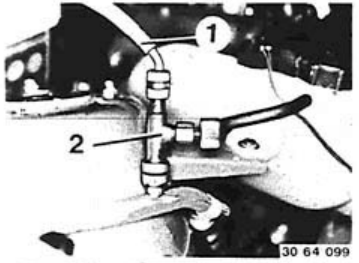
Conform with operating instructions supplied with pertinent charging equipment.
Major Procedures:
1) Connecting charging equipment.
2) Discharging (time depends on condition of air conditioner).
3) Flushing with refrigerant.
4) Discharging.
5) Charging with refrigerant – "volume"*.
   Caution!
   Never operate air conditioner while charging.
6) Checking function of air conditioner.

* See Specifications

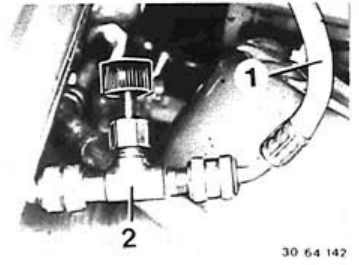


Check operating condition of discharging and charging equipment before using.
Check oil level and oil grade in compressor.
Also refer to operating instructions for charging equipment.
Caution!
Do not subject pressure gage (2) to excessive pressure during procedures – danger of destruction.

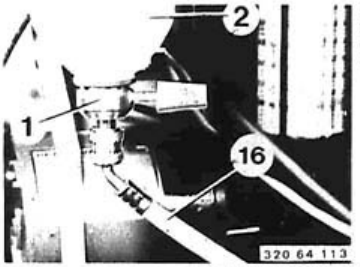
Note:
An air conditioner could also be discharged and charged with only one charging hose (high or low pressure side).
Discharging and charging procedures, however, are faster when carried out with a core valve remover and two charging hoses..
Absolute cleanliness is required for work on air conditioners.
Wear protective clothes.
Close all valves on equipment before starting work.
Following jobs are only applicable to the illustrated charging station.



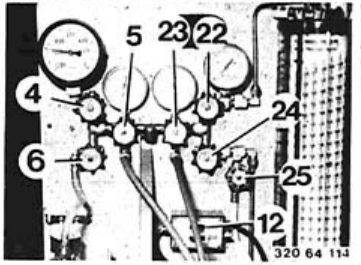
Remove cap.
Connect blue charging hose (1) on low pressure side (thick pipe) of air conditioner.



Remove cap.
Connect red charging hose (1) on high pressure side (thin pipe or drier) of air conditioner.

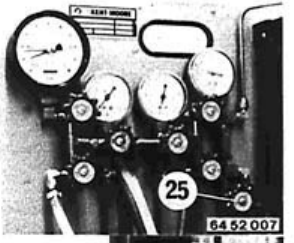


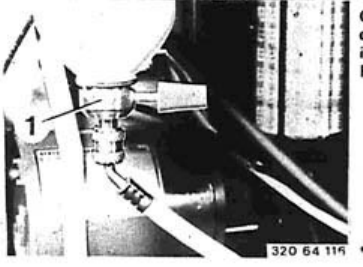
Connect refrigerant bottle (2) and charging hose (16) with charging valve (1).
Charging valve (1) remains closed until filling the charging cylinder.



Open valves (4, 6 and 22).
Turn on pump with switch (12) and discharge air conditioner.
Close valve (22) and open valves (5 and 23).
Discharge air conditioner.

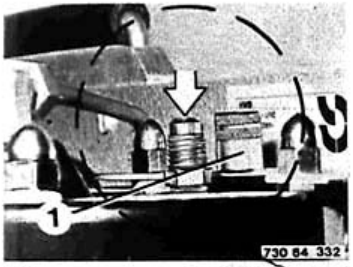
Open valve (25).



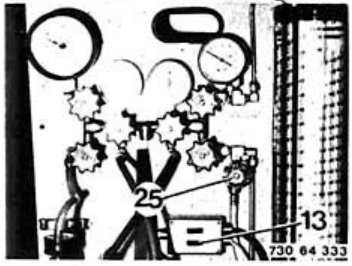


Open charging valve (1) and fill charging cylinder with refrigerant while air conditioner is being further discharged.
Refrigerant and volume*.

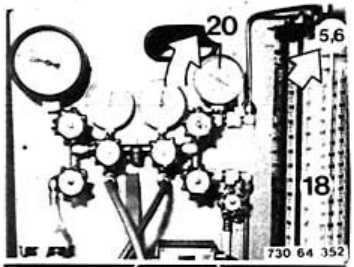
* See label in engine compartment.



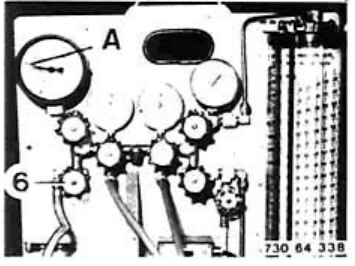
To fill charging cylinder, unscrew the cap (1) and let pressure escape from charging cylinder by pressing down on the valve core.
This is necessary to have refrigerant flow into the charging cylinder.



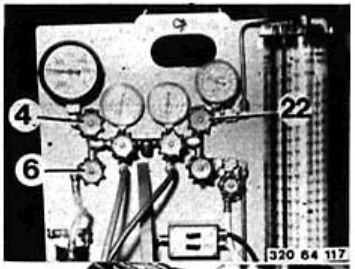
Close charging valve (25) after finishing charging procedures and operate heater with switch (13).



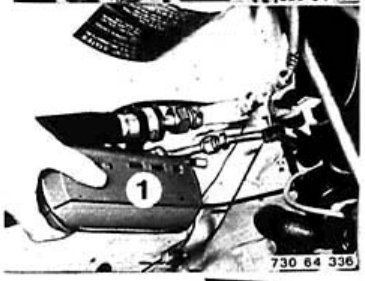
Read rising pressure in charging cylinder on pressure gage (20) and set same pressure (e.g. 5.6 bar / 80 psi) on volume scale (18).
Only the amount of refrigerant in the charging cylinder can be read on the volume scale.
Switch off heater after reaching charging pressure of 4.9 to 9.1 bar (70 to 129 psi).



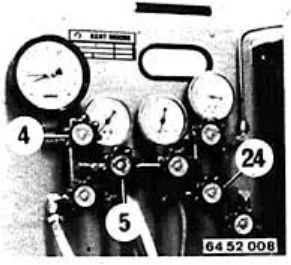
After completion of discharging:
Close shut-off valve (6).
Mark red needle (A) with displayed value.
If pressure does not rise, air conditioner does not have moisture or leaks.
Switch off vacuum pump.



Leak Test:
Close shut-off valve (6).
Close vacuum valve (4).
Switch off vacuum pump.
Open charging valve (22) about 1 second and then close again.



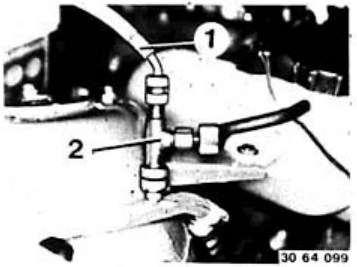
Calibrate leak detector (1) according to supplied operating instructions.
Check air conditioner for leaks with the leak detector (1).
Eliminate leaks.
Note:
Always look for leaks below an assumed leak point, since refrigerant is heavier than air.



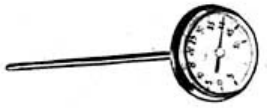
Charging System:
Close vacuum valves (4 and 5).
Open valve (24) and let correct amount* of refrigerant flow into system.

After the correct amount* of refrigerant is in the system, close valve (24).
Disconnect hoses and screw on caps.

* See Label in Engine Compartment

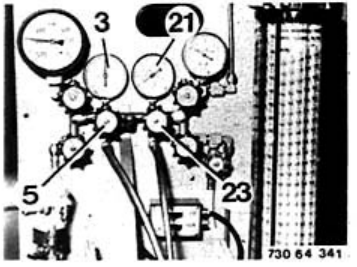


Checking Air Conditioner:
Unscrew cap.
Connect blue charging hose (1) with valve core remover (2) on low pressure side of air conditioner.
Connect high pressure hose as low pressure hose was connected.

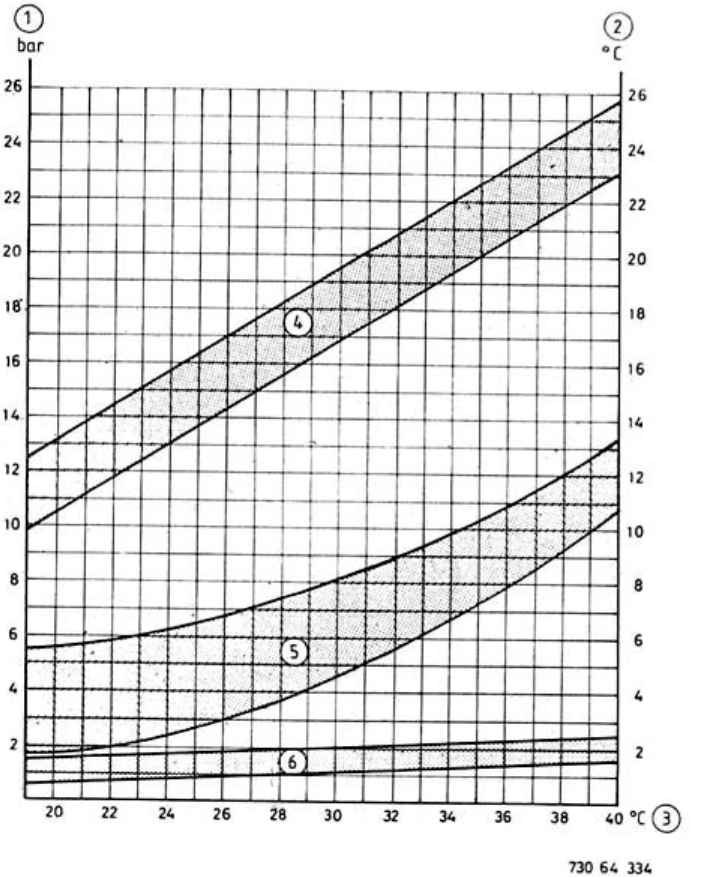


Insert a thermometer in the air outlet grill.
Test Conditions:
1. Car parked in shade (inside of building).
2. Air conditioner discharged, charged. Compressor oil volume and grade okay.
3. Engine speed 2000 rpm and air conditioner switched on.
4. Doors closed.

730 64 350

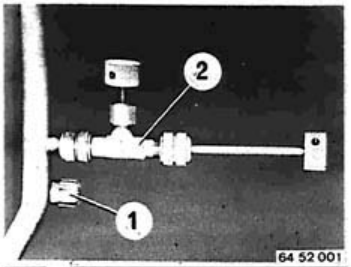


Close all valves of discharging and charging station.
Only open charging valves (5 and 23).
Read pressure from low and high pressure gages (3 and 21) and compare with nominal value graph 730 64 334.
Always only check one pressure range.



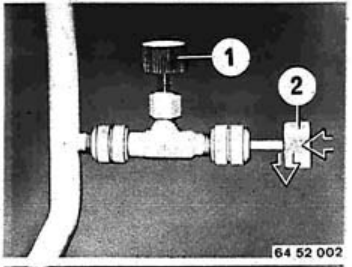
730 64 334

(1) = Pressure scale in bar
(2) = Temperature scale in °C
(3) = Ambient temperature scale in °C
(4) = High pressure range tolerances
(5) = Center nozzle air outlet tolerances
(6) = Low pressure range tolerances

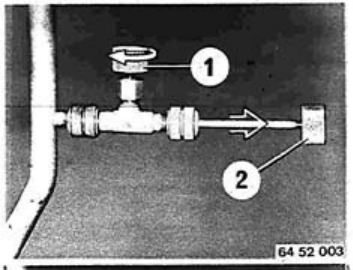


64 52 . . . REMOVING AND INSTALLING VALVE CORE

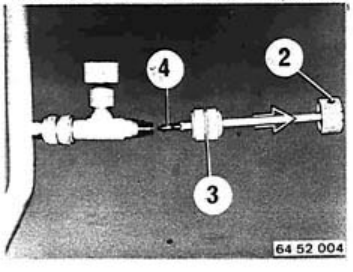
Unscrew cap (1).
Screw on valve core remover (2).



Open valve (1).
Unscrew valve core with valve turner (2).



Pull back valve turner (2) with valve core.
Close valve (1).



Unscrew coupling nut (3) and take off valve turner (2) with valve core (4).

730 64 304

Installation:
Refrigerant-proof valve cores can be recognized on transparent seal (1).

64 52 020 REMOVING AND INSTALLING COMPRESSOR

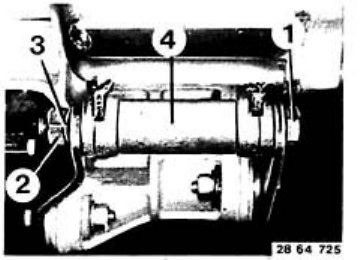
316 ... 318 I / M 10 Engine:
Important!
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment

Installation:
Discharge, charge and check air conditioner for leaks after installation.

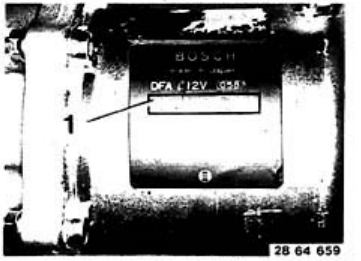
Disconnect plug (1) for solenoid of pulley.

Unscrew bolts (1 an 2).
Disconnect pipes (3 and 4).
Insert plugs in open connections immediately.

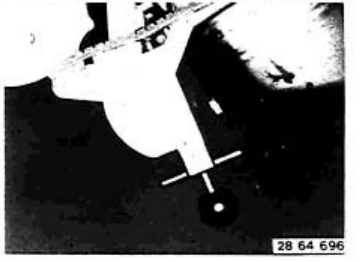
Installation:
Replace seals.
Tightening torque*.



Unscrew nut (2).
Remove bolt (1), washer (3) and spacer (4).
Take off compressor.



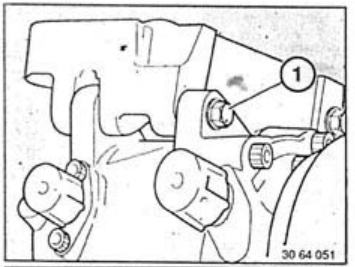
Installation:
Check code number (1)*.
Tightening torque*.



Installation:
Check drive belt tightness with a tester, correcting if necessary.
Pulling hook must always rest on tip of tooth.

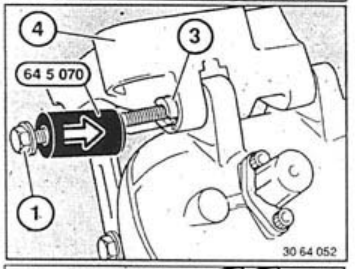
* See Specifications

* See Specifications and Parts Microfiche



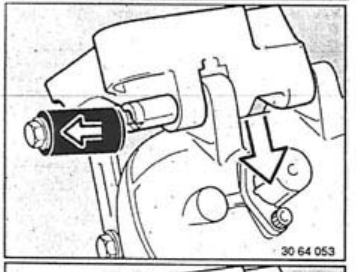
316 ... 318 I / M 40 Engine:
Unscrew bolt (1).

Note:
Shown on removed compressor with bracket for better presentation.

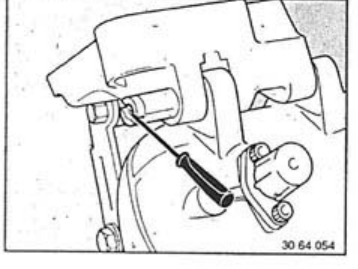


Pull dowel sleeve (3) out of bracket (4) from behind with bolt (1) and Special Tool 64 5 070 so far, until the compressor is loose.

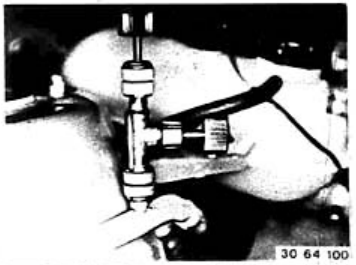
Important!
Use the original bolt so that the compressor is still held while pulling the dowel sleeve out of the compressor bracket and does not fall on the ground.



Unscrew bolt in the dowel sleeve with help of the special tool and remove the compressor.



Installation:
The groove on the dowel sleeve must face out while pulling in so that the dowel sleeve could be held tight should it be turning. The dowel sleeve must be pulled in against the stop.

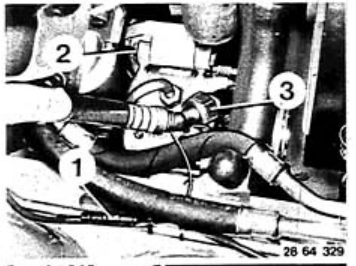


64 52 020 REMOVING AND INSTALLING COMPRESSOR

320 i ... 323 i:

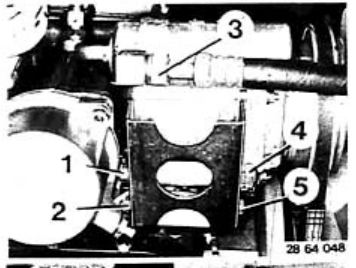
Important!
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment.

Installation:
Discharge, charge and check air conditioner for leaks after installation.



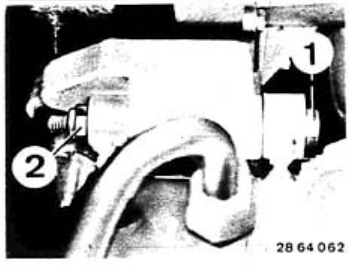
Remove air cleaner.
Disconnect plug (1).
Unscrew nut (2).
Disconnect hose (3).
Insert plugs in open connections immediately.

Installation:
Tightening torque*.
Replace seal.



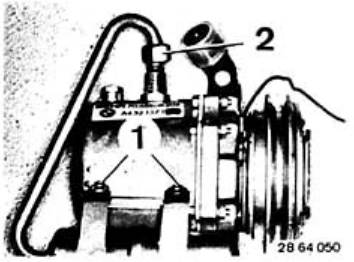
Unscrew nuts (1 and 2).
Disconnect hose (3).
Insert plugs in open connections immediately.
Remove bolts (4 and 5).

Installation:
Tightening torque*.
Replace seal.



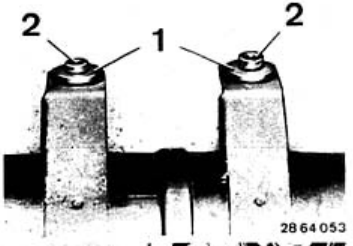
Remove bolt (1).
Remove compressor.

* See Specifications

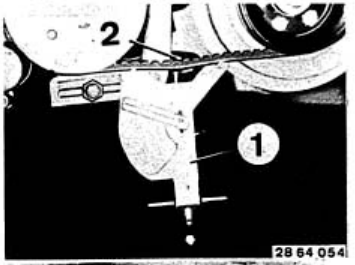


Unscrew bolts (1).
Unscrew nut (2) and take off stabilizer.

Installation:
Tightening torque*.
Replace seal.



Installation:
Check rubber mounts (1), replacing if necessary.
Don't forget the spacers (2).



Installation:
Check drive belt tightness with tester (1).

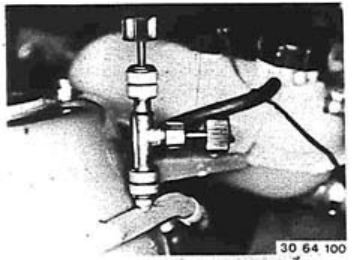
Note:
Pulling hook (2) must always be on tip of a tooth.

Note:
Replace compressor oil.
Unscrew bolt (1).
Let oil run out of the compressor.
Pour in oil.
Oil volume*.
Oil grade*.

* See Specifications

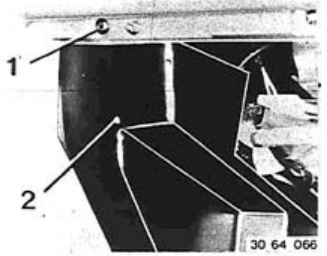
64 51 050 REMOVING AND INSTALLING EXPANSION VALVE

Disconnect battery ground lead.
Remove center console – see 51 16 200.
Remove dashboard trim panel at left – see 51 45 180.

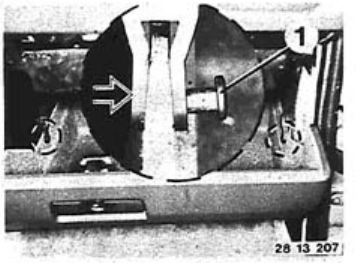


Important!
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment.

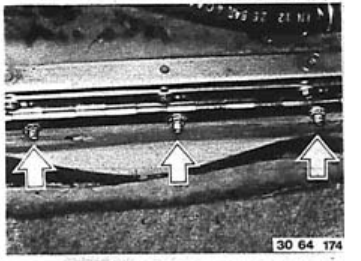
Installation:
Discharge, charge and check air conditioner for leaks after installation.



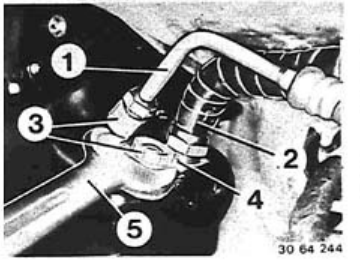
Open glove box.
Unscrew screw (1).
Take off trim (2).



Disengage pins (1) of both retaining straps.



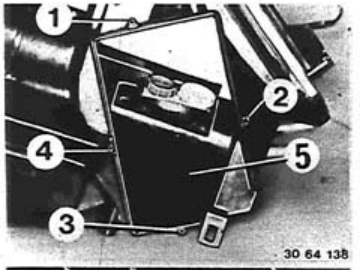
Loosen nuts and remove glove box.



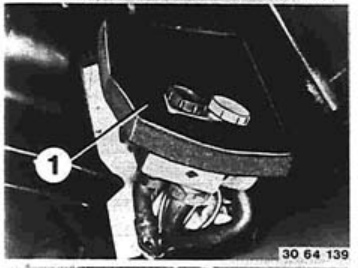
Unscrew pipes (1 and 2).
Insert plugs (3) in open connections immediately.
Counterhold on expansion valve (4) with wrench (5).

Installation:
Tightening torque*.
Replace seals.

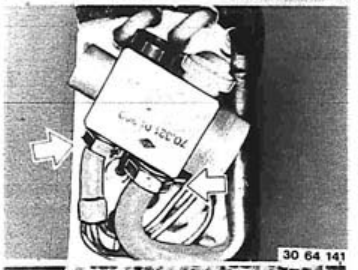
* See Specifications



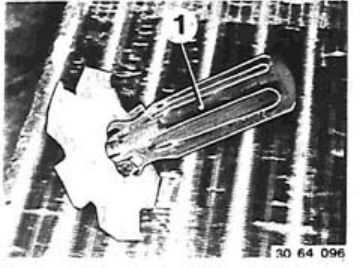
Unscrew bolts (1 ... 4).
Take off cover (5).



Take off foam rubber cover (1).
Pull evaporator out of housing.



Disconnect both pipes.
Insert plugs in open connections immediately.
Counterhold on expansion valve with a wrench.
Installation:
Replace seals.
Tightening torque*.

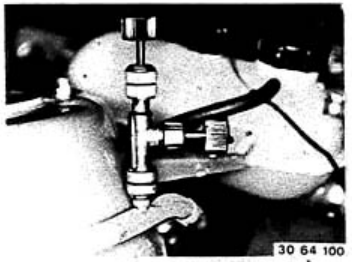


Note.
Straighten up bent plates on evaporator with help of fin comb (1).

* See Specifications

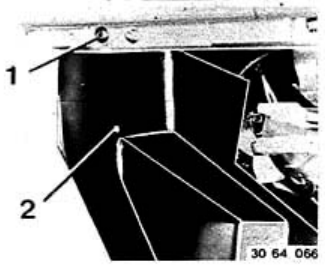
64 51 590 REPLACING EVAPORATOR

Disconnect battery ground lead.
Remove center console – see 51 16 200.
Remove dashboard trim panel at left – see 51 45 180.

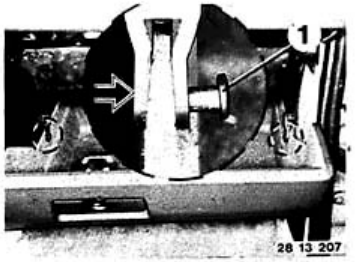


Important!
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment.

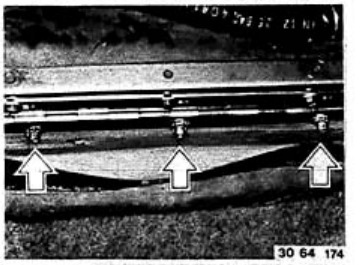
Installation:
Discharge, charge and check air conditioner for leaks after installation.



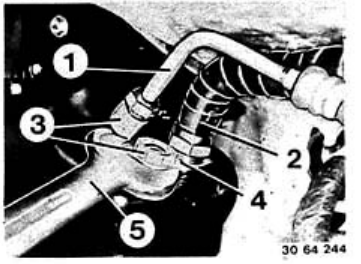
Open glove box.
Unscrew screw (1).
Take off trim (2).



Disengage pins (1) of both retaining straps.



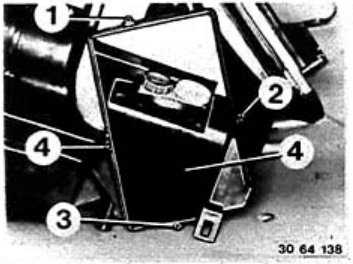
Loosen nuts and remove glove box.



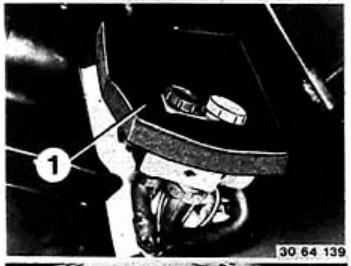
Unscrew pipes (1 and 2).
Insert plugs (3) in open connections immediately.
Counterhold on expansion valve (4) with wrench (5).

Installation:
Tightening torque*.
Replace seals.

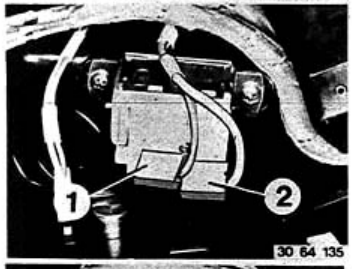
* See Specifications



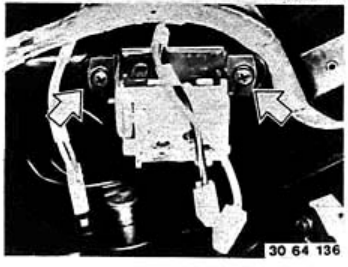
Unscrew screws (1 ... 4).
Remove trim panel (5).



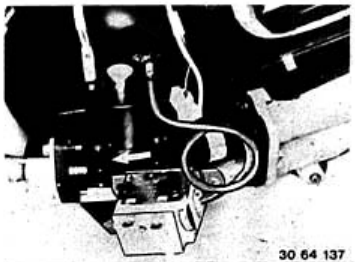
Remove foam rubber cover (1).



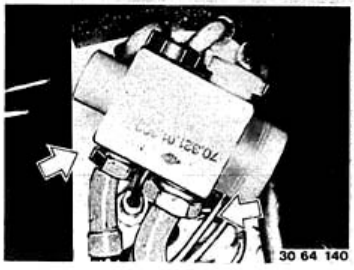
Pull off plugs (1 and 2).



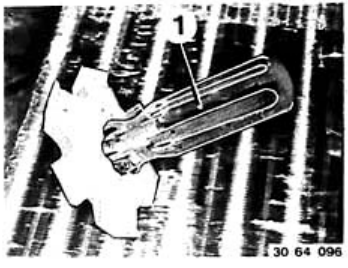
Unscrew bolts.



Remove temperature switch, pulling temperature sensor out of housing at same time.
Note:
Don't bend temperature sensor.

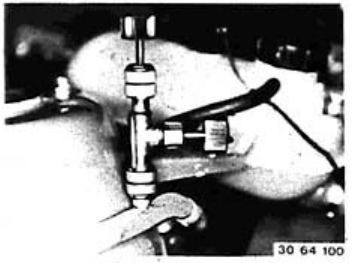


Pull evaporator out of housing.
Disconnect both pipes.
Insert plugs in open connections immediately.
Counterhold on expansion valve with a wrench.
Installation:
Install freezing prevention switch only after installation of evaporator.
Replace seals.
Tightening torque*.



Note:
Straighten bent cooling fins on condenser with help of fin comb (1).

* See Specifications



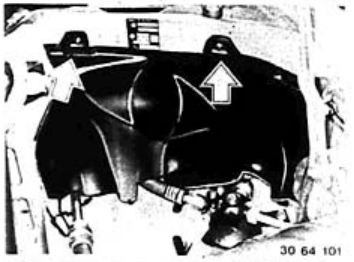
30 64 100

64 53 010 REMOVING AND INSTALLING A/C DRIER

Important!
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment.

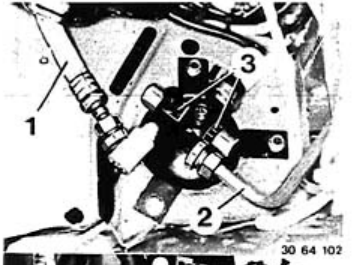
Installation:
Dischrage, charge and check air conditioner for leaks after installation.

Remove washing fluid tank.



30 64 101

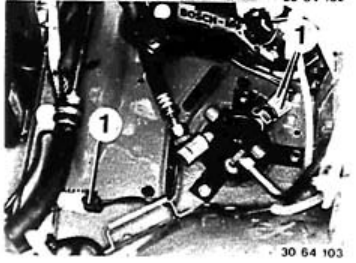
Unscrew screws.
Take off trim.



30 64 102

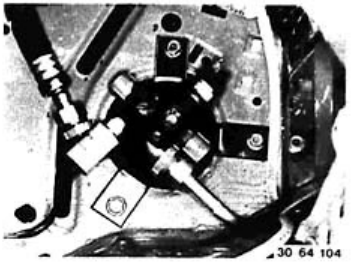
Unscrew pipes (1 and 2), while counterholding on hexagon (3).
Insert plugs in open connections immediately.

Installation:
Tightening torque*.
Check seals, replacing if necessary.



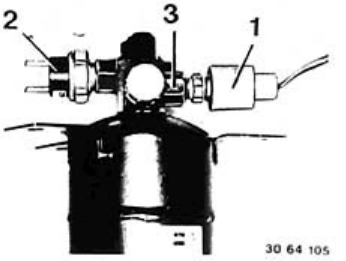
30 64 103

Disconnect plugs (1) on both safety switches.



30 64 104

Unscrew bolts.
Remove drier.



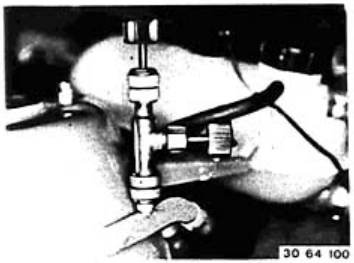
30 64 105

Unscrew safety switch (1 = high pressure and 2 = low pressure pressostat), while counterholding on hexagon (3).
Insert plugs in open connections immediately.

Installation:
Install both safety switches with bolt cement, HWB No. 81 22 9 407 144.
Tightening torque*.

* See Specifications

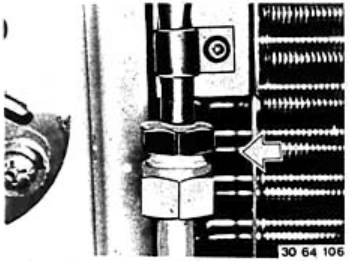
* See Specifications



64 53 050 REMOVING AND INSTALLING CONDENSER

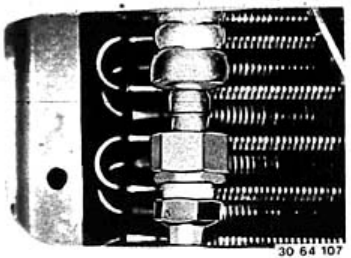
Remove radiator.
Don't discharge refrigerant outdoors, but instead draw it out of system – see operating instructions supplied with equipment.

Installation:
Discharge, charge and check air conditioner for leaks after installation.



Remove right radiator grill section.
Unscrew pipe connection.
Insert plugs in open connections immediately.

Installation:
Tightening torque*.
Replace gasket.

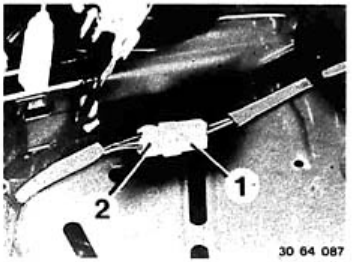


Unscrew pipe connection.
Insert plugs in open connections immediately.

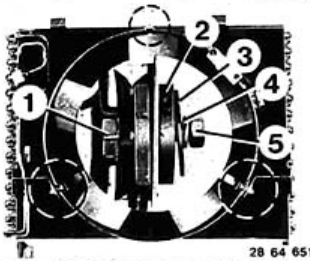
Installation:
Tightening torque*.
Replace gasket.

Unscrew bolts.
Remove condenser from above.

* See Specifications

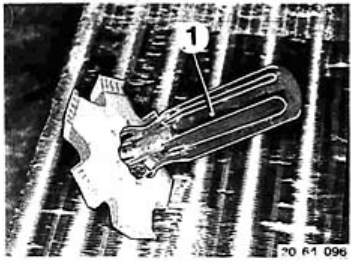


Disconnect multiple-pin plug (1) from additional fan.



Unscrew bolts.
Take additional fan off condenser.

1 = Bolt
2 = Rubber mount
3 = Washer
4 = Lock washer
5 = Nut



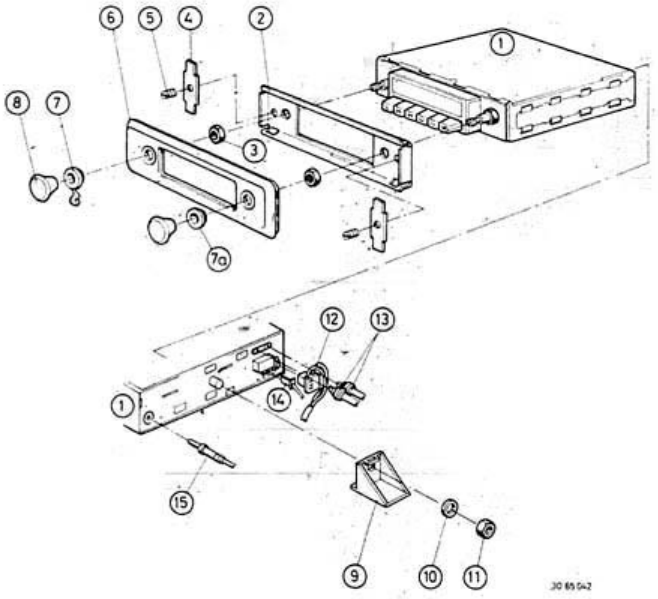
Note:
Straighten bent cooling fins with help of special cooling fin comb.

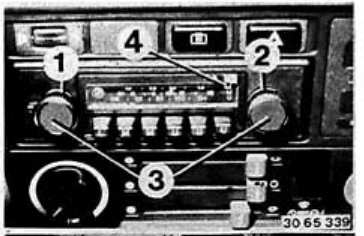
65 Radio and Special Equipment

65 11 030	Radio – remove and install or replace	65- 110
	Bavaria S / Bavaria	65- 110
	Bavaria Cassette III / Europe / CR Digital / Europe Digital	65- 111
	Bavaria C II or Reverse II	65- 111a
	Bavaria Electronic	65- 112
	Becker Mexico Electronic	65- 113
	Business	65- 113a
	Testing instructions for "Bavaria" radios	65- 114
	Troubleshooting	65- 118
65 12 000	Loudspeakers, front – remove and install or replace	65- 120
020	Loudspeakers, rear – remove and install or replace	65- 120
65 13 . . .	Sound system layout	65- 130
000	Treble loudspeakers – remove and install or replace	65- 131
020	Rear sound system loudspeakers – remove and install or replace	65- 131
65 14 000	Cassette box – remove and install or replace	65- 140
65 21 101	Retractable antenna (rear) – remove and install or replace	65- 210
65 22 005	Automatic antenna (rear) – remove and install or replace	65- 220
040	Automatic antenna telescope – replace	65- 221
65 71 010	Control unit for cruise control – remove and install or replace	65- 710
020	Drive for cruise control – remove and install or replace	65- 710
040	Cable for cruise control – remove and install or replace	65- 712
	Test procedures for cruise control	65- 714
65 75 . . .	Burglar alarm survey	65- 750
	Burglar alarm control unit – remove and install or replace	65- 751
	Burglar alarm coding lock – remove and install or replace	65- 751
	Burglar alarm switching unit for driver's door – remove and install or replace	65- 752
	Burglar alarm switching unit for trunk lid – remove and install or replace	65- 752
	Burglar alarm horn – remove and install or replace	65- 753
	Burglar alarm – troubleshoot	65- 754
65 81 020	Control panel for on-board computer – remove and install or replace	65- 810
045	Relay for on-board computer II – remove and install or replace	65- 811
050	Gong for on-board computer – remove and install or replace	65- 811
060	Air temperature sensor – remove and install	65- 812
	Test instructions for on-board computer II	65- 813

65 11 030 REMOVING AND INSTALLING OR REPLACING RADIO

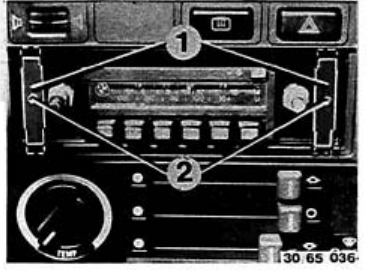
1.1 Bavaria S / Bavaria





Pull off knobs (3).
Pull off tone regulator (1) and ornament (2).
Installation:
Mounting the left knob activates the no-sound circuit (see operating instructions).
4 = Opening for antenna trimmer

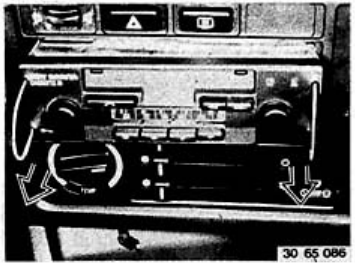
Push back spring retainers (2) upwards to remove the radio face plate (1).
Installation:
Install face plate that spring retainers face up.



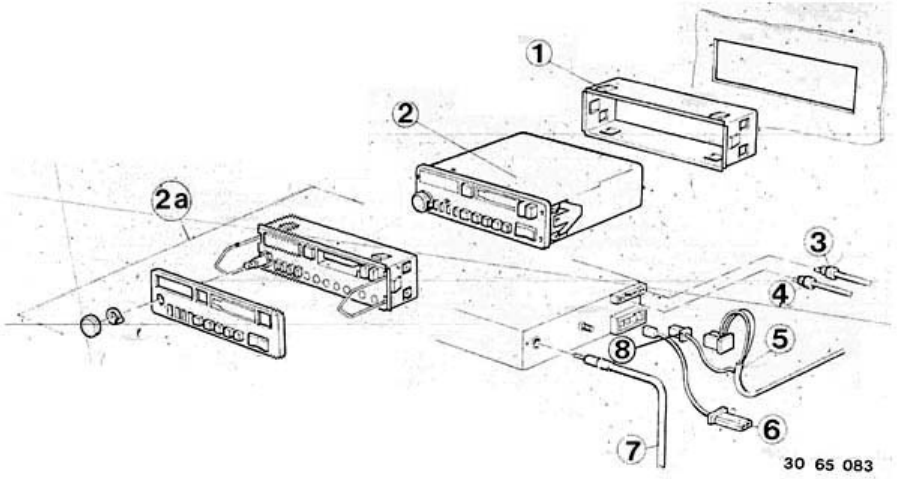
Remove screws (2) and holders (1).
Take out radio.
Installation:
Do not screw in screws too tight.

1	Radio	8	Knob
2	Radio console	9	Support
3	Nut	10	Washer
4	Holder	11	Nut
5	Screw	12	Plug for B + and ground
6	Face plate	13	Plug for speaker
7	Tone regulator (ornament for Bavaria)	14	Plug for automatic antenna
7a	Ornament	15	Plug for antenna

1.2 **Bavaria Cassette III / Bavaria Europe**
Bavaria CR Digital / Bavaria Europe Digital
Bavaria C
Bavaria C Reverse

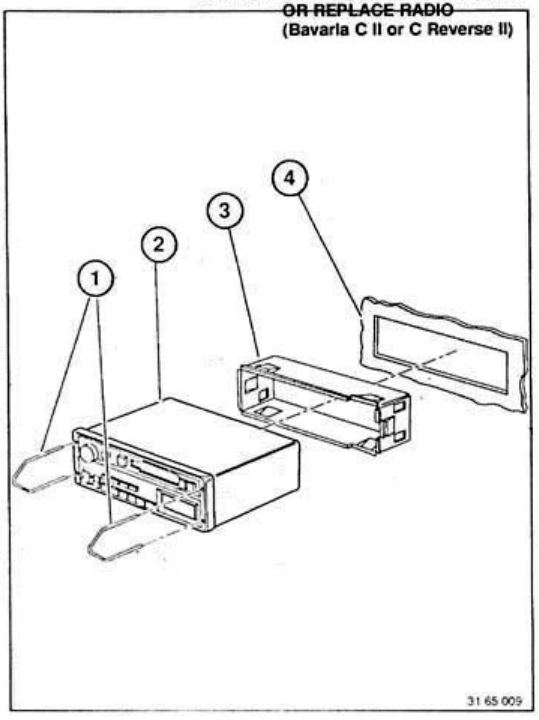


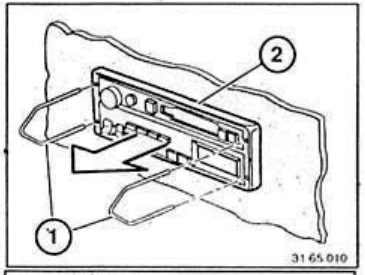
Insert hook and pull out radio with it.
Radios Without Holes in Face Plate:
Pull off knobs and face plate.
Insert unlocking hook and pull out radio.



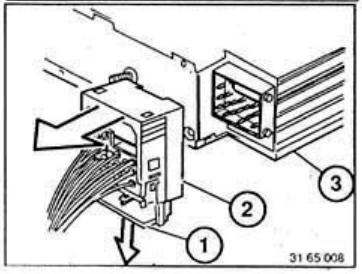
1 Radio console
2 Radio (with holes for removal)
2a Radio (without holes for removal)
3 Plug for speaker, left
4 Plug for speaker, right
5 Plug for B + and ground
6 Plug for power supply (term. 30) (only digital models)
7 Plug for antenna
8 Plug for automatic antenna control

65 11 030 REMOVING AND INSTALLING OR REPLACE RADIO (Bavaria C II or C Reverse II)





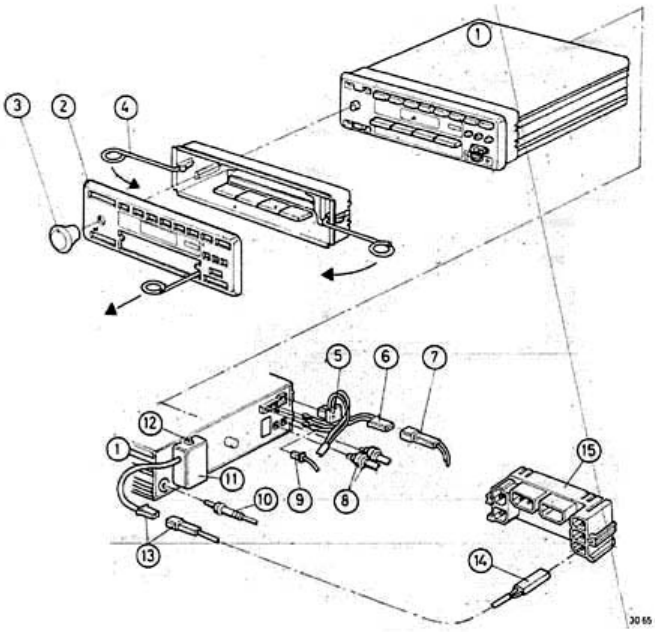
Press left and right unlocking hooks (1) into radio.
Pull out radio with hooks carefully.

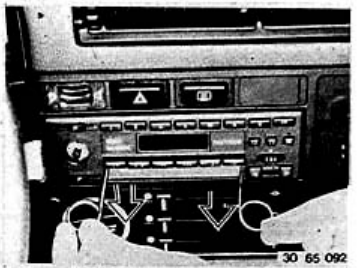


Pull out retainer (1) and disconnect plug (2) on radio (3).

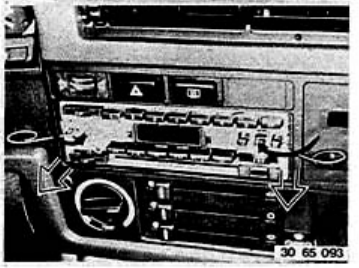
1 = Unlocking hook
2 = Radio
3 = Radio carrier
4 = Radio opening

1.3 Bavaria Electronic





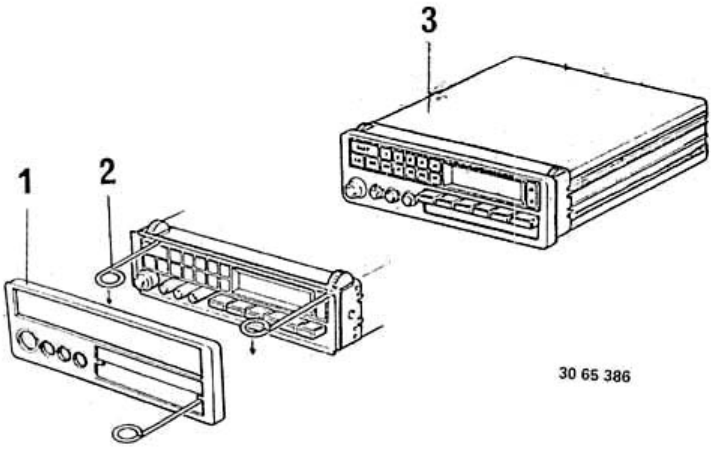
Pull off Knob.
Take off face plate carefully with the unlocking hook.
Note:
Only attach hook on the face plate.



Push back clamps on left and right sides with the unlocking hooks and pull out the radio.

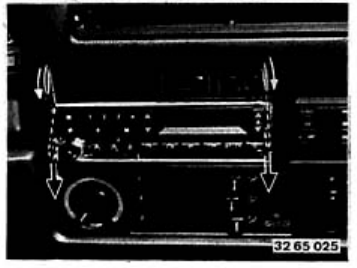
1 Radio
2 Face plate
3 Knob
4 Unlocking hook for radio removal
5 Plug for B + and ground
6 Adapter
7 Plug for power supply to electronics and light
8 Plug for speakers
9 Plug for automatic antenna
10 Plug for antenna
11 Adapter for noise-dependent loudness control
12 Switch for 11
13 Plug for 11
14 Plug for 11
15 Plug receptacle on instrument carrier

1.3.1 Bavaria C "Exclusive"
Bavaria C "Electronic"



30 65 386

Take off mask carefully with the unlocking hooks.
Note:
Only grab hold of mask with hooks.



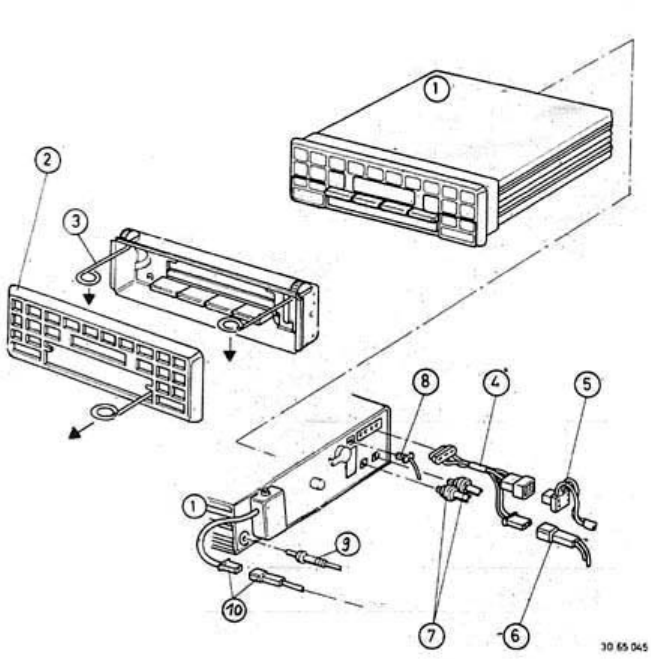
Press down clamps on left and right sides with the unlocking hooks and pull out radio.

1 Mask

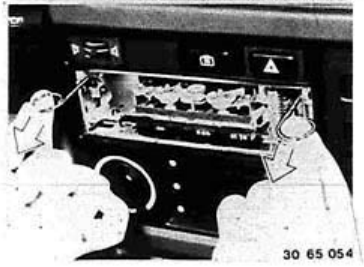
2 Unlocking hook for radio removal

3 Radio

1.4 Becker Mexico Electronic



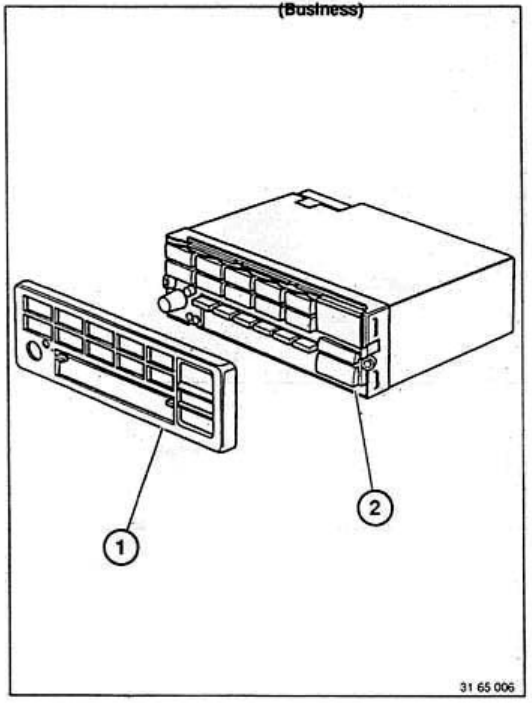
Take off the control panel with unlocking hooks (1).
Note:
The control panel fits very tight.



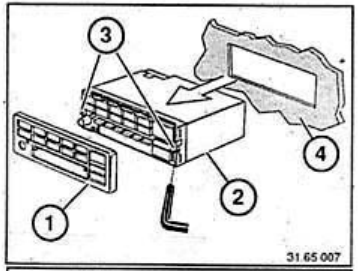
Push back clamps on left and right sides with the unlocking hooks and pull out the radio.

1 Radio
2 Control panel
3 Unlocking hook for radio removal
4 Adapter
5 Plug for B + and ground
6 Plug for power supply to electronics and light
7 Plug for speakers
8 Plug for automatic antenna
9 Plug for antenna

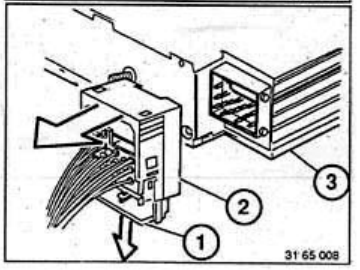
65 11 030 REMOVING AND INSTALLING OR REPLACING RADIO (Business)



1 = Front panel
2 = Radio



Pull off front panel (1).
Unscrew left and right screws (3).
Pull radio (2) out of radio opening.



Pull out retainer (1) and disconnect plug (2) on radio (3).

TESTING INSTRUCTIONS FOR "BAVARIA" RADIO

GENERAL INFORMATION

A car radio has especially great requirements to fullfill in regards to reception, reproduction quality and operational safety.

The "BAVARIA" radio, as all other car radios, differs in several points to a stationary home radio. Direct comparsion with a home radio unit is not possible due to the relatively unfavorable acoustic conditions, to which the very changing reception conditions and the electrical system in the car belong.

These testing instructions will provide a brief explanation of the most important relations between the broadcasting station and radio, and also point out possible sources of defect and appropriate corrective measures.

NOTE

- Not every radio complaint necessarily menas a defective radio.
- Determine a test driving route for radio complaints and always tune in the same stations during test drives.
- Note the places where shade-off background noise etc. is heard.
- Compare the reception of radio being reprimanded with a radio of same type, a thorough inspection is only justified when deviations are extreme.
- Prior to test driving the operating instructions of the pertinent radio should be read for reference and perhaps explain to the customer how the radio should be operated and some of the general reception problems of the different wave ranges.

TRIMMING RADIO

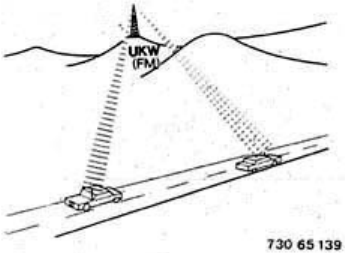
1. Pull out antenna to length of about 0.9 ... 1.0 meters (35 to 39"), making sure that bottom telescope section is pulled out fully.
2. Set medium wave range (AM) of radio to a weak reception station at 1100 kHZ. Now turn the antenna trimmer until the maximum loudness is reached.
   Should there not be station at 1100 kHZ, it would be sufficient to trim the background noise to maximum loudness.
   To check whether trimming is correct, turn the antenna trimmer around its axis once. Now the maximum loudness should be found at two different positions of the trimmer.
   At these points there is the greatest input voltage and the greatest resonance. The trimmer must be set to one of both positions.

NOTE:

Make sure that the antenna is "grounded" correctly; remove paint, Teroson or rust and coat cleaned surfaces with graphite grease for protection against corrosion.

INFLUENCES ON RADIO RECEPTION. WHILE DRIVING

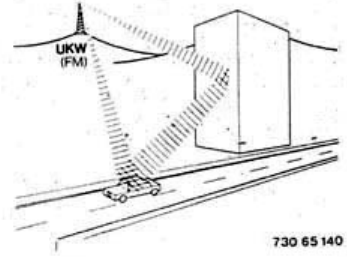
In spite of an accurately trimmed antenna, good ground contact and perfect car shielding, there could be many different disturbing noises while driving, which are described below and cannot be corrected.



730 65 139

FLUTTER

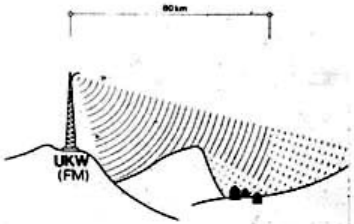
This noise will usually occur because of shade off. The direct station/radio connection will be interrupted by a natural or artificial obstacle. When driving down an avenue this is known as the "lattice effect".



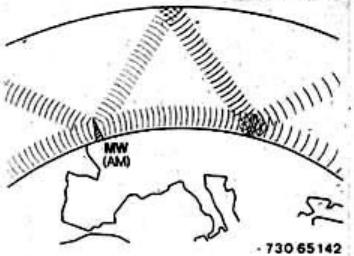
730 65 140

HISS, CRACKLE AND SPLASH

These noises will usually be caused by reflection. Reflections occur, when the same station signals are received in the car radio two or many times within a fraction of a second.
The quickly changing loudness is very disturbing. An optical comparision would be the "ghost" on the TV screen, which is also produced by reflections.



730 65 141



730 65 142

CONSTANT BACKGROUND NOISE

This disturbing noise will usually take place after leaving the reception area of a station or is indication of a wide-spread shade-off area.
The only remedy would be to tune in a stronger station.

FADING

This happens especially in the medium wave range (AM) and is usually accompanied by reception distortion.
The cause of this is a superimposition of ground and space waves at site of reception.

Weather factors, such as fog, rain or snow, could also have a negative effect on radio reception.

DIFFICULT RECEPTION CONDITIONS FOR STEREO RADIO SETS

Good quality reception with a stereo radio is only possible in areas with high field strength.
When the stereo indicator lamp comes on, this does not necessarily mean that a stereo station is being received, rather only that the station does broadcast stereo programs.
If the distance from the station is too great, the radio will switch to mono even though the stereo indicator lamp is still on. If there is fast switching between mono and stereo, the reception will be disturbed by background noise.
In this case the switch must be set to "mono".

CASSETTES

The cassette should conform with the special conditions in a car. Consequently only use cassettes C 60 = 2 x 30 minutes or C 90 = 2 x 45 minutes playback time.
The tape in cassettes C 120 = 2 x 60 minutes is naturally thinner, which could lead to problems.
When driving on rough roads the shaking could cause the tape to run up, which could delay and finally stop the tape movement.

NOTE

The use of SM cassettes will only prevent the tape from tangling (tape salad).
Store cassettes underneath the instrument panel as cool as possible. If temperatures are constantly + 40° C (105° F) or higher, the cassette housings could be distorted.
This would result in difficult winding of the tape and therefore constant ejection of the cassette.
A pushed in cassette must be ejected after turning off the radio, when operating the ejection button at end of a tape or when tape movement is disturbed.

NOTE

Mexico full stereo reverse cassettes should only be ejected when turning off the radio and when operating the ejection button.
Also when tape movement is disturbed.

TROUBELSHOOTING

Troubleshooting should always begin with an inspections of the antenna.

ROD ANTENNA / Antenna Length

The ideal antenna length for AM/FM reception is about 0.9 to 1.0 meters (35 to 39").
IMPORTANT:
The bottom telescope section must always be pulled out fully.

CHECKING ANTENNA

CONNECTION:
Tune in a medium wave station.
The connection of the antenna is okay, if when contacting the antenna rod the reception turns considerably quieter (at least difference in loudness).
GROUND CONNECTION:
The resistance measured between the antenna plug, ground terminal and body should be zero. If this value is not reached, the ground connection on the antenna base and/or upper holder is not correct.

CURRENT FLOW

The current flow resistance measured between the antenna plug peak and antenna rod should be zero ohms, and never above 3 ohms. To check for breaks, the antenna wire must be moved continuously while measuring the resistance.

IMPORTANT!
Not applicable to extension wire due to shortening capacitor.

INSULATION RESISTANCE
If the insulation resistance between the antenna plug peak and plug ground terminal is less than 1 M-ohm, the antenna or antenna wire has ground out and must be replaced.

SERVICING
Clean a pulled out antenna rod often with a dry cloth and then coat with an antenna grease*. This is especially important after long trips in rain.

* Source HWB

TROUBLESHOOTING

Condition	Possible Cause
Crackle and sizzle	Tune in a weak station just next to the station concerned. Accelerate engine to about 5,000 rpm, turn off ignition. Radio should still be receiving. If reception noise disappears when turning off ignition, ignition disturbance is concerned. CHECK: – Shielding of distributor cap. – Shielding ground wire connection. – Shielding capacitor 2.2 µF at ignition coil term. (15). IMPORTANT! Not for thyristor ignition. – Shielded filter in wire (1). – Perfect connection and resistance of ignition wires - plug caps/distributor cap/ignition coil. – Distributor rotor resistance*. – Hairline cracks in distributor cap/distributor rotor/plug caps/spark plugs/ignition coil neck. – Ground wire of engine/firewall) – Ground wire of engine hood/body) perfect contact – Ground connection of radio) – Engine hood closed correctly.
Crackle and knock	Accelerate engine until interference noise is considerably louder. Now turn on headlights and rear window defogger. If noise disappears or changes, regulator is defective.
Howl and/or whistle, depending on engine speed	Detach drive belts and run engine briefly. If this eliminates the interference, check capacitor at term. (+) on the alternator. If an electronic antenna is installed, install a 2.2 µF bypassing capacitor in the positive wire to the electronic antenna (at antenna height) as close as possible to the wire inlet of the antenna amplifier.
Sizzle and knock	This interference is only heard while driving and disappears when operating the brake pedal. Cause – electrostatic charge. Remedy – install wheel hub contacts on front axle.
Knock and crash	These noises are similar to those for ignition disturbances and are caused by a break in the antenna wire (usually occurs while driving).
Howl and crackle	This interference will disappear when switching off extra equipment, for example: Windshield wiper motor) Washer pump) remedy: install shielded filter 2 x 0.47 µF Extra fan)
Scale light not on, no reception	– Fuse oxidation – Fuse defective - type* – Power wire loose/not connected – Ground connection – Radio defective
Scale light on, no background noise with loudness control turned up fully; automatic station tuner malfunctions	– Speaker wire plug loose on radio – Break in speaker wires – Plugs on speaker balance control loose – Speakers defective – Dummy plug on tape socket loose or defective – Radio defective

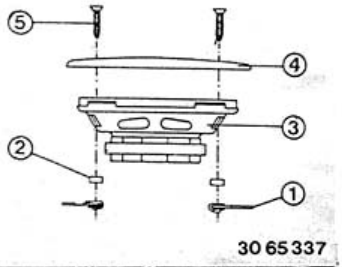
* See Specifications

TROUBLESHOOTING

Condition	Possible Cause
Background noise with loudness control turned up fully, but no reception	– Antenna plug not connected on radio – Break in antenna wire – Antenna not pulled out (failure of automatic antenna drive) – Antenna short circuit – Radio defective
Loud background noise while driving	– Antenna not pulled out fully – Antenna plug not connected on radio correctly – Check current flow in antenna wire – Antenna trimmer not adjusted – Regional reception area was changed – Station button or station set wrong – Radio defective – Switch stereo reception to "mono" – Station too weak, tune in stronger station – Radio set for reception of traffic reports only – Interference caused by electronic antenna – Check speaker connection
Reception cuts out while driving	– Break in power supply wire to radio – Fuse oxidized – Ground connection on radio not correct – Break in antenna wire – Loose antenna wire – Speaker wires loose – Break in speaker wires – Dummy plug in tape socket loose
USW reception, but no MW reception	– Break in antenna wire – Antenna trimmer not adjusted
Insufficient stations heard in MW range	– Antenna not pulled out far enough – Failure of automatic antenna drive – Antenna trimmer not adjusted – Antenna defective
USW reception cuts out while driving	– Station too weak (insufficient field strength) – Regional reception area was changed – Lower telescope section of rod antenna not pulled out fully – Wrong antenna length; ideal length: 0.9 to 1.0 meters (35 to 39") – Antenna defective
Stereo reception has background noise, cuts out sometimes, indicator lamp out	– Station tuned in is received too weak (insufficient field strength) – Weak reception area, in which stereo reception is not possible
No stereo reception	– Set mono/stereo switch to "stereo" – Mono/stereo switch defective
Reception of only several or no stations	– Wave range switch set for reception of traffic reports only

TROUBELSHOOTING

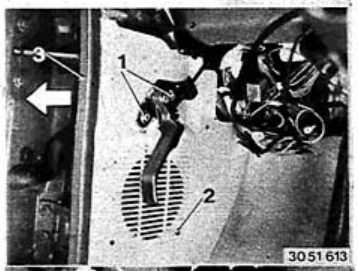
Condition	Possible Cause
Traffic report indicator cuts out or flickers	– Tuned in traffic report station reception too weak (insufficient field strength) – Weak reception area; reception not possible – Regional reception area was changed
Radio with automatic station tuner receives no or only several stations, but has normal reception from manual lever	– Sensitivity switch for automatic station tuner set to unsensitive – Antenna not pulled out completely – Lower telescope section of rod antenna not pulled out fully
Automatic station tuner runs through all wave ranges without stopping	– Start button for automatic station tuner stuck or maladjusted
Whistle spots throughout LW, MW and SW ranges	– Caused by electronic antenna
Stations from LW, MW and SW ranges heard in USW range	– This happens only close to broadcasting station and is caused by electronic antenna. – Range of other stations extended by weather conditions
Sound quality not satisfactory	– Foreign particles in speaker diaphragms – Speakers installed with tension. – When using more than one speaker per channel all speakers must be connected equally – Speaker balance control set to center position for stereo radio – Install other speakers for comparison – Only for cassette reception: Use Q-tips soaked in alcohol or a cleaning tape to clean the sound head, sound and pressure shafts
Cassette ejected while playing	– Cassette without SM – Tape of cassette winds too slowly – Cassette housing distorted – C-90 or C-120 cassette – tape is too thin due to long playing time



30 65 337

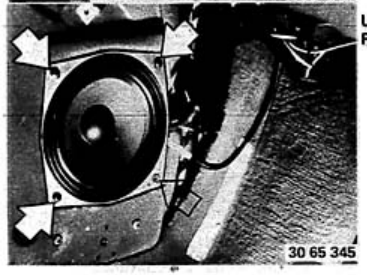
65.12 000 REMOVING AND INSTALLING OR REPLACING FRONT RADIO SPEAKERS

Unscrew screws.
Remove face plate and speaker.
Pull off plug.
Arrangement:
1 Door beam panel
2 Spacer
3 Speaker
4 Face plate
5 Screw



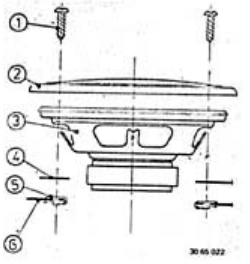
30 51 613

Models Since 9/85:
Unscrew screws (1) and take off lever.
Pull off edge guard (3) partially.
Unscrew screw (2) and remove trim panel.
Note:
Cement trim panel on carpet partially.



30 65 345

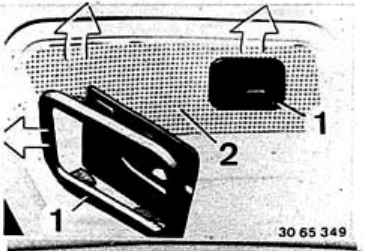
Unscrew screws.
Remove speaker and pull off plug.



30 65 022

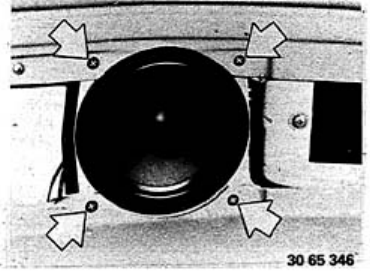
65 12 020 REMOVING AND INSTALLING OR REPLACING REAR RADIO SPEAKERS

Unscrew screws.
Remove face plate and speaker.
Pull off plug.
Arrangement:
1 Self-tapping screw
2 Face plate for speaker
3 Speaker
4 Washer
5 Self-tapping nut
6 Hatrack



30 65 349

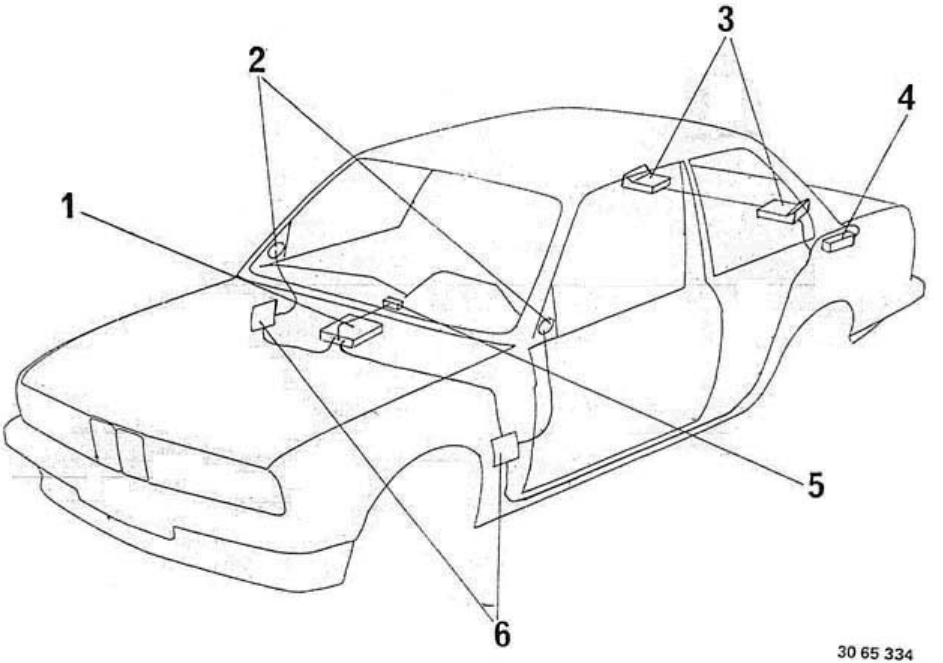
Convertibles:
Pull out grip plate (1) toward rear.
Pull off speaker trim (2) from above and remove.



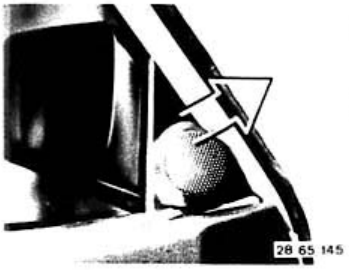
30 65 346

Unscrew screws and remove speaker.
Pull off plug.

SOUND SYSTEM SURVEY

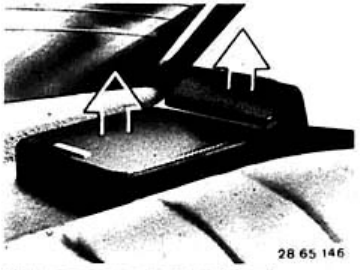


1 Radio
2 High tuner
3 Speakers – rear
4 Amplifier
5 Speaker balance control
6 Speakers – front



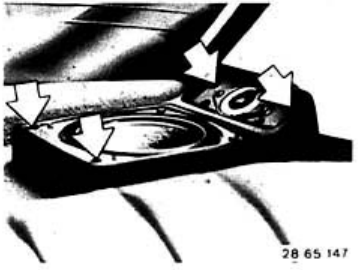
65 13 000 REMOVING AND INSTALLING OR REPLACING HIGH TONE RADIO SPEAKERS

Lift out trim panel with high tone speaker.
Disconnect plug.



65 13 020 REMOVING AND INSTALLING OR REPLACING REAR RADIO SPEAKERS (SOUND SYSTEM)

Lift out speaker face plate.

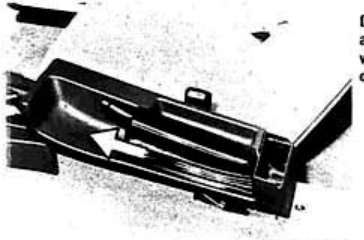


Unscrew screws and lift speaker.
Disconnect plug.

65 14 000 REMOVING AND INSTALLING OR REPLACING CASSETTE BOX

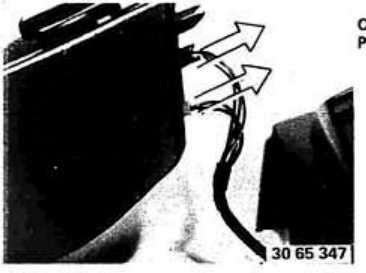
30 51 002

Lift out ashtray.
Unscrew nut.



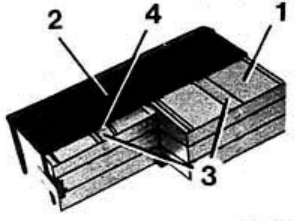
30 51 003

Disengage console at front by pulling back and pull it off of the parking brake lever, while pulling the ashtray light off of the console.



30 65 347

Cars with EH Transmission:
Pull off wire plug.

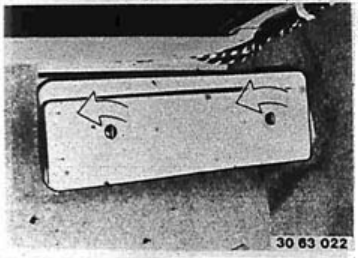


30 65 066

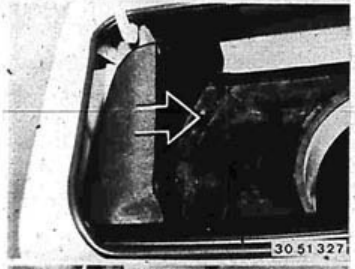
Pull cassette boxes (1) downward out of holding frame (2).
Installation:
Web (3) of cassette box must slide in opening (4) of holder.

65 21 101 REMOVING AND INSTALLING OR REPLACING (REAR) RETRACTABLE ANTENNA

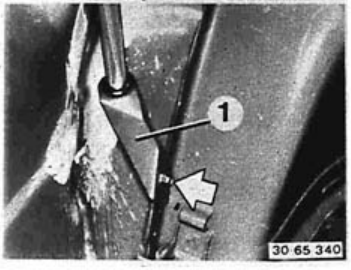
Remove car jack.



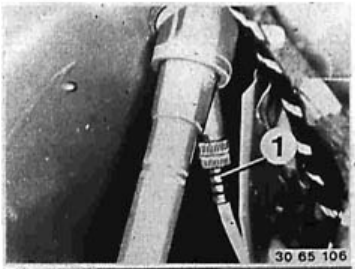
Turn holding screws of tail light cover 90° and take off cover.



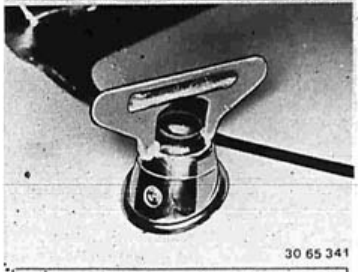
Pull out trim panel at top first and then remove it.



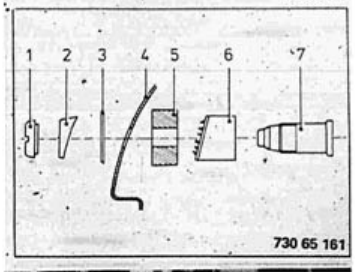
Unscrew screw on antenna holder (1).



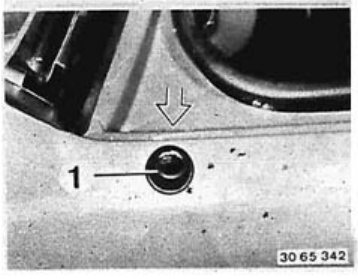
Disconnect antenna lead (1).



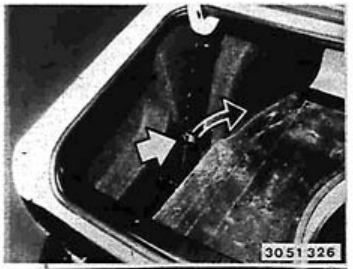
Bolted Antenna:
Unscrew nut with an antenna wrench and remove antenna from below.



Installation:
1 = Nut
2 = Adapter
3 = Seal
4 = Car's side panel
5 = Seal
6 = Brass ring
7 = Antenna

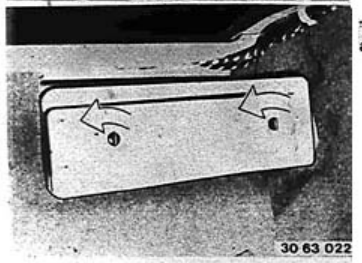


Plugged In Antenna:
Disconnect ground lead.
Pull out antenna from below.
Installation:
If guide (1) had been removed, use a lubricant for installation when necessary.

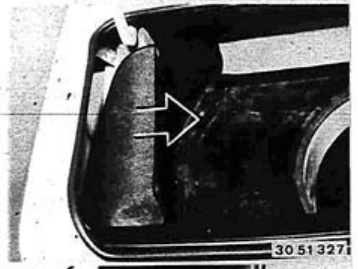


65 22 005 REMOVING AND INSTALLING OR REPLACING (REAR) AUTOMATIC ANTENNA

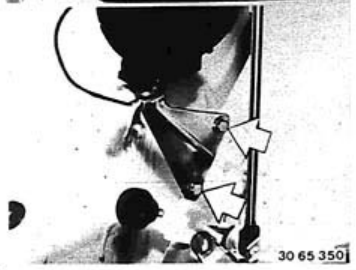
Remove car jack.



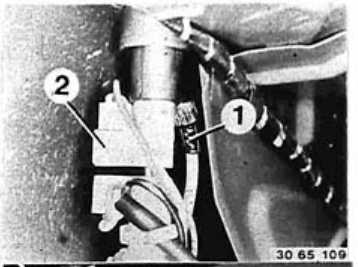
Turn holding screws of tail light cover 90° and take off cover.



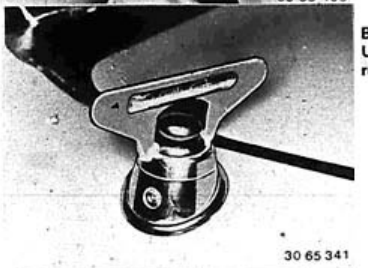
Pull out trim panel at top first and then remove it.



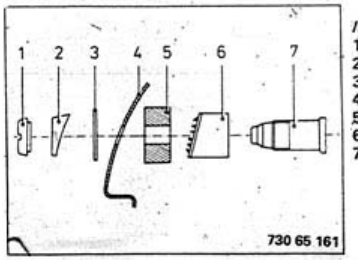
Unscrew screws on antenna holder.



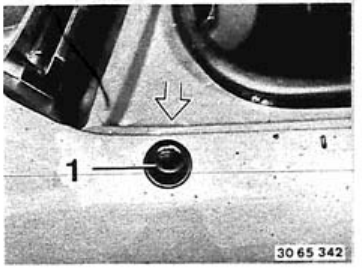
Disconnect antenna lead (1) and plug (2).
Disconnect antenna ground lead.



Bolted Antenna:
Unscrew nut with an antenna wrench and remove antenna from below.



Installation:
1 = Nut
2 = Adapter
3 = Seal
4 = Car's side panel
5 = Seal
6 = Brass ring
7 = Antenna



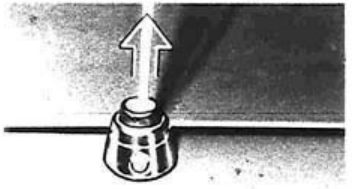
Plugged In Antenna:
Pull out antenna from below.
Installation:
If guide (1) had been removed, use a lubricant for installation when necessary.

65 22 040 REPLACING TELESCOPE FOR AUTOMATIC ANTENNA

The automatic antenna remains in the car when replacing telescope.
Telescope is replaced together with the plastic cable.

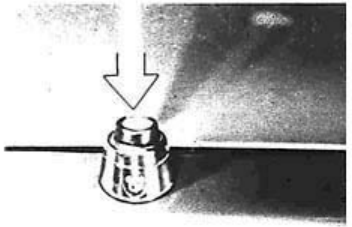
28 65 026

Turn on radio to run out telescope as far as possible.
Unscrew threaded sleeve.



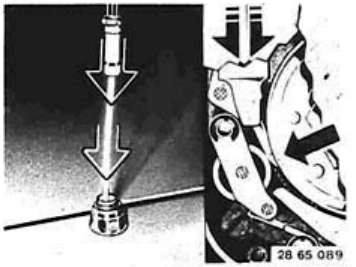
28 65 027

Remove telescope and plastic cable.
This requires firm pulling, especially if, for example, a bent telescope cannot be run out fully.



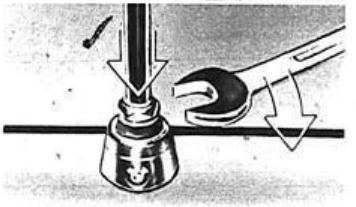
28 65 028

Slide straightened, pointed plastic end of new telescope into antenna adapter until resistance is felt on the contact roller.



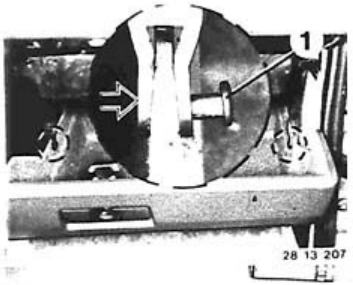
28 65 089

Turn off radio to run in the antenna.
Push in cable slightly until it is pulled in automatically by the drive.
Guide in plastic cable and telescope by hand at same time.



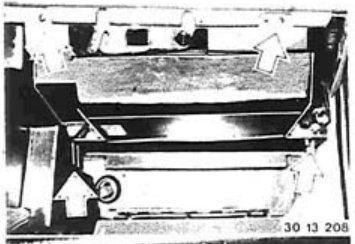
28 65 030

Screw in threaded sleeve tight and run telescope out and in several times.

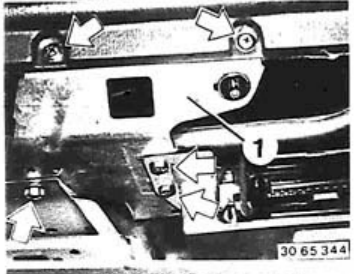


65 71 010 REMOVING AND INSTALLING OR REPLACING CONTROL UNIT FOR CRUISE CONTROL

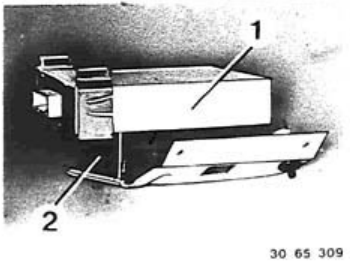
Open glove box and disconnect both straps by pulling out pins (1).



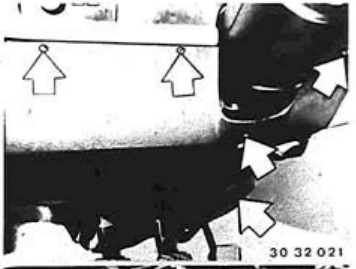
Unscrew screws and remove the cover.



Unscrew screws and remove holder (1).

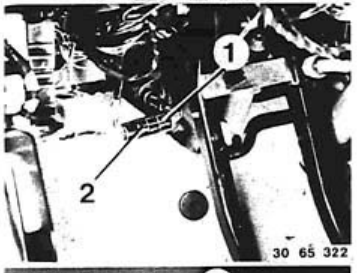


Pull off plug and pull control unit (1) out of holder (2).

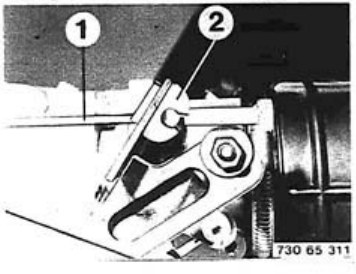


65 71 020 REMOVING AND INSTALLING OR REPLACING DRIVE FOR CRUISE CONTROL

Turn holding screws of instrument panel trim at bottom left 90° and remove the trim panel.

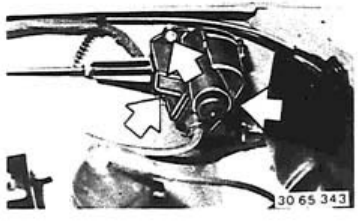


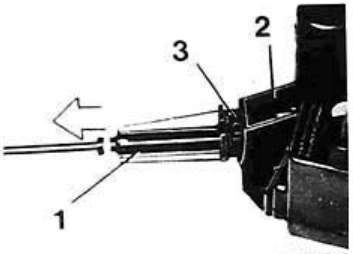
Pull off drive motor wire plug (1) from auxiliary wire harness (2) and pull out wire toward front.



Disconnect cable (1) with holder (2) on the throttle valve lever.

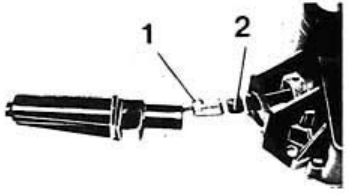
Unscrew screws and take off drive motor.





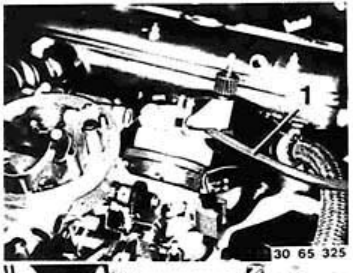
30 65 348

Press down spring retainer (3) and pull cable sleeve (1) out of drive motor (2).



Disconnect cable (1) in cable holder (2).

28 65 312

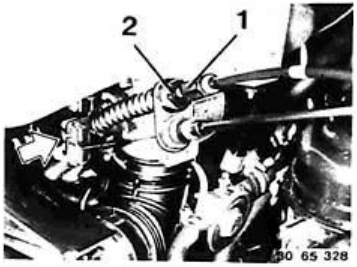


30 65 325

Installation – BMW 316:
Start engine.
Disconnect hose (1).
Stop engine.
Important!
The throttle valve lever must bear on the stop (throttle valve closed).

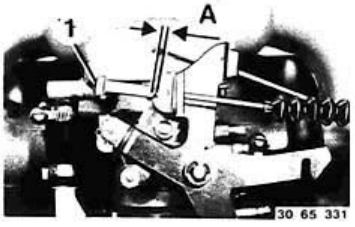
65 326

Check gap = 1.0 to 1.5 mm (0.039 to 0.059") between the nipple and nipple holder.
Adjust with screw (1) and nut (2) if necessary.



30 65 328

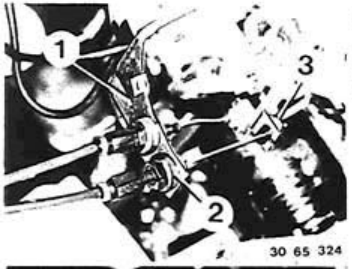
Installation – BMW 318 i:
Check gap = 1.0 to 1.5 mm (0.039 to 0.059") between the nipple and nipple holder with the throttle valve closed and the drive motor deactivated (motor in neutral).
Adjust with screw (1) and nut (2) if necessary.



30 65 331

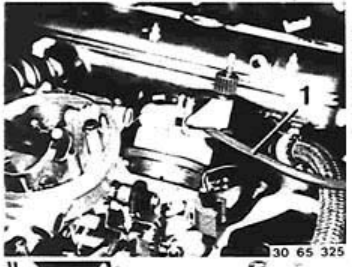
Installation – BMW 320 i ... 325 i and 324 d:
Check gap A = 1.0 to 1.5 mm (0.039 to 0.059") with the throttle valve closed and deactivated drive motor (motor in neutral).
Adjust with knurled nut (1) if necessary.

65 71 040 REMOVING AND INSTALLING OR REPLACING CABLE FOR CRUISE CONTROL

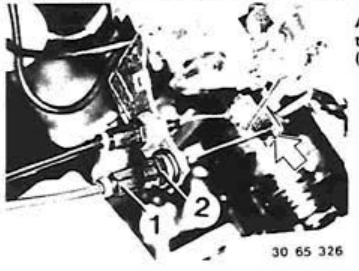


BMW 316:

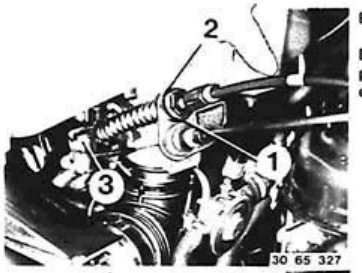
Disconnect cable with black nipple holder (3) and pull out of holder (1) together with the rubber grommet (2).



Installation:
Start engine.
Disconnect hose (1).
Stop engine.
Important!
The throttle valve lever must bear on the stop (throttle valve closed).

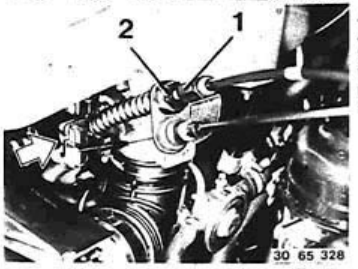


Adjust gap between nipple and nipple holder to 1.0 ... 1.5 mm (0.039 to 0.059") on screw (1) and nut (2).

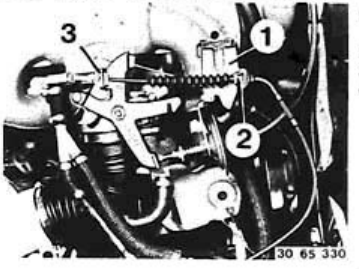


BMW 318 i:

Disconnect cable with nipple holder (3) and pull together with rubber grommet (2) out of holder (1).

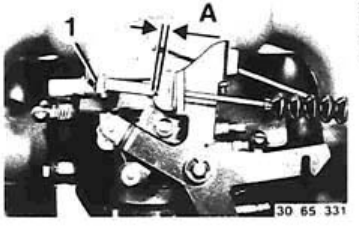


Installation:
Adjust gap between nipple and nipple holder to 1.0 ... 1.5 mm (0.039 to 0.059") with the throttle valve closed and deactivated drive motor (motor in neutral) on screw (1) and nut (2).

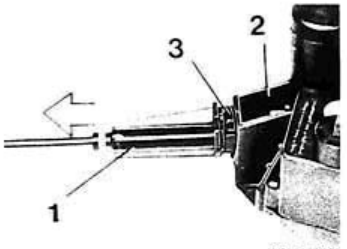


BMW 320 i ... 325 i and 324 d:

Disconnect cable with white nipple holder (3) and pull out of holder (1) together with clamp (2).

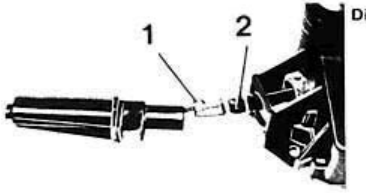


Installation:
Adjust gap A to 1.0 ... 1.5 mm (0.039 to 0.059") on knurled nut (1) with the throttle valve closed and deactivated drive motor (motor in neutral).



30 65 348

Press down spring retainer (3) and pull cable sleeve (1) out of drive motor (2).



28 65 312

Disconnect cable end (1) on cable holder (2).

TESTING PROCEDURES FOR ELECTRONIC CRUISE CONTROL

Test Requirement:
Battery charged – battery voltage okay. (U ≥ 11,5 V).
Specified multimeter functions (e.g. M 01) are in reference to the BMW SERVICE TEST. The following multimeter functions are required: 01/06/14. The following test procedures do not include sources of defect, which are outside of the electronic cruise control system.

Check fuse no. 6 and contact of fuse. Fuse and contact okay? — no → Replace fuse. Clean and bend fuse holder.

yes ↓

Check bulbs of stop lights and their contact. Bulbs and contact okay? — no → Replace light bulbs. Clean and bend contacts.

yes ↓

Check cable adjustment. Cable adjustment okay? — no → Adjust cable. Replace cable, see 65 71 040 in Repair Manual.

yes ↓

Check cable and strap of operating motor for damage and easy movement. Cable and strap okay? — no → Replace cable or operating motor.

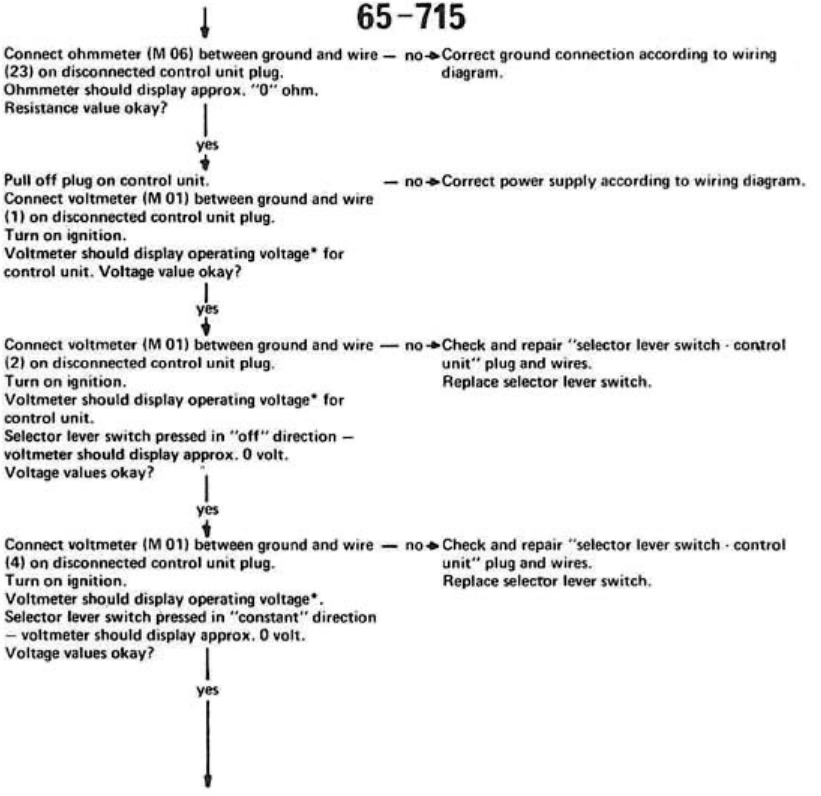
yes ↓

Check adjustment of brake and clutch pedal switch. Adjustment okay? — no → Adjust brake and clutch pedal switch. See group 35 of repair manual.

yes ↓

Check all plugs (see wiring diagram) and wires for tight fit and damage. Plugs and wires okay? — no → Repair or replace plugs and wires.

yes ↓



* See Specifications

Connect voltmeter (M 01) between ground and wire (5) on disconnected control unit plug.
Turn on ignition.
Voltmeter should display about 0 volt.
Press selector lever switch in "call" direction ⏚ voltmeter should display operating voltage*.
Voltage values okay?

— no → Check and repair "selector lever switch - control unit" plug and wires.
Replace selector lever switch.

yes ↓

Connect voltmeter (M 01) between ground and wire (9) on disconnected control unit plug.
Turn on ignition.
Voltmeter should display approx. 0 volt.
Voltage value okay?

— no → Replace brake pedal switch, see Group 35 in Repair Manual.

yes ↓

Connect voltmeter (M 01) between ground and wire (9) on disconnected control unit plug.
Turn on ignition.
Operate brake pedal.
Voltmeter should display operating voltage*.
Voltage value okay?

— no → Check stop light switch:
Pull off both plugs on stop light switch.
Connect ohmmeter (M 06) on stop light switch.
Operate brake pedal.
Ohmmeter should display approx. 0 ohm.

— no → Replace stop light switch.

yes ↓

Check clutch switch:
Pull off both plugs on clutch switch.
Connect ohmmeter (M 06) on clutch switch.
Ohmmeter should display approx. 0 ohm.
Operate clutch pedal.
Ohmmeter should display 0 ohm.
Values okay?

— no → Replace clutch switch.

yes ↓

Check wires, repairing if necessary.

* See Specifications

Connect frequency meter (M 14) on wires 23 and 6 on disconnected control unit plug. Lift car. Support driven axle close to wheels to avoid damaging drive shaft joints. Start engine. Accelerate briefly to about 60 km/h. Frequency meter should display frequency*. Value okay?

no → Check sender for speedometer, see Group 62 in Repair manual.

no → Check electric wires, repairing if necessary.

yes

Reconnect control unit plug. Following tests are carried out on 7-pin plug for "control unit – drive motor".
Connect voltmeter (M 01) on connection (4) and connection (3).
Switch on ignition.
Voltmeter should display voltage.
Voltage value okay?

no → Replace control unit.

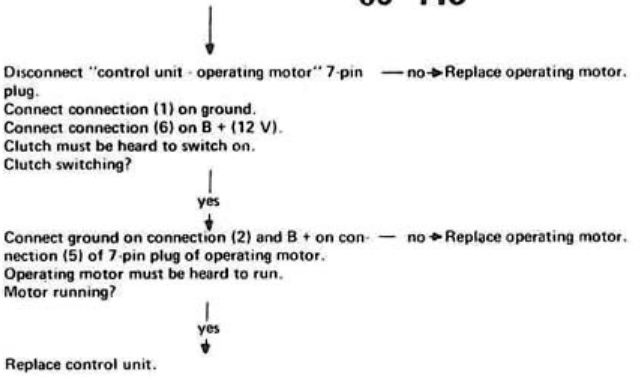
yes

Connect voltmeter (M 01) on connection (3) and connection (7).
Switch on ignition.
Voltmeter should display voltage.
Voltage value okay?

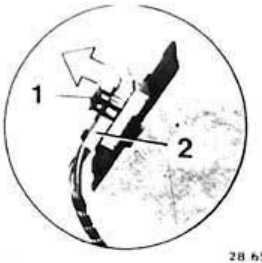
no → Replace drive motor.

yes

* See Specifications of Group 62.



Disconnect "control unit - operating motor" 7-pin plug.
no → Replace operating motor.
Connect connection (1) on ground.
Connect connection (6) on B + (12 V).
Clutch must be heard to switch on.
Clutch switching?
yes
Connect ground on connection (2) and B + on connection (5) of 7-pin plug of operating motor.
no → Replace operating motor.
Operating motor must be heard to run.
Motor running?
yes
Replace control unit.

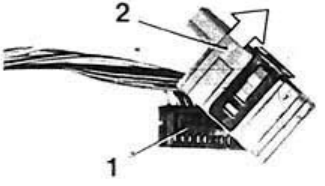


28 65 181

Important Information for 26 Pin Central Plug:
Pull back holding clip (1).
Pull off central plug (2).

28 65 182

Cut off wire strap (1).

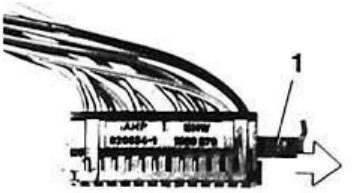


28 65 183

Pull plug cartridge (1) out of housing (2).

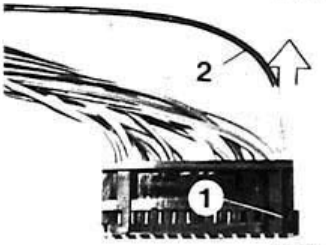
28 65 184

Testing on a disconnected central plug, e.g. for troubleshooting, can be performed with test clips on windows (1).



28 65 185

Pull out slide control (1)

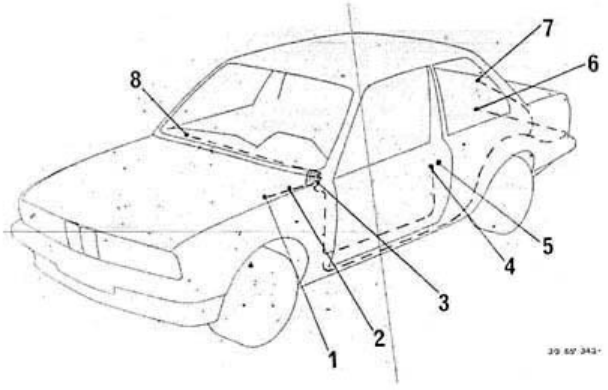


28 65 186

Push on pertinent wire window with a screw driver and pull wire (2) out of plug receptacle.

BURGLAR ALARM SURVEY

A. Burglar Alarm Layout



1 = Alarm horn
2 = Engine compartment contact
3 = Control unit
4 = Burglar alarm lock with light
5 = Switching unit - driver's door
6 = Indicator lamp
7 = Switching unit - trunk lid
8 = Connection on engine wire harness

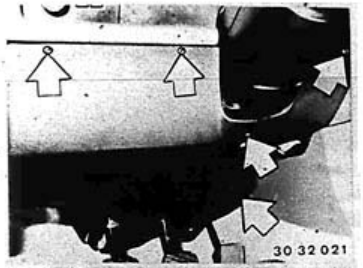
B. Components Monitored By Burglar Alarm

a) All doors
b) Engine hood
c) Trunk lid
d) Rear window defogger circuit
e) Ignition lock

C. Description

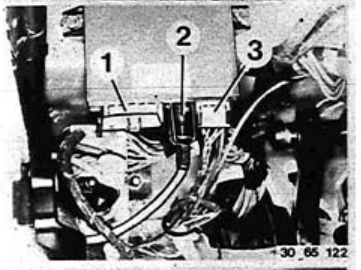
Operation / Burglar Alarm Initial State	Insert Coding Key	Unlock Door or Trunk Lid Lock	Unlocking, Locking or Operating Components Described in B
SYSTEM OFF	a) Light on approx. 15 seconds*, burglar alarm on. b) Light flashes approx. 15 seconds, burglar alarm on, but car not locked correctly: – Turn burglar alarm off and lock car.		
SYSTEM ON	Light on approx. 1.5 seconds, burglar alarm off.	Light flashes approx. 15 seconds – turn off burglar alarm before opening door or trunk lid.	Burglar alarm activates alarm – horn blown 30 seconds. Ignition is interrupted.

* Applicable for domestic version (FRG), otherwise light on 24 hours.

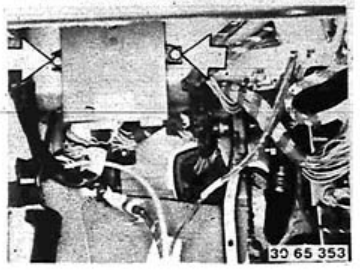


65 75 ... REMOVING AND INSTALLING OR REPLACING CONTROL UNIT FOR BURGLAR ALARM

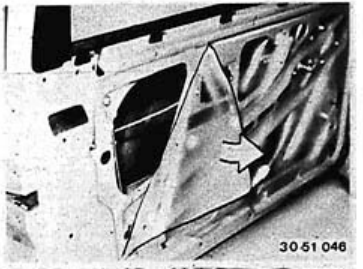
Turn holding screws of instrument panel trim at bottom left 90° and remove trim panel.



Disconnect plugs (1 ... 3).
Note:
First unlock plugs (1 and 2).

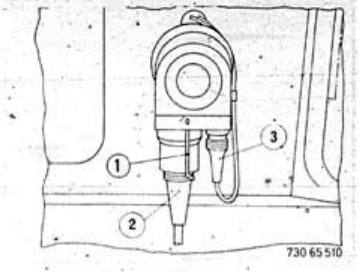


Unscrew screws and remove control unit.

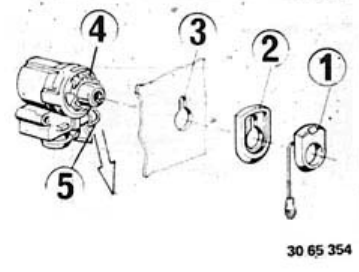


65 75 ... REMOVING AND INSTALLING OR REPLACING CODING LOCK FOR BURGLAR ALARM

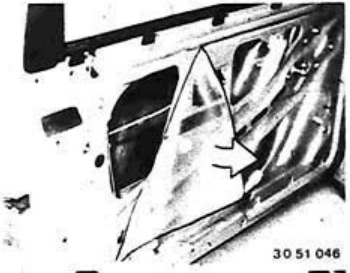
Remove door trim panel – see 51 41 001.
Pull off plastic sheet partially.
Installation:
Replace damaged plastic sheet.



Push back clamp (1).
Pull off plugs (2 and 3).

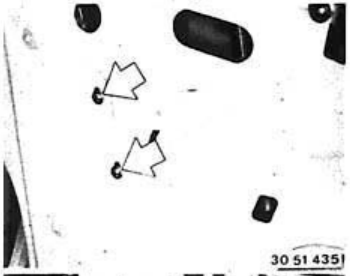


Pull off spring retainer (5) and remove coding lock (4).
Installation:
1. Place spring retainer in groove below the diaphragm spring on the coding lock and align that tab faces plug connection of the door wire harness.
2. Assemble plate (1) and liner (2), and insert in door panel (3).
3. Press coding lock against the plate until the spring retainer engages.

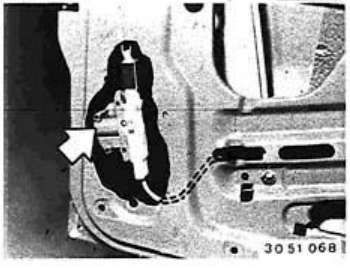


65 75 ... REMOVING AND INSTALLING OR REPLACING SWITCHING UNIT FOR DRIVER'S DOOR (BURGLAR ALARM)

Remove door trim panel – see 51 41 001.
Pull off plastic sheet partially.
Installation:
Replace damaged plastic sheet.



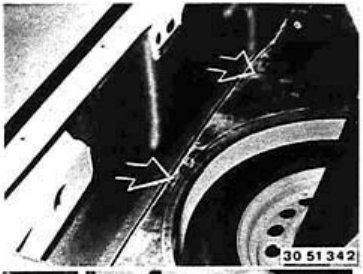
Unscrew screws.
Pull off plug.
Disengage switching unit.



Installation:
Check for correct installed position.

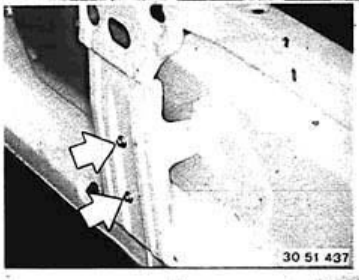
Two Door Cars:
Housing faces rear (see picture).

Four Door Cars:
Housing faces forward.

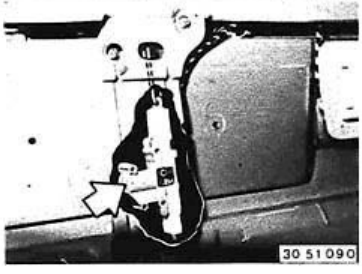


65 75 ... REMOVING AND INSTALLING OR REPLACING SWITCHING UNIT FOR TRUNK LID (BURGLAR ALARM)

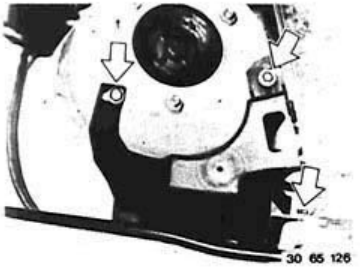
Fold back trunk mat.
Remove tail light carrier.
Lift rear wall trim panel at bottom slightly and pull out.



Unscrew screws.



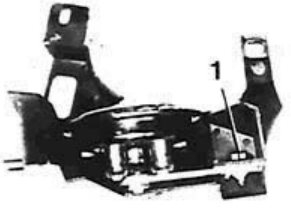
Pull off plug.
Disengage and remove switching unit.
Note:
Check installed direction.



30 65 126

65 75 . . . REMOVING AND INSTALLING OR REPLACING ALARM HORN FOR BURGLAR ALARM

Unscrew screws.
Take off holder and pull off plug.



30 65 124

Unscrew screw (1) and take out alarm horn.

TROUBLESHOOTING BURGLAR ALARM

Test Requirements:
Fuse no. 27 in power distributor okay.
Battery charged (voltage at least 11.5 V).
Tests made with BMW service tester or BMW digital tester II and universal adapter with 26-pin connecting lead.
If applicable to car, central locks and/or on-board computer okay.

Pull off all plugs on burglar alarm control unit and connect the universal adapter on leads.

Fault Description	Test No.
A. Burglar alarm not working at all Cars with central locks/unlocking arrest — continue with Cars without central locks — continue with	I I a I b
B. Burglar alarm can be turned "on", but lamp flashes	II
C. Burglar alarm can be turned "on" and "off", but no alarm	III
D. Burglar alarm can be turned "on" and "off", but no ignition alarm	IV
E. Indicator lamp not on, but burglar alarm not working	V

Note for Tests III and IV:

Plug A (4-pin flat male plug, 2 bevelled edges) is located right rear on the burglar alarm control unit.

I Is there resistance between pin 10 and car ground? — no → Check ground connection of burglar alarm control unit, repairing if necessary.

yes ↓

Check voltage between pin 6 and car ground. Battery voltage? — no → Check connection of term. 30 on burglar alarm control unit, repairing if necessary.

yes ↓

a) Central locks unlocked/unlocking arrest (if applicable) unlocked. Check voltage between pin 20 / 21 and car ground. 0 to 2 volts? — no → Check and repair central locks – see Group 51 in Repair Manual.

yes ↓

Central locks locked / unlocking arrest (if applicable) operated. Check voltage between pin 20 / 21 and car ground. 4 to 12 volts? — no → Check and repair central locks – see Group 51 in Repair Manual.

yes ↓

Burglar alarm control unit or burglar alarm lock defective.

b) Driver's door and trunk lid unlocked.
Resistance between pin 21 and car ground? — yes → Replace switching units for driver's door and trunk lid.

no

Pull off plug on trunk lid switching unit.
Resistance between pins 3 and 5 on trunk lid switching unit? — yes → Replace trunk lid switching unit.

no

Resistance between pin 21 and car ground with trunk lid plug pulled off? — yes → Replace switching unit for driver's door.

no

Burglar alarm control unit or burglar alarm lock defective.

11 Resistance between pin 12 and car ground (with engine hood closed)? — no → Engine hood switch defective.

yes ↓

Resistance between pin 13 and car ground (with trunk lid closed)? — no → Trunk lid switch defective.

yes ↓

Resistance between pin 26 and car ground (with all doors closed)? — no → Remove and check door contacts separately.

yes ↓

Resistance between pin 19 and car ground (with rear window defogger switched off) < 10 ohms? — no → Check rear window defogger circuit – see Group 61 in Repair Manual.

yes ↓

Burglar alarm control unit or burglar alarm lock defective.

III Connect connection A 1 with connection A 2 on plug A. Alarm horn sounding? — no → Alarm horn defective.

yes ↓

Burglar alarm control unit defective.

IV Ignition turned on. Voltage (battery voltage) between connection A 3 and car ground? — no → Check wires.

yes ↓

Burglar alarm control unit defective.

V To check the indicator lamp (rear) connect pin 25 with car ground and pin 23 via ballast resistor (500 - 1000 ohms) with battery + (term. 30).

To check the indicator lamp (driver's door) pull off plug on coding lock; connect left side (II) of plug on car ground and right side (I) via ballast resistor (500 - 1000 ohms) on battery + (term. 30).

II I

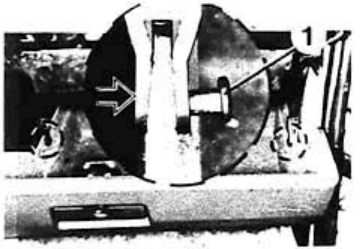
(term. 31) – + (term. 30 via ballast resistor)

Wire	Wire
brown	brown/red

Note for Replacement of Burglar Alarm Control Unit or Burglar Alarm Lock:
Both parts should be available for repairs, since it is not always possible to determine whether the burglar alarm control unit or burglar alarm lock is defective.
Always replace the burglar alarm lock first to avoid destruction of a new burglar alarm control unit with a defective burglar alarm lock.

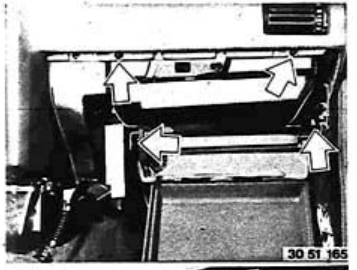
65 81 020 REMOVING AND INSTALLING OR REPLACING CONTROL PANEL FOR ON-BOARD COMPUTER

Important!
The coding has to be checked when replacing the control panel (see testing instructions).



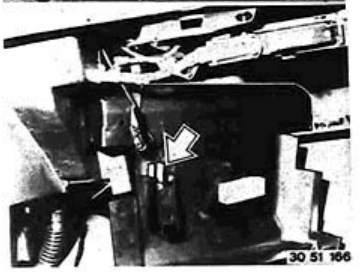
30 51 182

Open glove box.
Pull out pin (1) of both retaining straps.



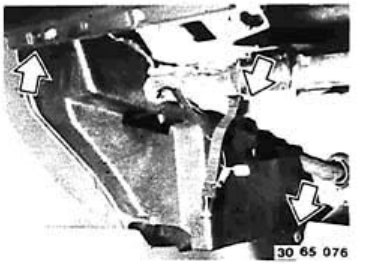
30 51 165

Unscrew screws and pull down cover.



30 51 166

Pull off wire plug and remove cover.

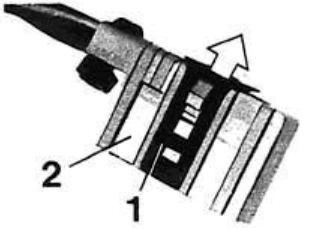


30 65 076

Unscrew screws and take off cover.

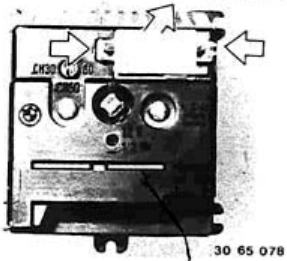
30 65 077

Unscrew screws and remove on-board computer.



733 62 019

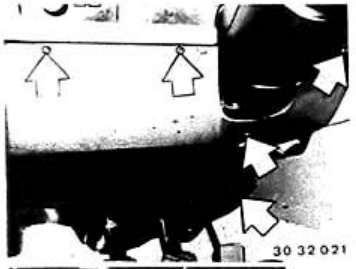
Pull out slide (1) and pull off plug (2).



30 65 078

Replacing Coding Plug*:
Compress retainers and pull out coding plug.

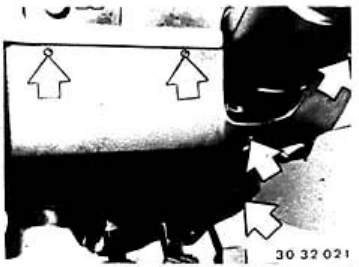
* See Specifications



65 81 045 REMOVING AND INSTALLING OR REPLACING RELAY FOR ON-BOARD COMPUTER II

Turn holding screws of instrument panel trim at bottom left 90° and remove trim panel.

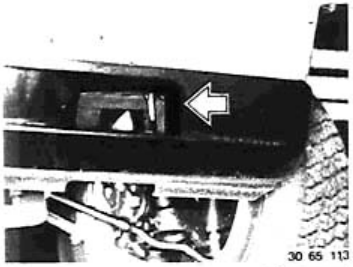
Pull off plug.
Unscrew screws.



65 81 050 REMOVING AND INSTALLING OR REPLACING GONG FOR ON-BOARD COMPUTER

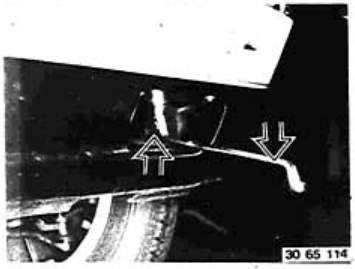
Turn holding screws of instrument panel trim at bottom left 90° and remove trim panel.

Disconnect plug.
Pull gong out of clamp.

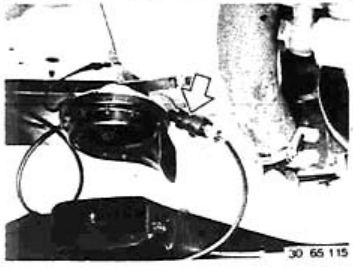


65 81 060 REMOVING AND INSTALLING AIR TEMPERATURE SENSOR

a) Before 9/85:
The air temperature sensor is located in the air inlet opening of the front spoiler.

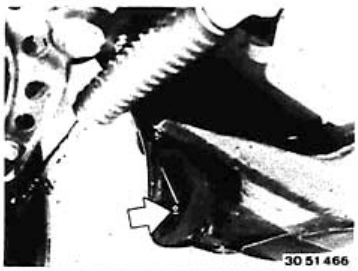


Press out temperature sensor with a bent 8 mm ring wrench.

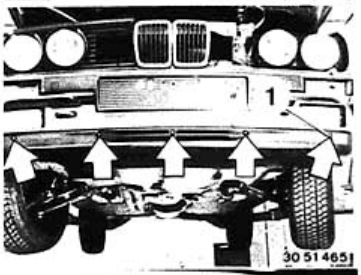


Pull plug out of holder and disconnect it.
(The lower trim panel has been removed for better illustration, but this is not necessary to remove the temperature sensor.)

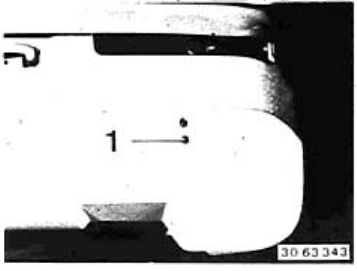
Checking:
Check temperature sensor by measuring the resistance*



b) Since 9/85:
Unscrew screws of front spoiler in front wheel house on left and right sides.



Unscrew screws.
Take off spoiler.
Disconnect plug on temperature sensor (1).
Pull out temperature sensor.



Note:
Temperature sensor (1) is located approx. 2 cm (3/4") below the left mounting screw.

* See Specifications

65-813

TESTING INSTRUCTIONS FOR SECOND GENERATION ON-BOARD COMPUTER – SERIES '3'

These testing instructions are given in logical order, but separate test steps may also be used. The specified pins (numbers) are mandatory – danger of short circuit!

- Testing requirements: On-board computer II calling and storing according to chapter 2 in Owner's Manual.
- Testing equipment required: Universal adapter* with connecting lead as well as BMW service test unit (multimeter tests).
- Data stored in on-board computer II (BC II) is cancelled by connecting the test adapter between BC II wire harness plug and BC II.
- Functions in ignition lock positions: 0 No indicator panel background lighting; no operation of buttons possible.
  R Indicator panel illuminated; operation possible; code function ready
  15 Same as R, however also distance/time/consumption functions; coding function blocked
  50 Same as 15, but only here and 6 seconds after taking away term. 50 signal may the starting interlock function

* Universal adapter, HWB No. 81 12 9 425 091
Conn. lead wire harness 26-pin 096
Conn. lead control unit 26-pin 097

Note: The type of coding plug* can be called in ignition lock position 15 by pressing buttons 1 and 100 at same time. If calling is not possible, check power supply between pin 10 (= B –) and pin 7 (= term. 15).

Malfunction When Operating	Possible Defect	Test / Nominal Values	Not Conforming with Nominal Values Sources of Defect / Instructions
1. PPPP appears in indicator panel	– In rear coding plug*	Coding test	– Replace coding plug, disconnect power supply, reconnect, perform coding test.
	– On its plug contacts		
	– Or on BC II		– Replace BC II. Check coding and compare reserve quantity after replacing BC II. If tank volume does not correspond with reserve range, pull fuel level transmitter out of tank far enough that float is on bottom stop. Remove anti-tamper lock on BC II (to the left of button 1000). Ignition lock in 15. Adjust displayed liter value* with a screwdriver then while pressing buttons 1 and 1000 at same time. Reinstall anti-tamper lock.
Note: The driving range display could be changed after calling the tank volume.			
2. AAAA appears in indicator panel	Internal BC II defect		Replace BC II, also refer to point 1.
3. No display	Power supply missing	Between pin 10 (= B –) and pin 6 (= B +) Nominal value: U ≧ 10 V	Wires to/from instrument cluster, plug connections
4. Weak clock display, but no other operations possible in ignition lock pos. R	– Voltage missing on term. R	Between pin 10 (= B –) and pin 5 (= term. R) Nominal value: U ≧ 10 V	– Wires to/from instrument cluster, plug connections
	– BC II defective (e.g. buttons)		– Replace BC II (see point 1).

* See Specifications

Malfunction When Operating	Possible Defect	Test / Nominal Values	Not Conforming with Nominal Values Sources of Defect / Instructions
5. Ignition lock from pos. R Indicator panel background/ button lighting (with light on) without function	– Term. 31g, term. R, term. 58 power supply missing – Bulbs in BC II defective	– Between pin 10 (= term. 31) and pin 5 (= term. R) Nominal value: ≙ 10 V (button panel lighting only works with lights switched on) – Between pin 9 (= term. 31g) and pin 8 (= term. 58k): Nominal value: U ≙ U battery, depending on switch position	– Wiring – Replace light bulbs; depending on type of defect either pull out light slide with a small pliers (check stamped voltage value for external testing) or lamp for button lighting (12 V, 1.2 W)
6. None or wrong SPEED display	– Wrong coding plug* in BC II Speedometer signal missing – Defect on input signal – BC II defective	– see point 1 – Simulate speedometer signal on wire plug connection with BMW service test unit – Turn ignition on (don't run engine) with simulation of 256 Hz; press SPEED and SET-RES buttons on BC II; see display value in coding plug table*	– Trace signal up to BC II – Replace BC II (also refer to point 1)
7. None or wrong CONSUMPTION display	– Wrong coding plug* in BC II Defect on input signal – BC II defective	– see point 1 – With engine running there must be a consumption signal on pin 17 and pin 10 (= B –)	– Check signal from L-Jetronic control unit pin 16 or wire 11 of 2BE control unit with BMW service test unit. Scope test or BMW digital tester 2: ⎍ ms test, possibly compare with signal of cyl. 1 or 2 – Replace BC II (also refer to point 1)

* See Specifications

Malfunction When Operating	Possible Defect	Test / Nominal Values	Not Conforming with Nominal Values Sources of Defect / Instructions
8. TEMPERATURE display Considerable display difference between R and 15 – displays – 30° C	– Fuel level transmitter or its line		– Fuel level transmitter/connections – Wire short circuit – Wire break
	– Temperature sensor or its wires	– Measure resistance* between pin 16 and pin 10 (= B –) (BCII not connected) and compare with actual temp..	– Wires – Temperature sensor
Wrong TEMP function	– Temp. sensor not as specified	– See Specifications* for values	– Replace temperature sensor
	– BC II defective		– Replace BC II (see point 1)
9. No GONG	– Defect on gong signal transmitter/ wires	Turn ignition switch to R or 15, connect pin 10 and pin 2; there should be gong	No gonging: – Defect in wires to gong – Defect in gong (check gong externally) Gonging:
	– BC II defective		– Replace BC II (see point 1)
10. No activation of parked car heating *Note:* Parked car heating will soon be available for E 30.	– Parked car heating relay defective/ wires	Connect pin 14 with pin 6 (= B +): relay should switch	Nominal value not reached. Measure resistance between pin 14 and pin 10 (BC II not connected) (ignition switch at 0), nominal value between 80 and 120 (see wiring diagram of enclosure 3) – Relay defective – Wires defective
	– BC II defective		– Replace BC II (see point 1)
11. No activation of horn relay	– Relay box for horn activation defective/wires	Connect pin 1 and pin 10 (= B –) Horn relay must switch and horn must be operated.	Defect in relay box, wires, horn – its function is okay.
	– BC II defective		– Replace BC II (see point 1)

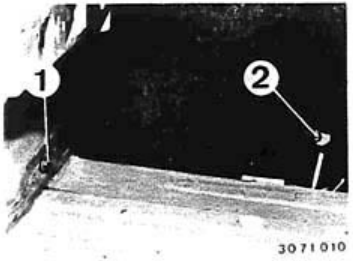
* See Specifications

Malfunction When Operating	Possible Defect	Test / Nominal Values	Not Conforming with Nominal Values Sources of Defect / Instructions
12. No activation of starter interlock activation	– Defect in relay box, starter interlock activation – Wires	Connect pin 11 with pin 10 (= B –) and turn ignition switch to R or 15: relay in relay box must switch	See defect notes of point 10, but between pin 6 and pin 11.
	– BC II defective		Replace BC II (see point 1)
13. No function of remote control	– Steering column switch defective – Wires	Ignition switch turned to R or 15 Connect pin 10 (= B –) with pin 4 several times briefly: displayed information must change each time	Nominal values not reached: – Defect in steering column switch (check without BC II) – Wires
	– BC II defective		– Replace BC II (see point 1)
14. Driving range malfunctions	– Coding plug – Reserve quantity – Speedometer signal – Consumption signal – Fuel level transmitter/reserve contact	– see point 1 – see point 6 – see point 7 – Fuel display in instrument cluster correct	 – Connection between instrument cluster and BC II – Supply wire to instrument cluster

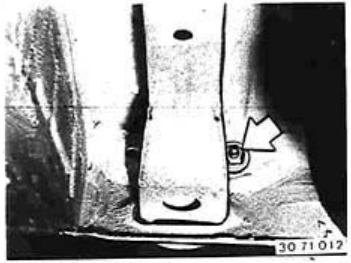
71 Equipment and Accessories for Engine and Chassis

71 60 010 Trailer hitch complete with electrical system – install 71- 1

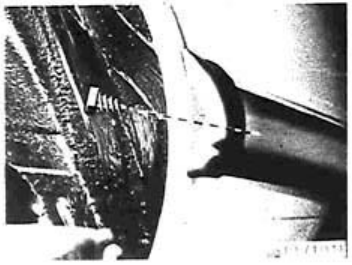
71 60 010 INSTALLING TRAILER HITCH COMPLETE WITH ELECTRICAL CONNECTIONS



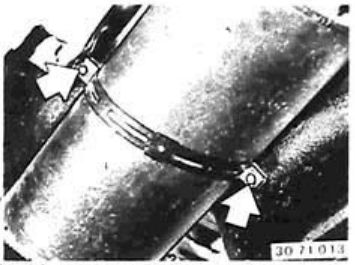
Remove trunk mat and, if applicable, trim on tail panel.
Unscrew nut (1) and bolt (2) on left and right sides.



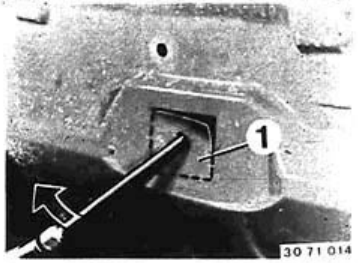
Unscrew nuts on left and right sides.



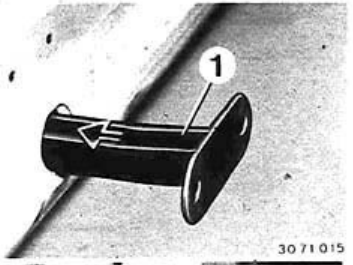
Unscrew bolts on left and right sides.
Remove bumper.
Remove left and right bumper brackets.
(Brackets are omitted – bumper is mounted on trailer hitch.)



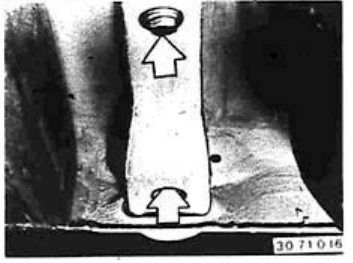
Unscrew nuts.
Lower final muffler approx. 10 cm (4") and suspend it from body with a piece of wire.



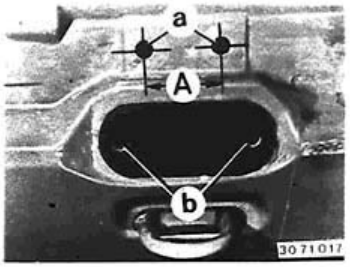
Knock out pre-punched openings (1) on left and right sides.
Coat opening edges with zinc dust paint.



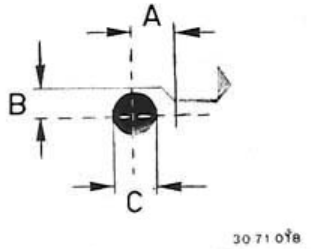
Push supports (1) into side members on left and right sides.
Note:
If necessary, recut M 10 tapped bores.



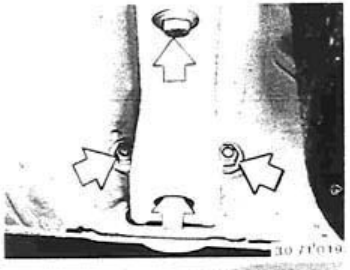
Bolt supports (1) on body hand tight.
Four each M 10 x 20 hexagon head bolts
Four each 10.5 x 30 x 3 washers
Important!
Remove undercoating on bearing surfaces for washers and coat blank metal surfaces with zinc dust paint.



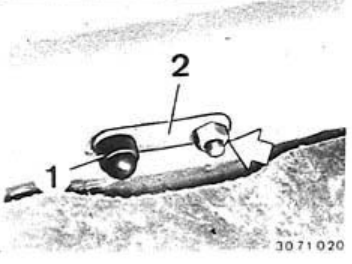
Open up holes (a).
Drill 5 mm (0.197") diameter holes (b).
Dia. = 10.5 mm (0.413").
A = 52 mm (2.047").
Deburr and coat edges of holes with zinc dust paint.



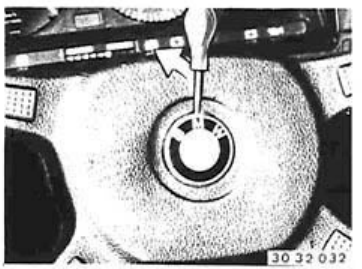
Mark location of hole for electric wires, center punch and drill hole (initial and final drilling).
A = 24 mm (0.945")
B = 20 mm (0.787")
C = 36 mm (1.417") dia.
Deburr and coat edges of hole with zinc dust paint.
Remove burrs from trunk.



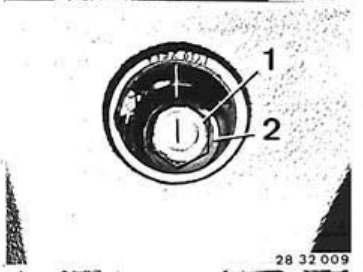
Mount trailer hitch.
Four each M 10 hexagon nuts.
Four each 10.5 x 30 x 3 washers
Tighten nuts and bolts to torque of 43 to 48 Nm (31 to 35 ft. lbs.).
Bolt final muffler.



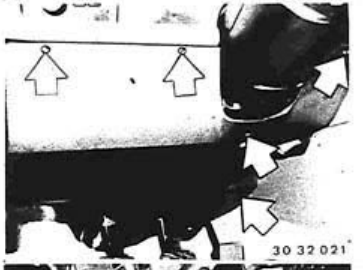
Install reinforcement plate (2).
Tighten nuts to torque of 43 to 48 Nm (31 to 35 ft. lbs.) and install caps (1).
Four each M 10 nuts
2 reinforcement plates
4 caps
Note:
Seal hole (a).



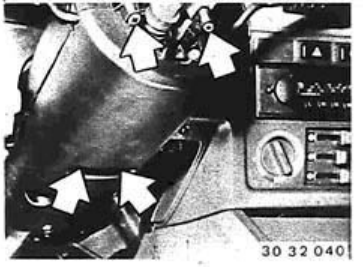
Disconnect battery ground lead.
Remove BMW emblem.



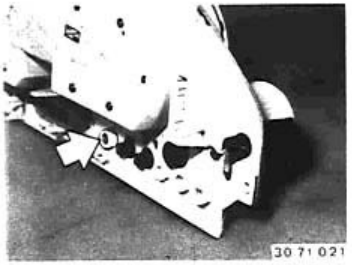
Mark position of steering wheel to steering spindle.
Unscrew nut (1) and remove with washer (2).
Important!
Steering wheel can only be pulled off after unlocking the steering lock.
Installation:
Replace self-locking nut.
Nut tightening torque: 73 to 85 Nm (53 to 61 ft. lbs.).



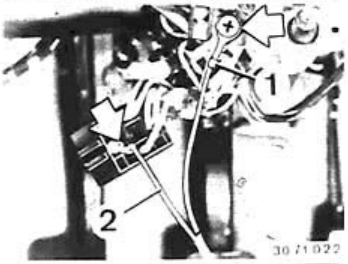
Remove instrument panel trim.



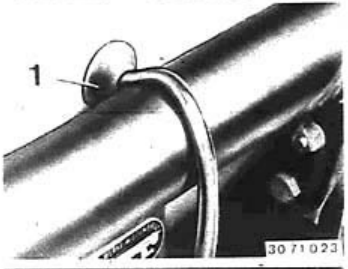
Remove steering column casing lower section.



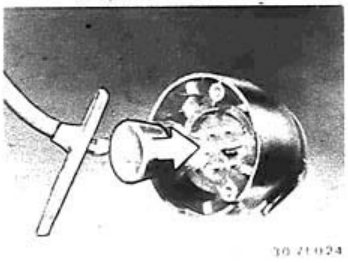
Insert light bulb in socket of extra wire.
Insert socket in turn signal indicator lamp holder on instrument carrier.
(Instrument carrier was removed for better photography.)
Route extra wire to steering column.



Bolt on ground wire (1) (brown).
Pull off plug receptacle on flasher relay and plug wire (2) in jack no. 4 of plug receptacle.
Replace flasher relay – connect plugs.

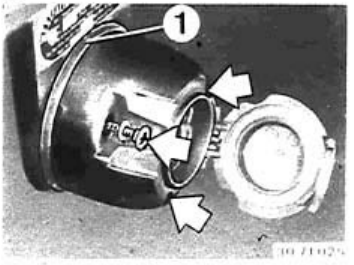


Run extra wire through hole and insert rubber grommet (1).

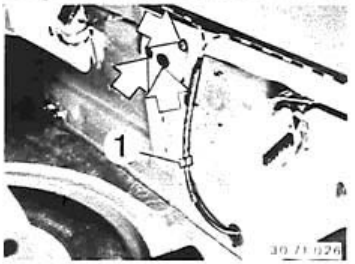


Connect central electric plug.
Plug Connections:

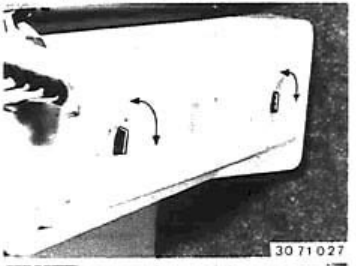
	Wire Color	Terminal No.
Turn signal, left	blue/red	1/L
Tail fog light	gray/violet	2/54G
Ground	brown	3/31
Turn signal, right	blue/black	4/R
Tail light, right and license plate light	gray/white	5/58R
Stop light	green/red	6/54
Tail light, left	gray/yellow	7/58L



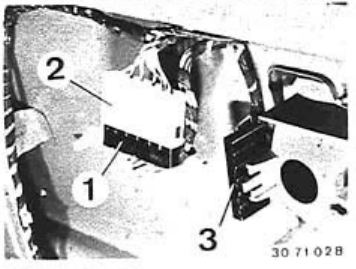
Install rubber seal (1) on socket.
Bolt socket on holder.
If necessary, recut tapped bores.



Remove trunk lid lock.
Install clamp (1) and route extra wire along standard wire harness to tail lights.
Install trunk lid lock.

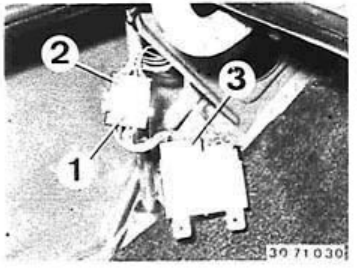


Remove bulb holders on left and right sides.



Press female plug (1) out of holder and connect with multiple-pin plug (2) of extra wire.
Insert female plug (3) of extra wire in holder of tail light housing.
Install bulb holder.

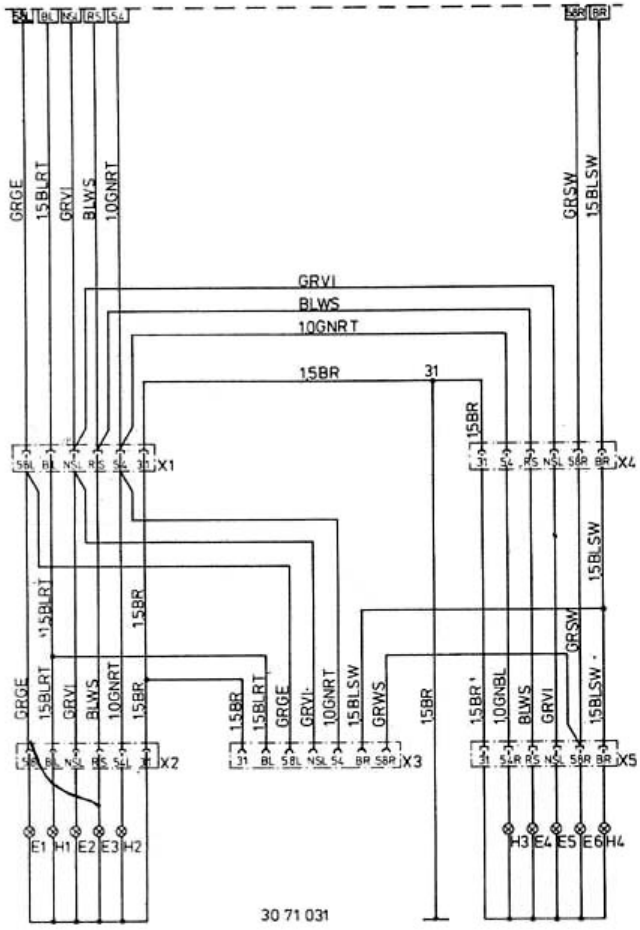
Extra for Cars with Check Control:
Pull off left wheel house trim partially.
Route extra wires along standard wire harness.
Remove control unit.

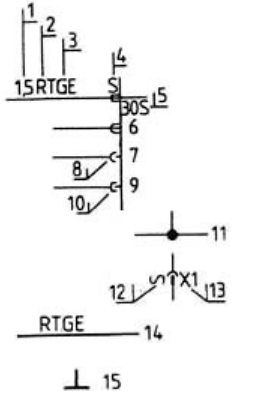


Pull off multiple-pin plug (1) on control unit and connect with female plug (2) of extra wire.
Connect multiple-pin plug (3) of extra wire on control unit.
Install control unit.

Checking Operation:
Connect battery ground lead.
Make sure connections of corresponding plug match connections of socket.
Check function of trailer lights and turn signals when hitching a trailer.
Extra indicator lamp flashes only when trailer is hitched.
Install all removed parts.
Install drawbar load label.
Important!
Install a 15 ampere fuse in place of 7.5 amp fuse in fuse position no. 6, if car has extra stop lights.

CURRENT FLOW DIAGRAM WITHOUT CHECK CONTROL





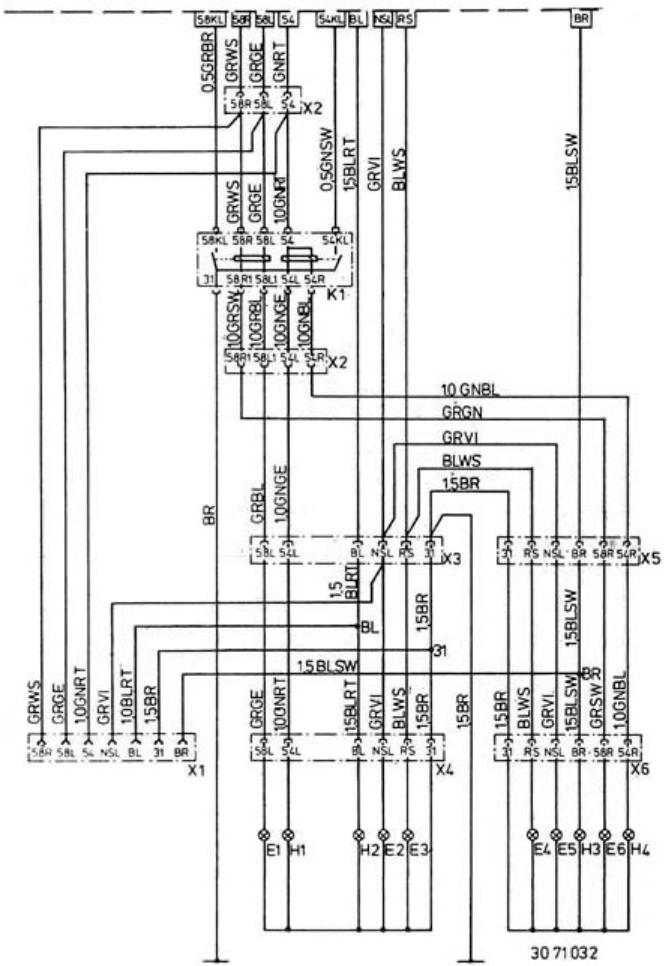
Explanation of Current Flow Diagram Codes:

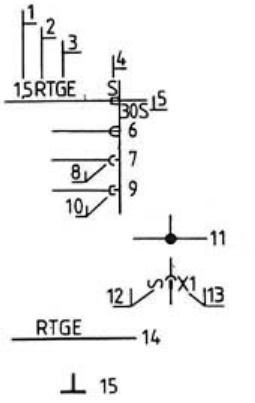
1	Wire cross section size in mm²
2	Wire basic color
3	Wire spiral color
4	Chamber number
5	Terminal designation
6	Wire connector
7	Round male plug
8	Round female plug
9	Flat male plug
10	Flat female plug
11	Soldered point or connector
12	Chamber number
13	Plug connection designation
14	Wires without size data always 0.75 mm²
15	Ground
E1	Tail light left
E2	Tail fog light left
E3	Backup light left
E4	Backup light right
E5	Tail fog light right
E6	Tail light right
H1	Turn signal left rear
H2	Stop light left
H3	Stop light right
H4	Turn signal right rear
X1	Plug, main wire harness left – trailer hitch wire
X2	Connection for left tail lights
X3	Trailer socket
X4	Plug, main wire harness right – trailer hitch wire
X5	Connection for right tail lights
54	Current flow continuation (see car current flow diagram)

Wire Color Codes:

BL	blue
BR	brown
GE	yellow
GN	green
GR	gray
RT	red
SW	black
VI	violet
WS	white
TR	transparent

CURRENT FLOW DIAGRAM WITH CHECK CONTROL





Explanation of Current Flow Diagram Codes:

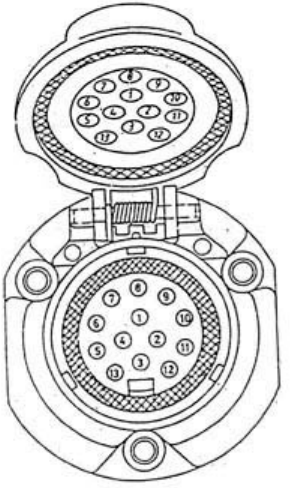
1	Wire cross section size in mm²
2	Wire basic color
3	Wire spiral color
4	Chamber number
5	Terminal designation
6	Wire connector
7	Round male plug
8	Round female plug
9	Flat male plug
10	Flat female plug
11	Soldered point or connector
12	Chamber number
13	Plug connection designation
14	Wires without size data always 0.75 mm²
15	Ground
E1	Tail light left
E2	Tail fog light left
E3	Backup light left
E4	Backup light right
E5	Tail fog light right
E6	Tail light right
H1	Stop light left
H2	Turn signal left
H3	Turn signal right
H4	Stop light right
X1	Trailer socket
X2	Plug, main wire harness (bulb tester) – trailer hitch wire (8-pin)
X3	Plug, main wire harness (left tail light) – trailer hitch wire
X4	Left tail light connection
X5	Plug, main wire harness (right tail light) – trailer hitch wire
X6	Right tail light connection
54	Current flow continuation (see car current flow diagram)

Wire Color Codes:

BL	blue
BR	brown
GE	yellow
GN	green
GR	gray
RT	red
SW	black
VI	violet
WS	white
TR	transparent

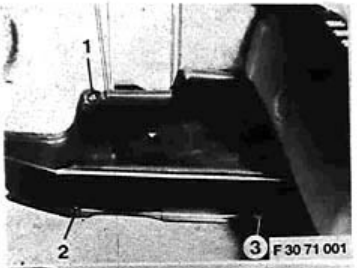
CONNECTIONS OF 13-PIN PLUG

13 Pin Plug	Description	7 Pin Plug
Pin 1	Turn signal indicator, left	Pin 1/L
Pin 2	Rear fog lights	Pin 2/54g
Pin 3*	Ground for circuit contacts 1 through 8	Pin 3/31
Pin 4	Turn signal indicator, right	Pin 4/R
Pin 5	Right tail lights, outline light, side marker and license plate lights	Pin 5/58 R
Pin 6	Stop lights	Pin 6/54
Pin 7	Left tail lights, outline light, side marker and license plate lights	Pin 7/58 L
Pin 8	Backup lights and/or backup device for running-up brake	
Pin 9	Power supply (permanent positive)	
Pin 10	Positive charging lead for battery in trailer	
Pin 11	Not used	
Pin 12	Not used	
Pin 13*	Ground for circuits contacts 9 through 12	

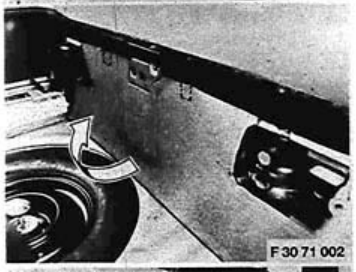


32 71031

* Both ground leads must not be connected with electric conductance on the trailer end.



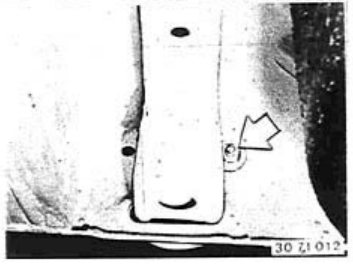
Since 1988 Models:
Disconnect battery ground lead.
Remove trun floor mat.
BMW 324 d, 324 td and 325 i;
Remove battery cover in trunk after turning screws (1 ... 3).



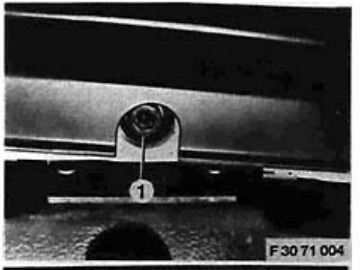
Remove trim panel on tail panel.

Unscrew nut (1).

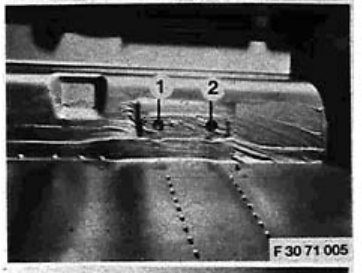
Note:
Remove battery when necessary.



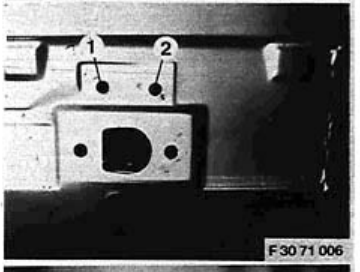
Unscrew nuts on left and right sides.



Unscrew bolt (1) on left and right sides.
Take off bumper carefully.
Unscrew bumper brackets on left and right sides.
Brackets and therefore impact absorbers are omitted.
The bumper is mounted on the trailer hitch.

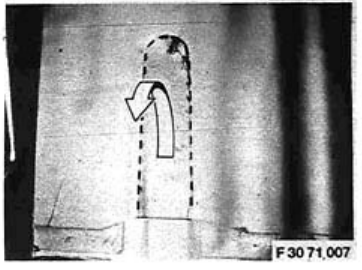


Mark location of holes (1 and 2).
Punch centers of holes with a punch from the inside.

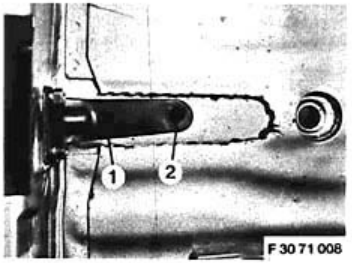


Pre-drill holes (1 and 2) to a diameter of 5 mm (0.197") from the outside.
Open them up afterwards to 10.5 mm (0.413") diameter.

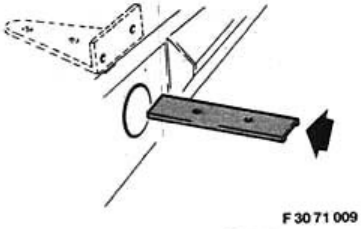
Caution!
Protect the unremoved battery to avoid damage.



Remove insulation sheet as shown.



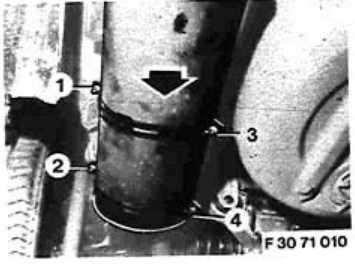
Insert reinforcement bracket.
Mark centers of holes (1 and 2).
Pre-drill to 5 mm (0.197") diameter.
Open up to 8.5 mm (0.335") diameter.
Remove burrs in trunk with a vacuum cleaner.
Deburr and coat edges of all holes with zinc dust paint.



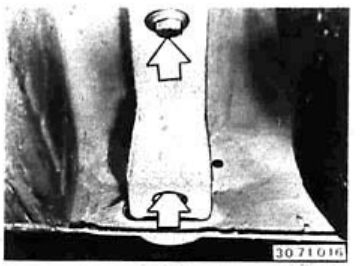
Insert plates in left and right side members and bolt reinforcement brackets on body finger tight.
Four (4) socket head screws.

Slide supports (1) into left and right side members.

Note:
If necessary, tap M 10 threaded holes.

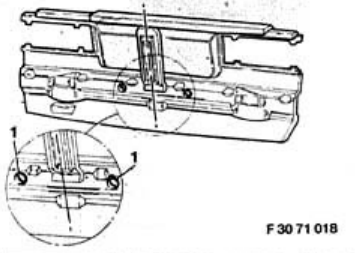


Unscrew nuts (1 ... 4).
Lower final muffler and mount on the body.

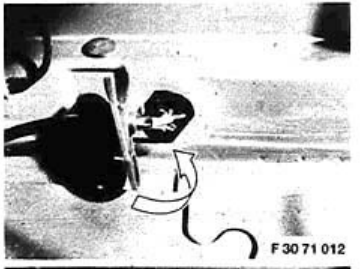


Bolt supports (1) on the body finger tight.
Four M 10 x 20 hexagon head bolts
Four 10.5 x 30 x 3 washers

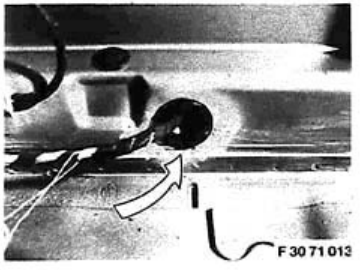
Important!
Remove undercoating on bearing surfaces for washers.
Coat blank metal surfaces with zinc dust paint.



Mark locations, punch centers and drill (initial and final drilling) holes for electric leads.
Final size: 35 mm (1.378") diameter.
Deburr and coat edges of holes with zinc dust paint.
Remove burrs in trunk with a vacuum cleaner.

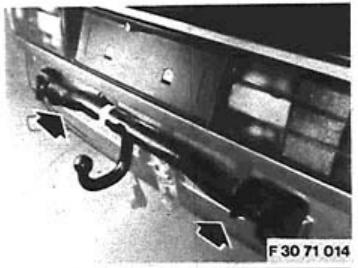


Guide additional wire harness plugs through the holes.

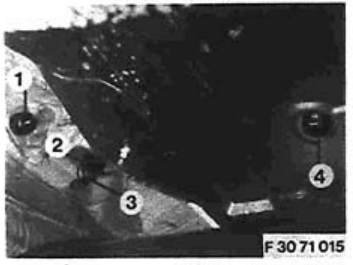


Insert rubber grommets.

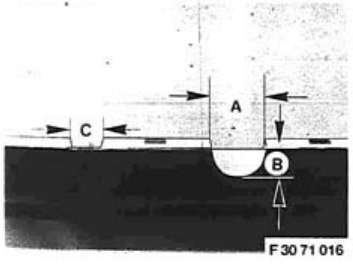
Note:
Check for correct seating of rubber grommets.



Install trailer hitch.



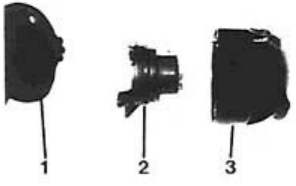
Tighten nuts (1 ... 4) finger tight.
Four M 10 hexagon nuts
Four 10.5 x 30 x 3 washers
Tighten all nuts and bolts to torque of 43 to 48 Nm (31 to 35 ft. lbs.).
Bolt down final muffler.



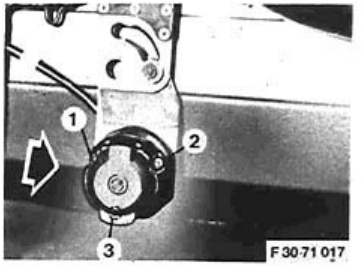
Mark location of and produce openings in middle of bumper.

A = 50 mm (1.968")
B = 40 mm (1.575")
C = 20 mm (0.787")

Mount bumper.



Connect central plug (1), adapter (2) and socket (3).



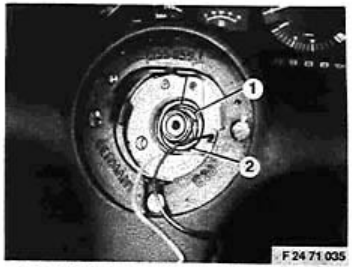
Insert assembly in trailer hitch holder.

Note:
If necessary, secure the additional wire harness on the trailer hitch with wire straps.

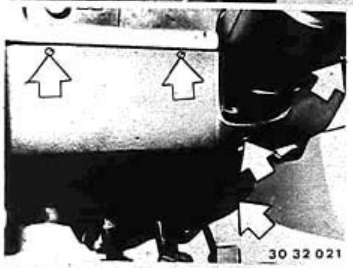
Bolt socket assembly on the holder.
Three bolts
Three washers
Three nuts

Note:
Check for correct seating of rubber seal.

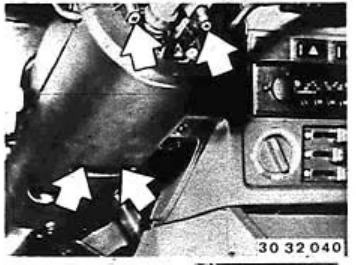
Pry off BMW emblem carefully with a screwdriver.



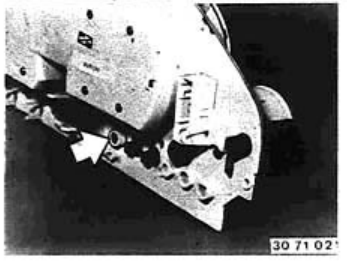
Unscrew nut (1) and remove with washer (2).
Mark position of steering wheel to steering spindle.
Important!
The steering wheel can only be pulled off after unlocking the steering.
Take off steering wheel.
Installation:
Replace self-locking nut.
Tightening torque: 70 to 85 Nm (51 to 61 ft. lbs.)
Be careful not to damage the turn signal self-cancelling cams.



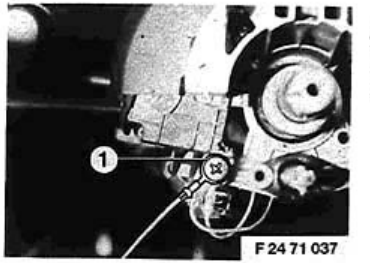
Remove dashboard trim panel at bottom.



Unscrew screws (1 ... 4).
Remove lower steering column casing section.

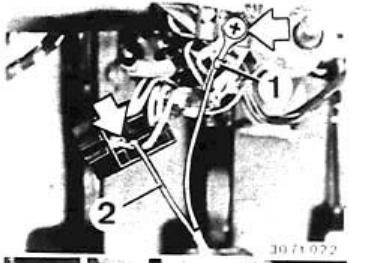


Insert light bulb in socket of additional electric lead.
Insert socket in holder for additional turn signal indicator on the instrument carrier (instrument carrier was removed for better understanding).
Route additional electric lead to the steering column.

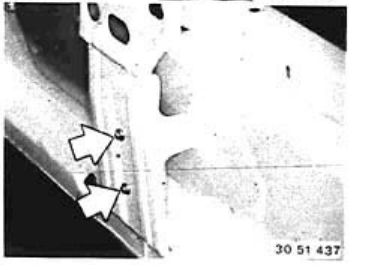


Route additional electric lead to the steering column.
Unscrew screw (1).
Mount the ground connection (brown) of the additional wire harness.

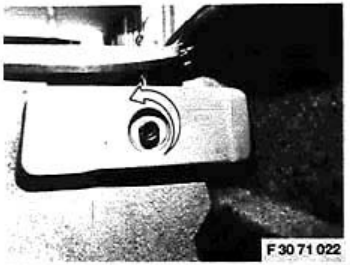
Exchange the flashing relay.



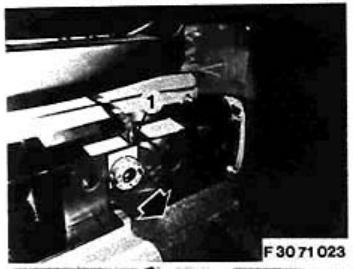
Insert additional electric lead (2) in plug receptacle no. 4.



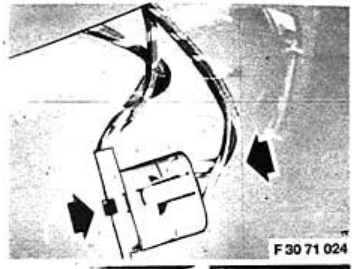
Unscrew screws of central locking mechanism and route the additional wire harness along the standard wire harness to the tail lights.



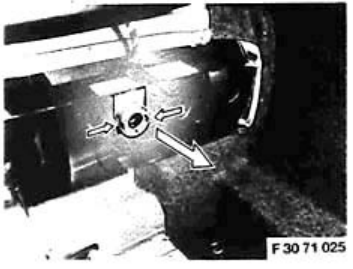
Remove left and right light bulb holders.



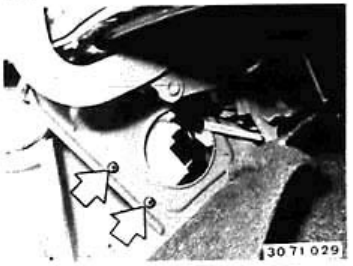
Unclip plug (1) by pressing in both tabs.



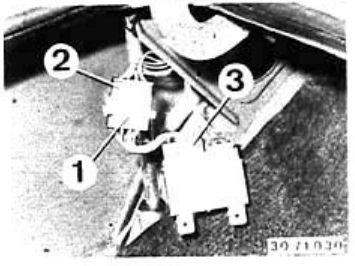
Connect connection with the additional wire harness.



Clip additional wire harness plug in the tail lights.
Place plug behind the side trim panel; secure with straps.
Install light bulb holder.



Additionally in Cars with Check Control:
Pull off left wheel house trim panel partially.
Route additional electric leads along the standard wire harness.
Unscrew control unit.



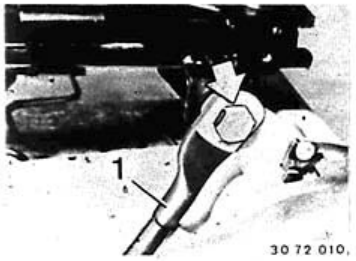
Pull multiple-pin plug (1) off of the control unit and connect it with female plug (2) of the additional electric lead.
Connect multiple-pin plug (3) of the additional electric lead on the control unit.
Screw on control unit.

Function Test:
Connect battery ground lead.
Always make sure that connections of pertinent plug match the connections of the socket.
Check operation of trailer lights and turn signals after hitching a trailer.
The additional indicator lamp flashes only when a trailer is hauled.
Install all removed parts.
Install drawbar load label.

Important!
Fuse No. 6 (7.5 amps) in cars with additional stop lights must be exchanged against a 15 ampere fuse.

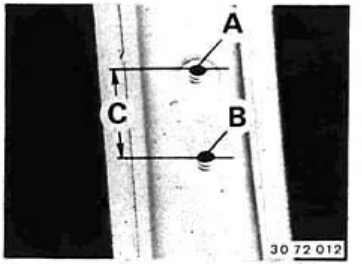
72 Equipment and Accessories for Body

72 11 030	Seat belt, front – remove and install or replace	72- 110
102	Seat belt, rear – remove and install or replace	72- 113
	Seats belts – inspect	72- 115
	Check list for automatic reel seat belts	72- 117
54 12 490	Wind deflector for sun roof – install	72- 120

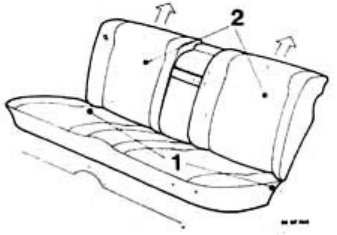


72 11 030 REMOVING AND INSTALLING OR REPLACING FRONT SEAT BELT (COMPLETE)

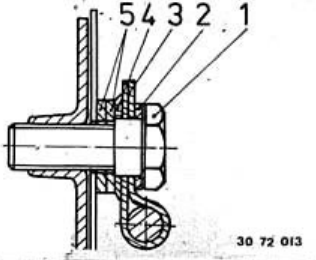
Remove and install front seat 52 10 000.
Pull off cap.
Detach bottom belt strap (1).
Installation:
Tightening torque*



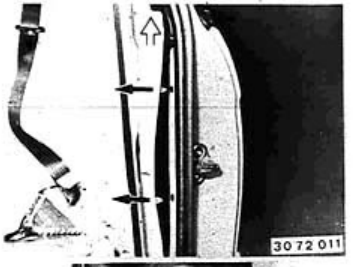
Belt holder can be mounted in bore A or B depending on size of person.
Cut out B pillar trim for bore B.
C = approx. 50 mm (2").



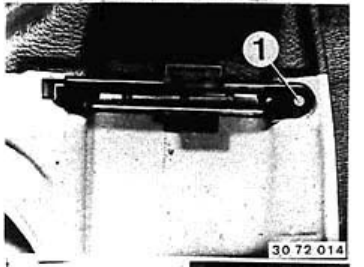
Two Door:
Lift out rear seat cushion from above.
Unscrew bolts (1) and disconnect backrest in holders (2) from above.



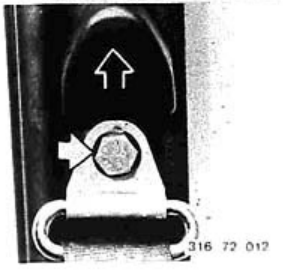
Installed Order:
1) Bolt
2) Plastic washer
3) Top belt
4) Plastic washer
5) Washer (2x)
Tightening torque*
Since 1985 Models:
Washers 2 and 4 omitted.



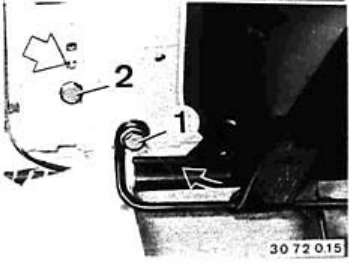
Disconnect side trim panel (3 clips) and pull up out of clamps.



Insert pin (1) and remove slide.



Pull off cap and unscrew bolt.

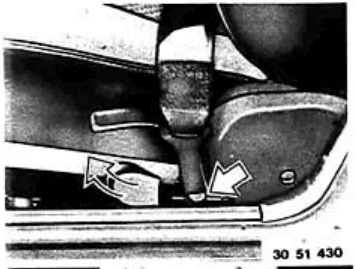


Unscrew bolt (1) and disconnect belt strap.
Unscrew bolt (2) and remove automatic reel.
Installation:
Centering pin engages in bore.
Tightening torque*.

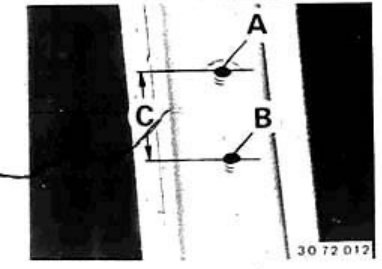
* See Specifications

* See Specifications

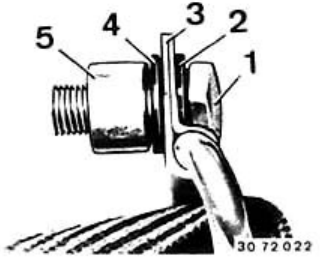
Four Door:
Pull off cap and unscrew bolt.



Pull off cap.
Unscrew bolt.
Installation:
Tightening torque*

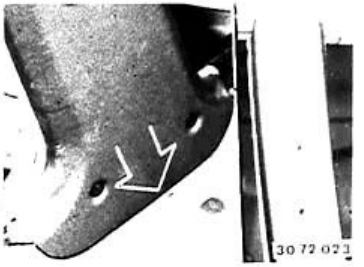


Belt holder can be mounted in bore A or B depending on size of person.
Cut out B pillar trim for bore B.
C = approx. 50 mm (2").

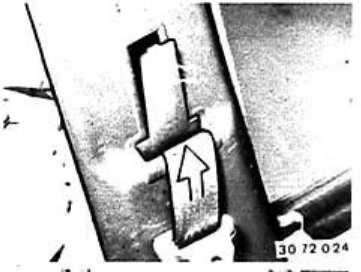


Installed Order:
1 = Bolt
2 = Plastic washer
3 = Top belt
4 = Plastic washer
5 = Spacer
Since 1985 Models:
Washers 2 and 4 omitted.

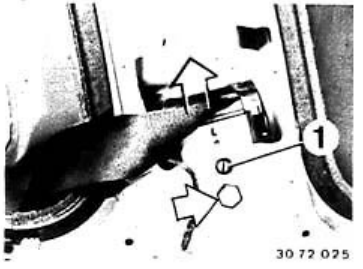
* See Specifications



Unclip or, if applicable, unscrew B pillar trim and pull out of upper holder.

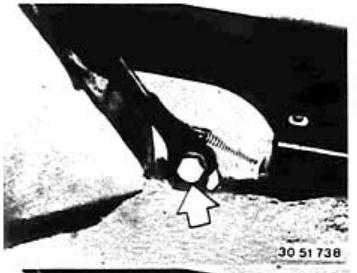


Press out cover and insert belt through B pillar trim.

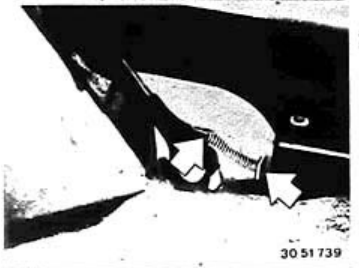


Unscrew bolt and remove automatic reel.
Installation:
Centering pin (1) engages in bore.
Tightening torque*.

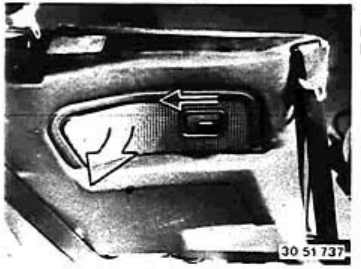
* See Specifications



Convertibles:
Lift out plate.
Unscrew screw.
Lift out seat belt.
Installation:
Tightening torque*.



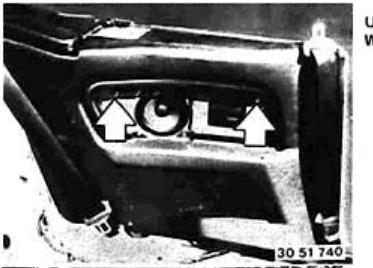
Installation:
Check for correct fit of spring.



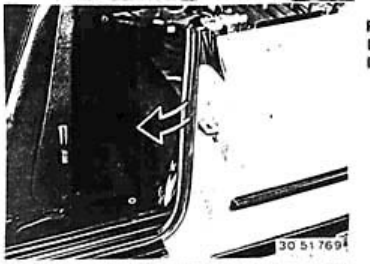
Remove complete rear seat – see 52 20 000.
If applicable, lift out plate.

Pull off trim.

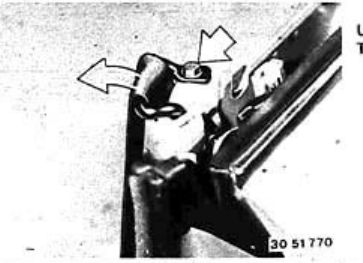
* See Specifications



Unscrew screws.
Window opened.



Pull off rubber seal on door.
Lift out trim.
If applicable, pull off speaker wires.



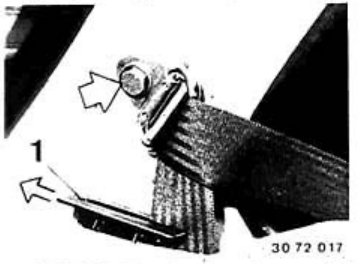
Unscrew screw.
Take off stirrup.

Unscrew bolt.
Remove automatic reel.
Installation:
Tightening torque*.

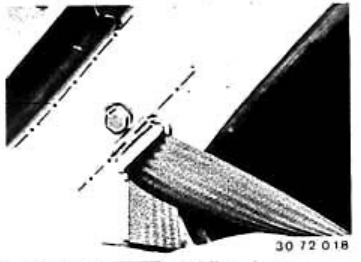
* See Specifications

72 11 102 REMOVING AND INSTALLING OR REPLACING REAR SEAT BELT

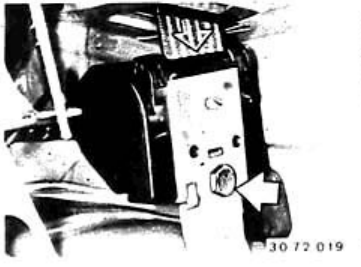
Remove and install rear seat cushion/backrest 52 20 000.
Unscrew bolt.
Installation:
Tightening torque*.



Pull off cap and unscrew bolt.
Lift off cover (1) and pull off of belt strap.

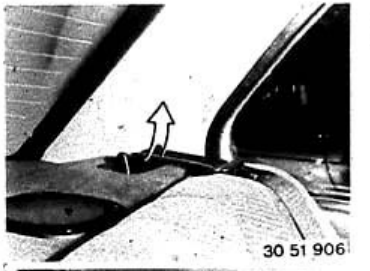


Installation:
Adjust belt holder to be parallel to C pillar.
Tightening torque*.

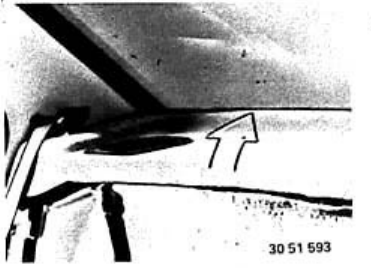


Unscrew bolt in trunk.
Pull belt strap through hatrack and remove automatic reel.
Installation:
Tightening torque*.

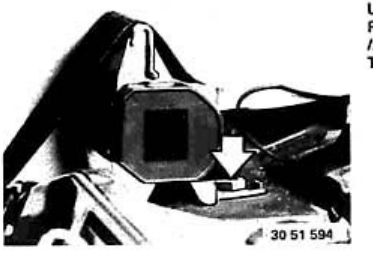
* See Specifications



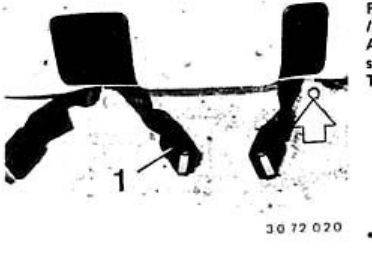
Since 1986 Models:
Lift out cover.



Lift out hatrack.

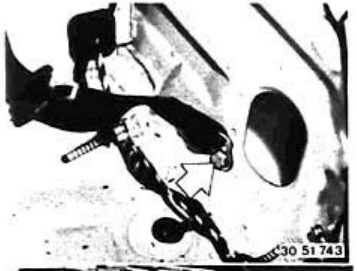


Unscrew bolt.
Remove automatic reel.
Installation:
Tightening torque*.



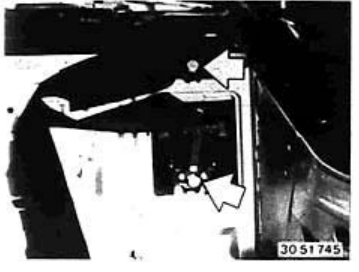
Remove lower belt strap.
Installation:
Attach belt lock for center seat belt on right side.
Tightening torque*.

* See Specifications

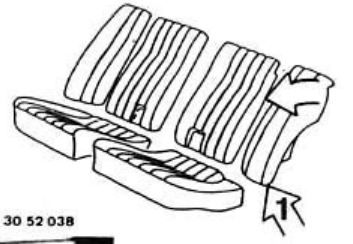


Convertibles:
Remove rear seat cushion and backrest - see 52 20 000.
Unscrew bolt.
Installation:
Tightening torque*.

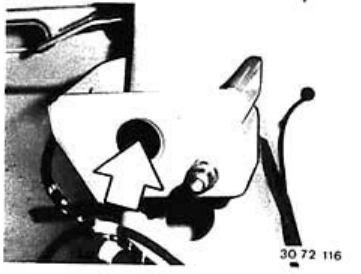
Lift out trim panel.



Unscrew bolts.
Remove automatic reel and reverser.
Installation:
Tightening torque*.

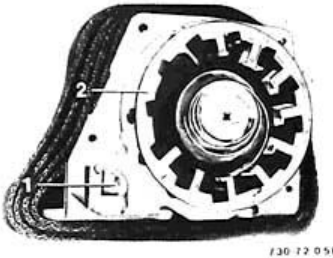


Touring:
Tilt the backrest forward.
Unscrew bolt (1).
Lift out side backrest.
Remove side trim panel - see 51 47 . . ..



Unscrew bolt.
Remove automatic reel.

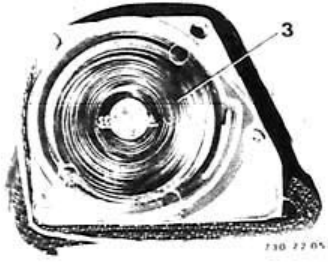
* See Specifications



730 72 058

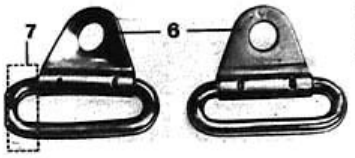
Checking Automatic Seat Belts:

The automatic reel has two independent activating systems for the locking effect.
The first activating system should lock the reel when driving fast in curves, driving in tight curves, when car rolls over, during sharp braking or by impact.
This activation is accomplished with a ball (1).
To check, seat must be set upright and both hands placed on steering wheel in supporting position.
Then apply brakes fully while driving at a road speed equal to twice walking speed (road must be dry).
The seat belt should lock.
The second activating system is for additional safety and is controlled by inertia mass (2).
If reel locks when pulling out belt suddenly, this system is also okay.



730 72 057

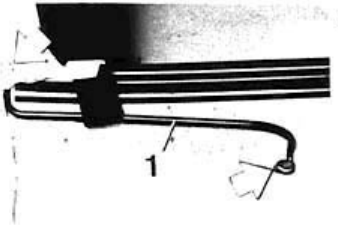
The belt should retract automatically as far as possible when released.
It could happen that the last section of the belt will have to be guided to the door beam by hand.
If this last section is not wound, there could be a weak or broken return spring (3) and/or excessive friction in the belt guides.
An unusuable seat belt or a seat belt worn in a serious accident should be destroyed immediately after removal to guarantee that it cannot be used again.
The automatic reel does not require servicing and must not be opened.



730 72 053

The automatic seat belt has to be replaced when the mounting bar (6) is bent or the stirrup is distorted in area (7).
The stirrup must still pivot after mounting bolt has been tightened; only applicable to front seat belts.

To fasten a belt the tongue should insert easily and engage in the lock with a loud click.
When pushing in the "PRESS" button the belt tongue will be ejected from the lock by spring force.
Replace seat belt when lock trim is missing or damaged.
When replacing a seat belt also replace the lower strap.
In the case of belts integrated in seats an impact could defform the lower strap stop on the seat rail.
Never attempt to straighten the seat or seat rails.

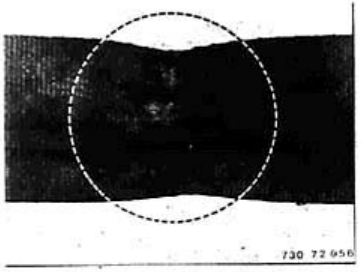


30 72 021

Deformed stirrups (1) must be replaced.

730 72 054

If the plastic cover in the opening for the belt above the anchorage bar (16) has traces of wear, the seat belt must be replaced.



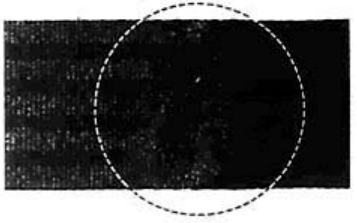
730 72 056

Belt Straps:

Only clean belt straps in a luke-warm soap solution or a commercial fine laundry detergent. Never clean belts chemically or dye belts.

An automatic seat belt must be replaced when there is

- creasing (see picture),
- unraveling,
- pinches,

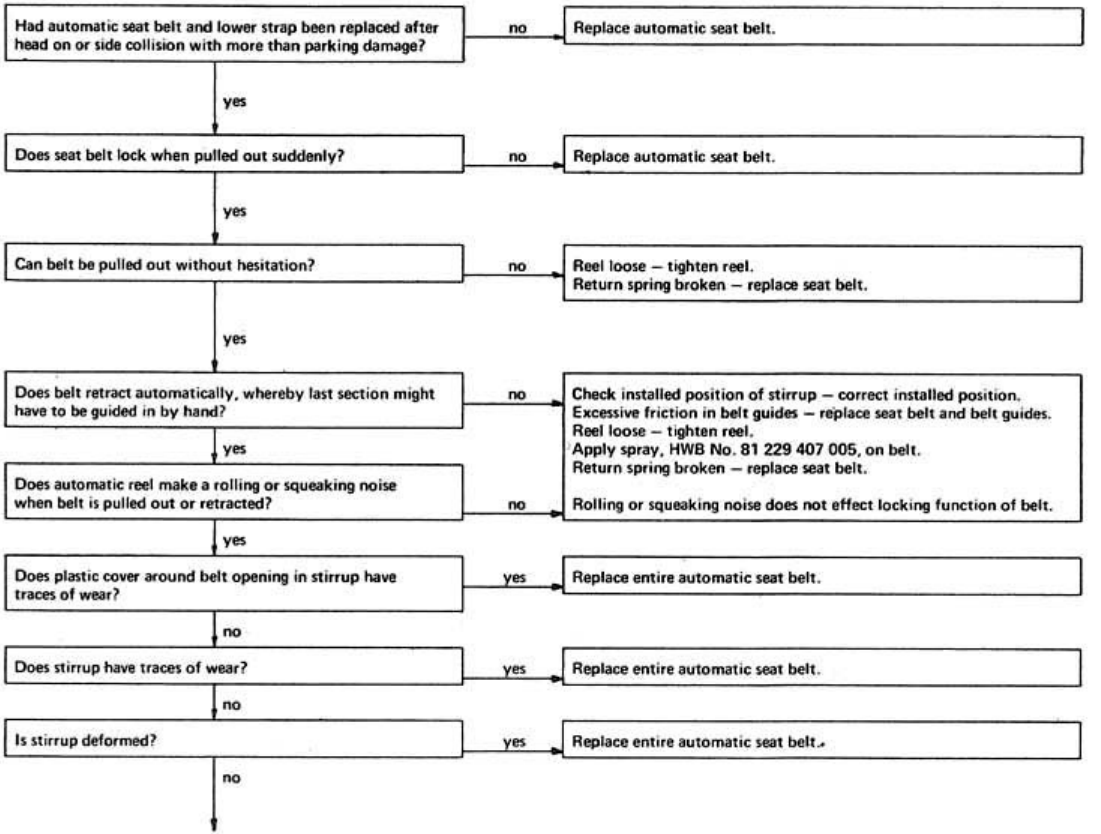


730 72 055

- tears and/or cuts,
- melting (see picture) or
- damaged seams on end of belt in area of holding or pivoting part.

To improve belt retraction the belt can be sprayed with universal belt spray, HWB No. 8 122 947 005.
This will reduce friction, especially on the stirrup.

CHECK LIST FOR AUTOMATIC REEL SEAT BELTS



Is mounting tab on belt reversing holder free of distortion? — no → Replace complete automatic reel seat belt.

yes

Is the fully pulled out belt strap free of pinches, melt spots, cuts, creases, tears and fringing? — no → Replace complete automatic reel seat belt.

yes

Is seam on end of belt strap free of damage? — no → Replace complete automatic reel seat belt.

yes

Does spring pressure eject the belt tongue out of the the lock when operating the "PRESS" button while seat belt is fastened? — no → Replace complete auromatic reel seat belt.

yes

Is a fastened seat belt locked when stopping a car from a speed twice as fast as walking with brakes applied fully? — no → Replace complete automatic reel seat belt.

yes

Is a fully pulled out belt strap free of serious dirt and spots? — no → Seat belt must be replaced, if dirt and spots cannot be removed with a commercial fine laundry detergent.

yes

Is the front tongue of the reclining mechanism or seat rails free of deformation in the case of seat-integrated seat belts? — no → Replace damaged parts and the complete automatic reel seat belt.

yes

Automatic reel seat belt is okay!

ADDITIONAL FOR BELT WARNING UNIT:

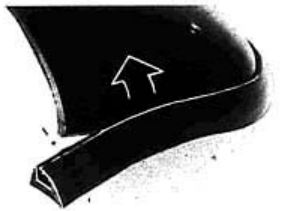
Is there a warning signal with the driver's door closed, ignition turned on and belt lock locked? — no → Automatic reel seat belt is okay.

yes

Check switch in the seat belt lock.
Measure resistance on switch of lock.
Lock locked = ∞ ohms
Lock unlocked = 0 ohm

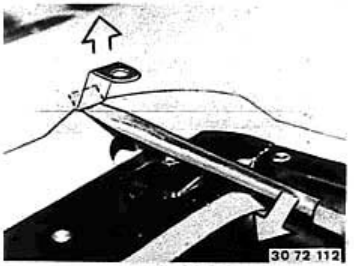
54 12 490 INSTALLING WIND DEFLECTOR FOR SUN ROOF

Parts:
1 Wind deflector
1 Rubber seal
2 Flat head screws
2 Knurled nuts
2 Holders



30 72 111

Mount rubber seal on wind deflector and, if applicable, cut off protruding ends.



30 72 112

Open sun roof.
Press in holders between beaded edge and panel on left and right sides with a screwdriver.

30 72 113

Align wind deflector parallel to roof opening and tighten left and right screws uniformly.
Note:
Tighten screws uniformly after driving car approx. 100 km (60 miles).

97 Body Cavity Sealing and Undercoating

97 00 010 Body cavity sealing for entire car 97- 1

97-1

BODY CAVITY SEALING – '3' SERIES – E 30

Sealing Preparations

- Underside of car must be clean and dry.
- If applicable, damaged PVC on underside including wheel housings and side panels must be repaired and treated with Tectyl.

  The thickness of undercoating should not exceed 250 μm (0.25 mm / 0.010").
- Check car for paint finish damage and damage from flying stones and, if applicable, repair after consulting the customer.
  - Sealing compounds and the car itself should have room temperature (approx. 20° C / 68° F).
  - Check spray pattern of guns and nozzles.
  - When drilling holes, dip the stepped drill bit in sealing compound to trap burrs.
  - Remove dripping sealing compound.
  - Insert plugs dipped in Tectyl in all drilled holes after finishing sealing.
  - Spray engine sealing compound on engine and engine compartment to cover completely.
  - When repairing body parts damaged in an accident or replacing the car body, body cavity sealing must be carried out immediately after painting and before installation of attachments, equipment, trim, etc.. If repair welding seams and joints are only accessible from one side, the side which produces a cavity has to be treated with wax. The same is applicable for the rear side panels, above the wheel housings up to the roof joint, as well as doors especially in the upper corner areas.

Body cavity sealing performed after body repairs must be confirmed on the annual inspection sheets (Owner's Manual) !

Sealing Procedures on Lifting Platform (wheels protected with covers available from HWB)

1.	Front cross member, through openings on sides	H or F
2.	Side panels and wheel housings - front	N or RS
3.	Engine carrier over entire length	N or RS
4.	Front side panels in rear area from behind through provided hole	N or RS
5.	All reinforcement of floor assembly in front seat area through provided openings	N or RS
6.	Door member at center from underneath	N or RS
7.	Doors twice each through provided holes as well as front door window frame at rear (plates removed)	T+N or F+RS
8.	Left and right rear spring mounts through provided openings	N or RS
9.	Side and cross members underneath trunk through provided openings	N or RS

Sealing Procedures without Lifting Platform

10.	Braces of engine hood and all member sections of front panel through provided openings	H of F
11.	Spring strut peak reinforcement	H or F
12.	Wheel house braces / cowl panel from underneath	H+N or F+RS
13.	A pillar (door contact switches removed; cars with radio: speakers removed)	N or RS
14.	Rear side panels and wheel housing through rubber rubbing strip openings (2-door cars) or door member/rear side panel joints (4-door cars)	N or RS
15.	Rear side panels and wheel housings from trunk	N or RS
16.	Braces of trunk lid through provided openings	H or F

H = Hook-type probe
N = Nylon probe
T = Door probe
RS = Round spray pattern slotted nozzle
F = Flat spray pattern nozzle

Construction group 11 Engine M10

	Engine view	11-	0
11 12 000	Cylinder head cover – remove and install	11-	1
101	Cylinder head gasket – replace	11-	1
500	Cylinder head – remove and install – engine removed	11-	2
595	Valve guide – inspect for wear	11-	3
591	Valve guide – replace – valves removed	11-	3
607	Valve seats and valves – machine – cylinder head disassembled	11-	3
719	Cylinder head sealing surface – grind – cylinder head disassembled	11-	4
729	Cylinder head – check for cracks in water test – cylinder head disassembled	11-	4
11 14 100	Timing case cover, upper – remove and install / seal	11-	5
120	Timing case cover, lower – remove and install / seal	11-	5
141	Radial oil seal in timing case cover – replace	11-	7
605	Radial oil seal in clutch end cover – replace – transmission removed	11-	7
11 21 000	Crankshaft – remove and install	11-	8
120	Pulley on crankshaft – remove and install	11-	9
501	Crankshaft – replace – crankshaft removed	11-	10
531	Crankshaft main bearing shells – replace – engine disassembled	11-	10b
571	Pilot bearing in crankshaft – replace	11-	11
11 22 000	Flywheel – remove and install	11-	12
051	Drive plate for torque converter – replace	11-	12
541	Starter gear ring – replace	11-	12
11 24 521	Connecting rods – replace – pistons removed	11-	13
571	Conrod bearing shells – replace – disassemble engine	11-	13
11 25 000	Piston – remove and install	11-	14
651	Piston rings of one piston – replace – piston removed	11-	15
11 31 000	Camshaft – remove and install	11-	16
051	Timing chain – replace	11-	17
061	Timing chain sprocket set – replace	11-	18
090	Timing chain tensioner piston – remove and install	11-	19
601	Tensioning rail / guide rail – replace – timing chain removed	11-	19
11 33 020	rocker arm shafts – remove and install	11-	20
031	Rocker arms – replace	11-	21
11 34 004	Valve clearance – adjust	11-	21
509	Valves – check for leaks – camshaft removed	11-	21
550	Valves – remove and install – rocker arm shafts removed	11-	22
	Engine oil circuit	11-	23
11 40 000	Engine oil pressure – check	11-	24
11 41 000	Oil pump – remove and install	11-	24
151	Oil pump drive chain – replace	11-	25
11 42 020	Full flow oil filter – remove and install/seal	11-	26
021	Full flow oil filter – replace	11-	26
11 51 000	Water pump – remove and install	11-	26
502	Water pump – overhaul	11-	27
11 52 000	Fan – remove and install	11-	28
020	Fan coupling – replace	11-	28
11 53 000	Coolant thermostat – remove and install	11-	28

M 10 = 4 cylinders

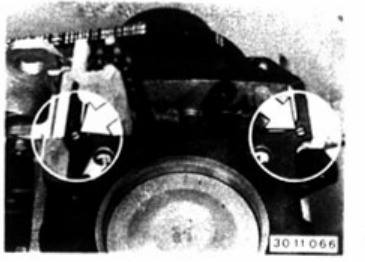
11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

Disconnect hose (8).
Unscrew cylinder head cover.
Installation:
Tighten nuts and bolts in order of 1 ... 7.
Tightening torque*.
Also screw on holder for ignition lead.
Check gasket, replacing if necessary.

11 12 101 REPLACING CYLINDER HEAD GASKET

Remove cylinder head – 11 12 100.
Clean sealing surfaces on cylinder head and crankcase – use gasket remover** and a hard wood scraper.
Check levelness with a standard steel ruler, grinding cylinder head sealing surface (see 11 12 719) if necessary.
Installation:
Only use original cylinder head gaskets to guarantee precise matching of holes and openings for coolant.

A gasket with standard thickness may be installed on a reground cylinder head, or a gasket which is 0.3 mm (0.012") thicker in order to avoid reduction in combustion chamber size.
Identification:
Stamped codes
1.8 / 1.8 E / 2.0 / 2.0 E.



Important!
Fill bores with a brush on type universal sealing compound / Three Bond Silicone 1207** prior to installation of timing case cover.

* See Specifications

** Source: HWB

11 12 500 REMOVING AND INSTALLING CYLINDER HEAD

– Engine Removed –

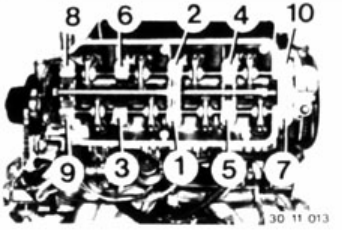
Disconnect hose (8).
Remove cylinder head cover.
Installation:
Tighten nuts and bolts in order of 1 ... 7.
Also screw on holder for ignition lead.
Tightening torque*
Check gasket, replacing if necessary.

Remove upper timing case cover – see 11 14 100.
Remove distributor – see 12 11 060.
Turn crankshaft until cylinder no. 1 is at TDC – cast boss aligned with notch in pulley.

Remove piston for chain tensioner – see 11 31 090.
Unscrew sprocket.
Caution!
Never turn engine after removing the timing chain.
Installation:
Position timing chain that the bore for the dowel pin faces down.
Tightening torque*.

Installation:
Turn in the camshaft before mounting the cylinder head, so that notch in camshaft flange is aligned with cast boss on cylinder head.
Cylinder no. 1 is at TDC.
Also install the timing chain in this position.

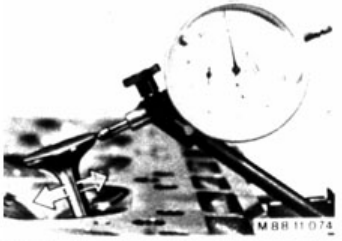
* See Specifications



Unscrew cylinder head bolts in order of 10 ... 1 and lift off the cylinder head.
Installation:
Keep oil out of cavities since otherwise bolts tightened with the specified torque might not exert sufficient pressure on the cylinder head. In addition, the crankcase might be cracked.
Clean cylinder head bolts.
Lubricate threads and bearing surfaces of bolt heads with a light coat of oil.
Replace cylinder head gasket – see 11 12 101.

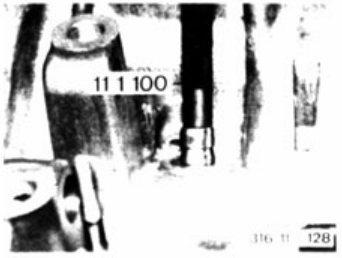
Tighten bolts in order of 1 ... 10 in 3 steps*.
Adjust valve clearance – see 11 34 004.
Adjust ignition timing – see 12 11 004.
Adjust engine idle speed and CO level – see 13 00 054.
Tighten cylinder head bolts to specified torque angle with Special Tool 11 2 110 regardless of the engine temperature in the 3rd step (cover of cylinder head removed again after running engine warm).
Note:
Cylinder head is not tightened again after 1,000 km (600 miles).

* See Specifications



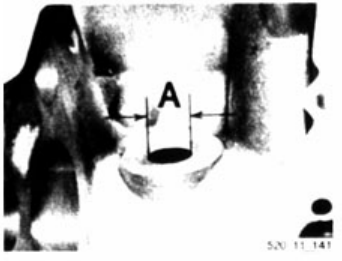
11 12 595 CHECKING VALVE GUIDE FOR WEAR
– Valve Removed –

To measure wear, insert a new valve that the end of the valve stem is flush with the valve guide.
Set up dial gage and measure tilt clearance.
Max. permissible tilt clearance*.

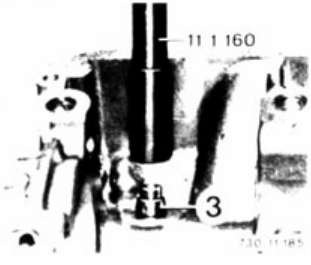


11 12 591 REPLACING VALVE GUIDE
– Valves Removed –

Drive out valve guide cold into the combustion chamber with Special Tool 11 1 100.

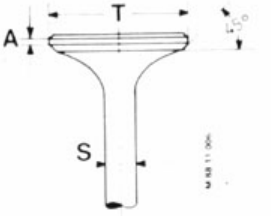


Check bore (A) in cylinder head.
If permissible diameter* is exceeded, bore must be reamed out and an oversize* valve guide installed.



Heat* cylinder head.
Drive in valve guide (3) from the camshaft end with Special Tool 11 1 160.
Bore in the special tool determines the amount of protrusion.*
Ream out valve guide to specified inside diameter.
Machine valve seats – see 11 12 607.

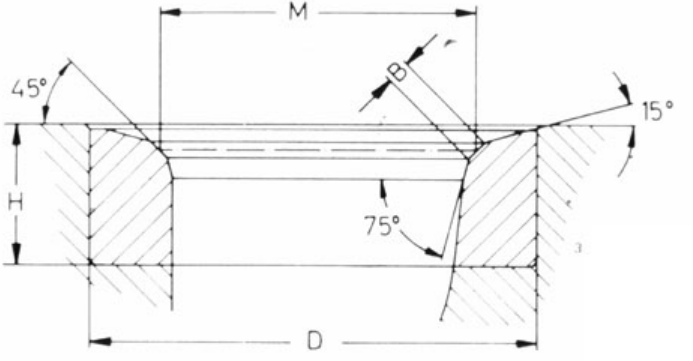
* See Specifications



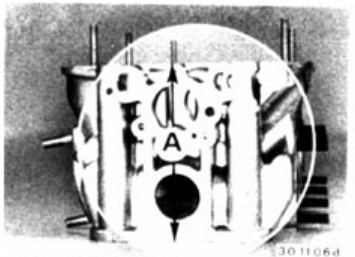
11 12 607 MACHINING VALVE SEATS AND VALVES
– Valves Removed –

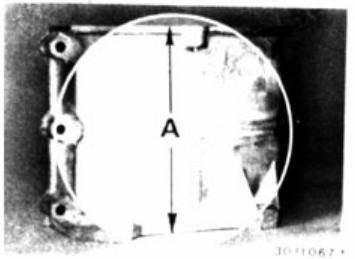
Valve must be replaced, if edge thickness A* is less than specified.

Machine correction angles* to produce valve seat diameter M* and valve seat width B*, after machining the valve seat angle*.
Grind in valves with grinding paste and check valves for leaks – see 11 34 509.



* See Specifications

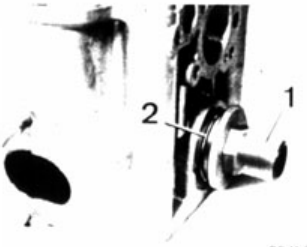




11 14 100 REMOVING AND INSTALLING/ SEALING UPPER TIMING CASE COVER

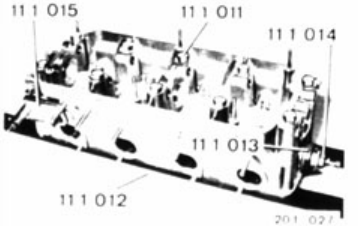
Remove cylinder head cover 11 12 000.
Unscrew bracket (1).
Unscrew timing case.
Installation:
Tighten bolts (2 and 3) finger tight.
Then tighten bolts (4 ... 9) one after the other and finally bolts (2 and 3).
Replace gasket and hold new gasket in position with grease.

Important!
Coat bores with a brush-on type universal sealing compound / Three Bond Silicon 1207** before installing the timing case cover.
If damaged, replace cylinder head gasket.



11 14 120 REMOVING AND INSTALLING/ SEALING LOWER TIMING CASE COVER

Disconnect battery ground lead.
Remove upper timing case cover 11 14 100.
Disconnect wires on alternator.
Unscrew bolt on crankcase.

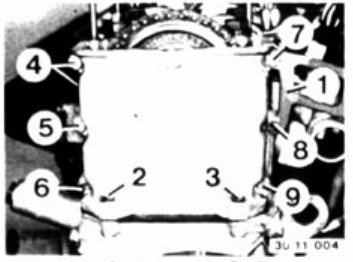


Unscrew alternator with console and tensioning bar.

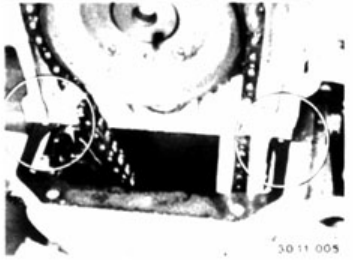
All Cars with Power Steering:
Loosen drive belt.
Unscrew bracket (1).
Pressure hoses remain connected.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.

Remove water pump 11 51 000.
Remove crankshaft pulley 11 21 120.
Remove chain tensioner piston 11 31 090.
Unscrew remaining timing case cover bolts.

** Source: HWB



Two-Piece Oil Pan:
Unscrew reinforcement plate.
Remove oil pan lower section 11 13 020.

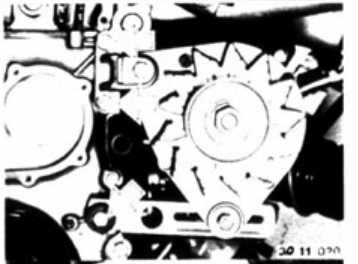


Unscrew bolts (1 ... 3).
Loosen remaining oil pan bolts.

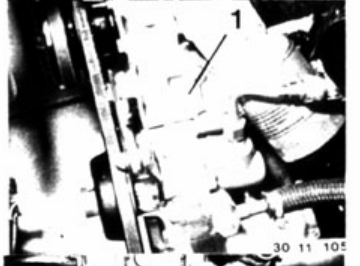
Lift oil pan gasket off of timing case cover carefully with a knife.
If oil pan gasket is damaged, remove oil pan 11 13 000.

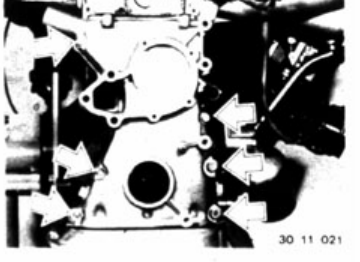
Take off timing case cover.
Installation
Coat mating surfaces between oil pan and crankcase with a brush-on type universal sealing compound / Three Bond Silicon 1207**.
Important!
Take-up web for tensioning piston must extend into oil pocket.

One Piece Oil Pan:
Unscrew reinforcement plate.



Unscrew oil pan bolts at front end.
Loosen all other oil pan bolts.

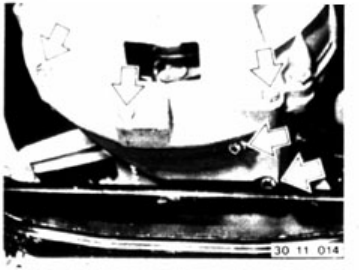




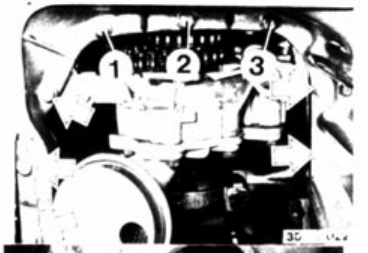
** Source: HWB

One Piece Oil Pan:
Unscrew reinforcement plate.

Unscrew front oil pan bolts.
Loosen all other oil pan bolts.

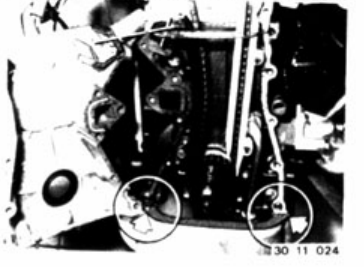


Two Piece Oil Pan:
Unscrew reinforcement plate.
Unscrew lower oil pan section – 11 13 020.



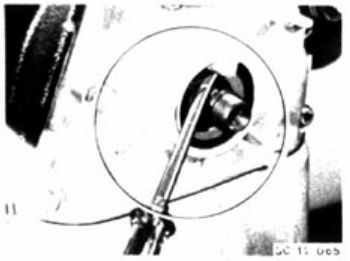
Unscrew bolts (1 ... 3).
Loosen all other oil pan bolts.
Installation:
Install bolts (1 ... 3) with Loctite No. 270**.

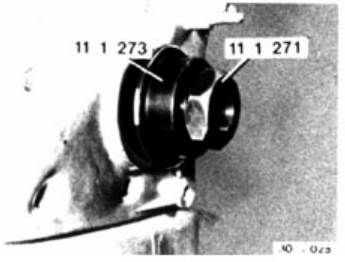
All Models:
Pry oil pan gasket off of timing case cover carefully with a knife.
Remove oil pan – see 11 13 000 – if oil pan gasket is damaged.



Remove timing case cover.
Installation:
Coat mating surfaces between oil pan and crankcase with a brush-on universal sealing compound (Three Bond Silicone 1207**).
Important!
Take-up for tensioning piston must be located in the oil pocket.

** Source: HWB

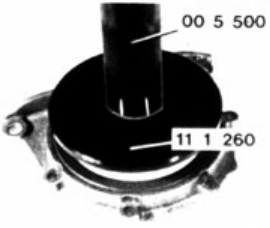




11 14 141 REPLACING RADIAL OIL SEAL IN TIMING CASE COVER

Remove crankshaft pulley – 11 21 120.
Lift out radial oil seal with a screwdriver.

Lubricate sealing lip of radial oil seal with oil.
Press in radial oil seal flush with Special Tools 11 1 273 and 11 1 271.



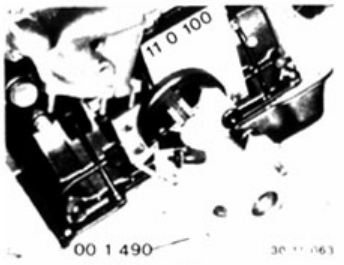
11 14 605 REPLACING RADIAL OIL SEAL IN CLUTCH END COVER – Transmission Removed

Remove flywheel – 11 22 000.
Drain engine oil.
Loosen oil pan bolts.
Pry off gasket carefully with a knife in area of end cover/oil pan joint.
Unscrew end cover.
Press radial oil seal out of end cover.
Installation:
Replace gasket.
If oil pan gasket was damaged, remove oil pan – 11 13 000.

Apply a coat of brush-on universal sealing compound / Three Bond Silicone 1207** on end cover/oil pan joint.
Use Special Tool 11 2 213 to avoid damaging the radial oil seal.

Press in radial oil seal with Special Tools 11 1 260 and 00 5 500.
In contradiction to the standard seal which had been installed flush, install the new radial oil seal with approx. 1 to 2 mm (0.039 to 0.079") offset toward the inside.
Lubricate sealing lip with oil.

** Source: HWB

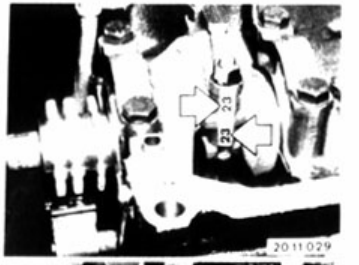


11 21 000 REMOVING AND INSTALLING CRANKSHAFT

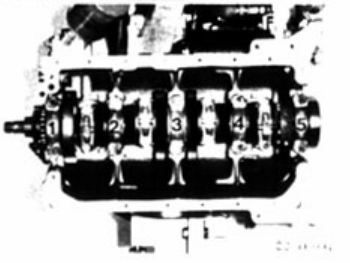
Remove engine 11 00 050.
Unscrew engine mounts.
Mount crankcase in assembly stand 00 1 490 with Special Tool 11 0 100.

Remove clutch 21 21 000.
Remove cylinder head 11 12 100.
Remove timing chain 11 31 051.
Remove oil pump 11 41 000.
Check axial play* before removing the crankshaft.
Max. Permissible Play Exceeded:
Check or replace thrust bearing.

Remove flywheel 11 22 000.
Unscrew end cover.
Installation:
Replace gasket.
Use Special Tool 11 2 213 to avoid damage on the radial oil seal.
Cut off gasket on oil pan sealing surface.



Unscrew conrod bearing caps.
Installation:
Replace conrod bearing shells and check conrod bearing play, see 11 24 571.
Pair numbers (0 ... 99) must be the same on connecting rods and caps.
Tightening torque*.

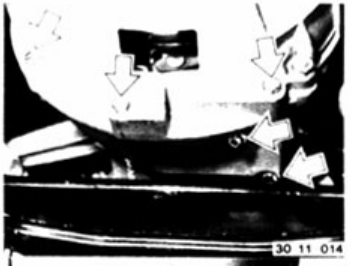


Unscrew crankshaft bearing caps and lift out crankshaft.
Installation:
Bearing cap no. 1 is on sprocket end.
Install bearing shells and check bearing play, see 11 21 531.
Installation:
Measure axial play after installing crankshaft loosen thrust bearing no. 3 again.
Center thrust bearing by applying knocks from a plastic hammer on front and rear ends of the crankshaft.
Tighten thrust bearing to specifications.
Check axial play*.

If crankcase is replaced, clean oil and water bores again thoroughly to remove casting sand.

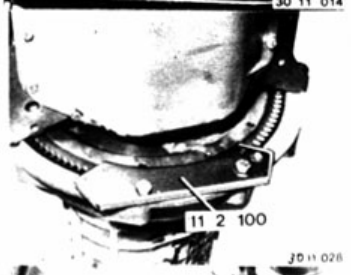
* See Specifications

* See Specifications



11 21 120 REMOVING AND INSTALLING PULLEY ON CRANKSHAFT

Detach reinforcement plate.



Hold flywheel with Special Tool 11 2 100.

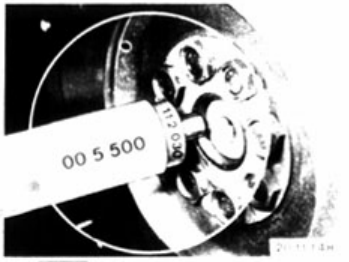
Unscrew nut on pulley.
Pull off pulley.
Installation:
Tightening torque*.

Installation:
Check that woodruff key (1) is positioned correctly.

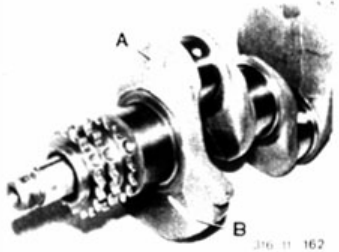
* See Specifications

11 21 501 REPLACING CRANKSHAFT
– Crankshaft Removed –

Note:
A replacement crankshaft is supplied complete with corresponding bearing shells for main and conrod bearings.



Fill bore in crankshaft with approx. 1 gram (0.035 oz.) of lubricating grease. Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

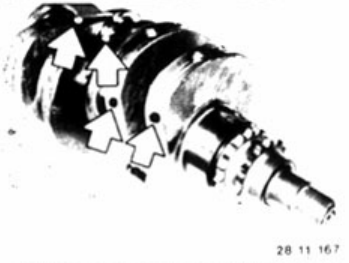


Crankshaft is surface treated and may only be reground in the factory.

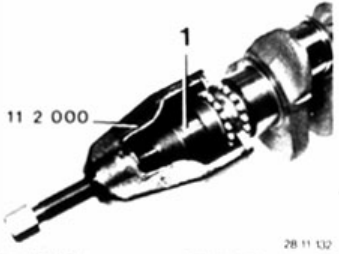
Reground crankshafts are marked with stripes of paint.

Conrod Bearing Journal (A)
1 paint stripe Size 1 *
2 paint stripes Size 2 *

Main Bearing Journal (B)
1 paint stripe Size 1 *
2 paint stripes Size 2 *

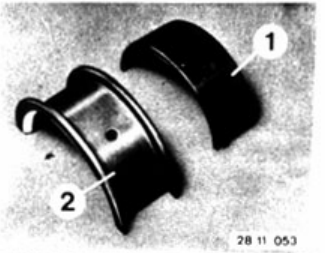


Replacement crankshafts are only supplied with bearing shells of double classification.
A crankshaft is marked with red or blue paint because of the main bearing journal tolerances.



Transferring Sprocket:
Lift out woodruff key (1).
Pull off sprocket with Special Tool 11 2 000.

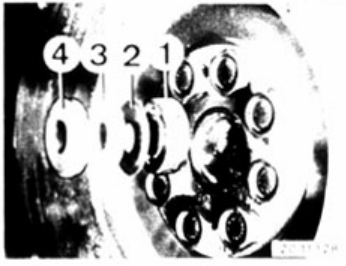
Installation:
Heat sprocket to max. 200° C (390° F) for installation.



1 = Bearing shell 1–2–4–5
2 = Bearing shell 3 (pilot bearing)

The color code is located on the side of a bearing shell.

Check the ground size of main bearing journals.



Cars with Manual Transmission:
Install pilot bearing for the transmission main shaft.

Installed Order:
Ball bearing (1), cover (2), felt ring (3) and capsule (4).

Insert cover (2) with embossment facing out.

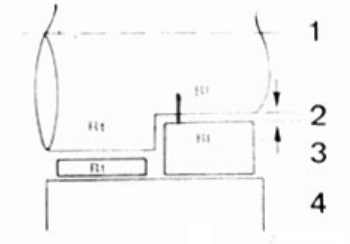
Installing Instructions:
Only place bearing shells with "red" marks in the crankcase (regardless of the old color code mark on the crankcase).
Install bearing shells in bearing caps depending on the color code of the crankshaft main bearing journals – "red" or "blue".

* See Specifications

Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with the correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with different color code marks.



Survey of Color Code Shaft Diameter/ Bearing Shell Thickness*

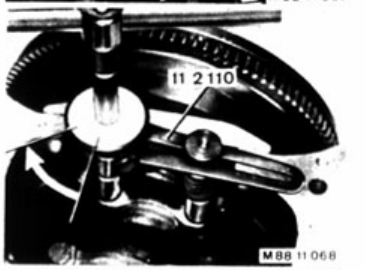
Double Classification Color Codes:
Rt = red
Bl = blue

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

Replacing Conrod Bearing Shells:
Red or blue conrod bearing shells are installed standard depending on the color code mark on the connecting rod for a pertinent crankshaft ground size.

Only install the red bearing shells of a pertinent ground size supplied with a replacement crankshaft.

* See Specifications



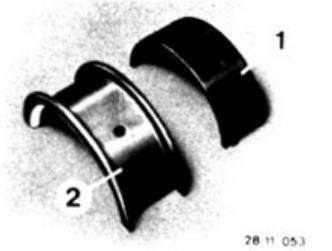
Place Type PG 1 Plastigage on a crankshaft wiped clean of oil in BDC position.
Connecting rods and caps are marked with the same pair number (0 ... 99).
All pair numbers are located on one side in an engine.
Mount conrod caps.
Tightening torque:
Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Important!
Do not turn connecting rods or the crankshaft.
Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with different color code marks.
Replace conrod bolts for final installation and tighten the conrod bearing caps.
Tightening torque*.

* See Specifications

11 21 531 REPLACING CRANKSHAFT MAIN BEARING SHELLS
– Engine Disassembled –

A crankshaft is marked with red or blue paint depending on main bearing journal tolerances.

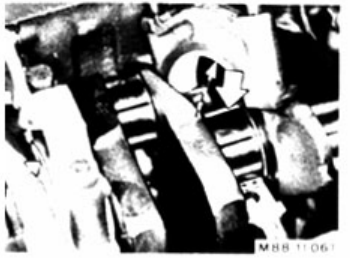


1 = Bearing shell 1–2–4–5
2 = Bearing shell 3 (pilot bearing)

Color code mark is located on the side of a bearing shell.

Check ground size of main bearing journals.

Install bearing shells in crankcase with same color code as the dot of paint on the console.
Install both bearing shells according to the crankshaft color code, if the color code mark on the crankcase is washed off.
Install bearing shells in bearing caps with the same color code as for the crankshaft.

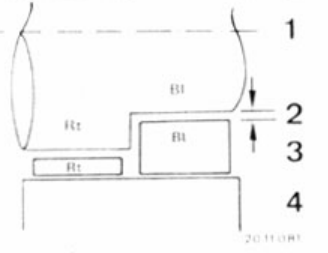


Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct bearing play by installing new bearing shells, bearing shells of different machined size or with different color code.



Survey of Color Code Shaft Diameter Bearing Shell Thickness*

Double Classification Color Codes:
Rt = red
Bl = blue

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

* See Specifications

11 21 571 REPLACING PILOT BEARING IN CRANKSHAFT

Remove clutch 21 21 000.
Pull out ball bearing with Special Tool 11 2 010

Installed Order:
1 Ball bearing
2 Cover
3 Felt ring
4 Capsule
Install cover (2) with stamp facing out.

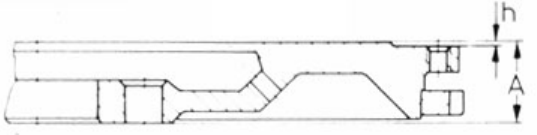
Pack bore in crankshaft with approx. 1 gram of lubricating grease.
Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

11 22 000 REMOVING AND INSTALLING FLYWHEEL

Remove clutch 21 21 000.
Hold flywheel with Special Tool 11 2 160.
Unscrew bolts and take off flywheel.
Installation
Clean tapped bores.
Install washer (1).
Replace and install expansion bolts with Loctite No. 270**.
Important!
Only coat threads of bolts.
Tightening torque*.

Check axial runout* of flywheel.

Friction surface may be machined to minimum thickness A*.
If machining the friction surface reduces distance "h" to zero, flange surface (distance "h") must be machined.



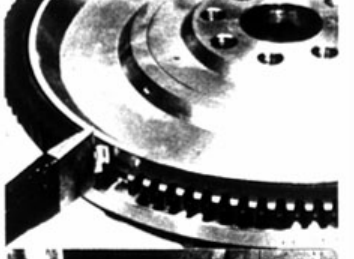
* See Specifications
** Source: HWB

11 22 051 REPLACING DRIVE PLATE FOR TORQUE CONVERTER

Remove transmission 24 00 020.
Hold flywheel with Special Tool 11 2 160.
Unscrew expansion bolts.
Replace drive plate (1).
Installation
Clean tapped bores.
Replace expansion bolts and install with Loctite No. 270**.
Important!
Only coat threads of bolts.
Tightening torque*.

11 22 541 REPLACING STARTER GEAR RING

Drill a 6 mm (0.236") dia. hole approx. 8 mm (0.315") deep below a tooth gap to make breaking the gear ring easier.



Break gear ring at drilled point with a chisel.

Installation
Heat new starter gear ring to 200 ... 230° C (395 to 445° F), checking temperature with a thermocolor pencil.
Tooth bevel faces engine.
Install starter gear ring to fit tight with a brass mandrel.

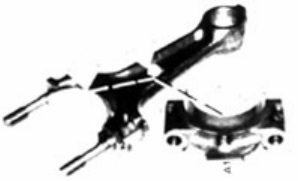
* See Specifications
** Source: HWB

28 11 275

11 24 521 REPLACING CONNECTING RODS – PISTONS REMOVED –

Important!
Only install connecting rods of same weight class in one engine.
Weight class is stamped in machined conrod cap surface or indicated by a color code.
Connecting rods may not be machined.

Piston pin must slide through conrod bushing under light pressure.
Install conrod bearing shells 11 24 571.



11 24 571 REPLACING CONNECTING ROD BEARING SHELLS – ENGINE DISASSEMBLED –

Install conrod bearing shells in connecting rods and conrod bearing caps.
Shells with Double Classification:
Install red or blue conrod bearing shells according to color code on connecting rod.
Important!
Check machined size (conrod bearing diameter).

28 11 305

28 11 306

In BDC position place Plastigage Type PG 1 on a crankshaft wiped clean of oil.
Connecting rods and conrod bearing caps are marked with identical pair codes (0 ... 99).
Pair codes must always be on one side in an engine.
Mount conrod bearing caps.
Tightening torque*.
Source for Plastigage:
Cartool
Alfred Brehm Str. 5
D-8070 Ingolstadt

28 11 061

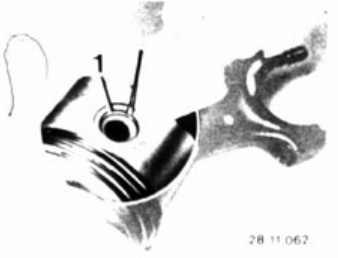
Important!
Don't turn connecting rods or crankshaft.
Take off bearing caps.
Read bearing play* on supplied scale by measuring width of flattened Plastigage.
Correct bearing play by installing new bearing shells, bearing shells of different machined size or with different color code.
For final installation, replace conrod bearing cap bolts and tighten bearing caps.
Tightening torque*.

* See Specifications

20.11.029

11 25 000 REMOVING AND INSTALLING PISTON

Remove engine.
Take off cylinder head, oil pan and oil pump.
Unscrew control bearing cap and press out piston with connecting rod upwards.
Important!
Mark installed position of connecting rod to crankshaft, if conrod bearing shells do not have to be replaced.



28.11.062

Remove circlip (1).
Press out piston pin.
Installation:
Piston pins and pistons are matched and must not be mixed up.
Important!
In case of excessive play between piston pin and conrod bush (which sounds like acceleration knock), check conrod bush diameter and, if necessary, replace connecting rod or bush.
Install connecting rod, see 11 24 521.

30.11.052

Only install a piston of same make and same weight class.
Weight class is die stamped with "+" or "-" in piston crown.
Important!
Check machined size (piston diameter)*.

Identification:

Type	E*	Piston Bowl Height (mm)	Dia. (mm)
M 10 B 18 V	9.5	4.5	89
M 10 B 18 L M 10 B 18 L.A/C/S	9.5	4.8	89
M 10 B 18 L.U	9.0	3.6	89
since 4/85	8.2	1.5	89

Check piston installed clearance*.

Engine	Make	Measuring Point A = mm
M 10 B 18	Mahle	14.00
(light alloy piston)	KS	30.85
	Alcan	15.50

28.11.064

* See Specifications

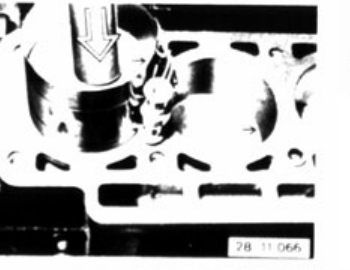
28.11.063

Set internal calipers to zero on micrometer with the measured piston diameter.

Measure cylinder bore with internal calipers at bottom, center and top in forward and rotational directions.
Check piston installed clearance*.

28.11.065

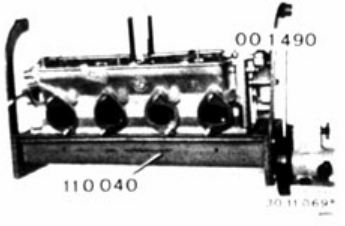
Lubricate piston and piston rings with oil.
Offset piston ring end gaps by 120°.
Compress piston rings with Special Tool 11 2 260.



28.11.066

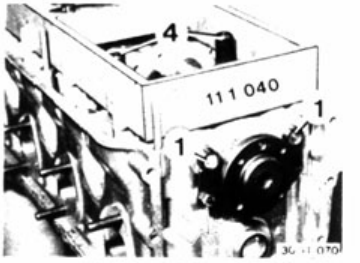
Install piston that arrow faces timing chain.

* See Specifications

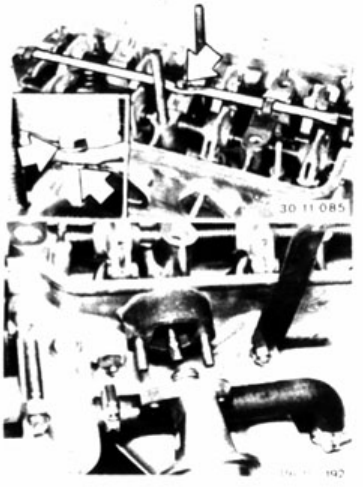


11 31 000 REMOVING AND INSTALLING CAMSHAFT

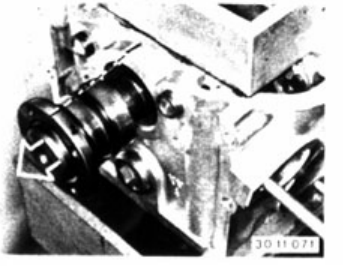
Remove cylinder head 11 12 100.
Mount cylinder head in Special Tool 11 1 040.



Insert dowel pins (4) and unscrew guide plate.
Installation:
Replace loose plugs (1) and install with Loctite No. 270**.
Camshaft must still turn easily after installing the guide plate.

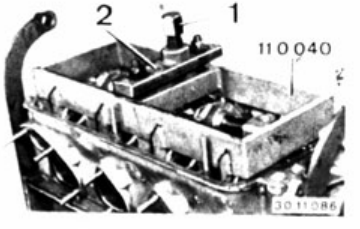


Unscrew oil line.
Installation:
Check installed position of seals.
Tightening torque*.



Pull out camshaft carefully.
Installation:
Turn camshaft in such a manner that notch on camshaft flange is aligned with cast boss on cylinder head, before removing the special tool.
Camshaft Identification:
2 = 264° = standard version.

M 10 B 18 V:
Unscrew fuel pump.
Installation:
Check gaskets and insulating flange, replacing if necessary.
Pull out plunger partially.



Adjust clearance of all valves to maximum value.
Mount Special Tool 11 1 040 and apply pressure on rocker arms.
Caution!
Pressure bolt (1) is off-center.
Apply tensioning bar (2) with short end facing the exhaust manifold, to avoid contact between valve heads.
Installation:
Adjust valve clearance 11 34 004.

* See Specifications

** Source: HWB

30 11 002

11 31 051 REPLACING TIMING CHAIN

Remove upper timing case cover 11 14 100
Remove lower timing case cover 11 14 120
Set cylinder no. 1 to TDC
Unscrew sprocket
Important!
Never crank engine after removing chain.

30 11 003

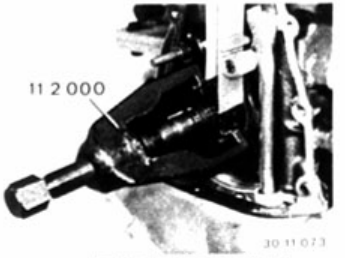
Installation
Install timing chain that notch in camshaft flange is aligned with cast boss on cylinder head.
Cylinder no. 1 is at TDC.
Tightening torque*.

Take timing chain off of lower sprocket and guide carefully out of guide rail.
Note:
Timing chain is stretched.

* See Specifications

11 31 061 REPLACING SET OF TIMING CHAIN SPROCKETS

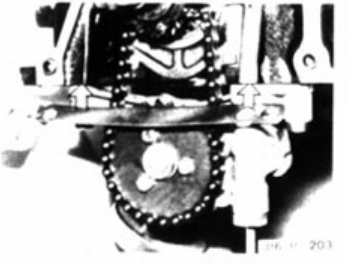
Remove timing chain 11 31 051
Single Piece Oil Pan:
Remove oil pan 11 13 000
Unscrew sprocket on oil pump
Remove woodruff key (1)
Take off chain



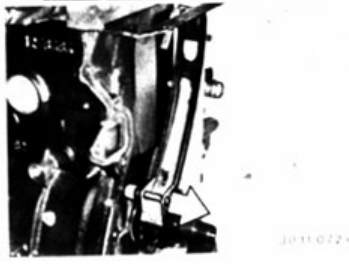
All Models:
Pull off sprocket with Special Tool 11 2 000
Installation
Heat sprocket to approx. 80° C (175° F)

Installation
Chain must be tightened to give under light thumb pressure applied midway between two pulleys

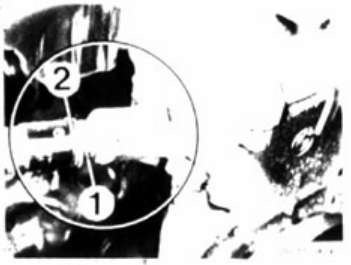
Double Piece Oil Pan:
Remove oil pan lower section 11 13 020
Unscrew sprocket (1) on oil pump
Take off chain



Adjust chain tightness with a shim
Important!
Check position of oil bore in shim

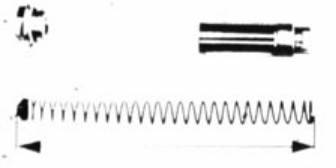


Remove lockwasher, swing tensioning rail toward inside and remove.

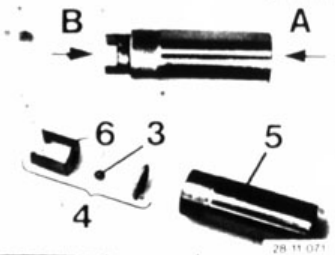


11 31 090 REMOVING AND INSTALLING CHAIN TENSIONER PISTON

Unscrew plug (1)
Caution!
Strong spring force
Remove spring and piston
Installation
Replace seal (2)



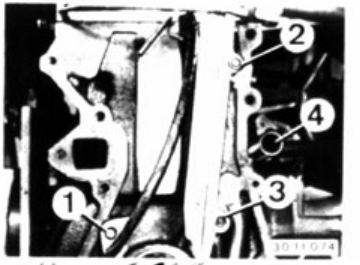
Installation
Check spring length*
Tapered end of coil spring faces plug



Checking Piston
Check free movement of ball (3) by shaking
Check function of valve by blowing air
in direction A = closed and
in direction B = opened
If applicable, drive valve (4) out of sleeve (5) and clean
Make sure vent slots (6) are not clogged

To bleed piston, remove cylinder head cover 11 12 000
Loosen plug (1) and remove tensioning rail (6) back and forth until oil runs out at plug (1) and resistance can be felt
Points Causing Unusual Chain Noise
a) Piston bled insufficiently
b) Piston seized
c) Vent slots clogged
d) Ball valve in piston malfunctions
e) Spring force excessive or insufficient

* See Specifications



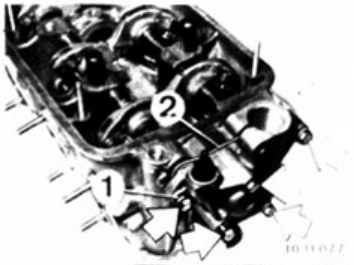
11 31 601 REPLACING TENSIONING RAIL GUIDE RAIL - TIMING CHAIN REMOVED

Remove circlips (1 ... 3)
Disconnect water pipe (4) on holder

Swing in and remove tensioning rail

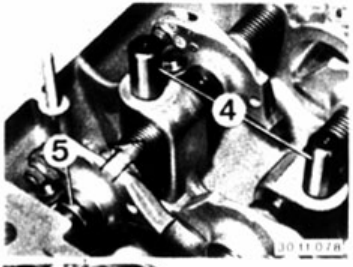
Pull off guide rail on bottom bearing pin

Swing guide rail aside and remove

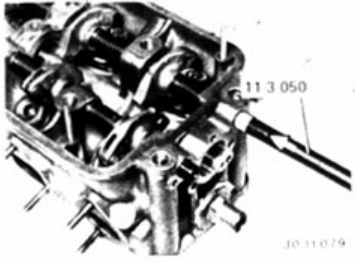


11 33 020 REMOVING AND INSTALLING ROCKER ARM SHAFTS

Remove camshaft 11 31 000
Unscrew distributor flange
Installation
Replace seal (1) and gasket (2)



Push back rocker arms and thrust rings
Remove snap rings (5)
Remove dowel pin (4)



Drive out rocker arm shafts with Special Tool 11 3 050.
Installation
Replace worn shafts.

Important!
Rear end of rocker arm shaft for intake side is open.
Rocker arm shaft on exhaust side must be closed.
Replace missing and install new or loose old plugs with Loctite No. 270**

Installed Order
Spring (9), washer (8), rocker arm (7), thrust ring (6) and snap ring (5)
A = Exhaust side
E = Intake side
Align rocker arm shafts that cylinder head bolts fit in openings.
Install dowel pins (4)
Important!
The new, short springs (9) may be installed together (mixed) with the conventional, long springs (9).

** Source: HWB

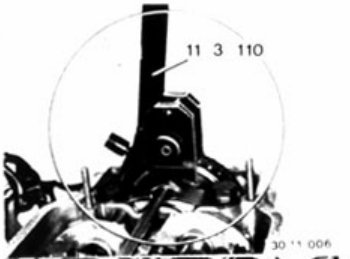
28 11 102

11 33 031 REPLACING ROCKER ARMS

Remove rocker arms 11 33 020
Replace worn rocker arms or rocker arms with loose slides.
Loose slides will be noticed as excessively loud valve noise.

28 11 566

Transfer setscrew (1), eccentric (2), washer (3) and nut (4) to new rocker arm.
Replace a worn eccentric.
Important!
Setscrew and nut have M 6 x 0.75 fine threads.
Bore faces out and thick side down.
Bevelled side of setscrew faces tab on rocker arm.



30 11 006

11 34 004 ADJUSTING VALVE CLEARANCE

Remove cylinder head cover 11 12 000
Crank engine with Special Tool 11 3 110

28 11 120

Adjusting order is same as firing order (1 3 4 2) in compression top dead center (TDC).
Adjust valve clearance* between valve and eccentric after loosening nut (1).

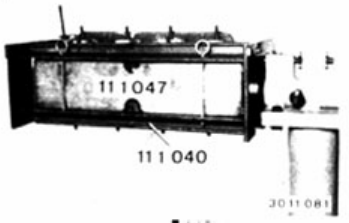
28 11 121

Tighten nut (1) with Special Tools 11 1 150 and 00 2 050.
Tightening torque*.

11 34 509 CHECKING ALL VALVES FOR LEAKS – CAMSHAFT REMOVED –

Spark plugs remain installed.
Fill combustion chamber with gasoline outdoors or indoors while conforming with fire prevention measures.
If gasoline runs past the valves, inspect valves and valve seats.
Remove and install valves 11 34 550.
Machine valve seats 11 12 607.

* See Specifications

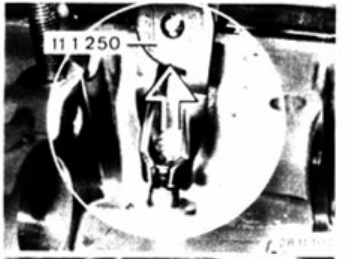


11 34 550 REMOVING AND INSTALLING VALVES
– Rocker Arm Shafts Removed –

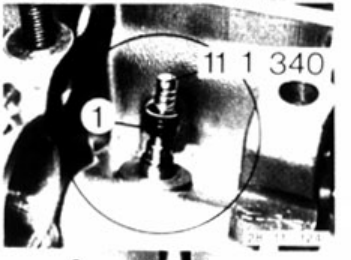
Place Special Tool 11 0 047 (tray) in Special Tool 11 1 040.

Press down on valve springs with Special Tool 11 1 040 and remove collets.

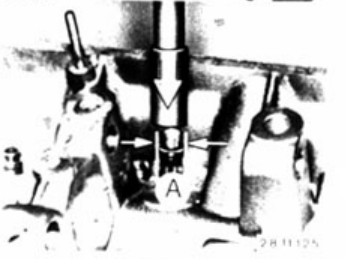
Remove upper spring retainer, valve springs and lower spring retainer.
Take tray out of special tool fixture and pull out valve.
Installation:
Only install valve springs with same color code, wire gauge size and length.
Lubricate valve guide and valve stem with oil.



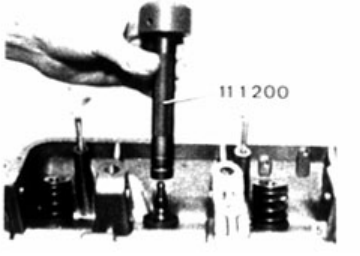
Pull off valve stem seal with Special Tool 11 1 250.



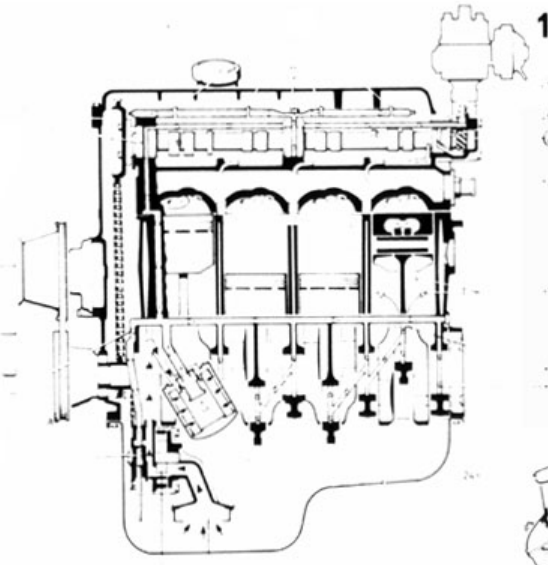
Install valve.
Use Special Tool 11 1 340 to avoid damaging valve stem seal.
Lubricate valve stem seal (1) with oil and install.
Special Tool Source:
Cartool
Alfred Brehm Str. 5
D–8070 Ingolstadt

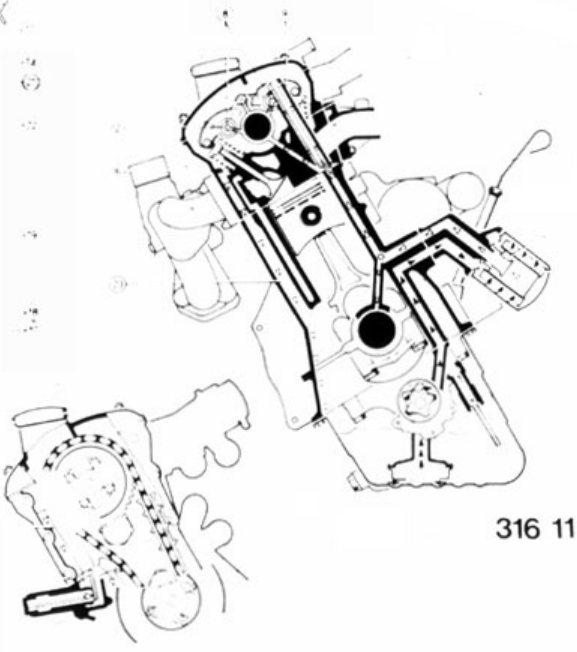


Press on valve stem seal against stop with Special Tool 11 1 090 when diameter A = 14.0 ± 0.2 mm (0.551 ± 0.008")
or
Special Tool 11 1 070 when diameter A = 14.3 ± 0.2 mm (0.563 ± 0.008").



New, improved valve stem seals with grooves on the inside are pressed on by hand with Special Tool 11 1 200.
Special Tool 11 1 200 has two diameters – for 7 mm (0.276") and 8 mm (0.315") valve stem seals.



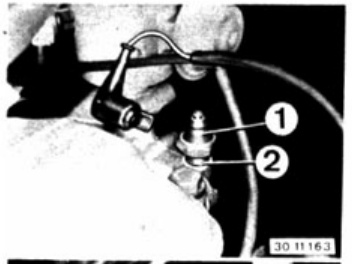


316 11 362

ENGINE OIL CIRCUIT

Unfiltered oil
Filtered oil

1 Oil pan
2 Intake with filter screen
3 Oil pump
3a Pressure relief valve
4 Oil filter
4a Safety valve
5 Main distribution bore
6 Oil bore in cyl. head
7 Camshaft bearing
8 Rocker arm shaft
9 Rocker arm bearing (intake valves)
10 Oil pressure transmitter
11 Camshaft bearing
12 Rocker arm bearings (exh. valves)
13 Camshaft bearing
14 Oil spray tube
15 Valve guide
16 Overflow from cylinder head
17 Crankshaft bearing
18 Conrod bearing
19 Spray oil
20 Pocket/chain lubrication
21 Oil sump/distributor drive
22 Overflow bore
23 Oil drain bore
24 Oil filler neck
25 Oil dipstick
26 Oil drain plug

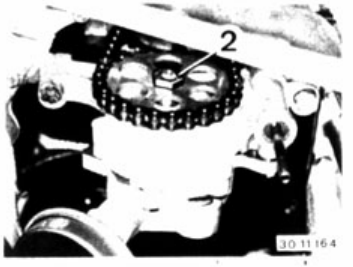


11 40 000 CHECKING ENGINE OIL PRESSURE

Pull off wires on oil pressure switch.
Unscrew oil pressure switch (1).
Installation:
Check seal (2), replacing if necessary.

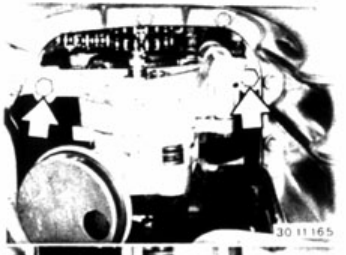
Screw in Special Tool 11 4 060.
Connect 10 bar (142 psi) pressure tester of BMW service test unit.
Check oil pressure*.

* See Specifications

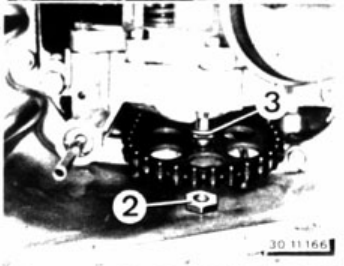


11 41 000 REMOVING AND INSTALLING OIL PUMP

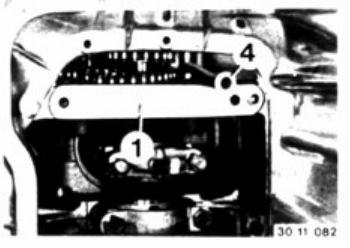
Remove oil pan lower section 11 13 020.
Unscrew nut (2) and take off sprocket.



Unscrew oil pump.

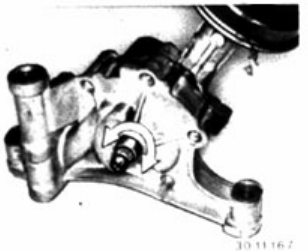


Installation:
Install shim (3).
Tightening torque* for nut (2).



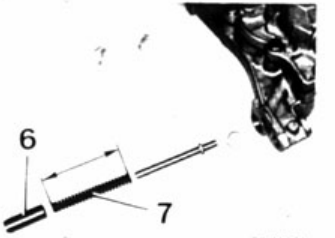
Installation:
Check installed position of O-ring (4) between housing and pressure line.
Important!
Adjust chain tightness with shim (1) that chain gives under slight thumb pressure.
Check position of oil bore in shim.

* See Specifications

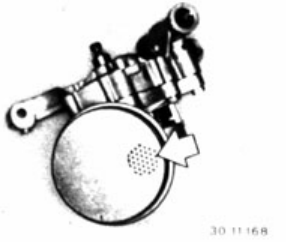


Checking and Servicing:

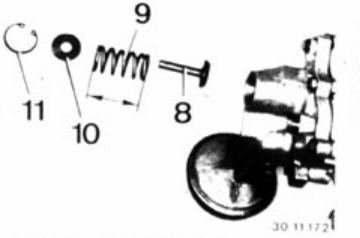
Turn drive shaft to check whether oil pump moves easily.



Pressure relief valve is located in main bore and regulates the engine oil pressure*, see 11 40 000.
Check whether piston (6) moves easily.
Check length of spring (7) = 68 mm (2.677").



Clean oil filter screen.



The 8 bar (114 psi) safety valve regulates the oil pressure in front of the oil filter and prevents oil filter leakage.
Check seating of piston (8).
Check length of spring (9) = 44 ± 0.4 mm (1.732 ± 0.016").

Disassemble oil pump.

Installation:
Press in spring (9) and washer (10) with a wrench socket and install circlip (11).

Check oil pump for wear.
– Scoring in body
– Wear on rotors

11 41 151 REPLACING OIL PUMP DRIVE CHAIN

Detach oil pan lower section 11 13 020.
Remove timing chain 11 31 051.
Unscrew nut (2) and take off sprocket.
Installation:
Check sprockets for wear.
Adjust chain tightness, see 11 41 000.
Chains with green color code are longer than those with red color code.
Tightening torque*.

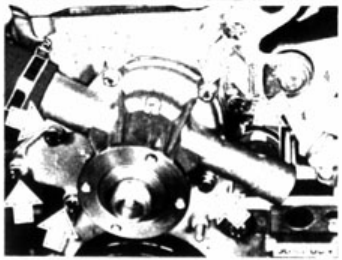
* See Specifications

11 42 020 REMOVING AND INSTALLING/ SEALING COMPLETE FULL FLOW OIL FILTER

Unscrew full flow oil filter on crankcase.
Installation:
Replace gasket (1).

11 42 021 REPLACING FULL FLOW OIL FILTER

Unscrew filter with Special Tools 11 4 000/ 11 4 020.
Installation:
Give gasket a light coat of oil.
Screw on oil filter by hand until gasket touches and then tighten filter by hand with one half turn.
Add oil, start engine and check oil level as well as for leaks.
If oil pressure is not built up in engines after replacing the oil filter cartridge, stop engine, loosen filter about 90° and tighten again only after starting engine and waiting until a small amount of oil runs out at filter (bleeding procedures).



11 51 000 REMOVING AND INSTALLING WATER PUMP

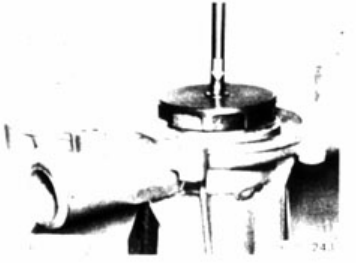
Remove fan 11 52 000.
Loosen alternator.
Remove pulley and drive belt.
Installation:
Tighten drive belt 12 31 299.

Loosen hose clamps.
Unscrew water pump.
Installation:
Replace gasket.

11 51 502 OVERHAULING WATER PUMP

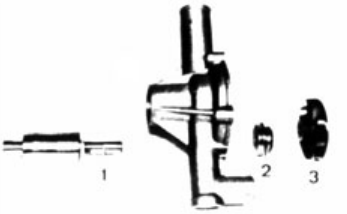
Pull off hub with Special Tool 00 8 500 from Kukko.

Installation
Distance (A)*.

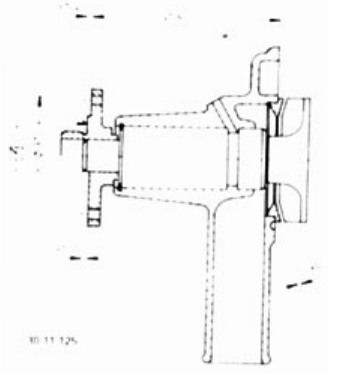


Remove circlip.

Press impeller off of shaft and water pump bearing out of housing.



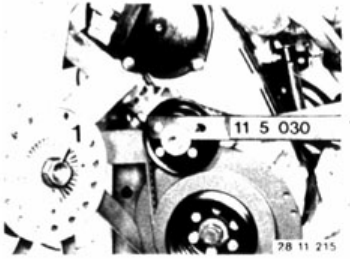
Replace bearing (1) and seal (2).
Check impeller (3), replacing if necessary.



Installation
Press on impeller with Loctite No. 270**.
Distance (B)* must always be held.

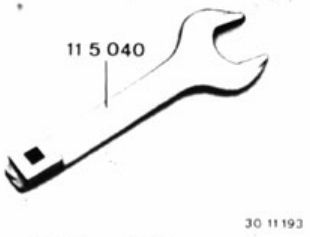
* See Specifications

* See Specifications
** Source: HWB

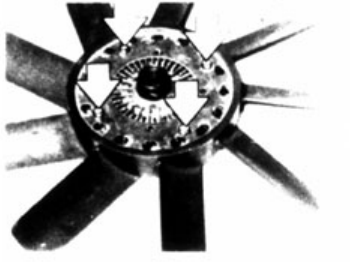


11 52 000 REMOVING AND INSTALLING FAN

Hold pulley with Special Tool 11 5 030 and unscrew coupling nut (1).
Important!
Left hand threads – turn nut clockwise to unscrew.
Tightening torque*.



Installation
Tighten fan with Special Tool 11 5 040.
40 Nm (29 ft. lbs.) tightening torque is equal to a 30 Nm (22 ft. lbs.) setting on torque wrench.



11 52 020 REPLACING FAN CLUTCH

Remove fan – see 11 52 000.
Replace fan clutch when
a) hub has seized (fan of stopped engine cannot be turned or is hard to turn),
b) fan coupling has axial/radial play or is losing oil.
Check switching points* with a Vibrocard***.
Unscrew fan mounting bolts and take off fan clutch.

11 53 000 REMOVING AND INSTALLING COOLANT THERMOSTAT

Drain coolant.
Loosen hose clamps.
Remove thermostat.
Installation
Bleed cooling system – see 17 11 000.

Checking Thermostat:
Place thermostat in a container filled with water and heat water.
Check opening temperature* and opening travel with a steel ruler.
Opening travel: 8 ± 1 mm (0.315 ± 0.039").

* See Specifications
*** See Workshop Equipment Catalog

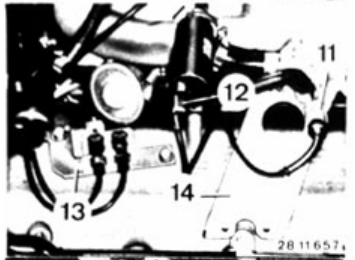
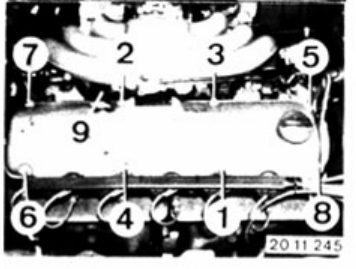
11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

M 20 B 20 / B 23:
Pull off hose (10).
Unscrew support (11).
Unscrew clamp (12).

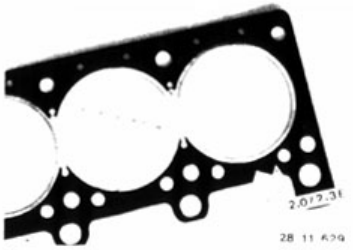
M 20 B 25:
Unscrew support (1).



M 20 B 27:
Pull off plugs (11 and 12) and unscrew holder (13).
Unscrew support (14).



All Models:
Disconnect hose (9).
Unscrew nuts (1 ... 8) and take off cover.
Installation:
Check gasket, replacing if necessary.
Screw on ground strap with nut (6).
Tighten nuts in order of 1 ... 8.
Tightening torque*.



11 12 101 REPLACING CYLINDER HEAD GASKET

Remove cylinder head 11 12 100.
Clean sealing surfaces on cylinder head and crankcase, using gasket remover** and a hard wood scraper.
Check levelness with a standard steel ruler, grinding cylinder head sealing surface (see 11 12 719) if necessary.
Installation:
Only use original cylinder head gaskets to guarantee matching of holes and openings for coolant.

Engine	Stamped Identification
M 20 B 20	2.0 / 2.3 E
M 20 B 23	2.0 / 2.3 E
M 20 B 25	2.5
M 20 B 27	2.7

Important!
A 0.3 mm (0.012") thicker gasket can be installed on a reground cylinder head to avoid reduction in size of the combustion chamber. This gasket can also be used to avoid engine knock when proper grade fuel is not available.

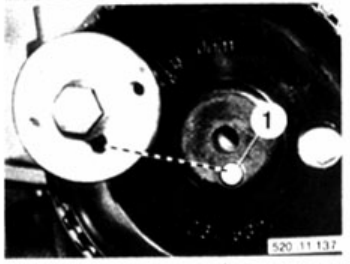
* See Specifications

** Source: HWB

11 12 240 REPLACING RADIAL OIL SEAL IN END COVER

Remove toothed drive belt - see 11 31 110.

M 20 B 20 / B 23:
Unscrew adapter.

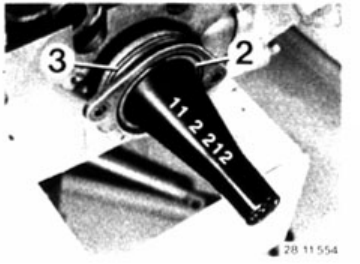


Unscrew toothed belt sprocket on camshaft.

Installation:
Cylindrical pin must be in bore of camshaft.

M 20 B 27 / B 25:
Take off toothed belt sprocket.

All M 20:
Unscrew cover.



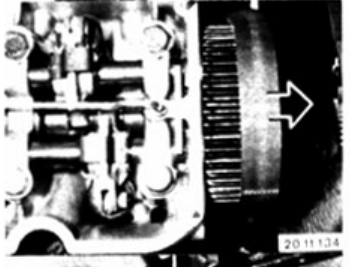
Replace radial oil seal (2) and round cord seal (3).

Installation
Use Special Tool for installation of the cover.

11 12 500 REMOVING AND INSTALLING CYLINDER HEAD (Engine Removed)

Remove cylinder head cover – see 11 12 000.
Turn crankshaft to have cylinder no. 1 in TDC – valves of cylinder no. 6 overlap.

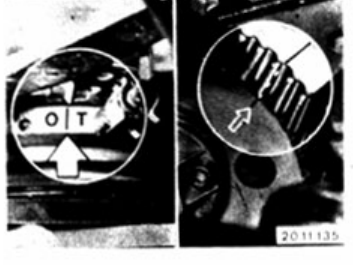
Remove drive belt cover.
Loosen bolts (7 and 8).
Push in tensioning roller and tighten bolt (8).



Take drive belt off of the camshaft sprocket.

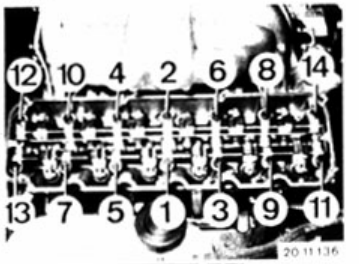
Caution!
Never crank engine after removing the drive belt.

Installation:
An used drive belt must always be replaced with a new belt each time the tensioning roller is loosened, regardless of the mileage***.
Replace drive belt – see 11 31 110.



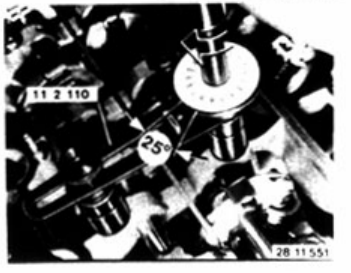
Installation:
Turn camshaft that mark on camshaft sprocket points to mark on cylinder head prior to mounting the cylinder head.
Cylinder no. 1 is set to TDC.
Also mount the drive belt in this position.

*** See Service Information of Gr. 11



Unscrew bolts in order of 14 to 1 and take off the cylinder head.

Installation:
Replace cylinder head gasket – see 11 12 101.
There must not be oil in cavities (danger of cracking, wrong tightening torque).
Clean and lubricate cylinder head bolts lightly with oil.
Tighten bolts in order of 1 to 14 in three steps.



Hexagon Head Bolts (Version A):

Step 1	40 Nm (29 ft. lbs.) torque 15 minute settling time
Step 2	60 Nm (43 ft. lbs.) torque 25 minute warm running
Step 3	25° torque angle

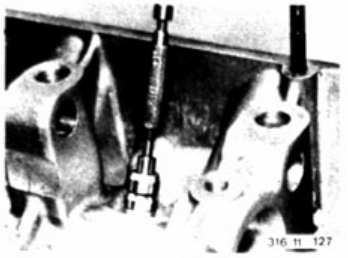
Torx Bolts (Version B):

Use new bolts!

Step 1	30 Nm (22 ft. lbs.) torque
Step 2	90° torque angle
Step 3	90° torque angle

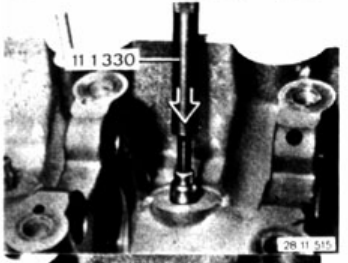
(no settling or warm running time)

Version A can be converted to Version B.

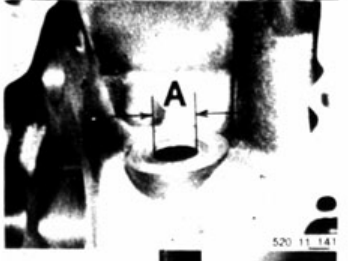


11 12 561 REPLACING VALVE GUIDE – Valve Removed

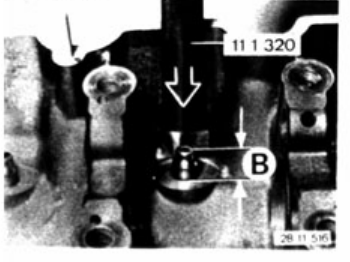
Check valve guide wear* with Special Tool 00 4 300.



Drive out valve guide (cold) into combustion chamber with Special Tool 11 1 330.



Check bore in cylinder head with Special Tool 00 4 530.
If permissible diameter has been exceeded, ream out bore A with a standard reamer and install an oversize* valve guide.

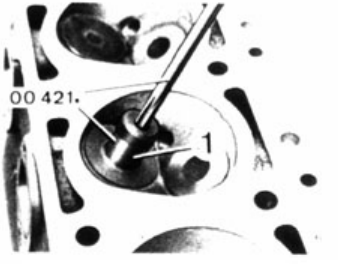


Heat* cylinder head.
Drive valve guide into combustion chamber from the camshaft side with Special Tool 11 1 320.
Stepped end of valve guide faces camshaft.
Important!
Bore in mandrel determines installed depth.
B = 14.5 ±0.5 mm (0.571 ±0.020").
Ream out valve guide to diameter of 7 H 7 mm (0.2756") with Special Tool 00 4 200.
Machine valve seat – 11 12 607.

* See Specifications

11 12 595 CHECKING VALVE GUIDE FOR WEAR – Valve Removed

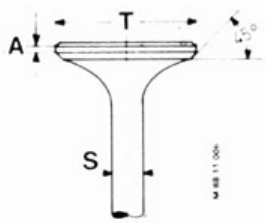
To measure amount of wear, install a new valve that end of valve stem is flush with valve guide.
Set up dial gage and measure tilt clearance.
Max. permissible tilt clearance*.



11 12 600 REAMING OUT VALVE GUIDE – Valve Removed

If there is excessive clearance between the valve guide and valve stem (see 11 12 595), ream out valve guide and install a repair valve with an oversized stem diameter "S"*.
This also requires machining the valve seat, see 11 12 607.
Press guide pad (1) on to valve seat and ream out valve guide starting from the combustion chamber side – turn down reamer once.

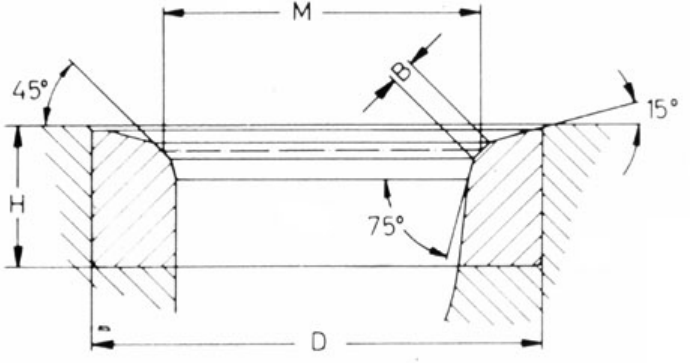
* See Specifications



11 12 607 MACHINING VALVE SEATS AND VALVES
– Valves Removed –

If edge thickness A* is less than specified, the valve must be replaced.

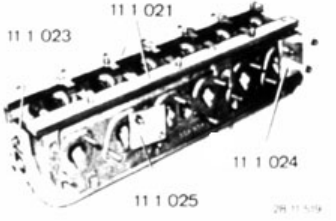
Machine correction angles* to produce valve seat diameter M* and valve seat width B* after machining the valve seat angle*.
Grind in valves with grinding paste and check valves for leaks – 11 34 509.



* See Specifications

11 12 719 GRINDING CYLINDER HEAD SEALING SURFACE
– Cylinder Head Disassembled

The total thickness (A) = 125.1 ± 0.1 mm (4.925 ± 0.004") of an original cylinder head must not be reduced by more than 0.3 mm (0.012").
Use a 0.3 mm (0.012") thicker gasket on a reground cylinder head (also refer to 11 12 101).

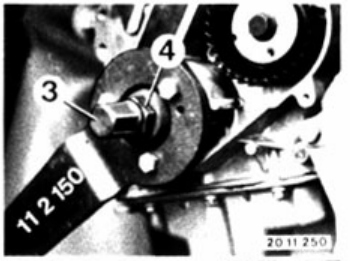


11 12 729 CHECKING CYLINDER HEAD FOR CRACKS IN WATER TEST
– Cylinder Head Disassembled

Mount Special Tools 11 1 021 on cylinder head (using cylinder head mounting bolts).
Close off water circuit on cylinder head with Special Tools 11 1 023, 11 1 024 and 11 1 025.

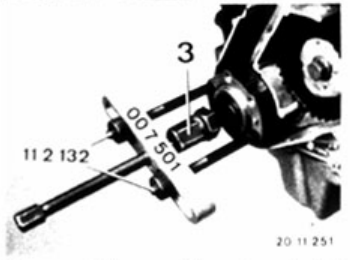
Apply compressed air on cylinder head.
Testing pressure: 4.5 bar (64 psi).
Place cylinder head in water bath and check for cracks.
Note
If necessary, relax water bath with a detergent.

* See Specifications



11 14 175 REMOVING AND INSTALLING FRONT END COVER

Remove radiator - see Group 17.
Remove toothed drive belt - see 11 31 110.
Single Piece Hub / Sprocket:
Hold sprocket with Special Tool 11 2 150.
Unscrew bolt (3).
Take off collar (4).
Installation:
Tightening torque*.



Screw in bolt (3) about three turns.
Pull hub / sprocket off of the crankshaft with help of Special Tools 00 7 501 and 11 2 132.

Important!
Woodruff key.

Double Piece Hub / Sprocket:
Screw in bolt (3) again.
Pull sprocket off of the crankshaft with help of Special Tools 00 7 501 and 11 2 131.

Important!
Woodruff key.

Installation:
Mount sprocket that the lettering faces forward.

Removing Sprocket on Intermediate Shaft:

Version with Two Tapped Bores in Flange of Intermediate Shaft:
Hold sprocket with Special Tool 11 2 190.
Unscrew bolt (6).
Take off washer (7) and toothed drive belt sprocket.

Version with One Tapped Bore:
Use Special Tool 11 2 280.

Unscrew bolts (8 ... 10).
Only loosen remaining oil pan bolts.
Loosen oil pan gasket on end cover carefully with a knife.
Unscrew cover.
Installation:
Remove oil pan and replace gasket (see 11 13 000), if oil pan gasket is damaged.
Coat holes of oil pan gasket with Three Bond Silicon 1207** brush-on universal sealing compound.
Replace gasket.

Check radial oil seal, replacing if necessary.

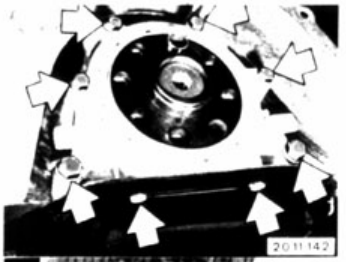
Important!
Always use Special Tools 11 2 211 (crankshaft) and 11 2 212 (intermediate shaft) for installation of the end cover.

* See Specifications

** Source of Supply: HWB

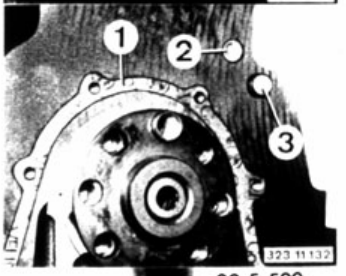
11 14 180 REPLACING RADIAL OIL SEAL IN FRONT END COVER

Remove front end cover - see 11 14 175.
Press radial oil seal out of cover.
Press in new radial oil seal with Special Tools 24 1 050 / 24 1 040.
Install new radial oil seals about 1 to 2 mm (0.039 to 0.079") deep in contradiction to the old seals, which were installed flush in standard production.
Lubricate sealing lips with oil.



11 14 605 REPLACING RADIAL OIL SEAL IN CLUTCH END COVER - Transmission Removed -

Remove flywheel - see 11 22 000.
Unscrew oil pan / end cover bolts.
Only loosen remaining oil pan bolts.
Loosen oil pan gasket on end cover carefully with a knife.
If the oil pan gasket is damaged, remove oil pan - see 11 13 000.
Unscrew end cover.
Replace gasket (1).



Important!
Check plug (2) of main oil bore for leaks, replacing with new plugs (3) front and rear if necessary.
Install plugs with Loctite No. 270**.

Use Special Tools 11 1 260 and 00 5 500 to press in the radial oil seal.
Install new radial oil seal about 1 to 2 mm (0.039 to 0.079") deep in contradiction to the old seal, which was installed flush in standard production.
Lubricate sealing lip with oil.

Coat joint between end cover and oil pan with Three Bond Silicon 1207** brush-on universal sealing compound.
Use Special Tool 11 2 213 to avoid damaging the radial oil seal.

** Source of Supply: HWB

11 21 000 REMOVING AND INSTALLING CRANKSHAFT

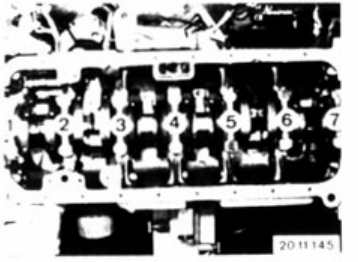
Remove engine 11 00 050.
Mount crankcase in assembly stand 00 1 490 with Special Tool 11 0 120.

Remove clutch 21 21 000.
Remove cylinder head 11 12 100.
Remove front end cover 11 14 175.
Remove oil pump 11 41 000.
Check axial play* before removing the crankshaft.
Max. Permissible Play Exceeded:
Check or replace thrust bearing.

Remove flywheel 11 22 000.
Unscrew end cover.
Installation:
Replace gasket.
Use Special Tool 11 2 213 to avoid damaging radial oil seal.
Cut off gasket on oil pan sealing surface.

Unscrew conrod bearing caps.
Installation:
Replace conrod bearing shells and measure conrod bearing play, see 11 24 571.
Pair numbers (0 ... 99) must be the same on connecting rods and caps.

* See Specifications

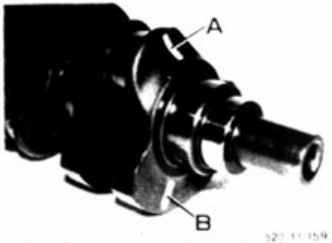


Unscrew crankshaft bearing caps and lift out crankshaft.
Installation:
Don't mix up bearing caps.
Bearing cap no. 1 is on drive belt end.
Bearing no. 6 is the thrust bearing.
Install bearing shells and check bearing play, see 11 21 531.

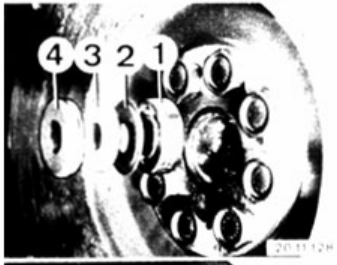
Installation:
Measure axial play after installing crankshaft loosen thrust bearing no. 6 again.
Center thrust bearing by applying knocks from a plastic hammer on front and rear ends of crankshaft.
Tighten thrust bearing to specifications.
Check axial play*.
If crankcase is replaced, clean oil and water bores again thoroughly to remove casting sand.

* See Specifications

28 11 307



521 11 159



20 11 12H

20 11 14H

11 21 501 REPLACING CRANKSHAFT
– Crankshaft Removed –

Note:
A replacement crankshaft is supplied complete with corresponding bearing shells for main and conrod bearings.
Crankshaft Identification:

Engine	Stroke	Grooves	Code
M 20 B 20	66.0 mm	1	U
M 20 B 23	76.8 mm	–	V
M 20 B 25	75.0 mm	3	X
M 20 B 27	81.0 mm	2	W

Crankshaft is surface treated and may only be reground in the factory.

Reground crankshafts are marked with stripes of paint.

Conrod Bearing Journal (A)
1 paint stripe — Size 1 *
2 paint stripes — Size 2 *

Main Bearing Journal (B)
1 paint stripe — Size 1 *
2 paint stripes — Size 2 *

Cars with Manual Transmission:
Install pilot bearing for the transmission main shaft.

Installed Order:
Ball bearing (1), cover (2), felt ring (3) and capsule (4).

Insert cover (2) with embossment facing out.

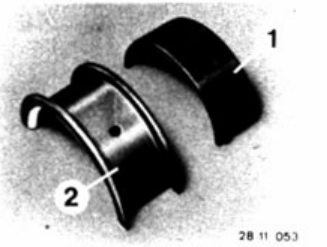
Fill bore in crankshaft with approx. 1 gram (0.035 oz.) of lubricating grease. Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

* See Specifications

28 11 308

Crankshaft bearing shells were installed standard with the following color codes for a pertinent ground size.
- Double classification: red blue (old color codes)
- Triple classification: yellow green white (new color codes)

Replacement crankshafts are only supplied with bearing shells of triple classification.



28 11 053

1 = Bearing shell 1–2–3–4–5–7
2 = Bearing shell 6 (pilot bearing)

The color code is located on the side of the bearing shell.

M88 11 060

Installing Instructions:
Only place bearing shells with "yellow" marks in the crankcase (regardless of the old color code mark on the crankcase).
Install bearing shells in bearing caps depending on the color code of the carnkshaft bearing journals – "yellow-green-white".

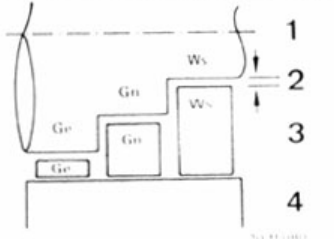
M88 11 061

Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with the correct torque*. Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

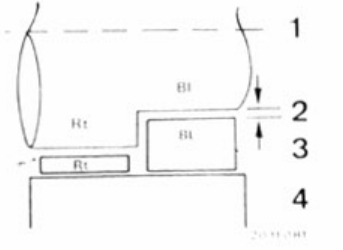
Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with different color code marks.



Survey of Color Code Shaft Diameter/ Bearing Shell Thickness*

Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white
Double Classification Color Codes:
Rt = red
Bl = blue

1 Crankshaft diameter
2 Bearing play
3 Bearin shell thickness
4 Console dimeter



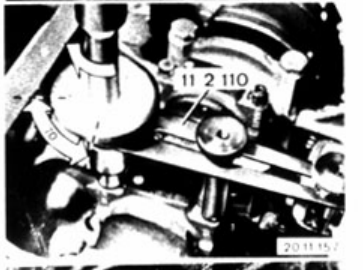
Replacing Conrod Bearing Shells:
Red or blue conrod bearing shells are installed standard depending on the color code mark on the connecting rod or crankshaft for a pertinent ground size.

Only install the red bearing shells of a pertinent ground size for a replacement crankshaft.

* See Specifications

Place Type PG-1 Plastigage on crankshaft wiped clean of oil in BDC position and mount the bearing caps that all grooves are on one side.
The pair number (0 ... 99) must be the same on connecting rods and caps.

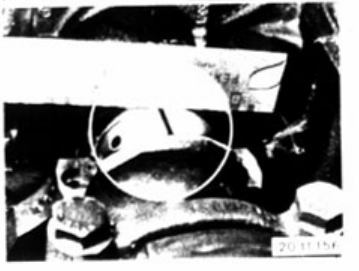
Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt



Tighten bolts in two steps (use old conrod bolts).
Step 1 20 Nm (14.5 ft. lbs.)
Step 2 70° torque angle

Important!
Do not turn the connecting rods or crankshaft.

Remove bearing caps.



Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with different color code marks.
Replace conrod bolts for final installation and tighten the conrod caps in two steps (see above).

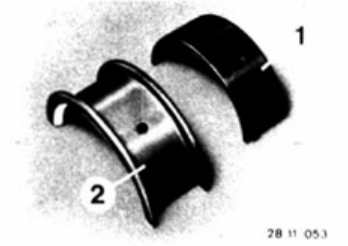
* See Specifications

28 11 308

11 21 531 REPLACING CRANKSHAFT MAIN BEARING SHELLS – Engine Disassembled –

Crankshaft bearing shells with the following color codes for a pertinent ground size had been installed standard.

- Double classification: red blue (old color code)
- Triple classification: yellow green white (new color code)



28 11 053

1 = Bearing shell 1–2–3–4–5–7
2 = Bearing shell 6 (pilot bearing)

Color code mark is located on the side of a bearing shell.

M88 11 060

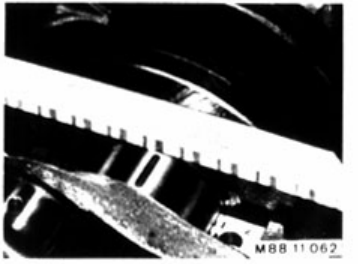
Install bearing shells in crankcase with same color code as the dot of paint on the console.
Install both bearing shells according to the crankshaft color code, if the color code mark on the crankcase is washed off.
Install bearing shells in bearing caps with the same color code as for the crankshaft.

M88 11 061

Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with the correct torque*.
Do not turn the crankshaft.

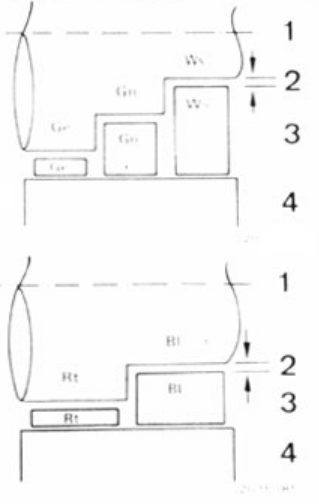
Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications



M88 11 062

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with a different color code.



Survey of Color Code Shaft Diameter Bearing Shell Thickness*

Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white
Double Classification Color Codes:
Rt = red
Bl = blue

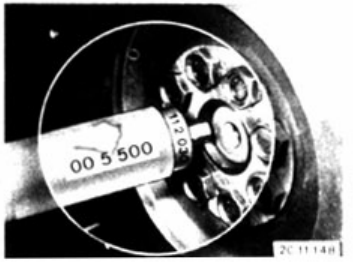
1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

* See Specifications

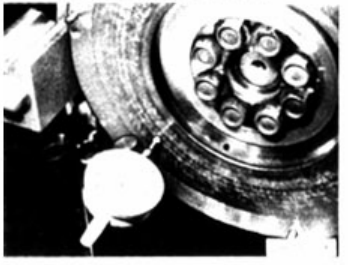
11 21 571 REPLACING PILOT BEARING IN CRANKSHAFT

Remove clutch 21 21 000.
Pull out ball bearing with Special Tool 11 2 010.

Installed Order:
1 Ball bearing
2 Cover
3 Felt ring
4 Capsule
Insert cover (2) with embossment facing out.



Pack bore in crankshaft with approx. 1 gram of lubricating grease.
Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.



11 22 000 REMOVING AND INSTALLING FLYWHEEL

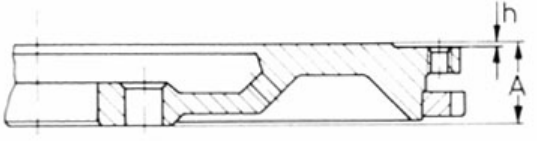
Remove clutch – see 21 21 000.
Hold flywheel with Special Tool 11 2 170.
Unscrew bolts and take off flywheel.

Installation:
Clean tapped bores.
Insert ring (1).
Install new bolts coated with microencapsulated cement.
Tightening torque*.

If necessary, check flywheel for axial runout*.

The friction surface may be machined to minimum distance A*.
If machining the friction surface reduces distance "h" to zero, the flange surface (distance "h") must be machined.
Machining is not possible on a double-mass flywheel.

M 88 11 072



* See Specifications
** Source of Supply: BMW Parts

11 22 051 REPLACING DRIVE PLATE FOR TORQUE CONVERTER

Remove transmission - see Group 24.
Hold flywheel with Special Tool 11 2 170.
Unscrew bolts and take off flywheel.

Installation:
Clean tapped bores.
Install new bolts coated with microencapsulated cement.
Tightening torque*.

11 22 541 REPLACING STARTER GEAR RING

Drill a hole about 8 mm deep below a tooth gap with a 6 mm dia. drill to make breaking the gear ring easier.

Break gear ring at drilled point with a chisel.

Installation:
Heat new starter gear ring to 200 ... 230° C.
Check temperature with a thermo-color pencil.
Tooth bevel faces engine.
Mount starter gear ring to fit firmly with help of a brass mandrel.

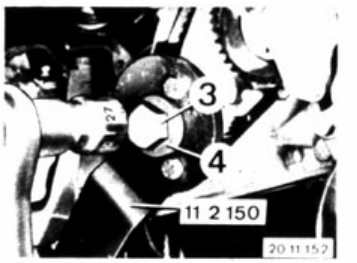
* See Specifications

11 23 010 REPLACING VIBRATION DAMPER

M 20 B 20 / B 27:
Take drive belts off of alternator, power steering pump and, if applicable, compressor for air conditioner.
Installation:
Tighten drive belts and check tightness with Special Tool 11 5 020.

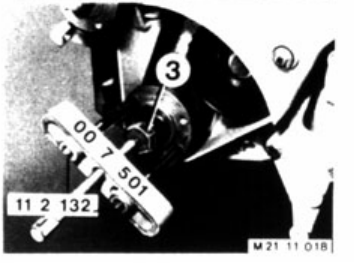
M 20 B 23 / B 25:
Remove fan – see 11 52 000.
Take drive belt off of alternator, power steering pump and, if applicable, air conditioner.
Unscrew pulley on water pump.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.

All:
Take pulley and vibration damper off of hub.
Installation:
Centering pin must be in bore of vibration damper.



11 23 031 REPLACING HUB FOR VIBRATION DAMPER

Two Piece Hub/Pulley:
Remove radiator – 17 11 000.
Remove vibration damper – 11 23 010.
Hold hub with Special Tool 11 2 150.
Unscrew bolt (3).
Take off collar (4).
Installation:
Tightening torque*.



Screw in bolt (3) about three turns.
Pull hub off of crankshaft with Special Tools 00 7 501 and 11 2 132.
Unscrew bolt (3).

* See Specifications

M 21 11 156

11 24 521 REPLACING CONNECTING RODS
– Pistons Removed –

Important!
Only install connecting rods of same weight class in one engine.
Weight class is stamped in machined surface of conrod bearing cap.
Connecting rods cannot be machined.
Check connecting rod length!

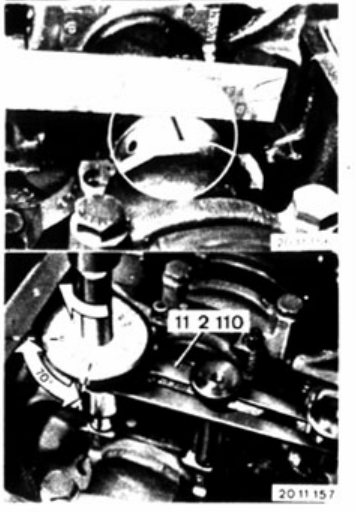
Piston pin must slide through conrod bushing under light pressure.

M 21 11 154

11 24 571 REPLACING CONROD BEARING SHELLS
– Engine Disassembled –

Place conrod bearing shells in connecting rods and conrod caps.
Double Classification:
Use red or blue conrod bearing shells according to color code on connecting rod.
Important!
Check machined size (conrod bearing diameter).

In BDC position place Plastigage Type PG * on crankshaft wiped clean of oil and install conrod bearing caps that all grooves are on one side.
Pairing code (0 ... 99) must be the same on cap and connecting rod.
Source for Plastigage
Cartool
Alfred Brehm Str. 5
D 8070 Ingolstadt



20 11 157

Tighten bolts in two steps (using old conrod bolts).
Step 1 = 20 Nm (14 ft. lbs.)
Step 2 = 70° torque angle
Important!
Do not turn connecting rods or crankshaft.
Remove bearing caps.
Read bearing play* from supplied scale used to measure width of flattened Plastigage.
Correct bearing play by installing new bearing shells, bearing shells of different machined size or with different color code.
Use new conrod bearing cap bolts for final installation and tighten bolts in two steps (see above).

* See Specifications

11 25 000 REMOVING AND INSTALLING PISTON

Remove engine.
Take off cylinder head, oil pan and oil pump.
Unscrew conrod bearing cap and push out piston with connecting rod upwards.

Important!
Mark installed position of connecting rod to crankshaft, if conrod bearings are not being replaced.

Remove circlip (1).
Push out piston pin.

20.11.159

Installation
Piston pins and pistons are matched and must not be mixed up.

Important!
In case of excessive play between piston pin and conrod bush (sounds like acceleration knock), check conrod bush diameter, replacing connecting rod or bush if necessary.

Only install a piston of same make and same weight class.
Weight class is stamped with "+" or "–" in piston crown.

20.11.160

Important!
Check machined size (piston diameter)*.

Engine	E*	Piston Bowl Height (mm)	Dia (mm)
M 20 B 20 L	9.8	3.3	80
M 20 B 20 L A/C/S	9.4	2.3	80
M 20 B 20 M Z	8.8	0.8	80
M 20 B 23 L	9.8	0.7	80
M 20 B 23 L A/C/S	9.4	–	80
M 20 B 25 M	9.7	–	84
M 20 B 25 M Z	8.8	4.4	84
M 20 B 27 M	11	0.65	84
M 20 B 27 since 9/85	10.2	0.9 (piston	84
M 20 B 27 M U	9	3.5 well)	84
M 20 B 27 M Z	8.5	3.6	84

* See Specifications

20.11.161

M88.11.052

20.11.162

20.11.163

Check piston installed clearance*.

Engine	Make	Measuring Point A = mm
M 20 B 20	Mahle	9.00
	KS	25.95
	Alcan	20.50
	Borgo	15.00
M 20 B 23	Mahle	12.00
	KS	18.05
	Alcan	22.70
M 20 B 25 M	Mahle	9.00
	KS	11.65
M 20 B 27	Mahle	23.00
	KS	23.00
M 20 B 27 M Z	Mahle	14.00

Set internal calipers to zero on the micrometer with the measured piston diameter.
Measure cylinder bore at bottom, middle and top with the internal calipers in forward and turning directions.
Compare measured piston installed clearance with specified piston installed clearance / max permissible total wear clearance.

Lubricate piston and piston rings with oil.
Offset piston ring end gaps by 120°.
Compress piston rings with Special Tool 11 2 260.

Install piston that arrow faces toothed belt.
Install connecting rod see 11 24 521.

* See Specifications

20.11.164

11 25 651 REPLACING PISTON RINGS OF ONE PISTON
– Piston Removed –

Measure side clearance* of piston rings.

Remove piston rings and measure end clearance*.

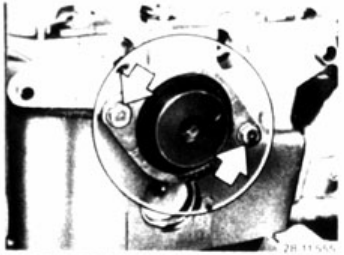
20.11.165

Installation
Install piston rings with the word "TOP" facing the piston crown.

1 Plain compression ring
2 Tapered face compression ring
3 Slotted oil scraper ring

Note
It might not be possible to find the identification on used piston rings.
Lay piston rings aside in correct sequence and installed position.

* See Specifications



11 31 000 REMOVING AND INSTALLING CAMSHAFT

Remove rocker arm shafts 11 33 020.
Unscrew end cover.

Check radial oil seal (1) and round cord seal (2), replacing if necessary.
Installation:
Use Special Tool 11 2 212 for installation of end cover.
Check axial play*.

Pull out camshaft.
Camshaft Codes:

Type	Degrees	Color Ring	Code
M 20 B 20 L	252	yellow	D
M 20 B 20 M.Z	260	–	L
M 20 B 23 L	252	white	C
M 20 B 25 M	260	green	F
M 20 B 25 M.Z	260	–	K
M 20 B 27 M	236	–	B
M 20 B 27 M since 9/85	236	blue	G
M 20 B 27 M.U	236	–	B
M 20 B 27 M.Z	236	–	B

* See Specifications

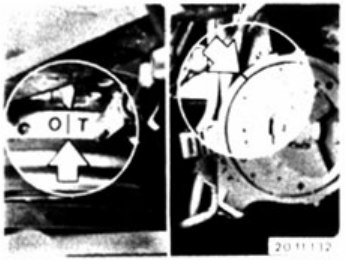
11 31 100 TIGHTENING TOOTHED DRIVE BELT

Do not retighten an used toothed drive belt replace a loose toothed drive belt.
Tighten toothed drive belt at coolant temperature of 15 to 35° C (60 to 95° F).
Remove rubber guard (1).
Unscrew nut (2).
Installation:
Tightening torque*.

Unscrew bolts (3).

Crank engine on crankshaft in running direction of engine.
This tightens the toothed belt.
Now tighten bolts (3).
Tightening torque*.

* See Specifications



11 31 110 REPLACING TOOTHED BELT

Important:
Always replace an used toothed belt each time the tensioning rooler is loosened, regardless of the mileage ***

Distributor Engine
Set valves in cylinder no. 1 to TDC (speed governor aligned with notch in distributor housing).

Loosen clamp (1).
Remove bolt (2) and take off suspension eye (3).

Unscrew nut (4).
Lift out TDC sender lead (5).
Remove protective cover (6).
Remove vibration damper - see 11 23 010.

Two Piece Hub/Toothed Belt Sprocket
Remove hub for vibration damper - see 11 23 031.
Swing away clamp (7).
Lift out TDC sender (8).
Unscrew screw (9) and take off protective cover.

*** See Service Information of Gr. 11

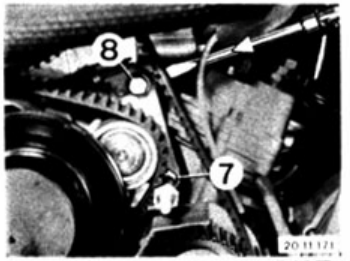
DME Engine
Unscrew distributor cap (1).
Unscrew distributor rotor (2).
Old version
Unscrew adapter (8).
Remove cover (3).
Unscrew screws (4).
Installation
Check seal (9), replacing if necessary.
Tightening torque*

Take off rubber guard (5).
Unscrew nut (6).
Remove protective cover (7).
Reinstall adapter (8).

Turn crankshaft to move valves in cylinder no. 1 to TDC (arrow on camshaft sprocket faces mark on cylinder head).
Remove vibration damper - see 11 23 010.

Two Piece Hub/Toothed Belt Sprocket
Remove hub for vibration damper - see 11 23 031.
Swing away clamp (7).
Lift out TDC sender (8).
Unscrew screw (9) and take off protective cover.

* See Specifications



All:
Loosen bolts (7 and 8).
Push in tensioning roller.
Tighten bolt (8).
Take off drive belt.

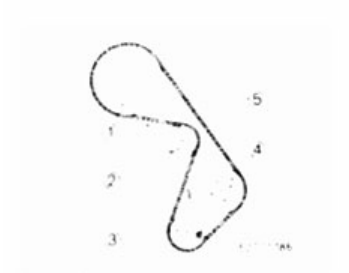
Installation
There are different toothed drive belt versions.

1. Sprockets with Square Profile:
   A. Square profile with 111 teeth
   B. Square profile with 110 teeth ("Z 127") with modified tensioning spring and tensioning roller marked "Z 127".

2. Sprockets with Semi-round Profile:
   A. Semi-round profile with 128 teeth
   B. Semi-round profile with 127 teeth ("Z 127") and tensioning roller marked "Z 127".

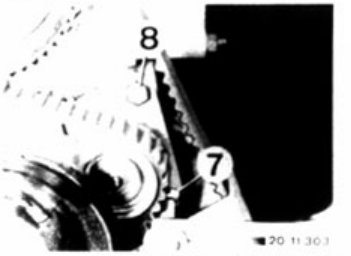
Versions A must be converted to B***.
Install toothed drive belt starting from the crankshaft sprocket and working opposite the engine's direction of rotation.

Important!
Check position of the distributor.



Toothed Drive Belt Assembly:
1 Camshaft sprocket
2 Tensioning roller
3 Crankshaft sprocket
4 Intermediate shaft sprocket
5 Toothed drive belt

*** See Service Information of Gr. 11



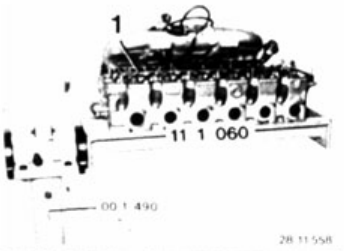
Tightening Toothed Drive Belt:

Loosen bolt (8) (spring force should be capable of moving the tensioning roller).

Crank engine once on the crankshaft in direction of rotation up to the TDC mark (drive belt is tightened).

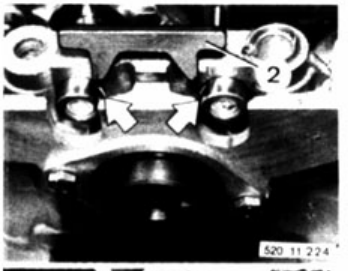
Check timing (mark on camshaft sprocket must be aligned precisely with mark on cylinder head with the crankshaft at TDC mark).

Paste a label containing the date and mileage on the cylinder head cover after finishing the work.



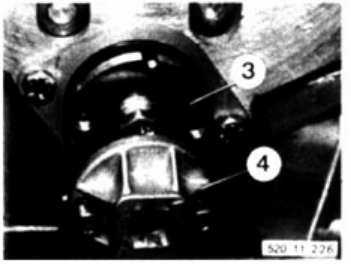
11 33 020 REMOVING AND INSTALLING ROCKER ARM SHAFTS

Engine with Distributor:
Remove cylinder head 11 12 100.
Mount cylinder head on Special Tool 11 1 060 and bolt down with one cylinder head bolt.
Unscrew oil line (1).

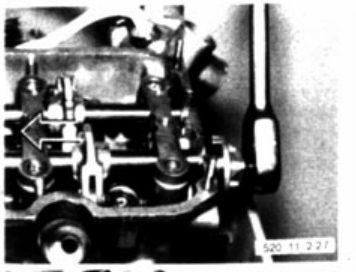


Unscrew toothed belt sprocket.
Adjust clearance of all valves to maximum value.
Remove plugs.
Remove guide plate (2).
Installation
Guide plate (2) must fit in grooves of rocker arm shafts.

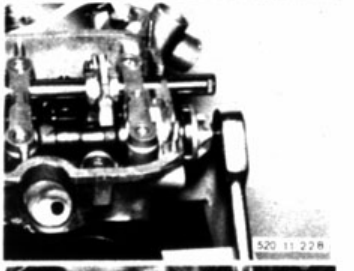
Lift out clamps.
Installation
Straight surface of clamp must fit in groove of rocker arm shafts.



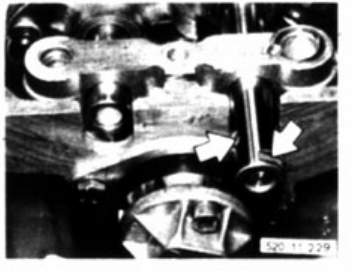
Mount disc (3) and adapter (4) on camshaft to turn the camshaft.



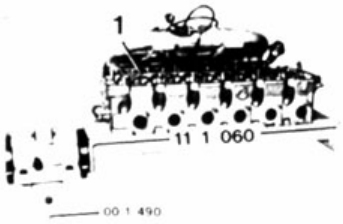
Removing Rocker Arm Shafts
a) Exhaust Side
Valves of cylinder no. 6 must overlap.
Push in rocker arm of first cylinder.
Turn camshaft on adapter toward intake side until pressure is taken off of all rocker arms.
Pull out rocker arm shaft or drive out with Special Tool 11 3 050.



b) Intake Side
Turn camshaft on adapter toward exhaust side until pressure is taken off of all rocker arms.
Pull out rocker arm shaft or drive out with Special Tool 11 3 050.



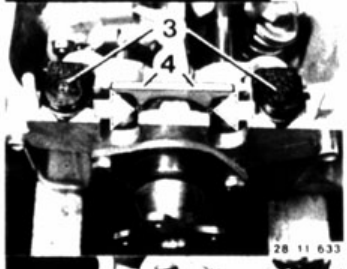
Replace worn rocker arm shafts and rocker arms.
Installation
Install rocker arm shafts that large oil bores face valve guides and grooves for guide plate face in.



11 33 020 REMOVING AND INSTALLING ROCKER ARM SHAFTS

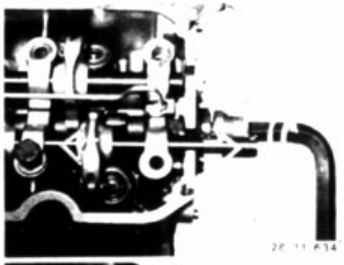
Engine with DME
Remove cylinder head 11 12 100
Mount Special Tool 11 1 060 on assembly stand 00 1 490 and mount cylinder head with one cylinder head bolt
Unscrew oil line (1)
Remove toothed belt sprocket

Mount adapter (2)
Adjust valve clearance of all valves to maximum value

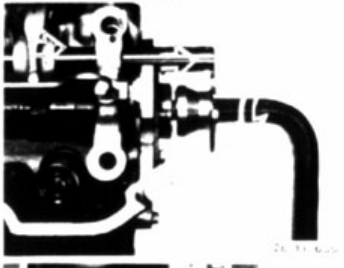


Lift out front and rear plugs (3)
Remove guide plate (4)
Installation
Guide plate (4) must fit in grooves of rocker arm shafts

Lift out clamps
Installation
Straight surface of clamps must fit in groove of rocker arm shafts



Removing Rocker Arm Shafts
a) Exhaust Side
Valves of cylinder no. 6 must overlap
Push in rocker arm of first cylinder and turn camshaft on adapter toward intake side until pressure is taken off of all rocker arms
Pull out rocker arm shaft or drive out with Special Tool 11 3 050



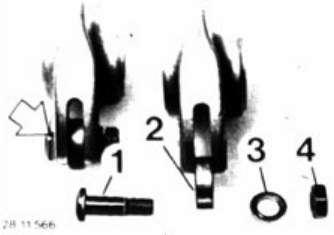
b) Intake Side
Turn camshaft on adapter toward exhaust side and move rocker arms until pressure is taken off of all rocker arms
Pull out rocker arm shaft or drive out with Special Tool 11 3 050

Replace worn rocker arm shafts and rocker arms
Installation
Install rocker arm shafts that oil bores (large face down toward valve guide and small oil bores and grooves for guide plate face in

28.11.565

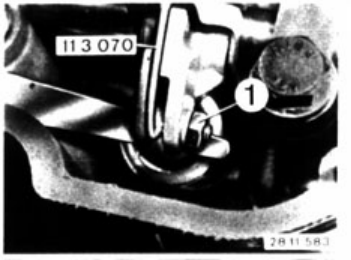
11 33 031 REPLACING ROCKER ARMS

Remove rocker arm shafts 11 33 020.
Replace worn rocker arms or rocker arms with loose slides.
Loose slides will be noticed as unusually loud valve noise.



28.11.566

Transfer adjusting screw (1), eccentric (2), washer (3) and nut (4) to new rocker arm.
Replace a worn eccentric.
Important!
Adjusting screw and nut have M 6 x 0.75 fine threads.
Bore faces out and thick side down.
Bevelled surface of adjusting screw faces boss on rocker arm.



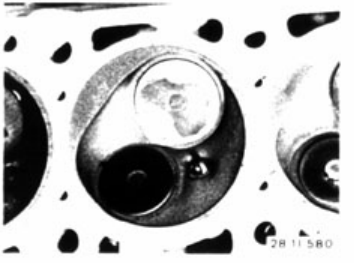
28.11.583

11 34 004 ADJUSTING VALVE CLEARANCE

Remove cylinder head cover 11 12 000.
Crank engine on crankshaft.
Make adjustments in firing order 1 5 3 6 2 4 in compression TDC.
Adjust valve clearance* between valve and eccentric after loosening nut (1).

28.11.582

Tighten nut (1) with Special Tools 11 1 150 and 00 2 050.
Tightening torque*.



28.11.580

11 34 509 CHECKING ALL VALVES FOR LEAKS
– Camshaft Removed

Spark plugs remain installed.
Fill combustion chamber with gasoline outdoors or indoors in conformance with fire prevention regulations.
Valves and valve seats must be inspected, if gasoline escapes around the valve heads.
Remove and install valves 11 34 550.
Machine valve seats 11 12 607.

* See Specifications

11 34 550 REMOVING AND INSTALLING VALVES

Remove rocker arm shafts 11 33 020.
Place Special Tool 11 1 066 (tray) in Special Tool 11 1 060.
Unscrew intake manifold.
Installation:
Replacing gaskets.

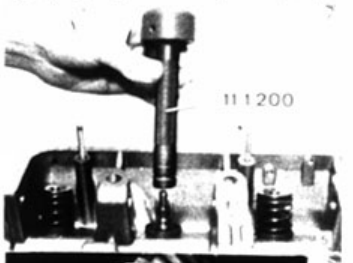
Press down valve springs with Special Tool 11 1 060 and remove valve collets.

Take off upper spring retainer, valve springs and lower spring retainer.
Take tray out of assembly fixture and pull out valves.
Installation:
Only install valve springs with same color code, wire gage size and length.
Lubricate valve guides and valve stems with oil.

Pull off valve seal with Special Tool 11 1 250.

Install valve.
Always use Special Tool 11 1 350 to avoid damaging valve seals.
Lubricate valve seal (1) with oil and install.
Source for Special Tool Sleeves:
Cartool
Alfred Brehm Str.
D-8070 Ingolstadt

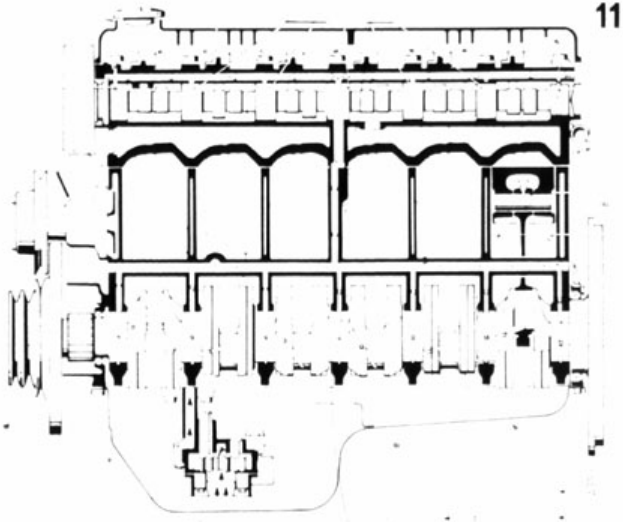
With "Gotze" Seals:
Press on valve seal to fit tight with Special Tool 11 1 140.
Dia. A = 12.8 mm (0.504").
With "Elring" Seals:
Press on valve seal to fit tight with Special Tool 11 1 080.
Dia. A = 13.5 mm (0.531").

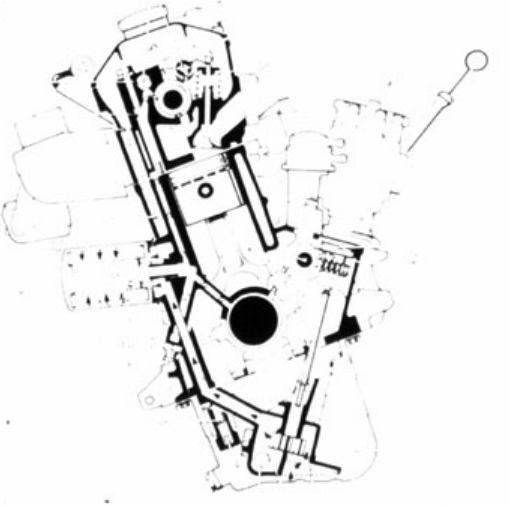


New, improved valve stem seals with grooves on the inside are pressed on by hand with Special Tool 11 1 200.
Special Tool 11 1 200 has two diameters – for 7 mm (0.276") and 8 mm (0.315") valve stem seals.

11 35 020 REMOVING AND INSTALLING DISTRIBUTOR INTERMEDIATE SHAFT

Remove fuel pump – see 13 31 030.
Remove distributor – see 12 11 060.
Remove front end cover – see 11 14 175.
Unscrew guide (1) and pull out intermediate shaft (2).
Installation
Check sprocket, replacing interm. shaft if necessary. Install sprocket with mark "B"***
Bearings in crankcase cannot be replaced
*** See Service Information of Gr. 11



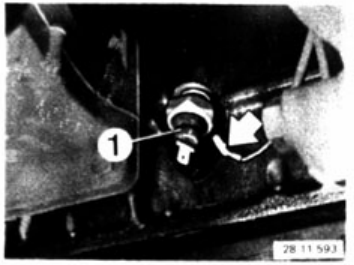


520 11 253

Unfiltered oil
Filtered oil

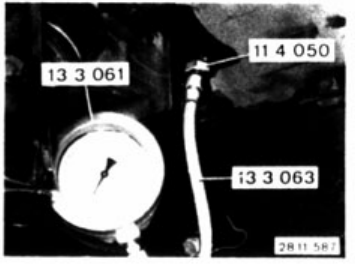
ENGINE OIL CIRCUIT

1 Oil pan
2 Intake with filter screen
3 Oil pump
3a Safety valve
4 Oil filter
4a Safety valve (oil filter)
4b Check valve, unfiltered side) prevent draining of filter
4c Check valve, filtered side) on stopped engine
4d Pressure relief valve
5 Main distribution bore
6 Oil pressure lamp sensor
7 Crankshaft bearing
8 Oil bore in cylinder head
9 Hollow rocker arm shaft
10 Front camshaft bearing
11 Camshaft bearing
12 Rear camshaft bearing
13 Rocker arm bearings (intake)
14 Rocker arm bearings (exhaust)
15 Intermediate shaft bearings
15a Spray oil for distributor gear
16 Oil line for cams
17 Valve guide
18 Conrod bearing
19 Spray oil
20 Piston pin/cylinder wall
21 Spill from cylinder head
22 Oil drain
23 Oil filler neck
24 Oil dipstick
25 Oil drain plug



11 40 000 CHECKING ENGINE OIL PRESSURE

Pull off wires on oil pressure switch.
Unscrew oil pressure switch (1).
Installation
Check gasket, replacing if necessary.



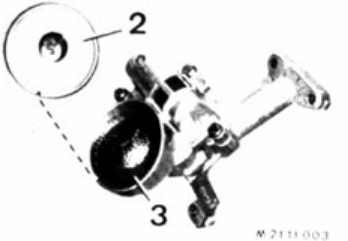
Screw in Special Tool 11 4 050 (connector).
Connect Special Tool 13 3 063 (hose) in conjunction with Special Tool 13 3 061 (pressure tester).
Check oil pressure*.

* See Specifications

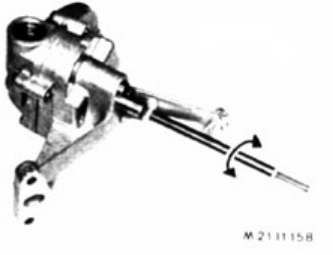
11 41 000 REMOVING AND INSTALLING OIL PUMP

Remove oil pan 11 13 000.
Unscrew oil pump.

Installation:
Guide in drive shaft (1).
Replace bearing – see 11 11 160.
325 iX:
Fill master oil bore (pressure end) of oil pump with engine oil***.



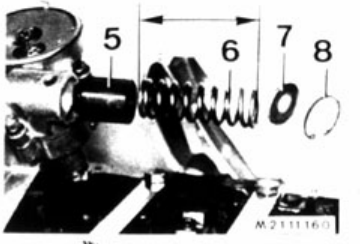
Testing and Servicing:
Unscrew cover (2) and clean oil filter screen (3).



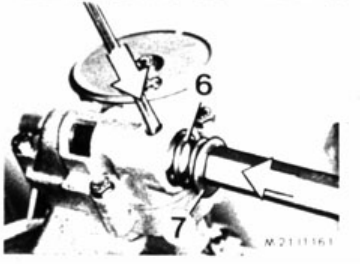
Check whether gears turn easily by turning the drive shaft.

*** See Service Information of Gr. 11

Unscrew oil pump cover and check oil pump for wear.
- Scoring in body / cover
- Wear on gears



The pressure relief valve regulates oil pressure in front of the oil filter and prevents oil filter leakage.
Check that piston (5) moves easily.
Check length of spring (6) = 44 ± 0.2 mm (1.732 ± 0.008").



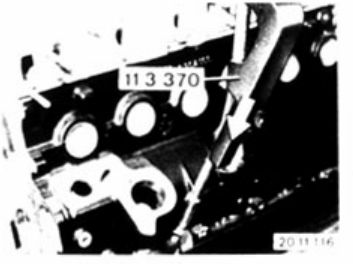
Installation:
Press in and hold spring (6) and washer (7) with a screwdriver.
Install circlip (8).

11 41 110 REMOVING AND INSTALLING PRESSURE RELIEF VALVE

The pressure relief valve is located in the main bore and regulates the engine oil pressure* after the oil filter.
Remove oil pan 11 13 000.
Unscrew pressure relief valve.
Remove sleeve (1).

11 42 020 REPLACING FULL FLOW OIL FILTER

Unscrew filter with Special Tool 11 4 020.
Installation:
Give gasket a light coat of oil.
Screw on oil filter by hand until gasket makes contact and then tighten by hand with one half turn.
Add oil, start engine, check oil level and check for leaks.
If oil pressure is not built up in engines after replacing the oil filter cartridge, stop engine, turn (loosen) filter about 90°, start engine again and tighten filter after oil runs out at filter briefly (bleeding procedures).



11 43 101 REPLACING GUIDE TUBE FOR OIL DIPSTICK

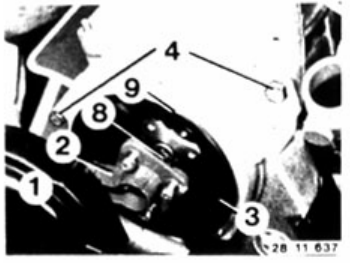
Install guide tube with Loctite No. 270** and drive in against stop.

* See Specifications

** Source: HWB

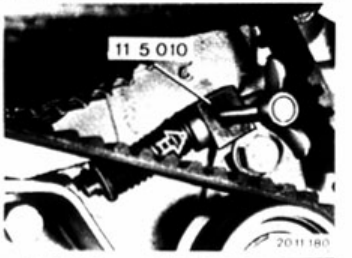
11 51 000 REMOVING AND INSTALLING WATER PUMP

Engine with Distributor:
Drain coolant.
Loosen clamp (1).
Remove bolts (2) and take off suspension eye (3).
Remove fan 11 52 000.
Installation:
Fill and bleed cooling system 17 00 039.



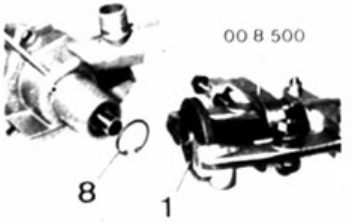
Engine with DME:
Drain coolant.
Remove distributor cap (1).
Remove distributor rotor (2).
Unscrew adapter (8).
Remove cover (3).
Unscrew bolts (4).
Remove fan 11 52 000.
Installation:
Fill and bleed cooling system 17 00 039.
Check seal (9), replacing if necessary.

Unscrew pulley.
Unscrew bolt (4) and take off drive belt.
Remove rubber part (5) and pull out cover (6).
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.



Compress spring clip and hold pin with Special Tool 11 5 010.
Installation:
Check installed position of pin to water pump.

Disconnect water hoses (7 and 8).
Unscrew water pump.
Installation:
Replace gasket.



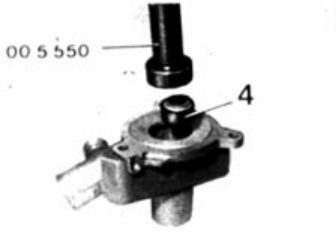
11 51 502 OVERHAULING WATER PUMP
– WATER PUMP REMOVED –

Pull off hub (1) with Special Tool 00 8 500
Remove circlip (8)

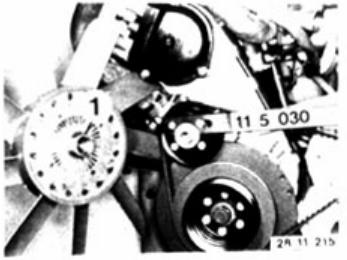
Replace bearing (3) and seal (4)
Check impeller (6), replacing if necessary
1 = Hub
2 = Water pump body
Installation
Press in bearing (3) against stop
Press on impeller (6)

Press out water pump bearing

Check assembled distances

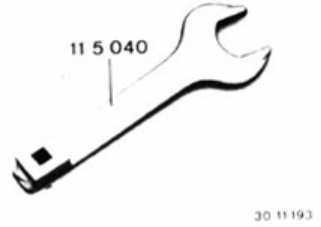


Drive out seal (4)
Installation
Press in seal (4) with Special Tool 00 5 550

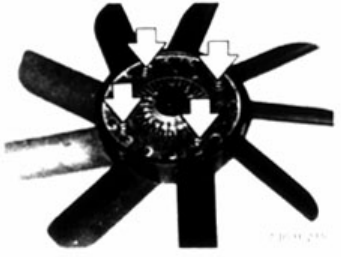


11 52 000 REMOVING AND INSTALLING FAN

Temperature Dependent Viscous Fan Clutch:
Hold pulley with Special Tool 11 5 030 and unscrew coupling nut (1).
Important!
Left-hand threads – loosen nut by turning clockwise.
Tightening torque*



Installation:
Tighten fan with Special Tool 11 5 040 40 Nm (29 ft. lbs.) tightening torque is equal to 30 Nm (22 ft. lbs.) setting on torque wrench.



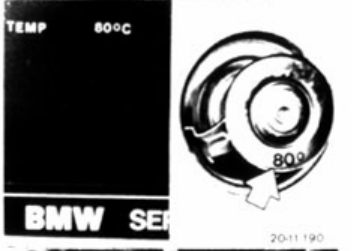
11 52 020 REPLACING FAN CLUTCH

Remove fan – see 11 52 000.
Fan clutch must be replaced when
a) hub has seized – fan of stopped engine cannot be turned or is hard to turn,
b) fan clutch has axial and/or radial play or is losing oil.
Check switching points* with a Vibrocard***
Unscrew fan mounting bolts and take off fan clutch.

11 53 000 REMOVING AND INSTALLING COOLANT THERMOSTAT

Drain coolant partially.
Take off cover (1).
Installation:
Bleed cooling system – see 17 00 039.

Remove thermostat.
Installation:
Clamp on thermostat faces out.
Replace rubber ring (2).
New Thermostat Housing Since 1986 Models:
Install thermostat with number 1 715 040 (small valve seat).



Checking Thermostat:
Does thermostat begin to open at temperature given in the Specifications?
Check opening temperature by placing thermostat in hot water and compare test value with specified value.

11 53 080 REPLACING TEMPERATURE TRANSMITTER

Pull off wire (1).
Unscrew transmitter.
Installation:
Replace seal (2).
Bleed cooling system – see 17 00 039.

* See Specifications
*** See Workshop Equipment Catalog

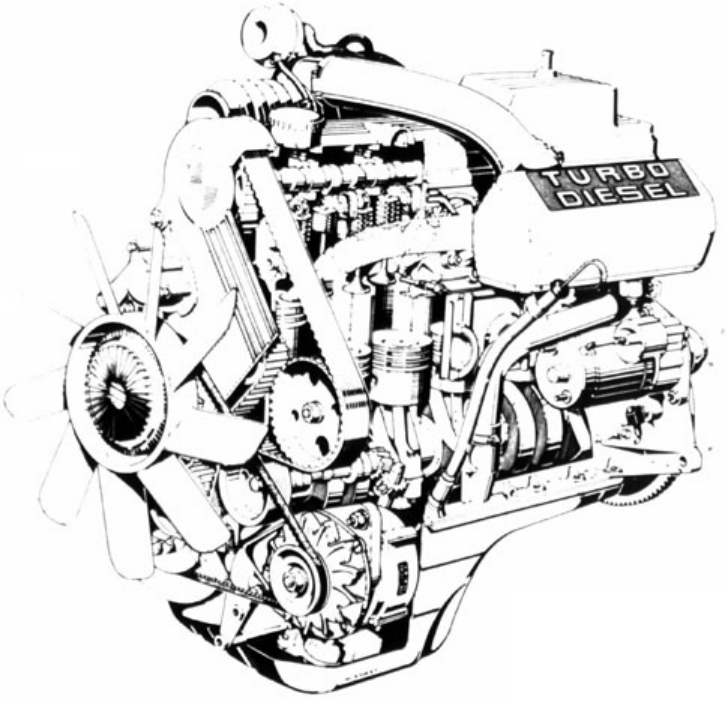
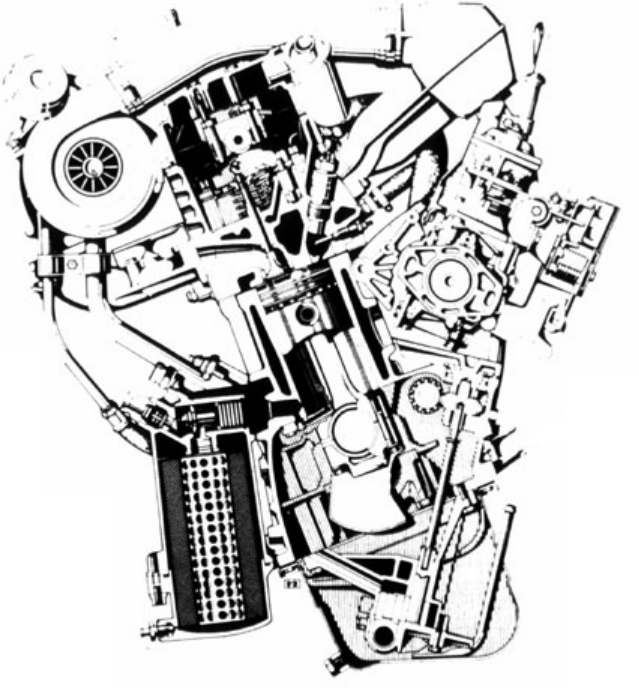
M 21 D 24 W – BMW 324 d / 524 d

M 21 = Small 6 cylinder
D = Diesel
24 = Displacement (x 100)
W = Swirl chamber
A = Turbocharged





M 21 D 24 W A – BMW 524 td

WORKING INSTRUCTIONS

concerning cleanliness on fuel system

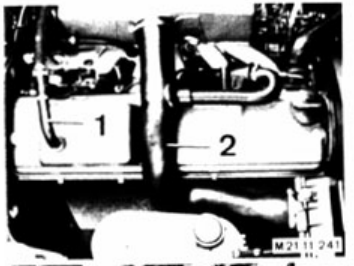
- Clean area around repair point thoroughly – e.g. prior to unscrewing lines, switches, etc.

  Always place removed parts on a clean surface and cover with plastic sheet – never use rags losing lint!

- Close off or insert plugs in open lines and components immediately.

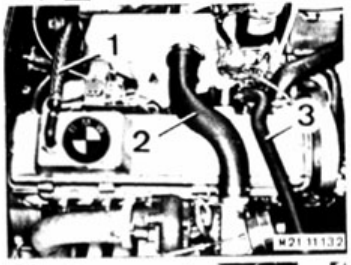
- Only install cleaned parts.
  Take new spare parts out of their packaging only immediately before installation.

- Never let diesel fuel spill on to coolant hoses – if applicable, wash off immediately with water.



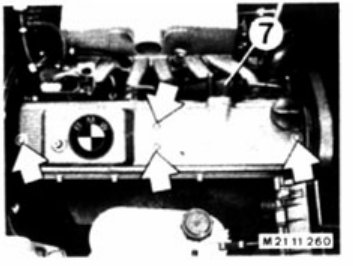
11 12 000 REMOVING AND INSTALLING CYLINDER HEAD COVER

M 21 D 24 W:
Disconnect hoses (1 ... 2).

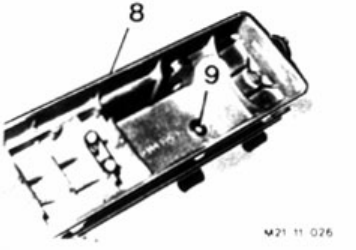


M 21 D 24 WA:
Disconnect hoses (1 ... 3).

Loosen screws of cover.
Installation:
First tighten the cylinder head cover and then the protective cover.



Remove oil trap (7).
Unscrew threaded sleeves and take off cylinder head cover.
Installation:
Install threaded sleeves with seals.
Check seal on oil trap, replacing if necessary.



Installation:
Check cylinder head cover gasket (8) and rubber ring (9), replacing if necessary.
Insert rubber ring (9) in cover and lubricate with oil.
Tightening torque*

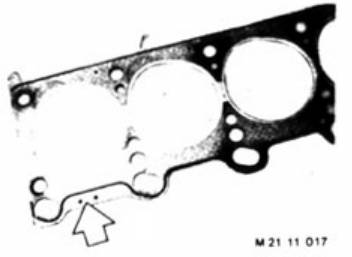
* See Specifications

11 12 101 REPLACING CYLINDER HEAD GASKET

Remove cylinder head 11 12 100.
Clean sealing surfaces on cylinder head and crankcase carefully with gasket remover** and a hard wood scraper (even slight scratching would cause engine td leak because of high compression).
Check levelness with standard steel ruler.
Never machine cylinder heads!
Install a cylinder head gasket conforming with highest piston protrusion of all six pistons.

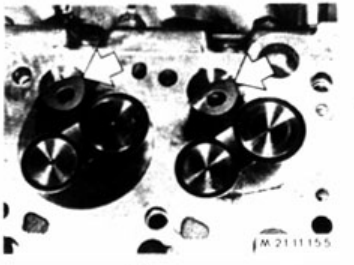
Measuring Piston Protrusion:
Place dial gauge in Special Tool 00 2 530 on cleaned cylinder head sealing surface and set to zero with pre load.

Apply dial gauge on measuring point "A" of cleaned piston and find highest point by turning crankshaft.
Note displayed value = piston protrusion "A".
Apply dial gauge on measuring point "B" and note piston protrusion "B".
Mean value of "A" + "B" is the "piston protrusion" of a piston.
Repeat measuring on all six pistons.

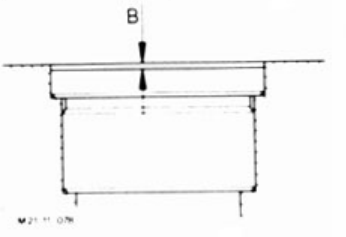


Piston with highest "piston protrusion" will determine thickness of cylinder head gasket.
Cylinder Head Gaskets:

Highest Piston Protrusion of All 6 Pistons (mm)	Code of Cylinder Head Gasket (no. of holes)
0.64 ... 0.78	1
0.79 ... 0.91	2
0.92 ... 1.08	3



Burners are installed with shrink fit in cylinder head.
Replace cylinder head, if burners are loose or damaged.



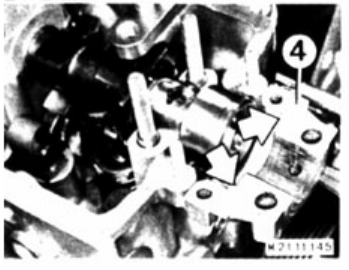
Burner retrusion = distance "B"*.

* See Specifications

11 12 240 REPLACING RADIAL OIL SEAL IN END COVER

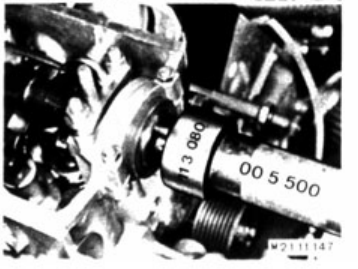
Remove toothed drive belt 11 31 110.
Unscrew pulley (1).
Installation
Slid- slot of pulley and bore of washer (2) over pin of camshaft.

Unscrew oil line (3) and take off bearing cap (4).
Pull off radial oil seal.



Coat sealing surface with a brush on universal sealing compound / Three Bond Silicon 1207** and mount bearing cap (4).
Tightening torque*.

Push on radial oil seal over Special Tool 11 2 212.
Lubricate sealing lip with oil.



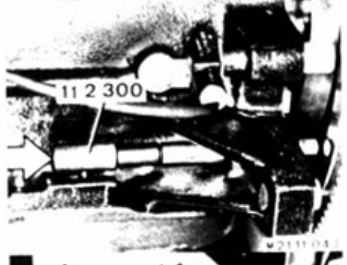
Press in radial oil seal with Special Tools 11 3 080 and 00 5 500.
Press in new radial oil seal against stop in contradiction to the standard seal, which was installed flush.

* See Specifications
** Source: HWB

11 12 500 REMOVING AND INSTALLING CYLINDER HEAD
– Engine Removed –

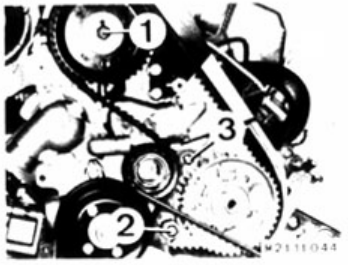
Unscrew injection pipes on fuel injectors and injection pump with Special Tool 13 5 020.
Mount protective caps.
Remove cylinder head cover – see 11 12 000.
Installation:
Tightening torque: 20 to 25 Nm (15 to 18 ft. lbs.).

Turn cylinder no. 1 to TDC – cylinder no. 6 overlaps.



Hold crankshaft with Special Tool 11 2 300.

Remove hose (5) and protective cover.
Installation:
Tighten the cylinder head cover first and then the protective cover.



Loosen bolts (1 and 2) and nut (3).
Loosen and take toothed drive belt off of the camshaft sprocket.

Installation:
Turn in the camshaft before mounting the cylinder head, so that valves of cylinder no. 6 overlap – hold camshaft with Special Tool 11 3 090.
Install and tighten toothed drive belt – see 11 31 110.

Unscrew bolts in order of 14 ... 1 and take off the cylinder head.
Installation:
Keep oil out of cavities since otherwise bolts tightened with specified torque might not exert sufficient force on the cylinder head. In addition, the crankcase might be cracked.
Clean cylinder head bolts.
Lubricate threads and bearing surfaces of bolt heads with a light coat of oil.
Replace cylinder head gasket – measure piston protrusion – see 11 12 101.
Tighten bolts in order of 1 ... 14 in three steps*.
Adjust valve clearance – see 11 34 004.
Check static adjustment of the injection pump – see 13 51 005.
Tighten cylinder head bolts to specified torque angle with Special Tool 11 2 110 regardless of the engine temperature in the 3rd step (cover of cylinder head removed again after running engine warm).

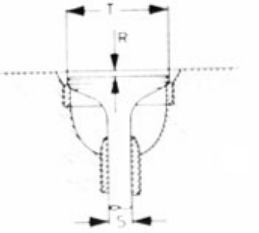
* See Specifications

11 12 595 CHECKING VALVE GUIDE FOR WEAR
– Valve Removed –

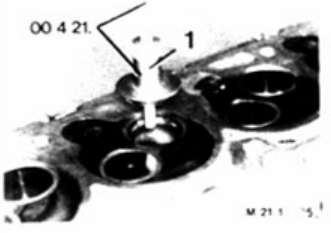
To check install a new valve that the end of the valve stem is flush with the valve guide.
Apply dial gauge and measure tilt play.
Max. permissible tilt play*.

11 12 607 MACHINING VALVE SEAT
– Cylinder Head Disassembled

The valve seat machine from Hunger and a five sided cutting tool from New Way must be used to machine valve seat insert rings.
An oversize valve must be installed after machining a valve seat.
Machine valve seat insert rings until specified valve retrusion "R" is reached.

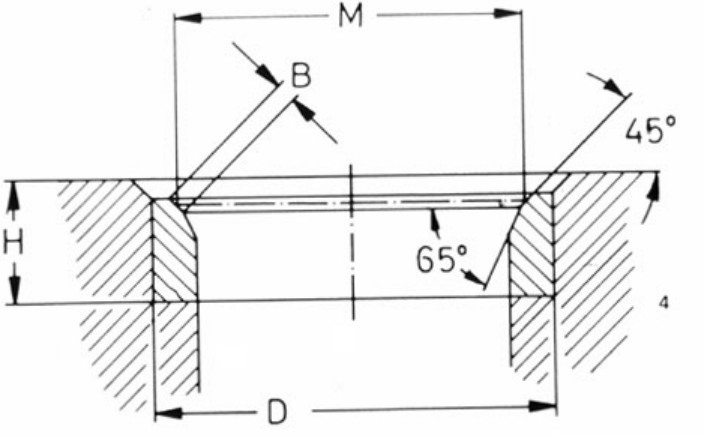


Valve retrusion R*.
Machine correction angles* to produce valve seat diameter M* and valve seat width B*, after machining the valve seat angle*.
Valves may not be ground in.
Check valves for leaks 11 34 509.



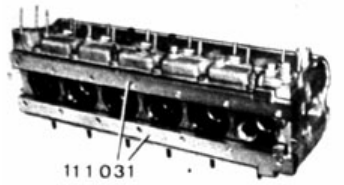
11 12 600 REAMING OUT VALVE GUIDE
– Valve Removed –

If there is excessive play between the valve guide and valve stem (see 11 12 595), ream out valve guide and install a repair valve with an oversized stem diameter "S"*.
This also requires machining the valve seat, see 11 12 607.
Press guide pad (1) on to valve seat and ream out valve guide starting from the combustion chamber end – turn down reamer once.



* See Specifications

* See Specifications

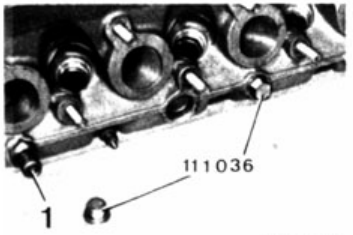


M 2111083

11 12 729 CHECKING CYLINDER HEAD FOR CRACKS IN WATER TEST

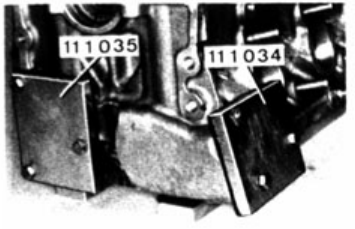
– Cylinder Head Disassembled –

Mount Special Tools 11 1 031 on cylinder head (using cylinder head bolts).



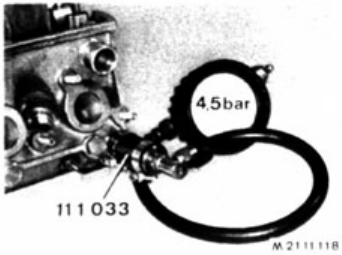
M 2111100

Unscrew adapter (1) and plug openings with Special Tools 11 1 036.
Insert seals.
Installation:
Install adapter with bolt cement**.



M 2111117

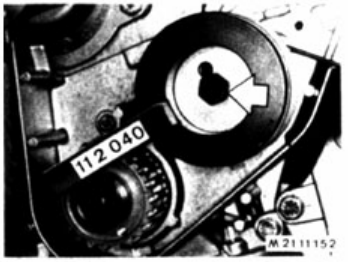
Apply Special Tools 11 1 034 and 11 1 035.



M 2111118

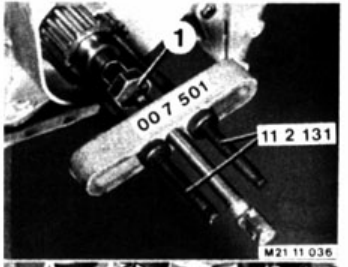
Attach Special Tool 11 1 033.
Apply compressed air on cylinder head.
Test pressure = 4.5 bar (64 psi).
Place cylinder head in water bath and check for leaks.
Note:
Relax water bath with a detergent if necessary.

** Source: HWB

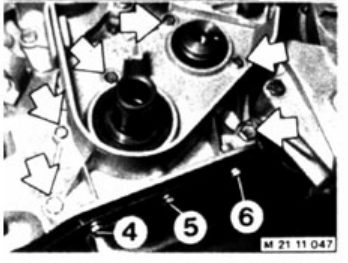


11 14 175 REMOVING AND INSTALLING FRONT END COVER

Remove vibration damper hub 11 23 031.
Remove toothed belt 11 31 110.
Hold intermediate shaft gear with Special Tool 11 2 040.
Unscrew bolt.
Remove washer and gear.
Installation:
Guide centering pin into bore.



Screw in bolt (1) again.
Pull gear off of crankshaft with Special Tools 00 7 501 and 11 2 131.
Important!
Woodruff key.
Installation:
Mount gear that shouldered end faces forward.



Unscrew bolts (4 ... 6).
Only loosen other oil pan bolts.
Separate oil pan gasket on end cover carefully with a knife.
Take off end cover.

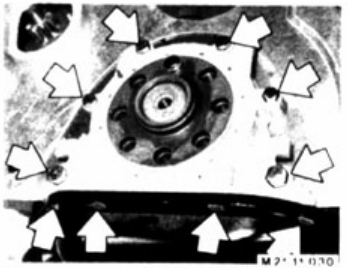
Installation:
If oil pan gasket is damaged, remove oil pan and replace gasket 11 13 000.
Fill bores of oil pan gasket with a brush on universal sealing compound / Three Bond Silicon 1207**
Replace gasket (7).

Check radial oil seals, replacing if necessary.
Use Special Tool 11 2 211 on crankshaft and Special Tool 11 2 212 on intermediate shaft when installing end cover.

11 14 180 REPLACING RADIAL OIL SEAL IN FRONT END COVER

Remove front end cover 11 14 175.
Press radial oil seals out of cover.
Press in radial oil seals with Special Tools 24 1 050 and 24 1 040.
Press in new radial oil seals to depth of approx 1 to 2 mm (0.039 to 0.079") in contradiction to standard seals which were installed flush.
Lubricate sealing lips with oil.

** Source: HWB



M21 11 030

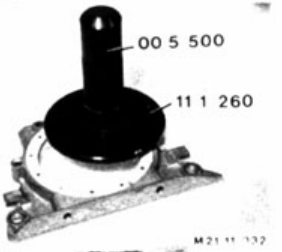
11 14 605 REPLACING RADIAL OIL SEAL IN CLUTCH END COVER

– Transmission Removed –

Remove flywheel 11 22 000.
Unscrew oil pan/end cover mounting bolts.
Only loosen other oil pan bolts.
Separate oil pan gasket on end cover carefully with a knife.
Take off end cover.
If oil pan gasket is damaged, remove oil pan and replace gasket 11 13 000.

M21 11 031

Installation:
Replace gasket (1).
Coat holes of oil pan gasket with a brush on universal sealing compound * Three Bond Silicon 1207**.



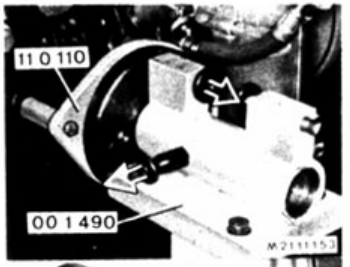
M21 11 032

Press in radial oil seal with Special Tools 11 1 260 and 00 5 500.
Press in new radial oil seal to depth of approx. 1 to 2 mm (0.039 to 0.079") in contradiction to standard seal which was installed flush.
Lubricate sealing lip with oil.

M21 11 033

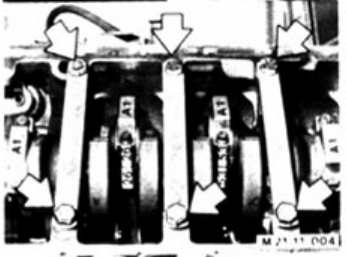
Installation:
Use Special Tool 11 2 213 to install end cover.

** Source: HWB



11 21 000 REMOVING AND INSTALLING CRANKSHAFT

Remove engine 11 00 050.
Mount crankcase on Special Tool 00 1 490 with Special Tool 11 0 110.



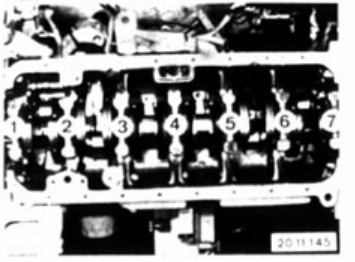
Remove clutch 21 21 000.
Remove cylinder head 11 12 100.
Remove front end cover 11 14 175.
Remove oil pump 11 41 000.
Unscrew braces.

Check axial play* before removing crankshaft.
If maximum permissible play is exceeded, check or replace thrust bearing.

Remove flywheel 11 22 000.
Take off end cover.
Installation:
Replace gasket.
Use Special Tool 11 2 213 to avoid damaging radial oil seal.
Cut off gasket on oil pan sealing surface.

* See Specifications

Unscrew connecting rod bearing caps.
Installation
Replace conrod bearing shells and check conrod bearing play, see 11 24 571.
Pair code numbers (0 ... 99) must be same on connecting rods and bearing caps.



Remove crankshaft bearing caps and lift out crankshaft.
Installation
Do not mix up bearing caps.
Bearing cap no. 1 is on toothed belt end.
Bearing cap no. 6 is the thrust bearing.
Install bearing shells and check bearing play, see 11 21 531.

Installation
Check axial play after installing crankshaft – unscrew thrust bearing cap no. 6 again.
Center thrust bearing by applying knocks from a plastic hammer on rear and front ends of the crankshaft.
Tighten thrust bearing cap bolts again as specified.
Check axial play*.

If crankcase is replaced, clean oil and water ports again thoroughly to remove casting sand.

* See Specifications

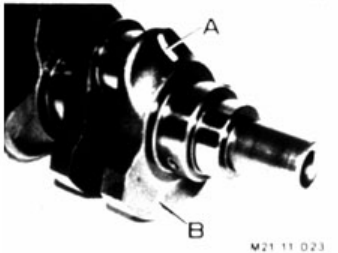
28 11 307

11 21 501 REPLACING CRANKSHAFT
– Crankshaft Removed –

Note:
A replacement crankshaft is supplied complete with corresponding bearing shells for main and conrod bearings.

Crankshaft Identification:

Engine	Stroke	Code
M 21 D	81.0 mm	C



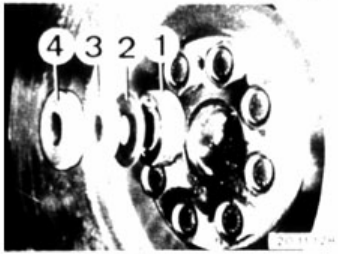
M21 11 023

Crankshaft is surface treated and may only be reground in the factory.

Reground crankshafts are marked with stripes of paint.

Conrod Bearing Journal (A)
1 paint stripe Size 1 *
2 paint stripes Size 2 *

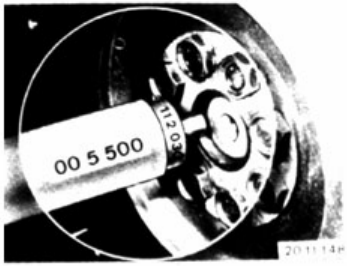
Main Bearing Journals (B)
1 paint stripe Size 1 *
2 paint stripes Size 2 *



Cars with Manual Transmission:
Install pilot bearing for transmission main shaft.

Installed Order:
Ball bearing (1), cover (2), felt ring (3) and capsule (4).

Insert cover (2) with the embossment facing out.



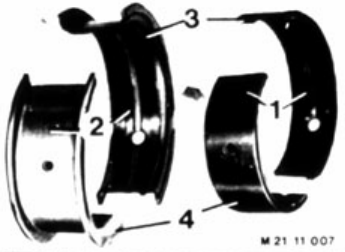
2011 14

Fill bore in crankshaft with approx. 1 gram (0.035 oz.) of lubricating grease. Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

* See Specifications

28 11 308

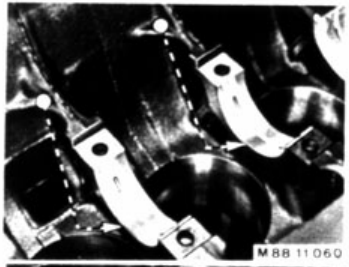
The crankshaft is marked with yellow, green or white paint depending on main bearing journal tolerances.



M 21 11 007

The bearing shells are marked with yellow, green or white paint.
1 Bearing shell 1-2-3-4-5-7
2 Bearing shell 6 (pilot bearing)
3 Bearing shell with lubricating groove installed in crankcase
4 Bearing shell without lubricating groove installed in bearing cap

Check ground size of the main bearing journals!



M88 11 060

Installing Instructions:
Install only bearing shells with "yellow" color code in the crankcase (regardless of old color code mark on the crankcase).
Install bearing shells with "yellow - green - white" color code in bearing caps depending on the crankshaft bearing journal color code.

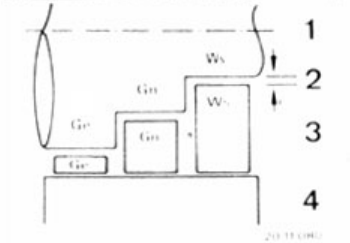
M88 11 061

Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with the correct torque*. Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with a different color code.



Survey of Color Code Shaft Diameter/ Bearing Shell Thickness*

Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

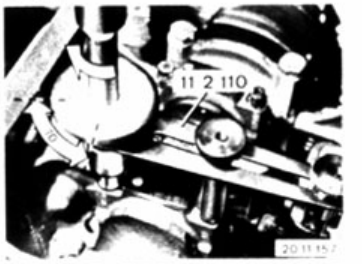
Replacing Conrod Bearing Shells:
Red or blue conrod bearing shells in accordance with the color code mark on the connecting rod are installed standard for a pertinent ground size or crankshaft.

Install only red bearing shells of a pertinent ground size for a replacement crankshaft.

Place Type PG-1 Plastigage on crankshaft wiped clean of oil in the BDC position and mount conrod bearing caps that all grooves are on one side. Pair numbers (0 ... 99) must be the same on caps and connecting rods.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

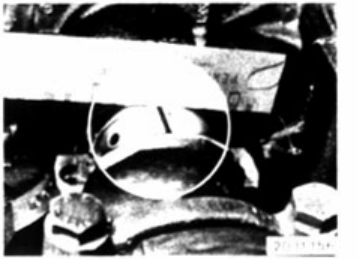
* See Specifications



Tighten bolts in two steps (use old conrod bolts).
Step 1 20 Nm (14.5 ft. lbs.)
Step 2 70° torque angle

Important!
Do not turn the connecting rods or crankshaft.

Remove bearing caps.



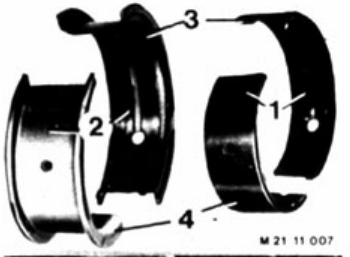
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearings shells of a different machined size or with a different color code.
Replace conrod bolts for final installation and tighten the conrod bearing caps in two steps (see above).

* See Specifications

28 11 308

11 21 531 REPLACING CRANKSHAFT MAIN BEARING SHELLS – Engine Disassembled –

The crankshaft is marked with yellow, green or white paint depending on main bearing journal tolerances.



M 21 11 007

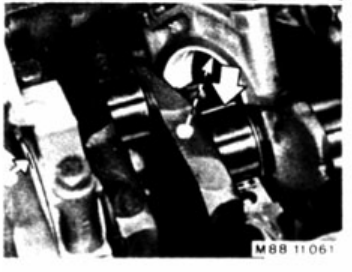
The bearing shells are marked with yellow, green or white paint.

1 Bearing shell 1–2–3–4–5–7
2 Bearing shell 6 (pilot bearing)
3 Bearing shell with lubricating groove installed in crankcase*
4 Bearing shell without lubricating groove installed in bearing cap

Check ground size of the main bearing journals!

M88 11 060

Install bearing shells in the crankcase with the same color code as the dot of paint on the console.
Install both bearing shells according to the crankshaft color code mark, if the color code marked on the crankcase is washed off.
Install bearing shells in the bearing caps with the same color code as for the crankshaft.



M88 11 061

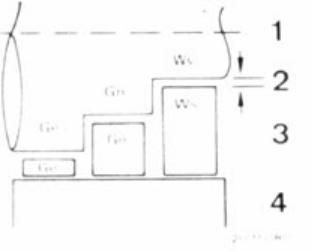
Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten the bearing caps with the correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

M88 11 062

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with a different color code.



Survey of Color Code Shaft Diameter Bearing Shell Thickness*

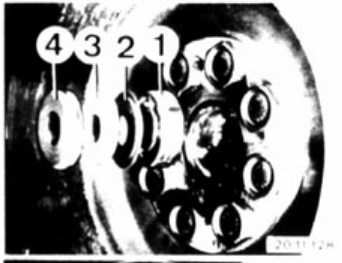
Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

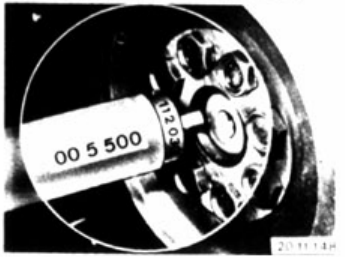
* See Specifications

11 21 571 REPLACING PILOT BEARING IN CRANKSHAFT

Remove clutch – see 21 21 000
Pull out ball bearing with Special Tool 11 2 010



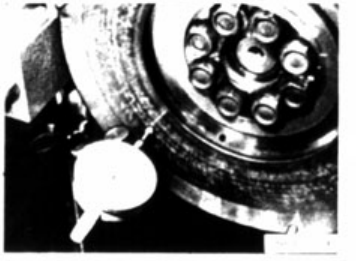
Installed Order:
Ball bearing (1), cover (2), felt ring (3) and capsule (4)
Insert cover (2) with embossment facing out



Pack bore in crankshaft with about 1 gram of lubricating grease
Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500

11 22 000 REMOVING AND INSTALLING FLYWHEEL

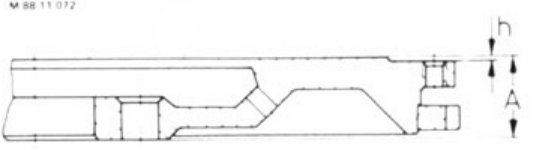
Remove clutch – see 21 21 000
Hold flywheel with Special Tool 11 2 170
Unscrew bolts and take off flywheel
Installation
Clean tapped bores
Insert ring (1)
Replace and install new expansion bolts with a bolt cement**
Tightening torque*



Check flywheel for axial runout*

Friction surfaces may be machined to minimum distance A*
If machining the friction surface reduces distance "h" to zero, the flange surface (distance "h") must be machined

Friction surfaces of double mass flywheels cannot be machined



11 22 051 REPLACING DRIVE PLATE FOR TORQUE CONVERTER

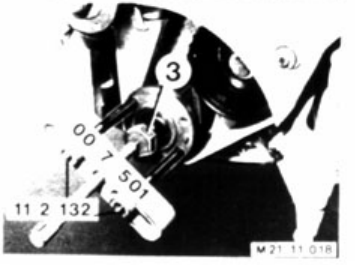
Remove transmission – see Group 24
Hold flywheel with Special Tool 11 2 170
Unscrew bolts and take off flywheel
Installation
Clean tapped bores
Replace and install new expansion bolts with a bolt cement**
Tightening torque*

* See Specifications
** Source: HWB

11 23 010 REPLACING VIBRATION DAMPER

Remove fan 11 52 000
Take off drive belt on alternator, power pump and, if applicable, compressor for air conditioner
Unscrew pulley
Installation
Tighten drive belt and check tightness with Special Tool 11 5 020

Unscrew pulley and vibration damper on hub
Installation
Centering pin must fit in bore in vibration damper



11 23 031 REPLACING VIBRATION DAMPER HUB

Remove radiator 17 11 000
Remove vibration damper 11 23 010
Hold hub with Special Tool 11 2 150
Unscrew bolt (3)
Take off collar washer (4)
Installation
Tightening torque*

Screw in bolt (3) about three turns
Pull hub off of crankshaft with Special Tools 00 7 501 and 11 2 132
Unscrew bolt (3)

* See Specifications

11 24 521 REPLACING CONNECTING RODS – PISTONS REMOVED –

Important!
Only install connecting rods of same weight class in one engine.
Weight class is die stamped in machined conrod bearing cap surface.
Connecting rods may not be reground.

Piston pin should slide through connecting rod bushing under light pressure.

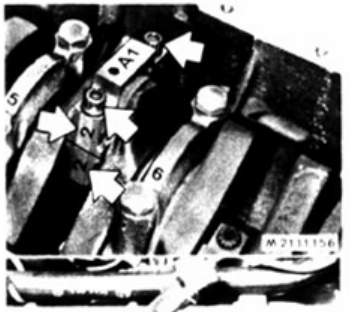
11 24 571 REPLACING CONNECTING ROD BEARING SHELLS – ENGINE DISASSEMBLED –

Install red or blue bearing shells in connecting rod depending on color code on crankshaft counterweight.
Important!
Check machined size (conrod diameter)*

Install red or blue bearing shells in connecting rod bearing cap depending on color code on conrod bearing caps.
In BDC position place Type PG 1 plastigage on crankshaft wiped clean of oil and install conrod bearing caps that lubricating grooves are on one side.
Paired code numbers (0 ... 99) must be same on caps and connecting rods.
Source for Plastigage:
Cartool
Alfred Brehm Str. 5
D-8070 Ingolstadt
West Germany

Tighten bolts in two steps (use old conrod bolts).
Step 1 = 20 Nm (15 ft. lbs.)
Step 2 = torque angle of 70°
Important!
Don't turn connecting rods or crankshaft.
Remove bearing caps.
Read bearing play* from width of flattened Plastigage with help of supplied scale.
Correct bearing play by installing new bearing shells, bearing shells of different machined size or with different color code.
Use new conrod bolts for final assembly and tighten connecting rod bearing cap bolts in two steps (see above).

* See Specifications



11 25 000 REMOVING AND INSTALLING PISTON

Remove engine.
Take off cylinder head, oil pan and oil pump.
Remove connecting rod bearing cap.
Important!
Mark installed position of connecting rod to crankshaft, if conrod bearing shells do not have to be replaced.

M 21 D 24 WA:
Important!
Engine oil is injected into annular bore (4) of piston via oil spray jet (3) for piston cooling. Even slight damage on oil spray jet (3) will impair guarantee of oil stream meeting bore (4), which would result in immediate engine failure.

Screw Special Tool 11 2 050 on connecting rod to avoid damage on oil spray jet (3).
Press out piston upwards.

Remove circlip (1).
Press out piston pin.
Installation:
Piston pins and pistons are matched and must not be mixed up.

M 21 11 008

M 21 11 009

Only install a piston of same make and same weight class.
Weight class is die stamped with * or ** in piston crown.
Important!
Check machined size (piston diameter)*.

Check piston installed clearance*.

Model	Make	Measuring Point A
M 21 D	Alcan	15.00 mm (0.591")
	KS	18.00 mm (0.709")
	Mahle	12.00 mm (0.472")
	Konig	

Set internal calipers to zero on micrometer with the measured piston diameter.

Measure cylinder bore with internal calipers at bottom, center and top in forward and rotational directions.
Check piston installed clearance*.

* See Specifications

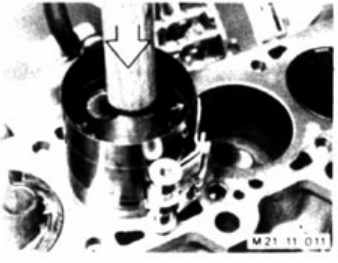
Lubricate piston and piston rings with oil.
Offset piston ring end gaps by 120° to each other.
Compress piston rings with Special Tool 11 2 260.

11 25 651 REPLACING PISTON RINGS OF ONE PISTON
- Piston Removed -

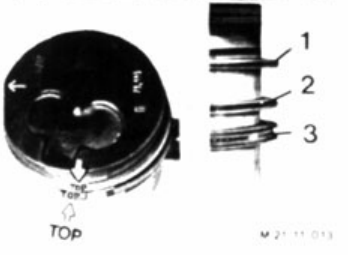
Measure side clearance* of piston rings (only possible on rings 2 and 3).

Screw Special Tool 11 2 050 on to connecting rod to avoid damaging oil spray jet (3).

Remove piston rings and measure end clearance*.



Insert piston that arrow points to the toothed drive belt.
Install connecting rod - see 11 24 521.



Installation
Install piston rings with the word "TOP" facing the piston crown.

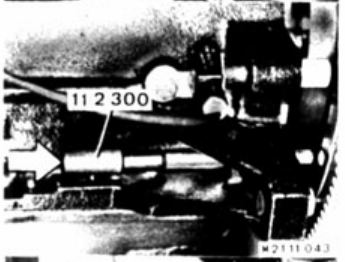
1 Double wedge compression ring
2 Bevelled face compression ring
3 Oil scraper ring with rubber lined spring

Note
It might not be possible to find the identification on used piston rings.
Lay piston rings aside in correct sequence and installed position.

* See Specifications

11 31 000 REMOVING AND INSTALLING CAMSHAFT

Remove air cleaner – see Group 13.
Remove fan – 11 52 000.
Turn crankshaft to have TDC in cylinder no. 1 and overlapping in cylinder no. 6.

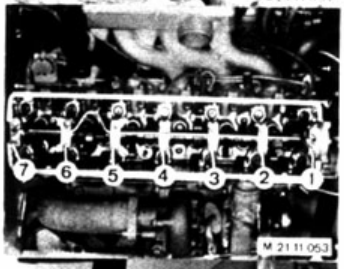


Hold crankshaft with Special Tool 11 2 300.

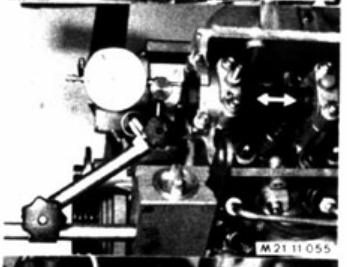
Unscrew hose (5) and cover.
Remove vacuum pump – 11 66 000.
Remove rocker arm for exhaust in 2nd cylinder and for intake in 3rd cylinder to take tension off of camshaft. See 11 33 031.

Loosen bolts (1 ... 2) and nut (3).
Loosen toothed belt and take it off of camshaft sprocket.
Unscrew bolt (1) and remove camshaft sprocket.
Installation:
Tightening torque*.

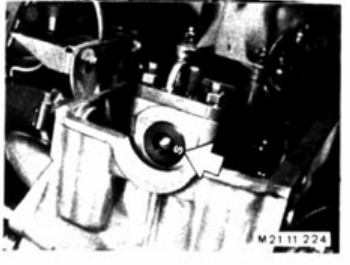
Installation
Slide slot of pulley and bore of washer (2) over pin of camshaft



Unscrew camshaft.
Installation:
Replace rocker arms when replacing a camshaft because of worn cams!
Slide steel ring over cam for vacuum pump.
Bearings are marked.
Bearing no. 1 is at front end.
See 11 12 240 for installation of bearing no. 1 with insertion of radial oil seal.
Mount oil line.



Check camshaft axial play*.
Install and tighten toothed belt, see 11 31 110.



Codes of Camshafts:

Engine	Code
M 21 D 24 W	S
M 21 D 24 WA	E / T

* See Specifications

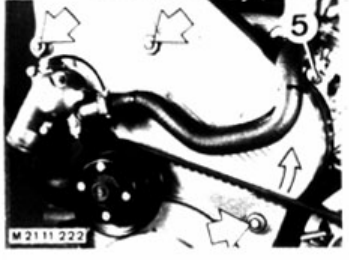
* See Specifications

11 31 100 TIGHTENING TOOTHED DRIVE BELT

Remove air cleaner – see Group 13.
Remove fan – 11 52 000.

Turn cylinder no. 1 to TDC; valves of cylinder no. 6 overlap.

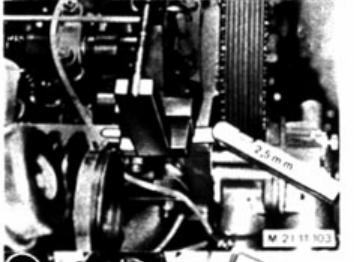
Hold crankshaft with Special Tool 11 2 300.



Disconnect hose (5) and unscrew cover.
Remove cylinder head cover 11 12 000.

Loosen bolts (1 and 2) and nut (3).

Hold camshaft in position with Special Tool 11 3 090 with cylinder no. 1 at TDC and valves of cylinder no. 6 overlapping.

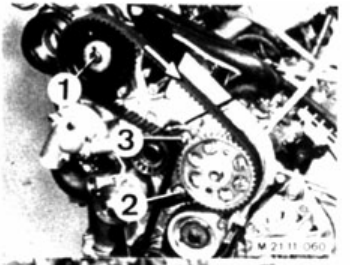


Important!
Tighten toothed drive belt with coolant temperature between 15 and 35° C (60 and 95° F).
Use a 2.5 mm (0.098") feeler gage blade on the exhaust side for a new toothed drive belt or a belt used less than 15,000 km (10,000 miles).

Press out tensioning roller with a torque wrench (analog display).
Torque for toothed drive belt used
up to 15,000 km (10,000 miles) = 42 + 3 Nm (30 + 2 ft. lbs.) or
from 15,000 km (10,000 miles) on = 30 to 35 Nm (22 to 25 ft. lbs.).
Tighten nut (3) and then bolts (1 and 2).
Check tightening torque for bolt (1).
Crank engine once in rotating direction and recheck timing.
Make static injection pump adjustment – see 13 51 005.

11 31 110 REMOVING AND INSTALLING TOOTHED DRIVE BELT

Remove air cleaner – see Group 13
Remove fan – 11 52 000



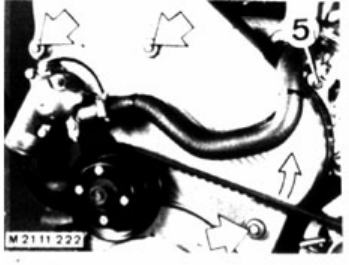
Loosen bolts (1 and 2) and nut (3)
Mark running direction of toothed drive belt and take off belt

Turn crankshaft for TDC in cylinder no. 1 and overlapping in cylinder no. 6

Installation
Hold camshaft with Special Tool 11 3 090 – TDC in cylinder no. 1 and overlapping in cylinder no. 6

Hold crankshaft with Special Tool 11 2 300

Hold injection pump gear wheel with Special Tool 13 5 340 for rough adjustment of the injection pump
Install toothed drive belt in opposite direction of engine rotation – turn loose camshaft sprocket against toothed drive belt completely
Remove Special Tool 13 5 340
Tighten toothed drive belt – see 11 31 100

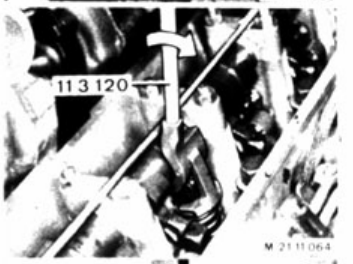


Disconnect hose (5) and remove cover
Remove vibration damper – 11 23 010
Remove cylinder head cover – 11 12 000

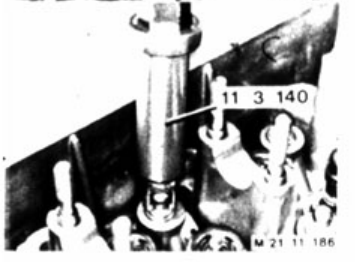
Toothed Drive Belt Layout
Adjust injection pump statically – see 13 51 005

11 33 050 REPLACING ROCKER ARM

Remove vacuum pump 11 66 000
Pull off spring clip (1)
Pertinent cams of camshaft must be turned up for removal of rocker arms



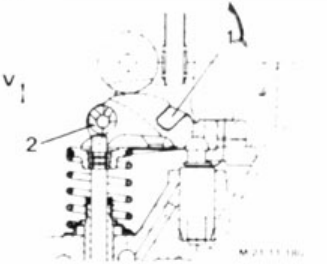
Press down valve springs with Special Tool 11 3 120 and remove rocker arm – watching out for valve collets
Important!
Install rocker arm with same ball headed bolt
When replacing rocker arms, it is always necessary to also replace the ball headed bolts



Pull out ball headed bolt with Special Tool 11 3 140
Installation
Install ball headed bolt with a bolt cement** and press in against stop

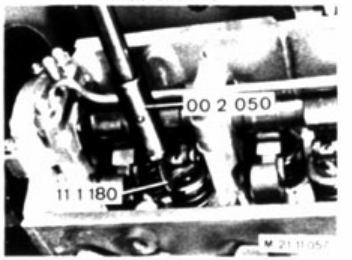
Installation
Press spring clip into groove of ball headed bolt
Adjust valve clearance 11 34 004

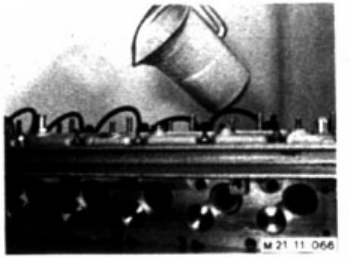
** Source: HWB



11 34 004 ADJUSTING VALVE CLEARANCE

Remove cylinder head cover 11 12 000
Turn engine to TDC with a wrench socket used on crankshaft (vibration damper)
Apply a 12 mm open end wrench on nut (1) for counterholding and unscrew nut on adjusting eccentric (2)
Adjust valve clearance "V" – eccentric always turned toward outside
Make adjustments in firing order (1 5 3 6 2 4) and in compression TDC
Tighten nut with Special Tools 11 1 180 and 00 2 050
Tightening torque*

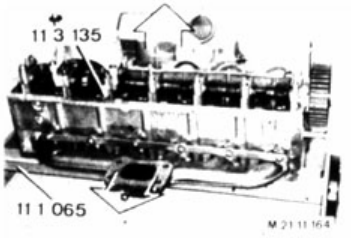




11 34 509 CHECKING VALVES FOR LEAKS – Camshaft Removed

Fill intake and exhaust ports with gasoline outdoors or indoors with strict conformance of fire prevention regulations
Valves and valve seats must be inspected if the gasoline runs past the valve heads
Remove and install valves 11 34 550
Machine valve seats 11 12 607

* See Specifications



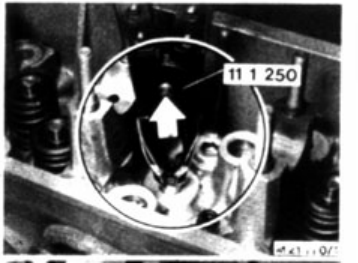
11 34 550 REMOVING AND INSTALLING VALVES

Remove cylinder head – 11 12 000.
Remove thermostat housing and mount cylinder head on Special Tool 11 1 065 with Special Tool 11 3 135.
Unscrew intake manifold and exhaust manifold.
Installation:
Replace gaskets.

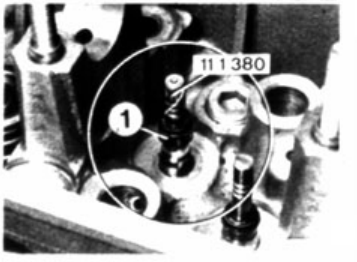
Remove camshaft – see 11 31 000.
Mount Special Tools 11 3 131 / 133 and place 11 3 132 (tray) in assembly fixture.
Remove rocker arm.

Press down valve springs and remove valve collets.

Take off upper spring retainers, valve springs and lower spring retainers.
Take tray out of assembly fixture and pull out valves.
Installation:
Only install valve springs with same color code, wire gage size and length.
Lubricate valve guides and valve stems with oil.
Measure valve retrusion R* – see 11 12 607.

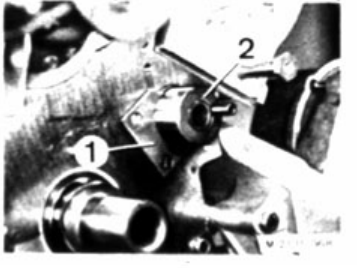


Pull off valve stem seal with Special Tool 11 1 250.



Install valve.
Always use sleeves to avoid damaging valve stem seals.
Lubricate valve stem seal (1) with oil and install.
Source for Sleeves:
Cartool
Alfred Brehm Str. 5
D 8070 Ingolstadt

Press on valve stem seal against stop with Special Tool 11 1 170.
New, improved valve stem seals with grooves on the inside are pressed on by hand with Special Tool 11 1 200.
Special Tool 11 1 200 has two diameters for 7 mm (0.276") and 8 mm (0.315") valve stem seals.

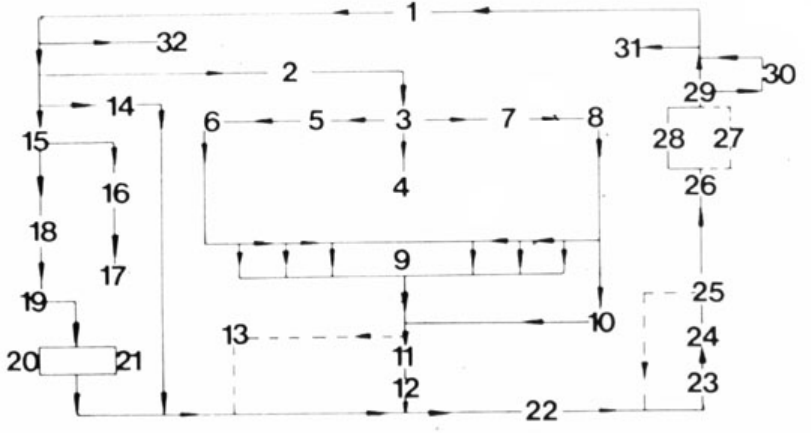


11 35 020 REMOVING AND INSTALLING INTERMEDIATE SHAFT

Remove front end cover – 11 14 175.
Unscrew guide plate (1).
Pull out intermediate shaft (2) – turning crankshaft if necessary.
Installation:
Check gear – replacing intermediate shaft if necessary.
Bearings in crankcase cannot be replaced.

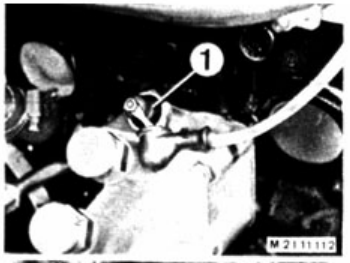
* See Specifications

M21 11 086



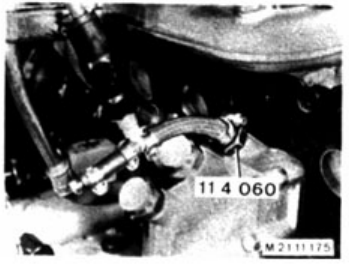
ENGINE OIL CIRCUIT

1 Main distribution bore in crankcase
2 Oil riser bore in cyl. head
3 Camshaft bearing, center
4 Distributing bore in cyl. head
5 Hollow camshaft
6 Camshaft bearing, front
7 Hollow camshaft
8 Camshaft bearing, rear
9 Oil supply line with open jets for cams on outside, valve guides and ball headed pins for rocker arms
10 Eccentric for vacuum pump
11 Spill from cylinder head
12 Drain to oil pan
13 Oil trap (crankcase vent)
14 Turbocharger
15 Crankshaft bearings
16 Intermediate shaft bearings and guide plate
17 Spray oil for gear wheels (oil pump drive)
18 Conrod bearings
19 Spray oil
20 Piston pins
21 Cylinder walls
22 Oil pan
23 Fuel intake with filter screen
24 Oil pump
25 Engine oil pressure regulating valve in oil pump (open with pressure of 5.5 to 6.5 bar = 78 to 92 psi)
26 Oil filter, volume: 1.2 ltr. (2.4 pts.)
27 Safety valve (open with pressure of 2.5 bar = 35 psi; oil supply guaranteed even with filter cartridge clogged.)
28 Filter cartridge
29 Thermostat
30 Oil cooler
31 Connection for oil pressure transmitter of indicator lamp
32 Oil spray jet (piston cooling) (open with pressure of 1.5 to 2 bar = 21 to 28 psi)



11 40 000 CHECKING ENGINE OIL PRESSURE

Disconnect wire on oil pressure switch.
Unscrew oil pressure switch (1).
Installation:
Check gasket, replacing if necessary.

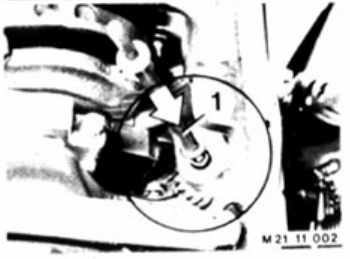


Screw in Special Tool 11 4 060.
Connect 10 bar (142 psi) pressure tester of BMW service test unit.
Check oil pressure*.

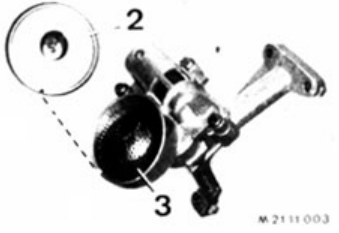
* See Specifications

11 41 000 REMOVING AND INSTALLING OIL PUMP

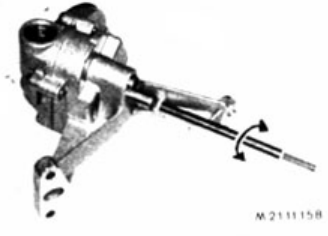
Remove oil pan 11 13 000.
Remove oil pump.



Installation:
Guide drive shaft (1) into bearing.
Replace bearing, see 11 11 160.

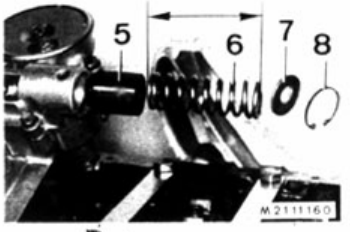


Testing and Servicing:
Unscrew cap (2) and clean oil filter screen (3).

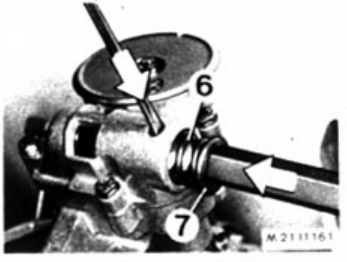


Check whether gears move easily by turning the drive shaft.

Unscrew oil pump cover and inspect oil pump for wear.
- Scoring in body / cover
- Wear on gears

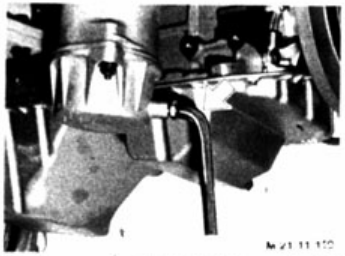


The engine oil pressure regulating valve regulates the engine oil pressure*.
Check that piston (5) moves easily.
Check length of spring (6) = 71.6 mm (2.819").



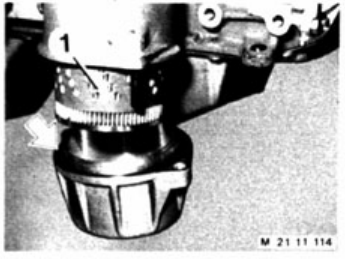
Installation:
Press in spring (6) and washer (7), and hold in with a screwdriver.
Install circlip (8).

* See Specifications



11 42 020 REPLACING OIL FILTER

Unscrew oil drain plug in oil filter and drain oil.
Installation:
Tightening torque*.



Unscrew cap and pull out oil filter (1).
Installation:
Replace seal.
Add oil* and ***.
Tightening torque*.

11 42 650 REMOVING AND INSTALLING/ REPLACING OIL SPRAY JET
– Crankshaft Removed –

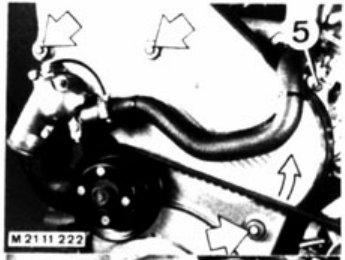
Engien oil is injected into annular bore (4) of piston via oil spray jet (3) for piston cooling. A guarantee that oil stream meets bore (4) could not be given were oil spray jet (3) even slightly damaged.
Follow up damage would be immediate engine failure.

Unscrew screws and take out oil spray jet (3).

* See Specifications
*** See Service Information of Gr. 00

11 51 000 REMOVING AND INSTALLING WATER PUMP

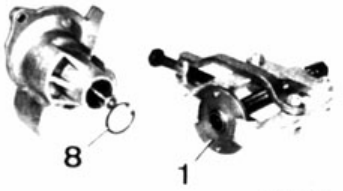
Remove air cleaner – see Group 13.
Remove fan – 11 52 000.



Take off drive belt and unscrew pulley.
Disconnect hose (5) and unscrew cover.
Installation:
Tighten drive belt and check tightness with Special Tool 11 5 020.

Detach water hose.
Unscrew water pump.
Note:
Only push toothed belt to one side.

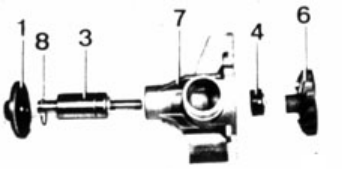
Installation:
Replace gasket (1).



M 21.11.166

11 51 502 OVERHAULING WATER PUMP
– WATER PUMP REMOVED –

Pull off hub (1) with Special Tool 00 8 500.
Remove circlip (8).

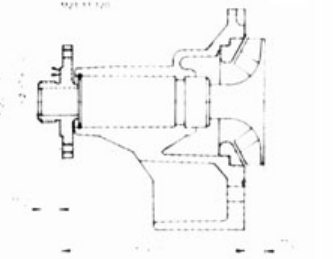


M 21.11.169

Replace bearing (3) and seal (4).
Check impeller (6), replacing if necessary.
1 = Hub
7 = Water pump body
Installation:
Press in bearing (3) against stop.
Press on impeller (6).

M 21.11.167

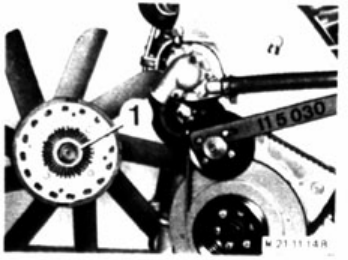
Press out water pump bearing.



Check assembled distances.

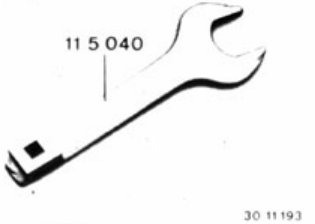
M 21.11.168

Drive out seal (4).
Installation:
Lubricate seal (4) with oil and press in with Special Tool 00 5 550.

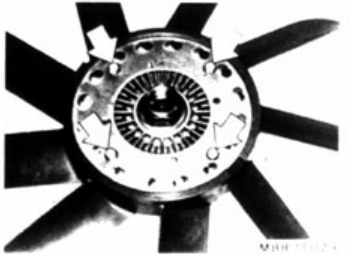


11 52 000 REMOVING AND INSTALLING FAN

Remove fan cowl.
Hold pulley with Special Tool 11 5 030 and unscrew coupling nut (1).
Important!
Left hand threads – turn nut clockwise to unscrew.
Tightening torque*



Installation:
Tighten fan with Special Tool 11 5 040.
40 Nm (29 ft. lbs.) tightening torque is equal to 30 Nm (22 ft. lbs.) setting on the torque wrench.



11 52 020 REPLACING FAN CLUTCH

Remove fan – see 11 52 000.
Replace fan clutch when
a) hub has seized (fan oilstopped engine cannot be turned or hard to turn),
b) fan clutch has axial/radial play or is losing oil.
Check switching points* with Vibrocard***.
Unscrew fan mounting bolts and take off fan clutch.

11 53 000 REMOVING AND INSTALLING COOLANT THERMOSTAT

Remove fan – see 11 52 000.
Drain coolant partially.
Remove caps (1).
Remove thermostat.

Installation:
Bar on thermostat faces out.
Replace rubber ring (2) and gasket.
Loosen bleeder screw (3) with engine at operating temperature, heater set to "warm" and engine running at fast idle speed.
Tighten bleeder screw again when escaping coolant is without air bubbles.

Testing Thermostat:
Does thermostat begin to open at specified temperature?
Check opening temperature by placing the thermostat in a hot water bath and comparing actual opening temperature against stamped value.

11 53 080 REPLACING TEMPERATURE TRANSMITTER

Pull off plug – unscrew transmitter.
Installation:
Replace seal.
Tightening torque*.
Testing – see Group 12.

* See Specifications
*** See Workshop Equipment Catalog

* See Specifications

Constrution group 11 Engine M40

	Section drawing view of M40 engine	11- 40/1
11 00 603	Engine – disassemble and assemble – engine removed	11- 40/2
	General information	11- 40/2
	Engine – mount on assembly stand	11- 40/2
	A. Cylinder head – remove, disassemble and repair	11- 40/2
	• Intake manifold – remove	11- 40/2
	• Ignition leads distributor – remove	11- 40/3

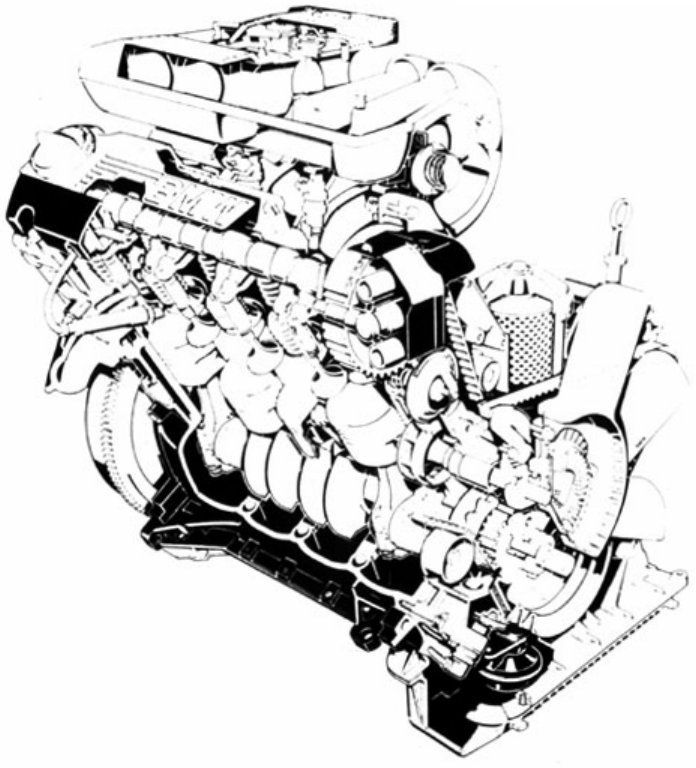
	• Water pump – remove	11- 40/15
	• Clutch flywheel – remove	11- 40/16
	• Pilot bearing in crankshaft – replace	11- 40/16
	• Oil pan – remove	11- 40/17
	• Pistons – remove	11- 40/18
	• Connecting rods – remove	11- 40/19
	• Connecting rods – check	11- 40/19
	• Bushing in conrod end bore – replace	11- 40/19
	• Connecting rods – replace	11- 40/19
	• Piston rings of one piston – replace	11- 40/20
	• Conrod bearing shells – replace	11- 40/21
	• Rear end cover – remove	11- 40/21
	• Front end cover	11- 40/22
	• Oil pump – remove, check	11- 40/23
	• Crankshaft – remove	11- 40/24
	• Main bearing shells – replace	11- 40/24
11 21 501	Crankshaft – replace – crankshaft removed	11- 40/50

M 40 ENGINE VIEW (Section Drawing)



11 00 603 DISASSEMBLING AND ASSEMBLING ENGINE
– Engine Removed –

General Information:

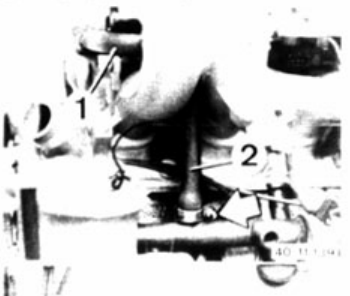
An engine (cylinder head) with installed hydraulic valve clearance compensators must not be left upside down longer than 10 minutes.
Hydraulic valve clearance compensators must be transported only in vertical position.
Drained hydraulic valve clearance compensators may not be installed.
After finishing repairs the hydraulic valve clearance compensators or rocker arms must not rattle during the trial run of the engine or the engine must be operated at speeds up to max. 2,000 rpm for so long until the rattling stops.

Disassembling and repairing the engine is described below in chronological sequence. The numbers provided in the list of contents will make it easier to continue after interrupting a repair job or find separate repair points. They only describe the actual removal or installation, but not the entire work scope.

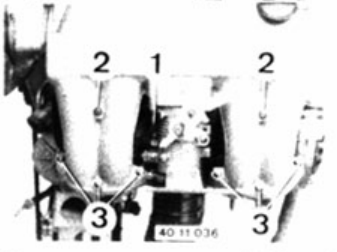
A. Removing, Disassembling and Repairing Cylinder Head

o Removing Air Cleaner:

Loosen clamp and pull hose off.

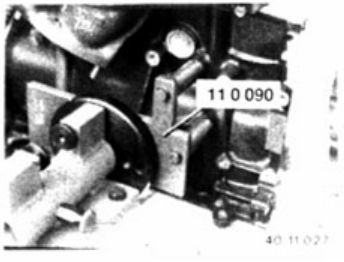


Pull hose (1) off of cylinder head cover.
Loosen clamp and pull hose (2) off of coolant pipe.



Pull vacuum hose (1) off.
Unscrew locating bolts (2) and nuts (3).
Remove upper manifold section.

Installation:
Replace gasket.
Graphite surface faces the cylinder head.
Tightening torque:
Bolts (2) 9 Nm
Nuts (3) 15 Nm

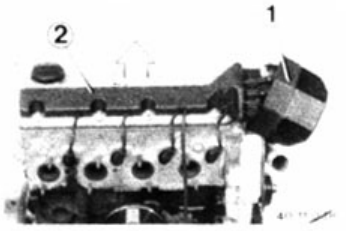


o Mounting Engine on Assembly Stand:

Mount engine on Special Tool 00 1 490 using Special Tool 00 1 490.

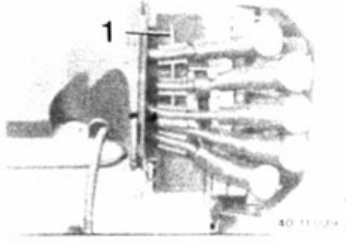
Unscrew nuts and remove lower manifold section.

Installation:
Replace gasket.
Tightening torque: 13 Nm

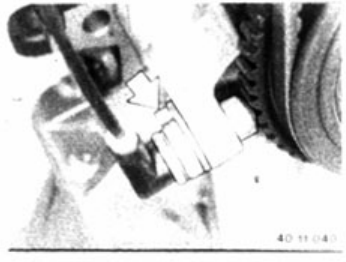


REMOVING IGNITION LEADS DISTRIBUTOR

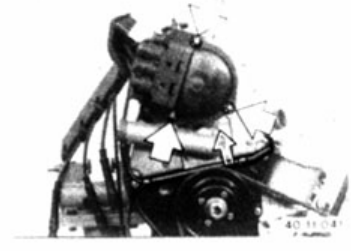
Pull [illegible] lead plugs.
Take [illegible] (1).
Lift o[illegible] electric lead duct (2) with a screwdriver.



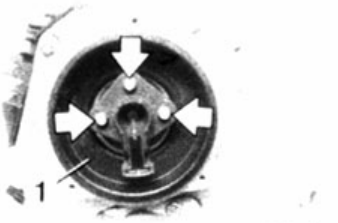
Installation:
Insert ignition leads in guides on insulator (1) in correct order.



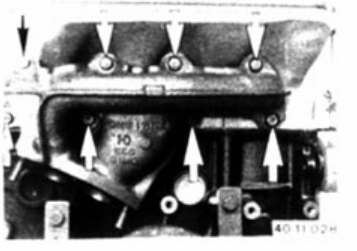
Unscrew reference mark sender.



Lift out electric lead duct on face end.
Unscrew screws on distributor cap and take off the ignition tackle.

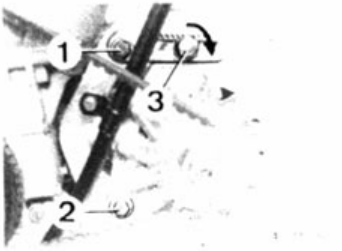


Unscrew screws and take off distributor finger.
Take off cover (1) afterwards.
Installation
Check O-ring on cover, replacing if necessary.



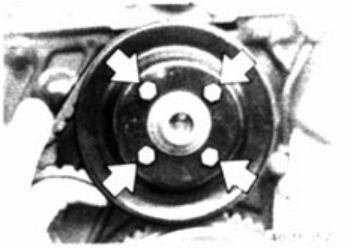
REMOVING EXHAUST MANIFOLD:

Unscrew nuts and take off exhaust manifold.
Installation
Replace self-locking nuts.
Tightening torque = 23 Nm (17 ft. lbs.).



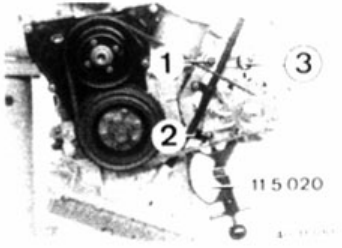
● REMOVING DRIVE BELT:

Loosen bolt (1).
Loosen nuts on bolts (2 and 3) and loosen drive belt by turning bolt (3) in direction of arrow.
Take off drive belt.

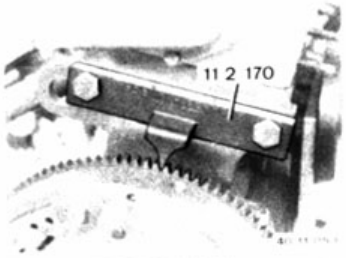


● REMOVING WATER PUMP PULLEY:

Counterhold pulley with drive belt and unscrew bolts

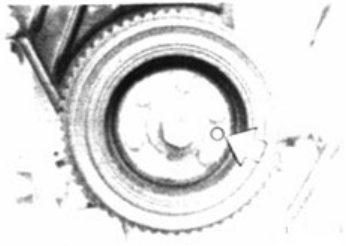


Installation:
Adjust tightness of drive belt with Special Tool 11 5 020 by turning bolt (3) in direction of arrow.
Tighten nuts on bolts (2 and 3) and bolt (1).



● REMOVING VIBRATION DAMPER:

Hold engine with Special Tool 11 2 170.



Unscrew bolts on vibration damper and take off vibration damper.

Installation:

Align dowel pin bore in vibration damper precisely with dowel pin.

Tightening torque: 23 Nm (17 ft. lbs.).

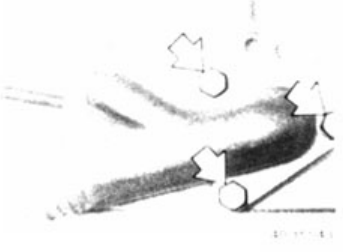
● REMOVING THERMOSTAT:

Unscrew bolts and take off thermostat housing and thermostat.

Installation:

Check O ring (1), replacing if necessary.

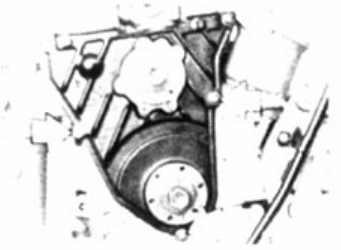
Install thermostat with O ring facing housing.



● REMOVING CONNECTORS FOR HEATER HOSES:

Installation:

Clean sealing surfaces and replace gasket.



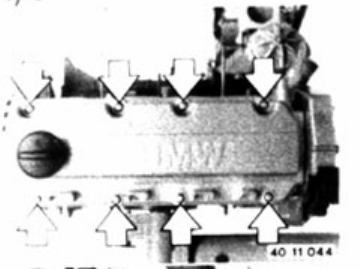
o Removing Toothed Belt Cover:

Unscrew screws and remove lower cover.

Installation:
Check gasket, replacing if necessary.

Unscrew screws and remove upper cover.

Installation:
Note dowel sleeves.



o Removing Rocker Arms:

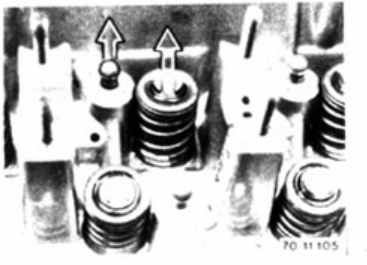
Unscrew bolts and remove cylinder head cover.

Installation:
Check gasket, replacing if necessary.
Tighten bolts diagonally from inside to outside.
Tightening torque: 9 Nm.

Important!
After tightening, retighten the four inner bolts diagonally one more time.

Press down on valve with Special Tool 11 31 80 and remove rocker arm.

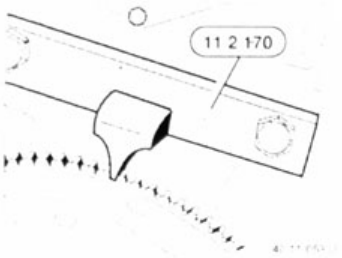
Note:
Have each cam facing up perpendicular to the cylinder head.
Special tool must not bear on the cam.
Lay rocker arms aside in order and install in the same positions.



Remove hydraulic valve clearance compensators and guides.

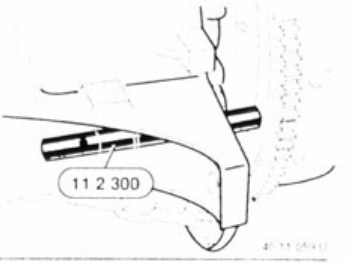
Important!
Keep removed hydraulic valve clearance compensators standing upright to prevent oil from running out.

Cover oil return bores to prevent guides from falling into the crankcase.



o Removing Toothed Belt:

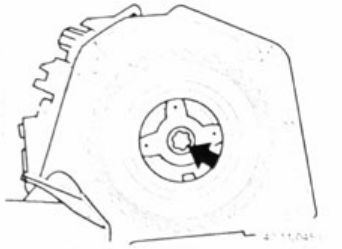
Turn crankshaft to TDC and hold flywheel with Special Tool 11 2 170.



o Installing Toothed Belt and Adjusting Timing:

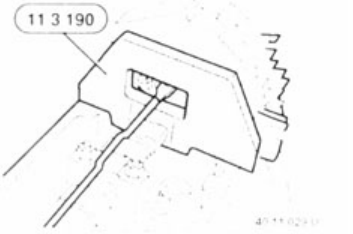
Hold crankshaft in TDC position with Special Tool 11 2 300.

Important!
Remove special tool before operating the engine.

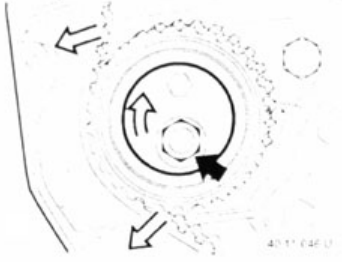


Loosen mounting bolt on camshaft sprocket.

Remove Special Tool 11 2 170.

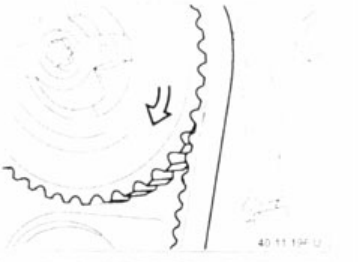


Hold camshaft in TDC position (valves of cylinder no. 4 overlap) with Special Tool 11 3 190.

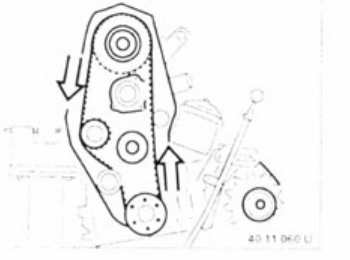


Loosen nut on tensioning roller and take off toothed belt.

Important!
Regardless of the hours of operation a toothed belt must always be replaced each time the tensioning roller is loosened.



Mount camshaft sprocket with an initial torque of 1 ... 3 Nm (turnable without play) and turn in engine's direction of rotation as far as stop (tab in groove).



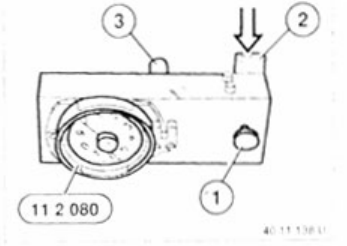
Install new toothed belt beginning at the crankshaft sprocket and going via the camshaft sprocket under tension to the tensioning roller.

Important!
Position toothed belt on sprockets in the middle.

Mount tensioning roller with torque of about 1 Nm that it can be turned easily.

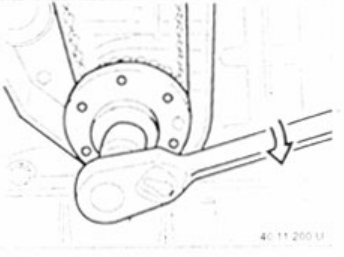
Adjust toothed belt tension to 45 + 5 scale units by turning the tensioning roller.

Tighten tensioning roller with 22 - 3 Nm and camshaft sprocket with 60 + 5 Nm torque.

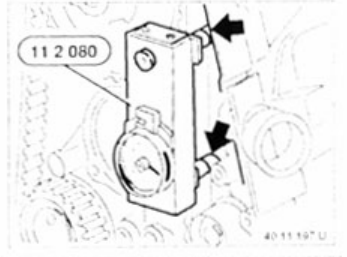


Prepare Special Tool 11 2 080 for the tension test (also refer to operating instructions for 11 2 080):

Pull lockpin (1) up and set bearing pins to maximum size with slide (2).
Set gage needle to "0" and align follow-up needle with gage needle.

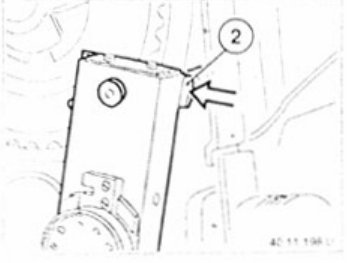


Crank engine on crankshaft at least two full turns in engine's direction of rotation.

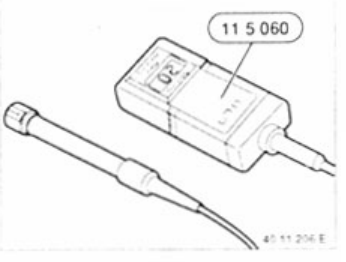


Apply tester between the camshaft and small intermediate roller in such a manner that both rollers of tester bear on the back of the teeth and the center pin is located in a tooth gap.

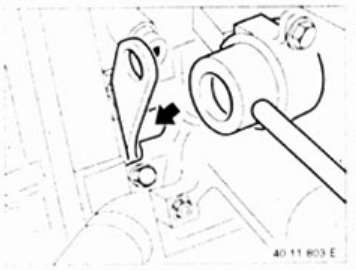
Hold crankshaft with Special Tool 11 2 300 and camshaft with Special Tool 11 3 190.
Loosen camshaft bolt to 1 Nm torque.
Apply Special Tool 11 2 080.
Loosen tensioning roller bolt and tension toothed belt briefly to 45 + 5 scale units.



Press slide (2) in until engagement of the lockpin is noticed.



Temperature expansion of engine components must be considered for precise belt tension.
To measure temperature:
Special Tool 11 5 060.



Place temperature sensor at machined cast boss on cylinder head above the coolant outlet and read the temperature.
Afterwards adjust the toothed belt tension precisely to the value given in the temperature / tension graph.

Tighten tensioning roller with 22 · 3 Nm and camshaft sprocket with 60 + 5 Nm torque.

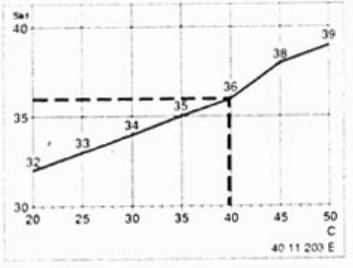
Remove holding tools and tester.

Adjusting Table for Readjustments:

Skt = Scale units on tester

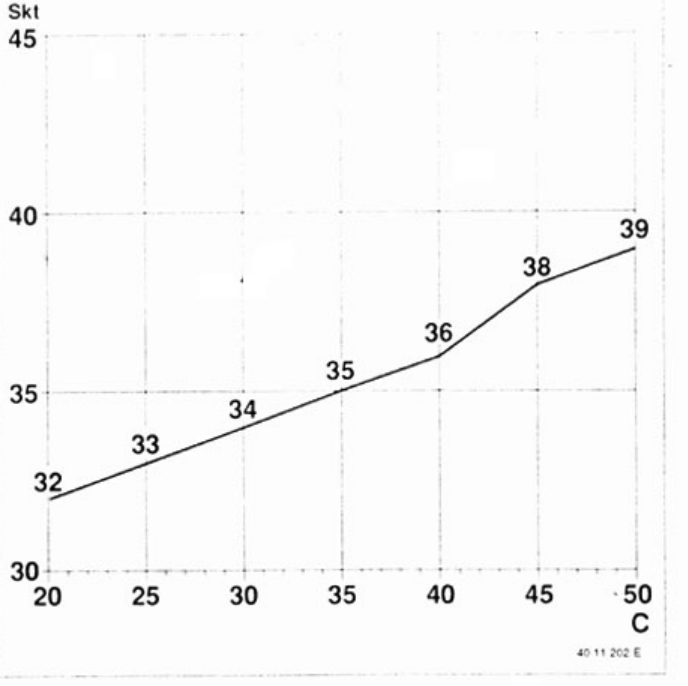
°C = Temperature measured at measuring point on cylinder head

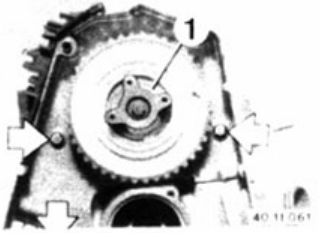
Permissible tolerance: + 2 scale units.



Example:
Engine temperature at measuring point: 40° C.
Adjust toothed belt tension to 36 scale units on the tester.
Round off values.

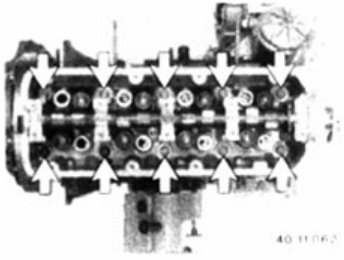
Important!
Toothed belt tension must not be adjusted if the component (cylinder head) temperature is less than 20° C.



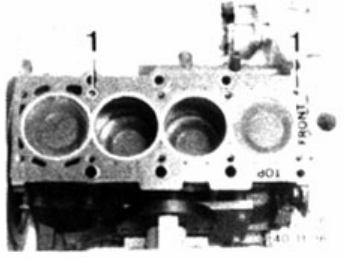


o Removing Cylinder Head:

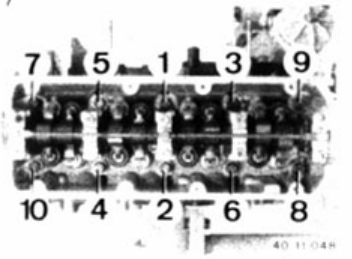
Unscrew camshaft sprocket (1).
Loosen bolts and take off housing.



Unscrew cylinder head bolts from outside to inside and take off cylinder head.



Installation:
Clean sealing surfaces on cylinder head and crankcase, if necessary removing remainders of gaskets with gasket remover** and a hard wood scraper; be careful that bits of gaskets do not fall into oil bores or cooling ports.
Install new cylinder head gasket with "TOP" facing up and "FRONT" facing the toothed belt end.
Check dowel sleeves (1) for damage and correct installed position.

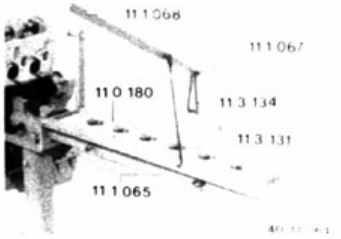


Mount cylinder head and tighten new bolts (lightly lubricated with oil) in three steps in the sequence of 1 through 10.

Step 1:	33 Nm torque
Step 2:	93° torque angle
Step 3:	93° torque angle

Important!
Cylinder head bolts may only be used once.
Keep oil out of holes in the engine block (danger of cracking the block, falsified tightening torque values).

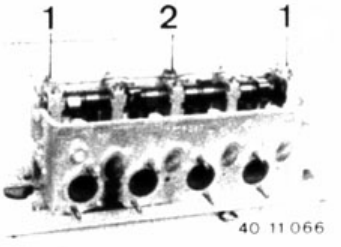
** Source of Supply: HWB



o Mounting Cylinder Head on Assembly Stand Fixture:

Mounting Special Tool 11 1 065 on Special Tool 00 1 490.

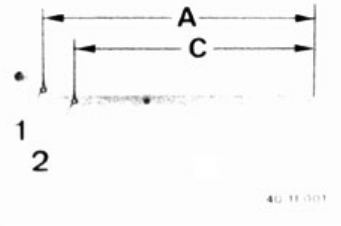
11 0 180 = Tray (opening on valve support faces forward)
11 1 067 = Guide rod
11 1 068 = Thrust lever
11 3 131 = Guide bar
11 3 134 = Thrust cage



o Removing Camshaft:

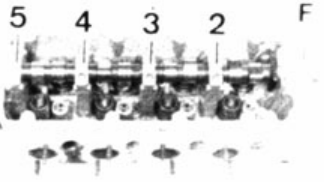
Loosen bolts (1 and 2) and take off oil pipe.

Installation:
Replace gasket between hollow connection bolt (2) and pipe.
Tightening torque:
Bolt (1) = 5.5 Nm
Bolt (2) = 11 Nm



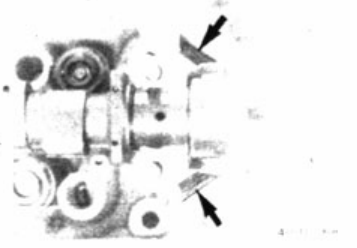
Note:
If not already produced, drill 5.1 mm dia. holes (1 and 2) in Special Tool 11 1 068 at distances A = 496 mm and C = 437 mm.

Hole 1 for removal of intake valve.
Hole 2 for removal of exhaust valve.

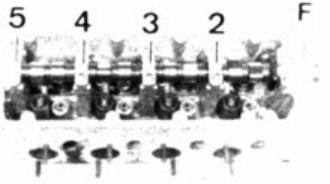


Unscrew and remove camshaft bearing caps (F, 2 ... 5) and take out camshaft.
Pull old radial oil seal off of camshaft.

Place cylinder head on assembly fixture that the exhaust end faces forward, align and secure with one cylinder head bolt (front center).

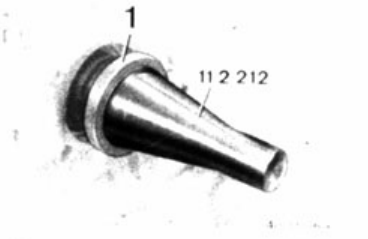


Installation:
Lubricate camshaft bearings with oil and install camshaft.
Apply a thin coat of non-hardening sealing compound** on the bearing surface of bearing cap (F).



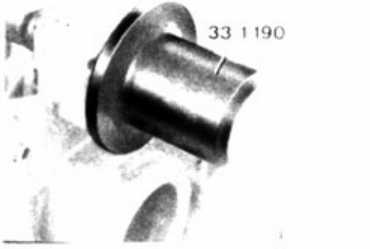
Mount bearing caps (F, 2 ... 5) in the same position and tighten the bolts.
Tightening torque: 11 Nm.

** Source of Supply: HWB

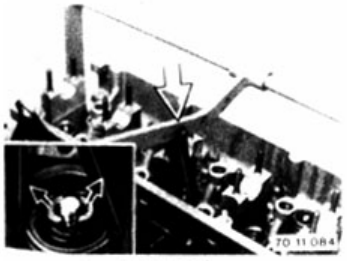


o Replacing Radial Oil Seal for Camshaft:

Lubricate sealing lip of new radial oil seal with oil.
Apply Special Tool 11 2 212 on camshaft and push on seal (1) as far as possible.

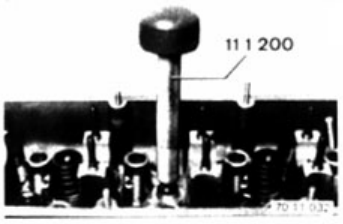


Drive in radial oil seal as far as stop with Special Tool 33 1 190.



REMOVING VALVES

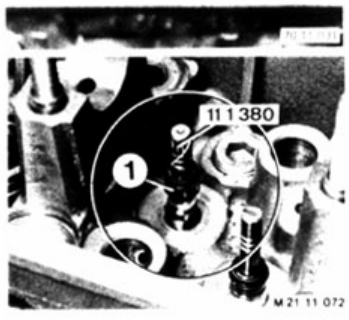
Compress valve springs and remove valve collets.
Take off valve springs and spring retainers.
Take tray out of assembly fixture from underneath and remove valves.



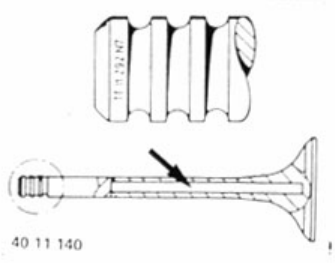
Press on valve stem seal by hand against the stop with help of Special Tool 11 1 200.

Pull off valve stem seal with Special Tool 11 1 250.

Installed Order:
1 = Valve
2 = Inner spring retainer
3 = Valve stem seal
4 = Outer spring retainer
5 = Inner spring
6 = Outer spring
7 = Upper spring retainer
8 = Valve collets



Installation:
Lubricate valve stem with oil and insert valve.
Use a new valve stem seal.
Always use Special Tool 11 1 380 to avoid damaging the seal.
Lubricate seal (1) with oil and mount.

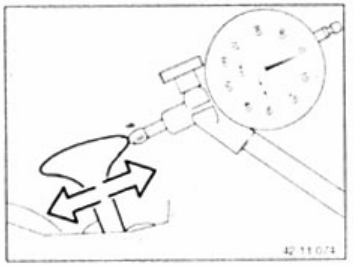


Important Scrapping Information!
Exhaust valves are filled with sodium to improve carrying off heat.

Sodium filled valves may not be scrapped as normal parts without special treatment.
The reason for this is that sodium could explode when melted.
It is also not approved to use them as "special tools" (for example: driving mandrels, etc.), which is common practice in some workshops!

Consequently sodium filled exhaust valves must be collected for scrapping and sent to the Landshut Factory, HT-L-2, for neutralization.

See Service Information of Group 11 for scrapping in countries, where it is absolutely impossible to return used valves or when they are not obligated to return parts.

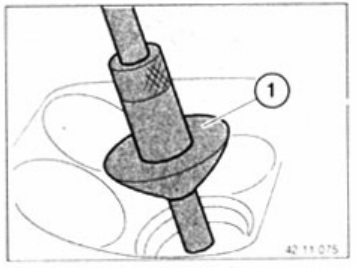


o Machining Valve Guide and Seat

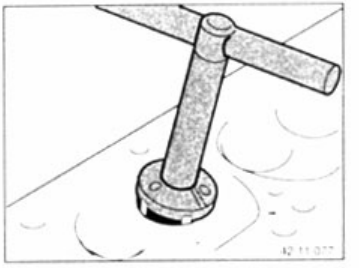
To measure, insert a new valve in such a manner that the valve stem end is flush with the valve guide.
Apply dial gage and measure tilt.
Max. permissible tilt*.

o Reaming Valve Guides

In case of excessive play between the valve stem and valve guide, the valve guide must be reamed out and a repair valve with oversized stem diameter* installed.



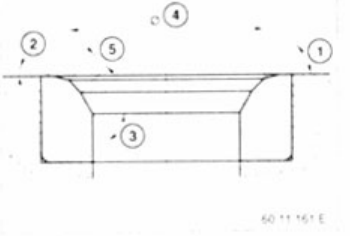
Assemble Special Tool 00 4 200 depending on the stem diameter.
Press mushroom guide (1) against the valve seat and ream out the valve guide dry from the combustion chamber end.
Turn down the reamer once.



o Machining Valve Seat

Machine the valve seat to instructions of the tool supplier using Special Tool 00 3 520 or 00 3 580.
Dimensions and angles*.

Correction cutter from Neway:



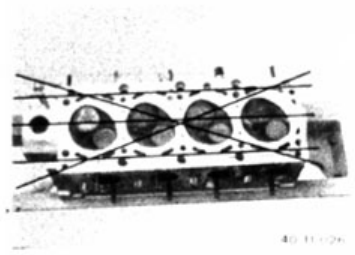
After Machining Valve Seat Surface:
Machine valve seat outside and inside diameters to specified size using a correction cutter* in such a manner that the specified valve seat width* is produced.

1 Valve seat angle
2 Outside dia. correction angle
3 Inside dia. correction angle
4 Valve seat outside diameter
5 Seat width

Valve seat dimensions*.

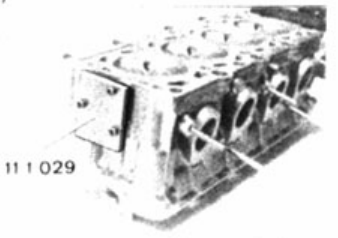
* Refer to Specifications

* Refer to Specifications



• CHECKING/MACHINING CYLINDER HEAD SEALING SURFACE:

Check levelness of cylinder head sealing surface with a standard steel ruler.
Max. deviation in levelness: 0.03 mm (0.0012").

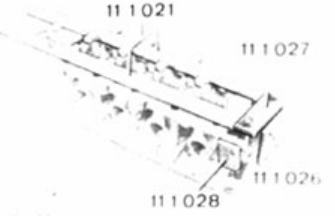


• CHECKING CYLINDER HEAD FOR CRACKS IN WATER TEST:
– Cylinder Head Disassembled –

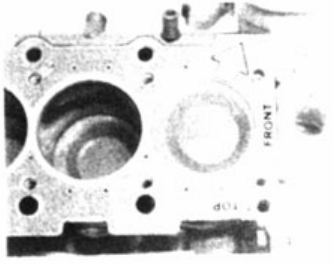
Mount Special Tool 11 1 029.
Note:
Leave the temperature sensor/sender installed.

Remove all attachments on cylinder head to machine the sealing surface.

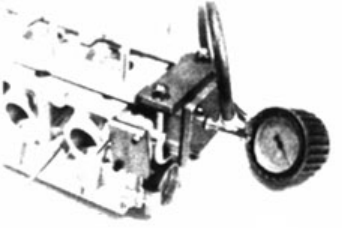
Max. machining:	0.3 ± 0.05 mm (0.012 ± 0.002")
New cyl. head height:	141.0 mm (5.551")
Machining limit:	140.55 mm (5.533")



Mount Special Tools 11 1 021 with cylinder head bolts.
Mount Special Tools 11 1 026 / 027 / 028.

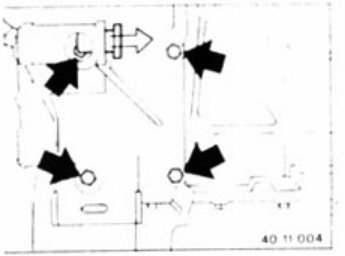


A 0.3 mm (0.012") thicker cylinder head gasket, which must be installed together with an appropriately thicker O-ring for the coolant duct, is available for 0.3 mm (0.012") machining.



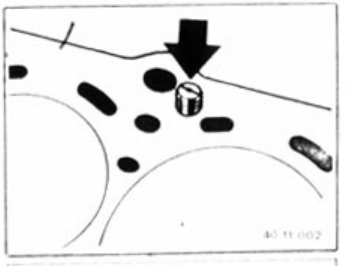
Fill cylinder head with compressed air (testing pressure: 4.5 bar = 64 psi).
If pressure drops, place cylinder head in water bath and check for cracks.
Note:
If necessary, relax water bath with a detergent.

B DISASSEMBLING AND REPAIRING ENGINE BLOCK CRANKSHAFT DRIVE



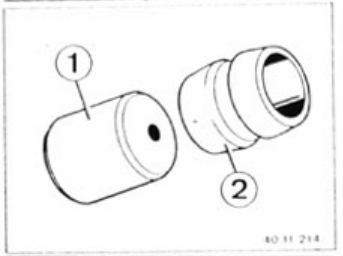
o Removing Alternator Console

Press out sleeve (1).
Unscrew bolts and remove console.

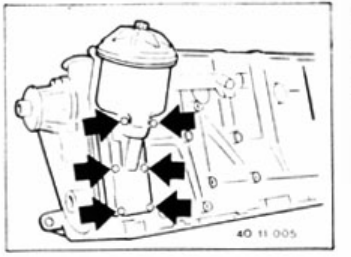


o Checking Orifice for Oil Supply to Hydr Valve Clearance Compensators

Screw orifice out of engine block and check that its bore is not clogged, cleaning the bore if necessary.



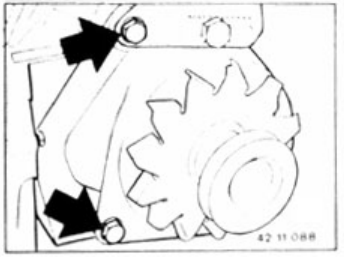
Important:
A reduction jet (1) with rubber-lined spacing sleeve (2) for oil supply to the cylinder head is installed in the engine block of M 40 engines since 9.92.



o Removing Oil Filter Housing

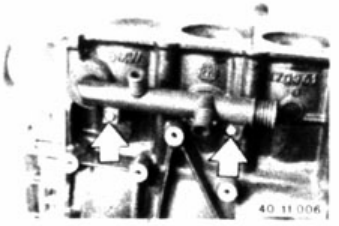
Unscrew bolts and remove oil filter housing.

Installation:
Check seals, replacing them if necessary.



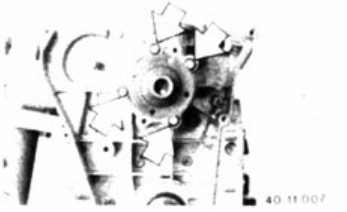
o Removing Alternator

Unscrew bolts and remove alternator.



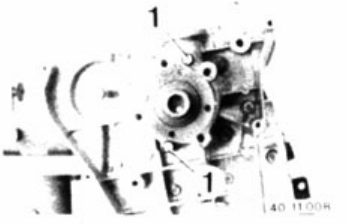
● REMOVING COOLANT PIPE:

Unscrew bolts and pull coolant pipe out of engine block.
Installation:
Replace and lubricate O-ring with a lubricant**.



● REMOVING WATER PUMP:

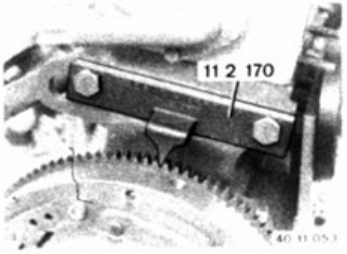
Unscrew bolts.



Screw two bolts in threads (1) and press off the water pump uniformly.
Installation:
Replace O-ring and coat with lubricant**.
Tightening torque: 9 Nm (6.5 ft. lbs.).

** Source: HWB

** Source: HWB

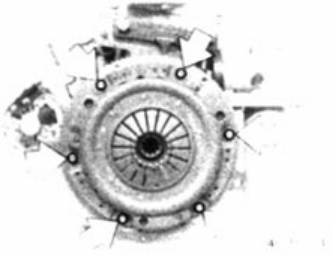


● REMOVING CLUTCH / FLYWHEEL:

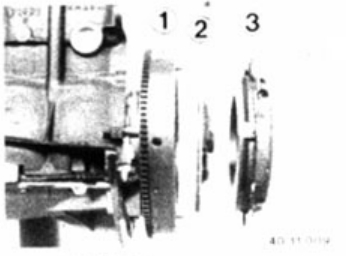
Hold flywheel with Special Tool 11 2 170.

Unscrew bolts and take off flywheel.

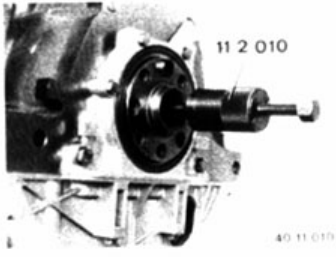
Installation:
Clean threads and install bolts with a bolt cement**.
Tightening torque: 105 Nm (76 ft. lbs.).



Unscrew bolts uniformly.
Take off pressure plate and drive plate.

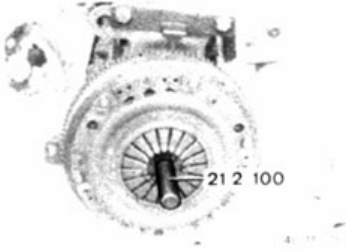


Installation:
1 = Flywheel
2 = Drive plate
3 = Pressure plate
Install drive plate (2) with flat end facing flywheel (1).

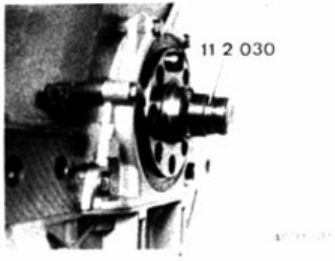


● REPLACING PILOT BEARING IN CRANKSHAFT:

Remove pilot bearing with Special Tool 11 2 010.

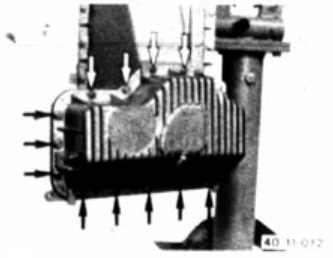


Center drive plate with Special Tool 21 2 100 and tighten bolts.
Tightening torque: 23 Nm (17 ft. lbs.).



Installation:
Insert pilot bearing and drive it in against the stop with Special Tool 11 2 030.

** Source: HWB



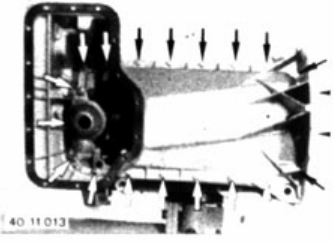
REMOVING OIL PAN:

Unscrew bolts and take off lower oil pan section.

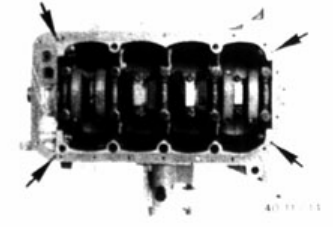
Installation

Replace gasket.

Tightening torque = 9 Nm (6.5 ft. lbs.).



Unscrew bolts and take off oil pan.



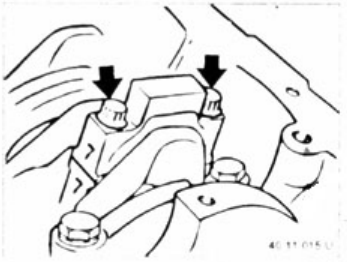
Installation

Replace gasket.

Fill out oil pan gasket on joints between front or rear end covers and crankcase with a non-hardening sealant**.

Tightening torque = 9 Nm (6.5 ft. lbs.).

** Source of Supply: HWB

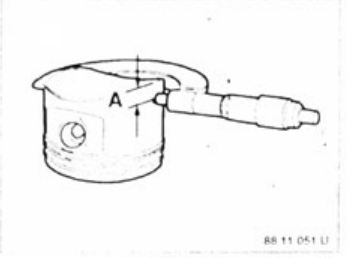


o Removing Piston

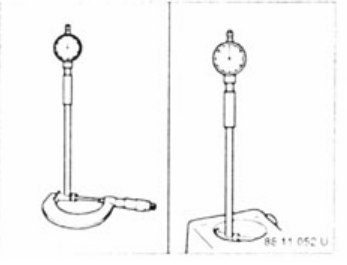
Unscrew conrod bearing cap.
Remove piston.

Important!
Mark position of connecting rod to crankshaft, if the bearing shells do not have to be replaced.
Connecting rods and caps are marked with the same pair numbers (1 ... 99) and must not be mixed up.

Mark piston and reinstall it at the same position, if the piston does not have to be replaced.



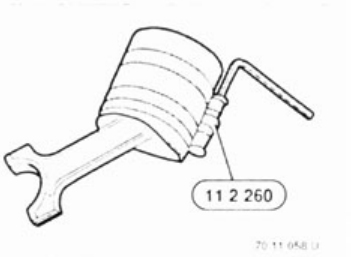
Installation:
Measure the piston installed clearance before installing.
Measure the piston diameter at distance A* from the bottom edge of the piston using a micrometer.



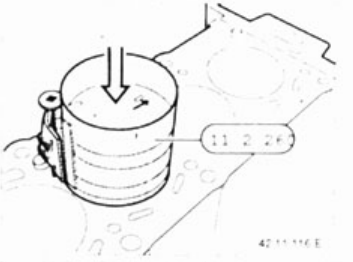
Set internal caliper to zero on micrometer with the measured piston diameter.
Measure cylinder bore at bottom, middle and top diagonally.

New piston installed clearance*.
Max. permissible total wear clearance*.

* Refer to Specifications

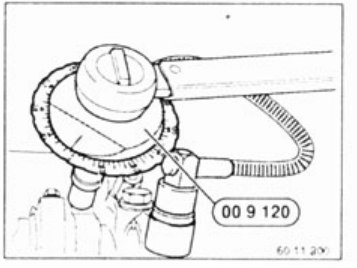


Installation:
Lubricate piston and piston rings lightly with oil.
Align gaps of piston rings (offset approx. 120°, but not above the piston pin eye).
Compress piston rings using Special Tool 11 2 260.
Apply Special Tool 11 2 470 on connecting rod.



Installation:
Insert piston that arrow points to camshaft drive.
Guide crankshaft journal and connecting rod together.
Compressing tool must bear flat on crankcase all around.
Press in piston with light knocks (e.g. from handle of a hammer).

Installation:
Lubricate conrod bearing shells with oil.
Mount bearing cap that pair numbers are aligned.
Use new conrod bolts.



Installation:
Tighten conrod bolts use Special Tool 00 9 120 or Special Tool 11 2 110.

Conrod bearing cap bolt tightening torque*.

* Refer to Specifications

70 11 063

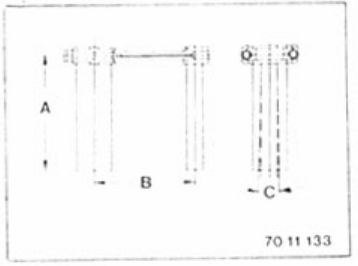
o Removing Connecting Rods:

Lift out circlip and press out piston pin.

Important!
Pistons and piston pins are matched and must not be mixed up.
Insert circlip that its opening is opposite the hole.

40 11 032

Note:
Install connecting rod that the pair number is opposite that piston's arrow for installed direction.



70 11 133

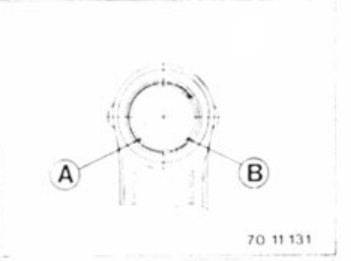
o Checking Connecting Rods:

Check connecting rod for deviation from parallel and distortion.

A Testing distance = 150 mm
B Max. permissible parallel deviation in testing distance = 0.04 mm
C Max. permissible distortion to either side = 0° 30'

70 11 068

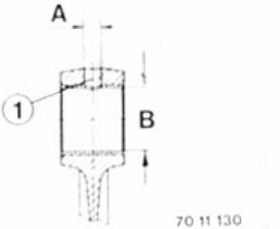
Checking Bush in Conrod:
Press-fit between the bush and piston pin is correct, if the piston pin can be pressed through the bush by hand with only slight force and there is no noticeable play.



70 11 131

o Replacing Bush in Conrod:

Press out old bush with a suitable mandrel.
Press in new bush.
Bush gap may be positioned optionally at point A or B.



70 11 130

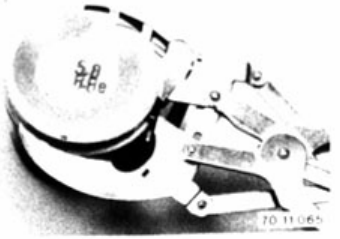
Drill oil bore (1).
Distance A = 6 mm diameter.
Deburr edges of bore at sliding surface of bush.
Ream bush open to diameter B = 22.005 ... 22.010 mm.

70 11 069

o Replacing Connecting Rods:

Only connecting rods of the same weight class (die-stamped on bearing caps) may be installed in one engine.

Note:
Therefore only sets of connecting rods are available from Parts.



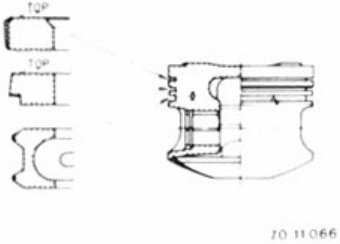
o Replacing Piston Rings of One Piston:

Remove piston rings with a piston ring compressing pliers.

Note:
It might not be possible to find the identification on used piston rings.
Lay piston rings aside in correct sequence and installed position.

Measure side clearance.

Groove 1: 0.020 ... 0.052 mm
Groove 2: 0.020 ... 0.052 mm
Groove 3: 0.020 ... 0.055 mm



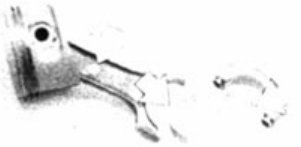
Installation:
Install piston rings with the word "TOP" facing the piston crown.

1 Plain compression ring
2 Bevelled face compression ring
3 Oil scraper ring with rubber lined spring

Offset piston ring end gaps by about 120° to each other, but not above piston pin bores.

Measure end clearance.

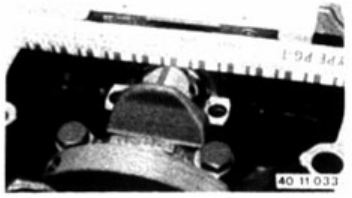
Specifications:
Ring 1: 0.20 ... 0.40 mm
Ring 2: 0.20 ... 0.40 mm
Ring 3: 0.20 ... 0.45 mm



40 11 083

● REPLACING CONNECTING ROD BEARING SHELLS:

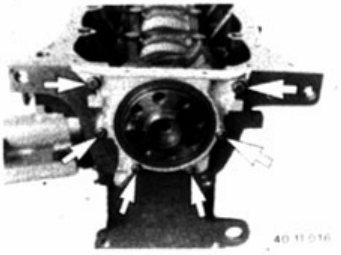
Select new bearing shells according to paint mark on connecting rod.
Important!
Check ground size of crankshaft also refer to Replacing Main Bearing Shells).



40 11 033

Installation:
Check conrod bearing play.
Place Plastigage Type PG 1 on crankshaft wiped clean of oil in BDC position.
Mount conrod bearing caps and tighten with the old conrod bolts to specified torque.

Important!
Do not turn the connecting rods or crankshaft.
Remove bearing caps and read bearing play (nominal: 0.020 to 0.055 mm = 0.0008 to 0.0022") by measuring width of flattened Plastigage with help of supplied scale.
Correct bearing play by installing new or bearing shells with a different paint mark.



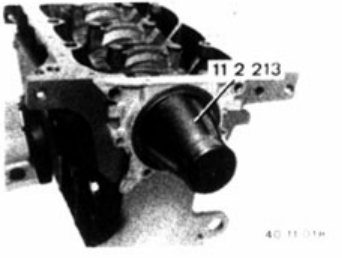
40 11 016

● REMOVING REAR END COVER:

Unscrew bolts and take off cover.

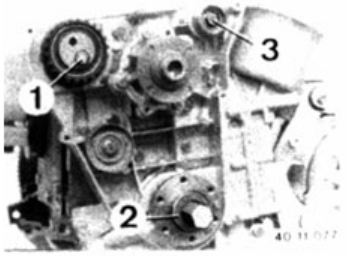
40 11 017

Installation:
Lift out radial oil seal and drive in new seal with Special Tool 11 1 260.



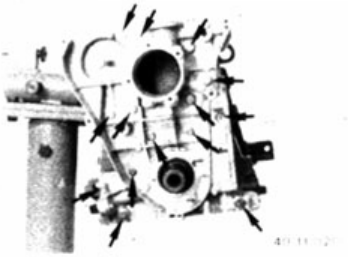
40 11 018

Apply Special Tool 11 2 213 on crankshaft.
– Replace gasket for cover.
– Lubricate sealing lip of radial oil seal with oil.
Slide on and tighten cover.
Tightening torque: M 6 – 9 Nm (6.5 ft. lbs.)
M 8 – 22 Nm (16 ft. lbs.)

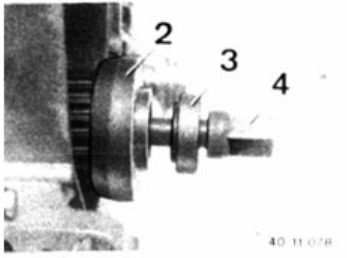


REMOVING FRONT END COVER:

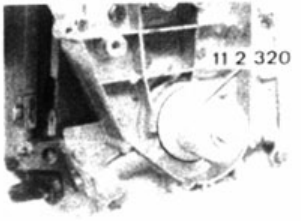
Unscrew tensioning roller (1), drive gear (2) and stabilizing roller (3).



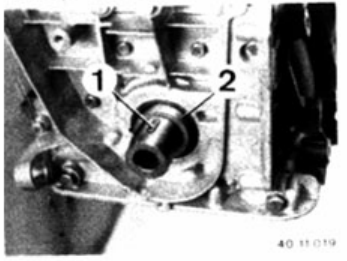
Unscrew all mounting bolts of end cover and take off cover.



Installation
Align drive gear (2) with groove facing the woodruff key and push on crankshaft.
Mount washer (3) with shoulder against the drive gear and tighten bolt (4).
Tightening torque = 310 Nm (224 ft. lbs.).
Screw on nut for tensioning roller only loosely.



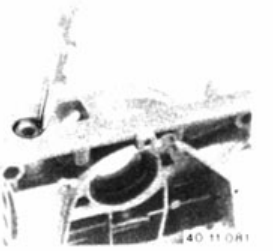
Installation
Replace O-ring on crankshaft.
Replace cover gasket.
Mount end cover.
Tightening torque:
M 6 = 9 Nm (6.5 ft. lbs.)
M 8 = 22 Nm (16 ft. lbs.)
Drive in new radial oil seal against stop with Special Tool 11 2 320.
Lubricate sealing lip of radial oil seal with oil.



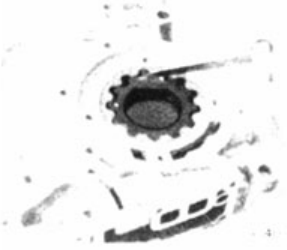
Lift out woodruff key (1) and pull off ring (2)

● REMOVING/CHECKING OIL PUMP:

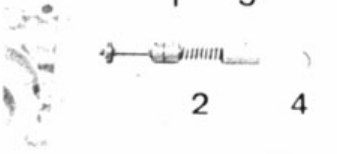
Unscrew bolts and take off cover.
Installation:
Tightening torque: 9 Nm (6.5 ft. lbs.).



Lift out circlip and remove pressure valve.



Measure play between pump body / outer rotor and outer rotor / inner rotor.
Nominal value = 0.12 to 0.20 mm (0.005 to 0.008").
Note
Reinstall rotors in the same position (inner rotor with guide facing the body).



Installation
1 = Piston
2 = Spring
3 = Sleeve
4 = Circlip

Measure length of unloaded spring (2).
Nominal value = 84.1 mm (3.311").

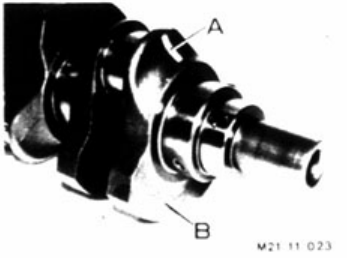
- REMOVING CRANKSHAFT
(Replace crankshaft - see 11 21 501)

Remove main bearing caps (1 ... 5) and lift out crankshaft.

- REPLACING MAIN BEARING SHELLS:

The crankshaft is marked with yellow, green or white paint depending on main bearing journal tolerances.

Installation:
Bearing caps (1 ... 3) are marked with die-stamped numbers.
Bearing cap (4) has a shoulder on the side of the cap and bearing cap (5) is not marked.



M21 11 023

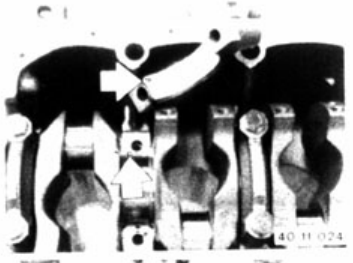
Important!
Check ground size* of the crankshaft.

Conrod Bearing Journal (A)

1 paint stripe	Size 1 (0.25 mm)
2 paint stripes	Size 2 (0.50 mm)

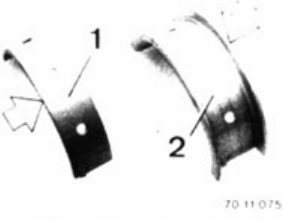
Main Bearing Journal (B)

1 paint stripe	Size 1 (0.25 mm)
2 paint stripes	Size 2 (0.50 mm)



40 11 024

Lubricate bearing shells with oil.
Install crankshaft.
Mount bearing caps (1 ... 5) with bearing cap no. 1 on the camshaft drive end in such a manner that all bearing shell grooves are on one side.
Align bearing caps precisely.



70 11 075

The bearing shells are marked with yellow, green or white paint.

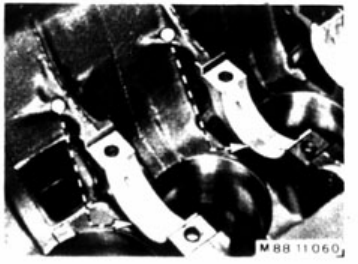
1 Bearing shell 1–2–3–4 (only caps)–5
2 Bearing shell 4 (thrust bearing, only crankshaft)

Check the ground size of main bearing journals!

40 11 042

Tighten bolts (washed and lubricated with oil) in two steps.

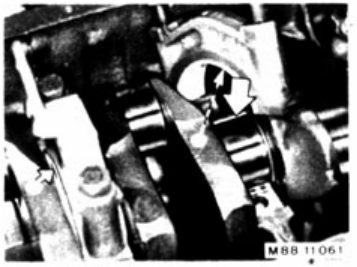
Step 1	23 Nm (17 ft. lbs.)
Step 2	50° torque angle



M88 11 060

Install bearing shells in the crankcase with the same color code mark as the dot of paint on the console.
Install both bearing shells according to the crankshaft color code mark, if the color code mark of the crankcase has been washed off.
Install bearing shells in bearing caps with the same color code mark as for the crankshaft.

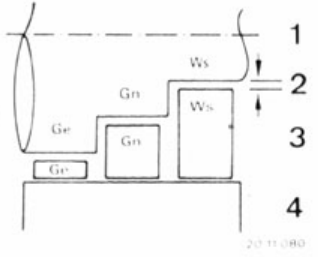
* See Specifications



Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps to the specified torqueing procedure*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with a different color code.



Survey of Color Code Shaft Diameter/ Bearing Shell Thickness*

Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

* See Specifications

11 21 501 REPLACING CRANKSHAFT
– Crankshaft Removed –

Note:
A replacement crankshaft is supplied complete with corresponding bearing shells for main and conrod bearings.

Crankshaft Identification
(Cast on Crank):

Engine	Stroke (mm)
M 40 B 16	72 (2.835")
M 40 B 18	81 (3.189")

The crankshaft is surface treated and may only be reground in the factory.

Reground crankshafts are marked with stripes of paint.

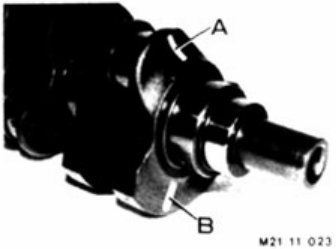
Conrod Bearing Journal (A)

1 paint stripe	Size 1 *
2 paint stripes	Size 2 *

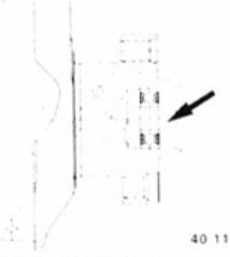
Main Bearing Journal (B)

1 paint stripe	Size 1 *
2 paint stripes	Size 2 *

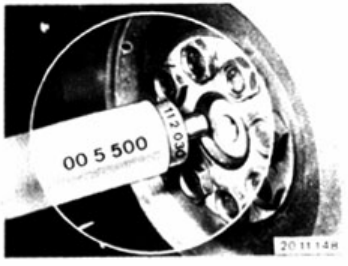
Cars with Manual Transmission:
Install pilot bearing for the transmission main shaft.



M21 11 023



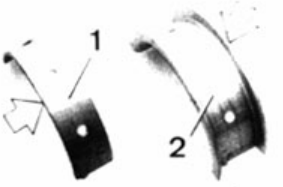
40 11 142



20 11 148

Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

The crankshaft is marked with yellow, green or white paint depending on the main bearing journal tolerances.

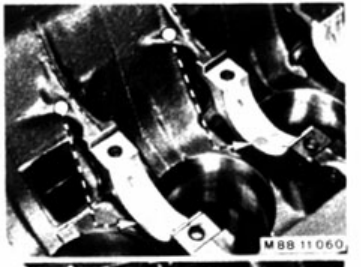


70 11 075

The bearing shells are marked with yellow, green or white paint.

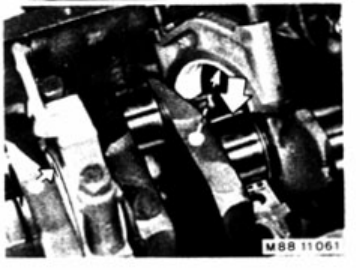
1 Bearing shell 1–2–3–4 (only cap)–5
2 Bearing shell 4 (thrust bearing, only crankcase)

Check the ground size of main bearing journals!



M88 11 060

Installing Instructions:
Install only "yellow" bearing shells in the crankcase (regardless of the old color code mark on the crankcase).
Install "yellow or green or white" bearing shells in bearing caps depending on the crankshaft bearing journal color code mark.



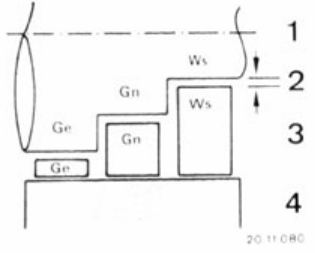
M88 11 061

Install crankshaft.
Place Type PG-1 Plastigage on the crankshaft wiped clean of oil and tighten the bearing caps with correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

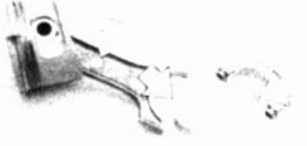
Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with a different color code.



Survey of Color Code/Shaft Diameter/ Bearing Shell Thickness*

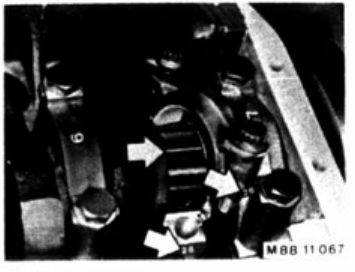
Triple Classification Color Codes:
Ge = yellow
Gn = green
Ws = white

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter



Replacing Conrod Bearing Shells:
Red or blue conrod bearing shells are installed standard according to the color code mark on the connecting rod for a pertinent ground size or crankshaft.

Install only red bearing shells of the pertinent ground size for replacement crankshafts.

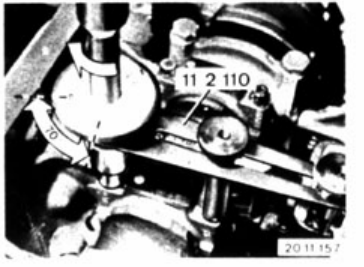


Installation:
Check conrod bearing play.
Place Type PG-1 Plastigage on the crankshaft wiped clean of oil in BDC position.
Mount conrod bearing caps and tighten the old conrod bolts with correct torque*.

* See Specifications

Important!
Do not turn the connecting rods or crankshaft.

Remove bearing caps and check bearing play = 0.020 to 0.055 mm (0.0008 to 0.0022") by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells or bearing shells with a different color code.



Tightening Conrod Bolts:
Lubricate conrod bearing shells with oil.
Mount bearing caps that pair numbers are on one side.
Use new conrod bolts and tighten them in two steps.

Step 1	20 Nm (14.5 ft. lbs.)
Step 2	70° torque angle

Constrution group 11 Engine M42

11 00 . . .	Engine – disassemble and assemble – engine removed	11- 42/1
	Engine – mount on assembly stand	11- 42/1
	A. Cylinder head – remove	11- 42/2
	• Cylinder head cover – remove	11- 42/2
	• Cylinder head – remove	11- 42/3
	B. Cylinder head – disassemble	11- 42/7

	• Lower timing case cover – remove	11- 42/17
	• Timing chain and guides – remove	11- 42/18
	• Oil pan – remove	11- 42/19
	• Timing case with oil pump – remove	11- 42/19
	• Oil pump – remove, check	11- 42/20
	• Clutch – flywheel – remove	11- 42/20
	• Pilot bearing in crankshaft – replace	11- 42/21
	• Rear end cover – remove	11- 42/21
	• Connecting rod and piston – remove	11- 42/22
	• Connecting rod – remove, check	11- 42/22
	• Connecting rod bearing shells – replace	11- 42/23
	• Piston – replace, check	11- 42/24
	• Piston rings – replace, check	11- 42/24
	• Crankshaft – remove	11- 42/25
	• Main bearing shells – replace	11- 42/25
	• Spray jets in crankshaft bearing caps – replace	11- 42/26
11 21 501	Crankshaft – replace – crankshaft removed	11- 42/27

11 00 DISASSEMBLING AND ASSEMBLING ENGINE
Engine Removed

If work had been carried out on the cylinder head for which the camshaft was removed, there must be compliance with the following.
Hydraulic valve tappets expand without load from the camshaft and require a certain amount of time to be compressed again after installation. Consequently in case of fast installation even the "closed" valves could be opened and touch the pistons.

The following waiting times are necessary between installing of the camshaft and mounting the cylinder head.

Room temp. (20° C)	4 minutes
10 to 20° C	11 minutes
0 to 10° C	30 minutes

After installation of the camshaft and timing chain the engine may first be cranked after the following waiting times.

Room temp. (20° C)	after 10 minutes
10 to 20° C	after 30 minutes
0 to 10° C	after 75 minutes

Working on Valve Train with Installed Cylinder Head

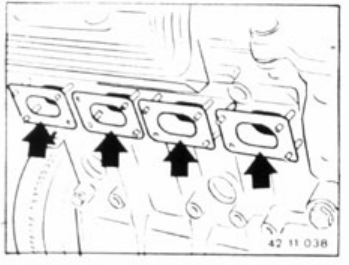
Turn crankshaft in engine's direction of rotation 90 - 45° from TDC.
In this manner none of the pistons will be in TDC.
Install camshaft that peaks of cams for cylinder no. 1 point to each other.
Keep to the above mentioned waiting times.
Turn crankshaft back to TDC and install the timing chain.
Crank engine for first time 10 minutes after installation of the camshaft.

Disassembling and repairing the engine are described in chronological sequence on the following pages. The list of contents is provided to help take up work again after an interruption or to more easily find a certain point. They only describe direct removal and installation, and do not contain full details of procedures.

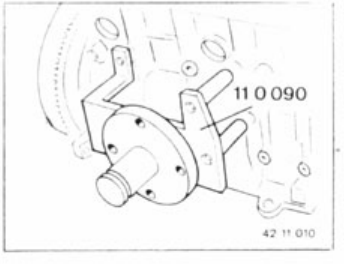
o Mounting Engine on Assembly Stand

Unscrew exhaust manifold.
Unscrew nuts.
Lift off exhaust manifold.

Installation:
Replace nuts.
Coat threads with copper paste**.
Tightening torque*.

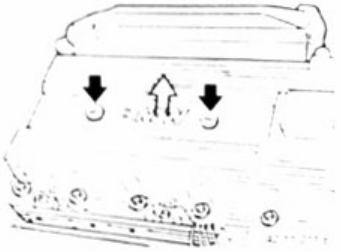


Installation:
Replace gaskets.
Beads of gaskets face the exhaust manifold.



Mount engine on Special Tool 00 1 490 using Special Tool 11 0 090.

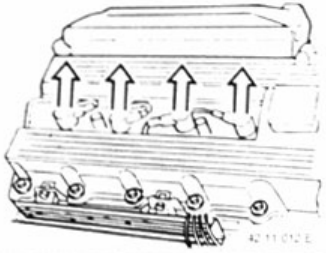
* Refer to Specifications
** Source of Supply: BMW Parts



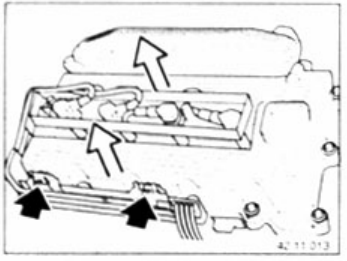
A. REMOVING CYLINDER HEAD

o Removing Cylinder Head Cover:

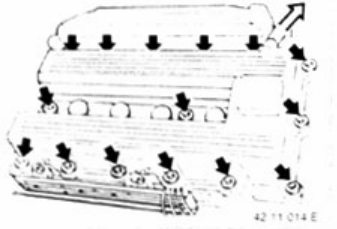
Unscrew cover for ignition coil.



Pull off spark plug connectors.



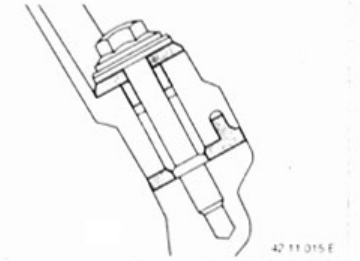
Loosen both nuts.
Lift out complete ignition tackle.



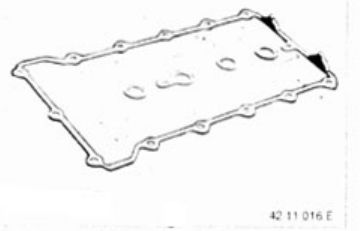
Pull off hose.
Unscrew cylinder head cover.

Installation:
Tightening torque*.

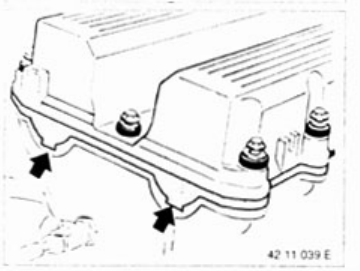
* See Specifications



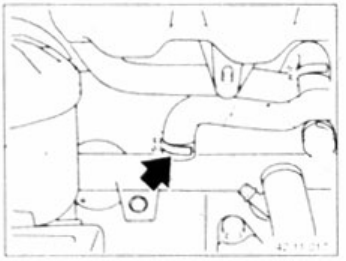
Note:
Rubber mounts and gaskets are used to separate the cylinder head cover and cylinder head in regards to oscillation.
Note arrangement of rubber mounts.



Installation:
Check gaskets, replacing if necessary.

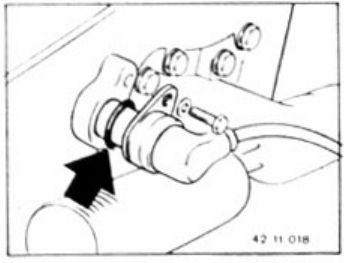


Installation:
Check for correct seating of gasket on back of the cylinder head when mounting the cylinder head cover.



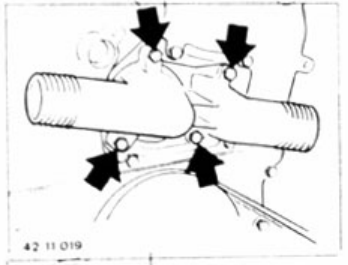
o Removing Cylinder Head

Disconnect coolant hose at coolant pipe.

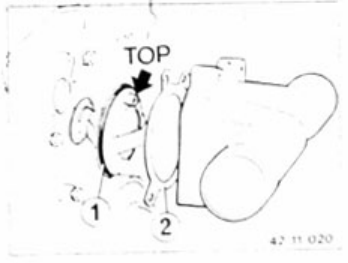


Remove sender.

Installation:
Check seal, replacing it if necessary.

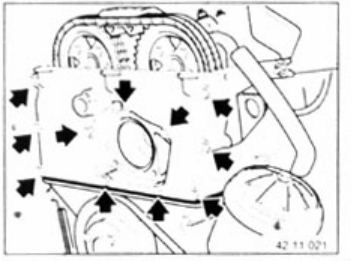


Remove thermostat housing and thermostat.

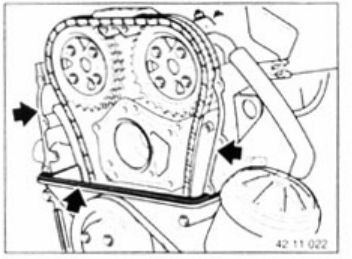


Installation:
Vent points up.
Replace O-ring.
Coat O-ring lightly with glycerine.

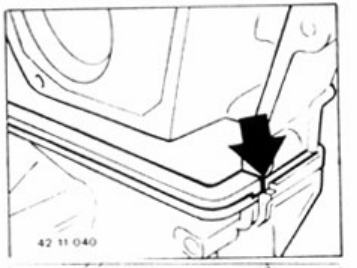
1 O-ring
2 Gasket



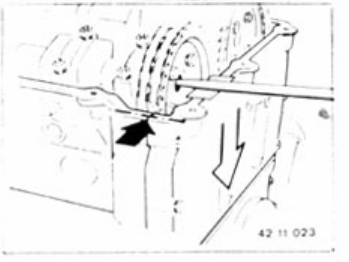
Unscrew upper timing case cover.



Installation:
Replace gaskets.

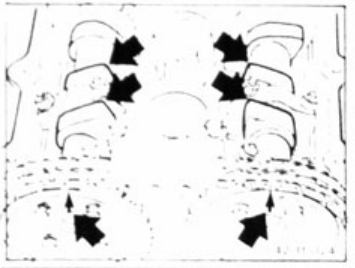


Installation:
Fill joints between gaskets with permanently elastic sealing compound 3 Bond 1209**.

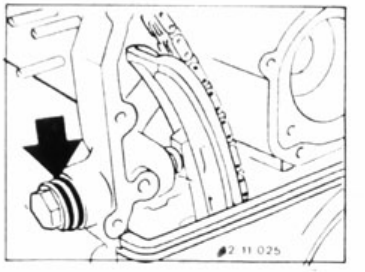


Installation:
Screw in 2 bolts.
Press down on timing case until upper edge of cover is in same plane as cylinder head.
Don't damage sealing surfaces.
Screw in and tighten all bolts.
Tightening torque*.

* Refer to Specifications
** Source of Supply: BMW Parts



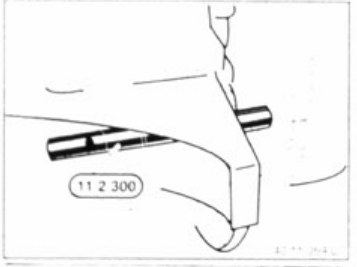
Crank over engine in direction of rotation until peaks of intake and exhaust cams in cylinder no. 1 face each other.
Arrows on timing chain sprockets face up.



Remove chain tensioner.

Installation:
Tightening torque*.

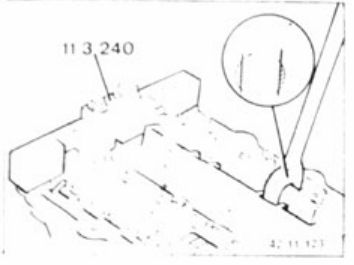
Important!
A new or disassembled chain tensioner is without an oil filling.
To guarantee correct function the engine must be operated the first time at 3500 rpm about 20 seconds.



Installation:
Hold crankshaft in TDC position with Special Tool 11 2 300.

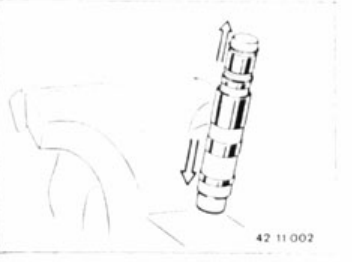
Caution!
Remove special tool before operating the engine.

Installation – Important!
The hydraulic plunger of the chain tensioner must be brought into basic position (transporting position for new chain tensioners) *before* installing or after loosening the plug.
Reason: After running out the hydraulic plunger is locked and cannot be pressed back.
No spring action — chain or tensioner would break.



Installation:
Align camshaft and hold it with Special Tool 11 3 240.
Camshafts can be turned on the hexagon with a 27 mm wrench.

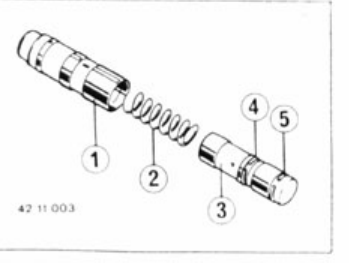
Caution!
Don't damage the bearing plate — machine sides of open-end wrench as shown if necessary.



Installation:
Bring hydraulic plunger into installed basic position:

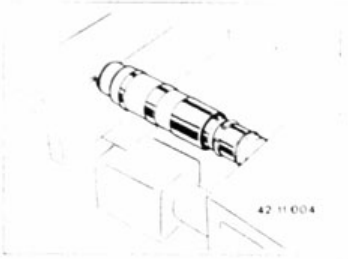
Knock outside sleeve of chain tensioner on a hard surface (clamp anvil).
This causes the piston to jump out of the lock.

Important!
If the camshaft position has to be corrected enough that there is valve movement in cylinder no. 1 and 4, first turn the crankshaft approx. 90° away from TDC position in the engine's direction of rotation and return it only after turning the camshaft.
In this manner contact between valves and the piston will be avoided.
Install and unlock chain tensioner after assembling.
Press chain tensioner against the timing chain.
Recheck the camshaft adjustment.

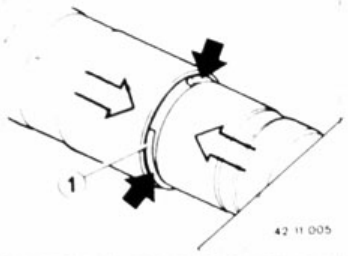


Installation:
Arrangement of Parts:

1 Sleeve
2 Spring
3 Hydr. piston
4 Circlip
5 Circlip

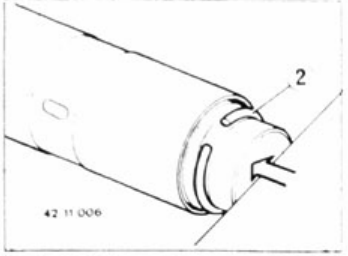


Installation
Assemble and clamp chain tensioner in a vise fitted with soft jaws.

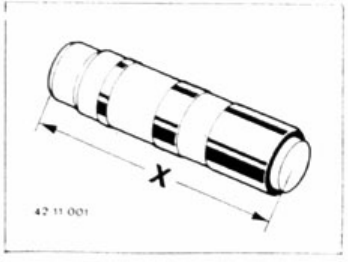


Installation
Push chain tensioner together.

Important!
Place circlip (1) in slip bevel of the sleeve.

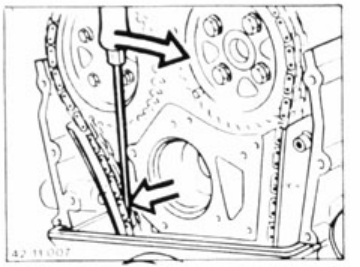


Installation
Push chain tensioner together even further until circlip (2) is heard to engage.
Loosen vise.
Chain tensioner must remain in the transporting position.

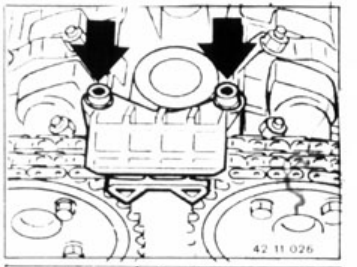


Installation
The hydraulic piston runs out again, if the "catch point" was overrun or not reached.
Chain tensioner must then be disassembled again and the procedures repeated.

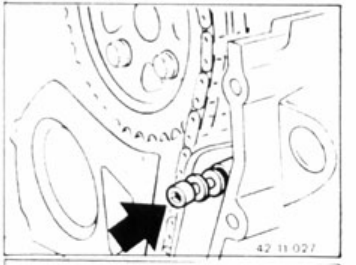
X = 68.5 mm (2.697").



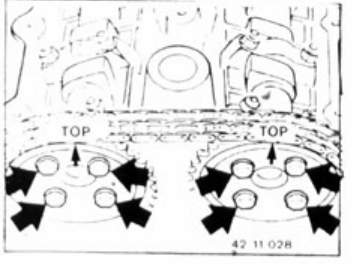
Installation
Install chain tensioner.
Push chain tensioning rail against the hydraulic piston briefly until the tensioning element is released.



Unscrew upper chain guide.



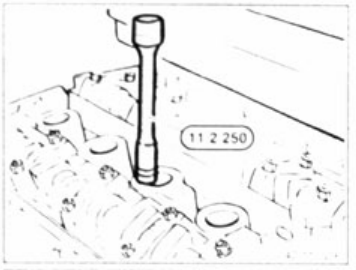
Unscrew upper chain guide bolt on right hand side.



Unscrew sprockets.

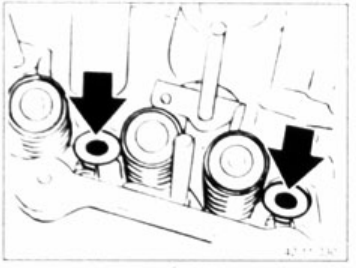
Installation:
Arrows on sprockets face up.
Tightening torque*.

* See Specifications



Unscrew cylinder heads bolts from outside to inside in several steps using Special Tool 11 2 250.
Lift off cylinder head.

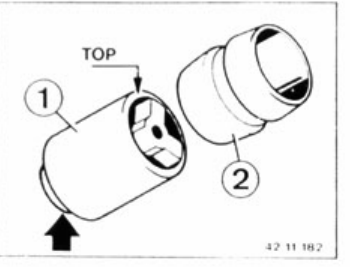
Note!
In contradiction to the M 40 engine, an orifice for supply of oil to the cylinder head is *not* installed in the M 42 engine block.



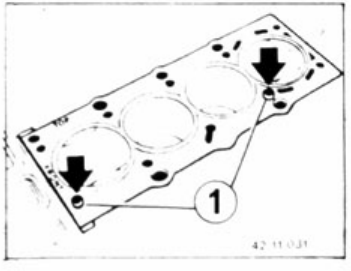
Note!
Standard production cylinder heads have punch-locked washers to avoid losing them.
When installing a new cylinder head, use new washers with punch-locking.

Important!
A check valve with rubber-lined spacing sleeve for supply of oil to the cylinder head is installed in the engine block of M 42 engines since 9.92.

Installation:
Keep to the waiting times for hydraulic valve tappets when installing the cylinder head.
Refer to "General Information".

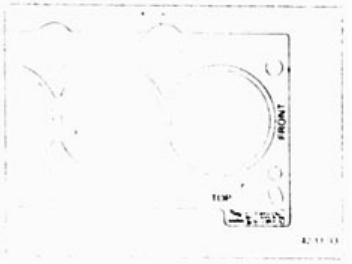


Installation:
Install check valve (1) with its collar facing the crankcase in the oil supply bore for the cylinder head.
Insert rubber-lined spacing sleeve (2).

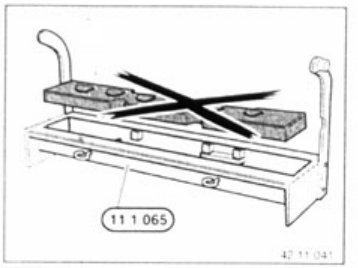


Installation:
Clean sealing surfaces on cylinder head and crankcase. If applicable, remove bits of gaskets using a hard wood scraper and ensure that bits of gaskets do not fall into oil and coolant bores.
Install new cylinder head gasket with "TOP" facing up and "FRONT" on the chain end.
Check dowel sleeves (1) for damage and correct installation.

Caution!
If check valve (1) were installed in the wrong direction, it would block the supply of oil to the cylinder head.



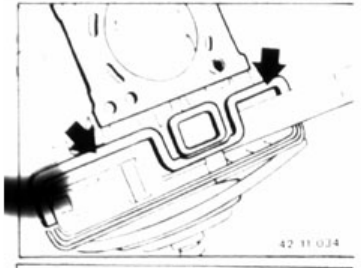
Installation:
A 0.3 mm thicker cylinder head gasket is available for machined (ground) cylinder heads.



B. DISASSEMBLING CYLINDER HEAD

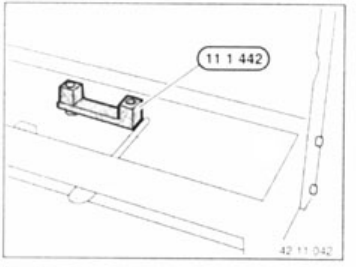
o Mounting Cylinder Head on Assembly Stand

Mount Special Tool 11 1 065 on Special Tool 00 1 490.
Do *not* insert Special Tool 11 0 180.

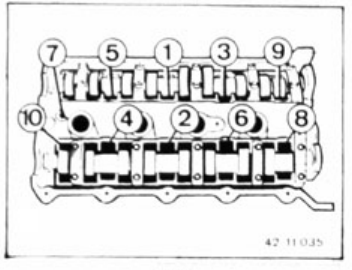


Installation:
Install timing case gasket.

Note:
The gasket can also be used together with the thicker cylinder head gasket.

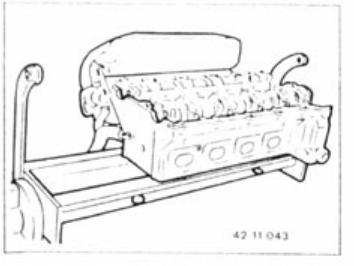


Note:
Screw Special Tool 11 1 442 on already delivered special tool assembly fixtures.

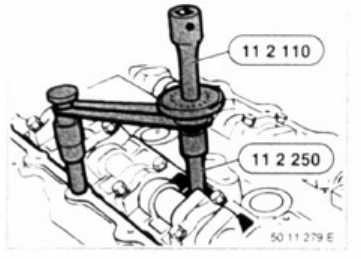


Installation:
Mount cylinder head and tighten the new (lightly oiled) bolts in sequence of 1 ... 10 in three steps.
Tightening torque*.

Important!
Cylinder head bolts may only be used once.
Keep oil out of tapped bores in the engine block (danger of cracking block, falsified torque values).

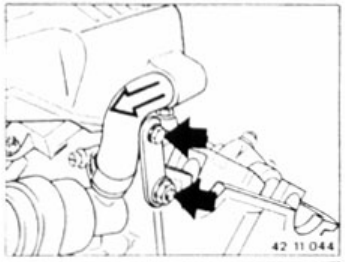


Mount cylinder head on assembly stand fixture using two cylinder head bolts.



Note:
Use Special Tools 11 2 250 and 11 2 110 or 00 9 120 to tighten bolts to torque angle*.

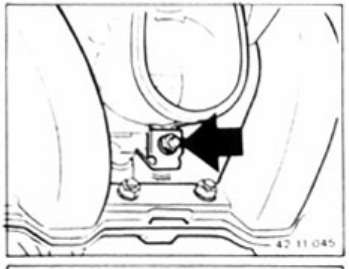
* Refer to Specifications



o Removing Intake Manifold:

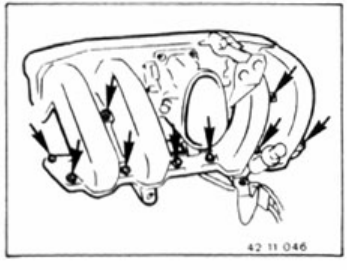
Unscrew upper manifold section.
Unscrew rear brace.
Pull off hose.

Loosen front brace.

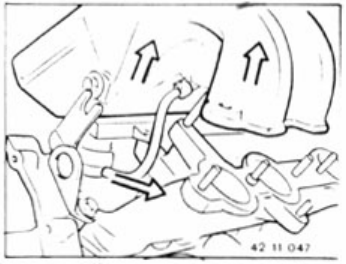


Unscrew holder for preheater.

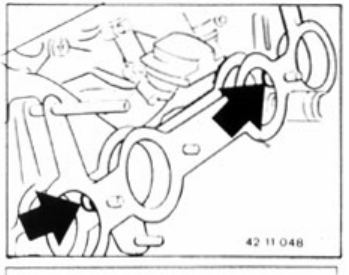
Installation:
If applicable, bend holder for preheater far enough that bearing surface of preheater bears firmly on the throttle valve assembly.



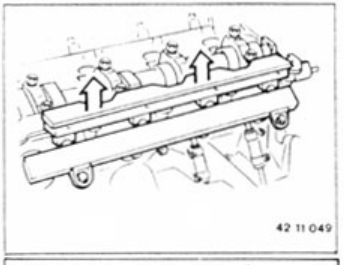
Unscrew bolts.



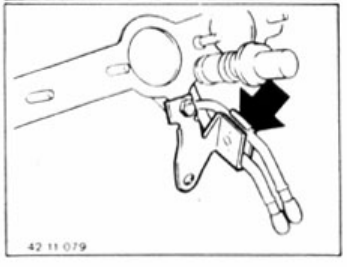
Lift off upper intake manifold section.
Pull hose off of fuel pressure regulator at the same time.



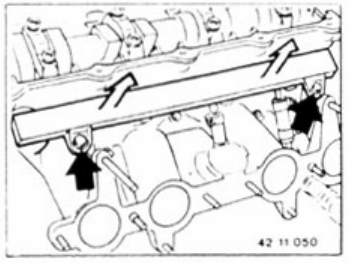
Installation:
Replace gasket.
Check dowel sleeves.



Pull plug plate off of fuel injectors.

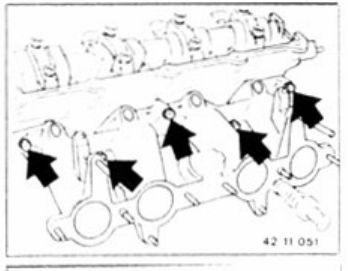


Unscrew clamp.

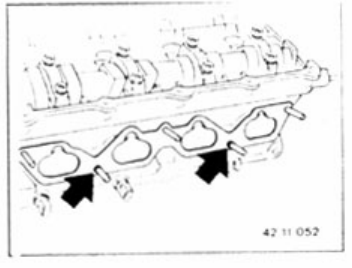


Unscrew bolts.
Pull off injection pipe complete with fuel injectors.

Installation:
Lubricate seals lightly with oil.



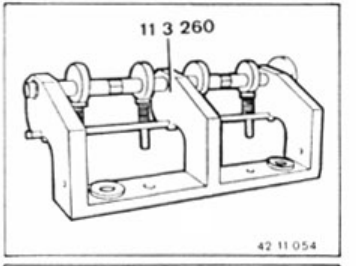
Unscrew lower manifold section.



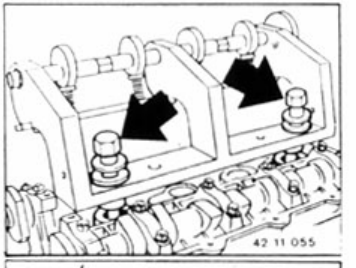
Installation:
Replace gasket.
Check dowel sleeves.

o Removing Camshafts:

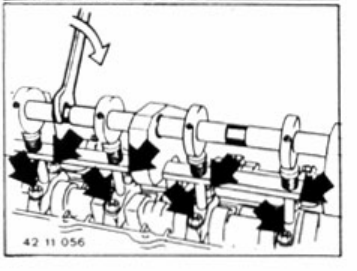
Important!
Camshafts could be pre-damaged or broken when removal/installation were performed incorrectly without a fixture. In addition, valves could be bent through contact with piston crowns when mounting the cylinder head on the crankcase.
Always conform with assembly instructions and sequence.



Prepare Special Tool 11 3 260 for a four cylinder engine.



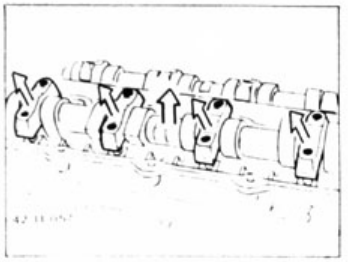
Unscrew spark plugs.
Mount and bolt special tool fixture in tapped bores for spark plugs.
Tightening torque = 23 Nm (17 ft. lbs.).



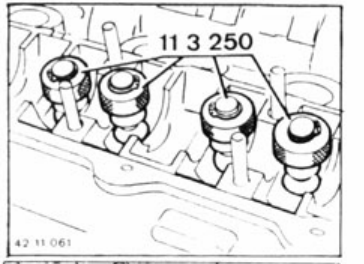
Apply load on bearing caps by turning the eccentric shaft.
Unscrew bolts for bearing caps.

Installation:
Tightening torque*.

* See Specifications

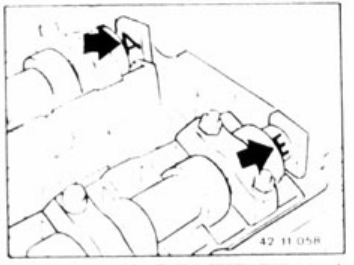


Release and remove special tool.
Lift out bearing caps and camshaft.

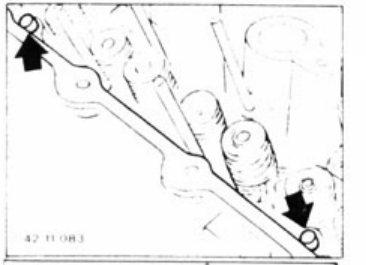


Hold valve clearance compensators tight with Special Tools 11 3 250.

Lift out bearing plate complete with valve tappets.

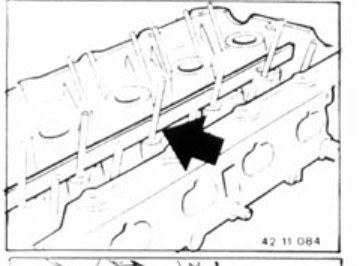


Installation:
Camshafts are marked with "A" for exhaust or "E" for intake.

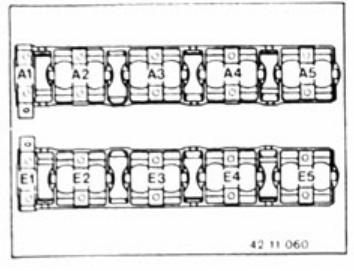


Installation:
Check centering sleeves on mounting bolts for bearings 2 and 5.

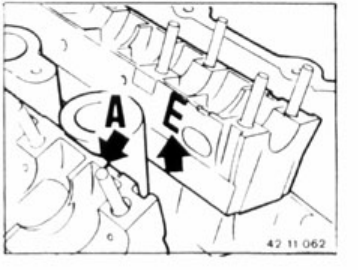
Installation:
Install camshafts that the peaks of intake and exhaust cams face each other in cylinder no. 1.



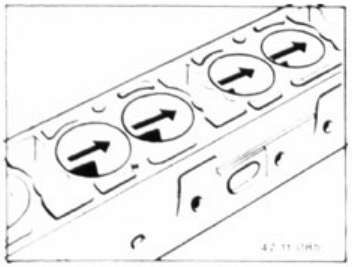
Note:
If the cylinder head has to be replaced because of mechanical damage (crack, distortion), the bearing surfaces of bearing plates must be checked for distortion with a steel straightedge on the old cylinder head.
Max. gap = 0.05 mm.
Also replace the bearing plates if this specification is exceeded.



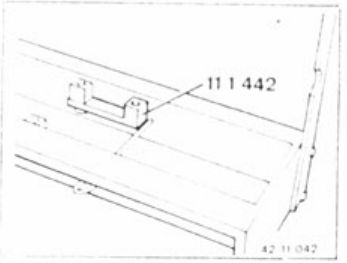
Installation:
Bearing caps are marked with
A1 ... A5 for the exhaust side and
E1 ... E5 for the intake side
and can be read from the intake side.



Installation
Bearing plates are marked with "A" for the exhaust side or "E" for the intake side.



Installation
Inspect bearing surfaces of valve clearance compensating elements for wear (scoring).



o Removing Valves:

Mount Special Tool 11 1 065 on Special Tool 00 1 490.

Note:
Bolt on Special Tool 11 1 442 in case of assembly fixtures supplied earlier.

Installation
Valve clearance compensating elements expand without load from the camshaft and require a certain amount of time after installation before they compress again. Consequently when installation is fast even the "closed" valves could still be open and bear on the pistons.

Always conform with the following waiting times between installation of the camshaft and mounting of the cylinder head.

Room temp. = 20° C (68° F)	4 minutes
10 to 20° C (50 to 68° F)	11 minutes
0 to 10° C (32 to 50° F)	30 minutes

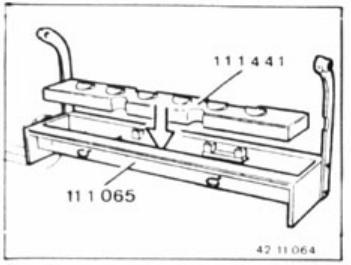
The engine may be cranked after installation of the camshaft and timing chain only after the following waiting times.

Room temp. = 20° C (68° F)	10 minutes
10 to 20° C (50 to 68° F)	30 minutes
0 to 10° C (32 to 50° F)	75 minutes

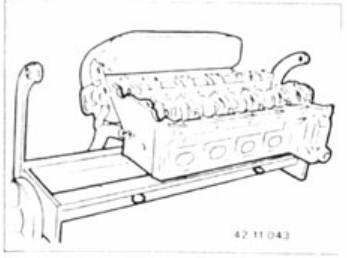
If applicable, proceed as described below.

Working on Valve Train with Mounted Cylinder Head:

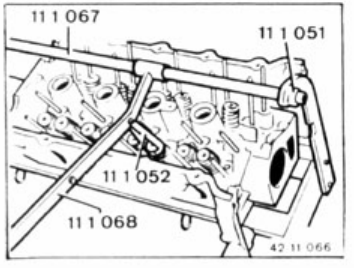
Turn crankshaft in engine's direction of rotation by 90° ± 45° from the TDC mark. This will mean that none of the pistons are at TDC.
Insert camshaft that cam peaks of the 1st cylinder face each other.
Wait the time mentioned above.
Turn crankshaft back to TDC position and install the timing chain.
Wait 10 minutes after installation of the camshaft before cranking the engine.



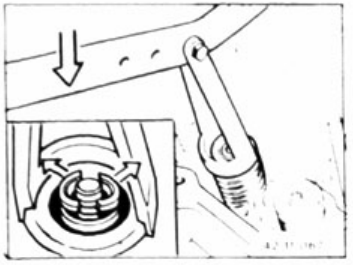
Place Special Tool 11 0 180 in the assembly fixture.



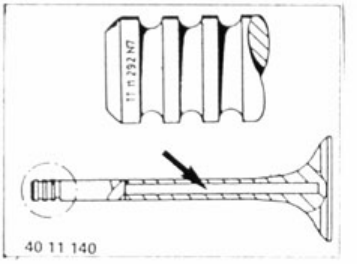
Mount cylinder head on the assembly fixture with two cylinder head bolts.



Bolt on Special Tool 11 1 051.
Mount Special Tools 11 1 068, 11 1 052 and 11 1 067.



Press down valve springs and take out valve collets.
Remove valve springs and spring retainers.
Take tray out of the assembly fixture from below and pull out valve.



Important Information On Scrapping!

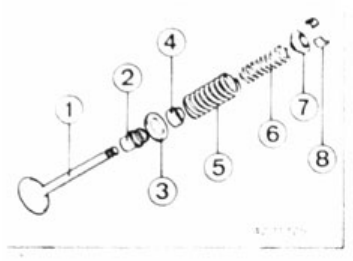
Exhaust valves are filled with sodium to improve carrying off heat.

Sodium filled valves may not be scrapped in the conventional manner without special treatment.
The reason for this is the danger of the sodium exploding when melted.
It is also not permitted to use them as "special tools" – such as, for example, impact mandrels – as is common in some workshops.

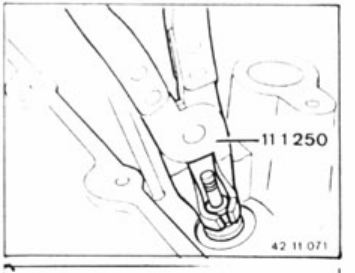
Consequently sodium filled valves to be scrapped must be collected and sent to HT-L-2 in the Landshut factory for neutralization.

Refer to Service Information of Gr. 11 for information on scrapping in those countries, where valves can not be returned regardless of circumstances or which are not obligated to return parts.

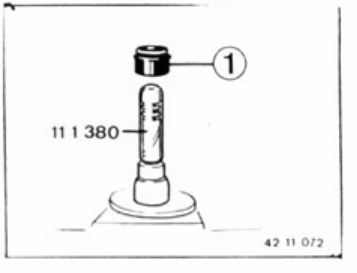
Installation
Both springs must be replaced, even if only one spring of a spring package (inner or outer spring) is damaged or broken.
Only use inner and outer springs from the same manufacturer and with the same color code.



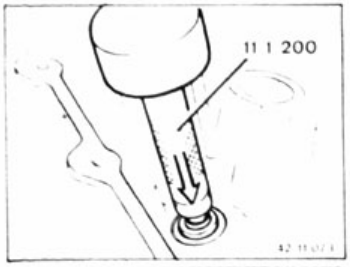
Installed Order:
1 Valve
2 Valve stem seal
3 Outer spring retainer
4 Inner spring retainer
5 Outer spring
6 Inner spring
7 Upper spring retainer
8 Valve collets



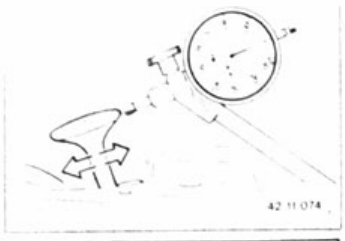
Pull off valve stem seal with Special Tool 11 1 250.



Installation:
Lubricate valve stem with oil and insert valve.
Apply Special Tool 11 1 380.
Lubricate new valve stem seal with oil and install.

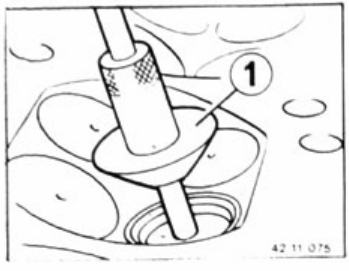


Installation
Press on valve stem seal against the stop by hand with Special Tool 11 1 200.



o Checking Valve Guide:

Insert a new valve in such a manner that the end of the valve stem is flush with the valve guide.
Mount dial gage and measure the tilt clearance.
Max. permissible tilt clearance = 0.5 mm (0.020").



o Reaming Valve Guide:

Ream valve guide and install a repair valve with an oversize stem diameter of + 0.1 or 0.2 mm (0.004 or 0.008") if there is excessive play between the valve stem and valve guide.
Press guide (1) on the valve seat and ream out the valve guide beginning at the combustion chamber end.
Turn down the reamer once.

Note:
Valve seat must be machined after reaming.

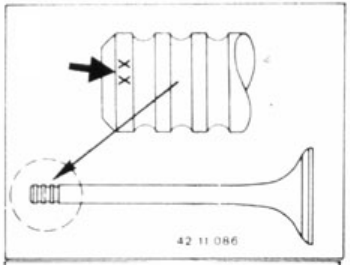
o Machining Valve Seat:

If more than 0.2 mm (0.008") is machined off of the valve seat, a valve with a thicker valve head must be installed (compression would be changed).
The following valve versions are available in addition to standard valves.

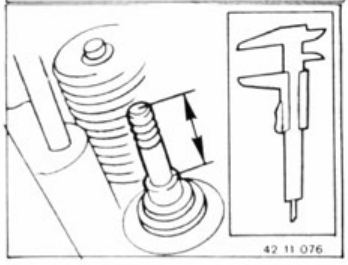
Stem oversize	0.0 mm	0.1 mm (0.004")	0.2 mm (0.008")
Valve head thickness oversize	0.2 mm (0.008")	0.2 mm (0.008")	0.4 mm (0.016")
For machining on seat insert ring in excess	0.2 mm (0.008")	0.2 mm (0.008")	0.4 mm (0.016")
Identification on stem (see picture)	0.0 mm	0.1 mm (0.004")	0.2 mm (0.008")

Information for 2nd Machining:
If size "00" is already installed and valve seat machining exceeds 0.2 mm (0.008"), install size "0.2".

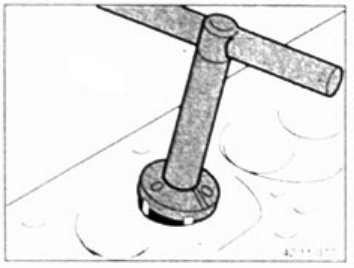
Important!
Valves with excessively thick valve heads cause engine damage (anti-knock limit is exceeded).



Valve Identification



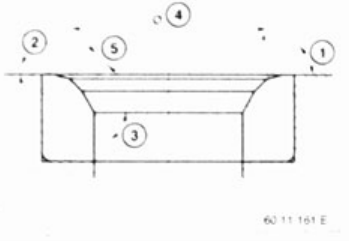
Determine to which extent the valve seat has to be machined by inserting the valve, measuring the protrusion from the valve stem to the valve guide and noting this distance.
Machine valve seat.
Insert the same valve again, measure protrusion from valve stem to valve guide and note this distance.
The difference between both distances is the amount of machining.



o Machining Valve Seat

Machine the valve seat to instructions of the tool supplier using Special Tool 00 3 520 or 00 3 580.
Dimensions and angles*.

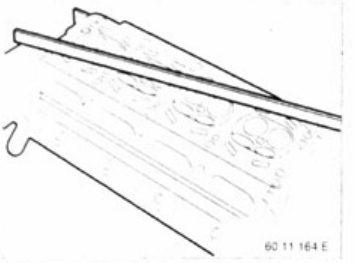
Correction cutter from Neway:



After Machining Valve Seat Surface:
Machine valve seat outside and inside diameters to specified size using a correction cutter* in such a manner that the specified valve seat width* is produced.

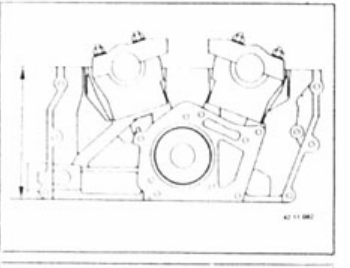
1 Valve seat angle
2 Outside dia. correction angle
3 Inside dia. correction angle
4 Valve seat outside diameter
5 Seat width

Valve seat dimensions*.



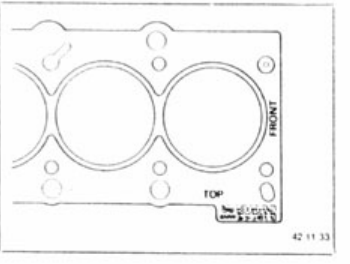
o **Inspecting Cylinder Head Sealing Surface**

Check levelness of the cylinder head sealing surface using a standard straightedge. Max. permissible deviation = 0.03 mm.



Remove all attachments from cylinder head to machine the sealing surfaces.

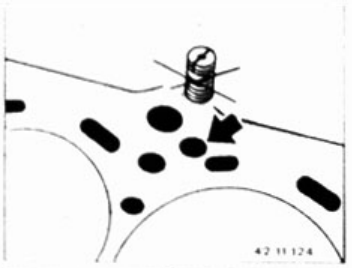
Machining limit*.



A 0.3 mm thicker cylinder head gasket is available for repairs when cylinder head thickness is reduced by 0.3 mm.

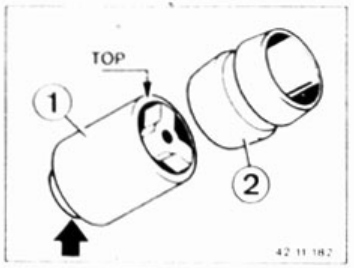
* Refer to Specifications

* Refer to Specifications



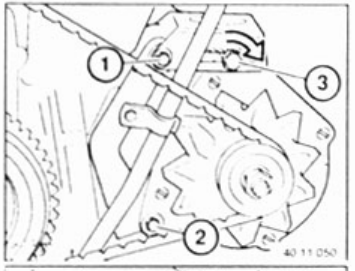
C DISASSEMBLING AND REPAIRING ENGINE BLOCK, CRANKSHAFT DRIVE

Note:
In contradiction to the M 40 engine, an orifice for supply of oil to the cylinder head is not installed in the M 42 engine block.



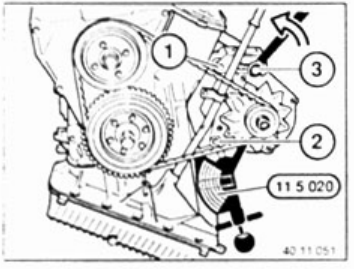
Important:
A check valve with rubber-lined spacing sleeve for supply of oil to the cylinder head is installed in the engine block of M 42 engines since 9.92.
Install check valve (1) with its collar facing the crankcase in the oil supply bore for the cylinder head.
Insert rubber-lined spacing sleeve (2).

Caution!
If check valve (1) were installed in the wrong direction, it would block the supply of oil to the cylinder head.

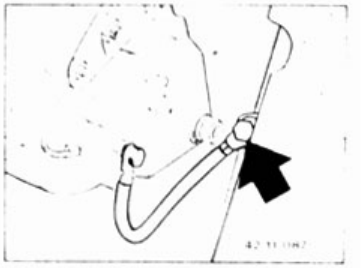


o Removing Drive Belt

Loosen bolt (1).
Loosen nuts on bolts (2 and 3) and turn bolt (3) in direction of arrow to slacken the drive belt.
Remove drive belt.

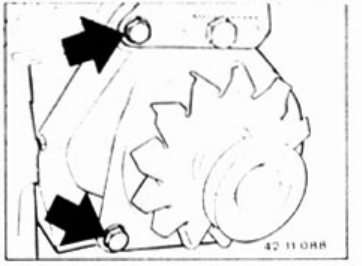


Installation:
Adjust drive belt tension by turning bolt (3) in direction of arrow using Special Tool 11 5 020.
Tighten nut on bolt (3).
Tighten bolts (1 and 2).

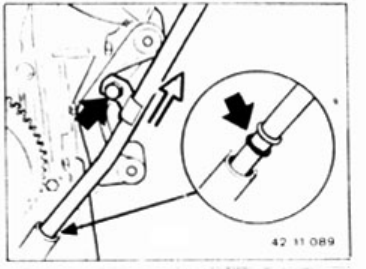


o Removing Alternator

Unscrew ground strap.



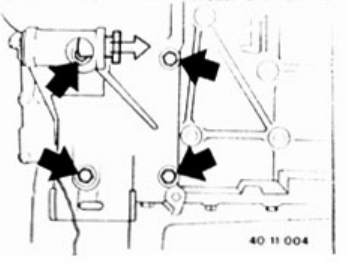
Unscrew bolts and remove alt[illegible]r.



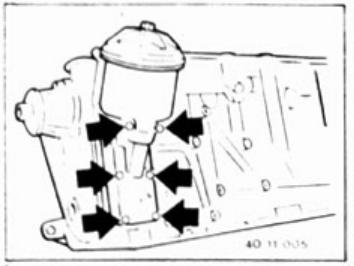
o Removing Alternator Conso[illegible]

Unscrew and pull out oil dipst[illegible]de tube.

Installation:
Replace seal.

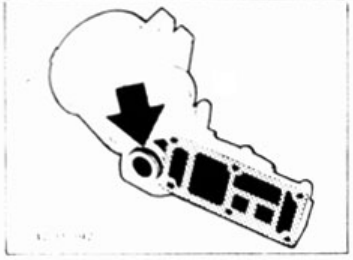


Press out sleeve.
Unscrew bolts and remove con[illegible]

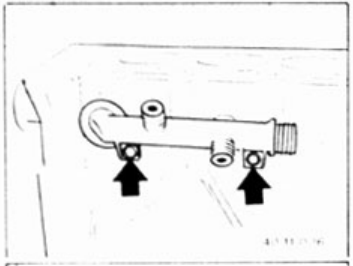


o Removing Oil Filter Housing:

Unscrew bolts and take off oil filter housing.



Installation
Replace O-ring and gasket.
Coat O-ring with a lubricant**.
Tightening torque = 9 Nm (6.5 ft. lbs.).



o Removing Coolant Pipe:

Unscrew bolts and pull coolant pipe out of the engine block.

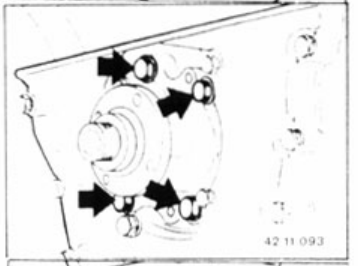
Installation:
Replace O-ring and coat with a lubricant**.

** Source of Supply: HWB

o Removing Water Pump:

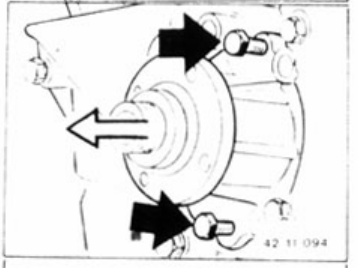
Hold pulley tight on the drive belt and unscrew bolts.

Installation
Tightening torque = 9 Nm (6 lbs.

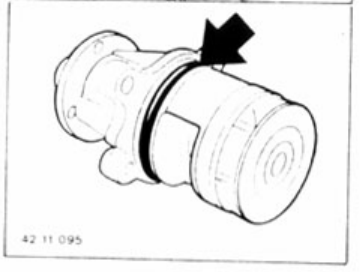


Unscrew bolts.

Installation
Tightening torque = 9 Nm (6.5 ft. lbs.

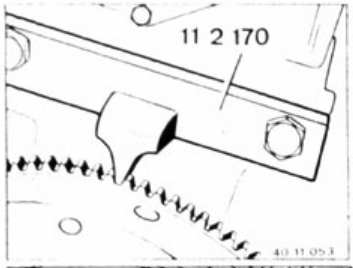


Screw two M 6 bolts in tapped bores (1) and press water pump out of the end cover uniformly.



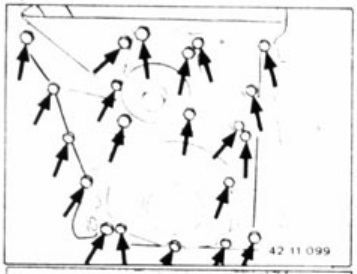
Installation:
Replace O-ring and coat with a lubricant**.
Tightening torque = 9 Nm (6.5 ft. lbs.

** Source of Supply: HWB



o Removing Vibration Damper:

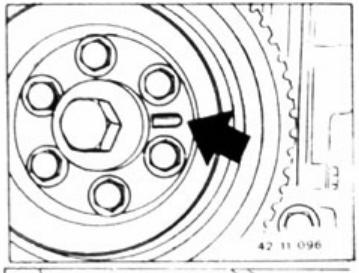
Prevent cranking of engine with Special Tool 11 2 170.



o Removing Lower Timing Case Cover

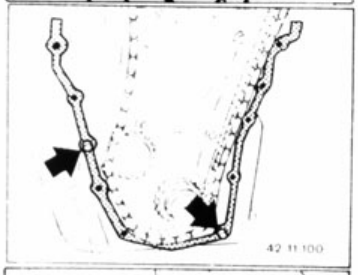
Unscrew bolts.
Lift off timing case cover.

Note:
Timing case cover could also be removed without removing the water pump.

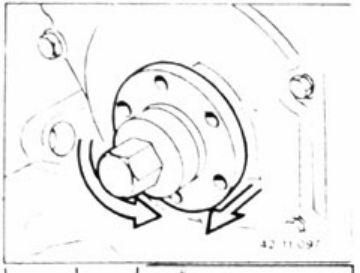


Unscrew bolts on vibration damper and take off vibration damper.

Installation:
Align dowel pin bore in vibration damper with dowel pin.
Tightening torque = 23 Nm (17 ft. lbs.).

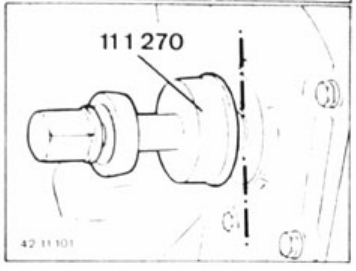


Installation:
Replace gaskets.
Check dowel sleeves.

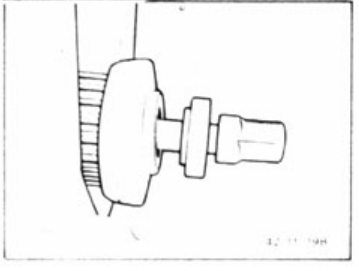


o Removing Vibration Damper Hub:

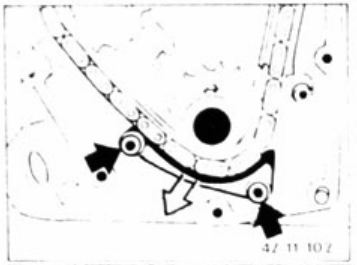
Hold flywheel with Special Tool 11 2 170.
Unscrew central bolt.
Take off washer and hub.



Installation:
Press in new radial oil seal flush with thrust ring of Special Tool 11 1 270 in conjunction with the central bolt and washer, with the timing case cover mounted.

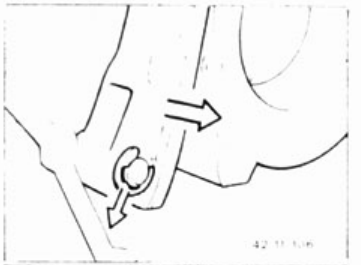


Installation:
Align groove of hub with woodruff key.
Collar of washer faces hub.
Tightening torque of central bolt = 310 Nm (224 ft. lbs.).

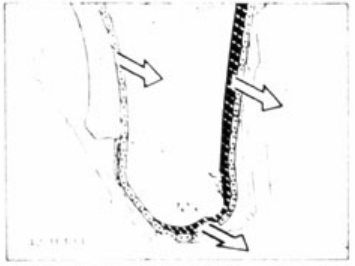


o Removing Timing Chain and Guides:

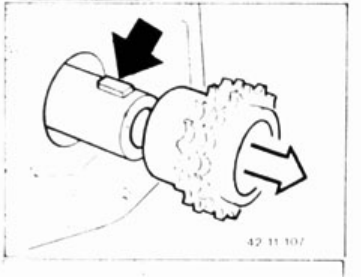
Unscrew lower guide.



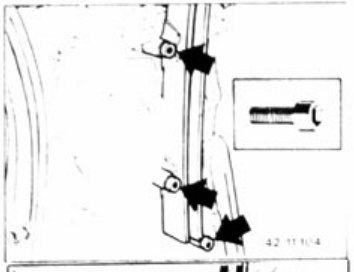
If applicable, remove tensioning rail



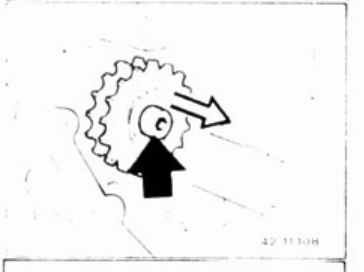
Lift out chain.



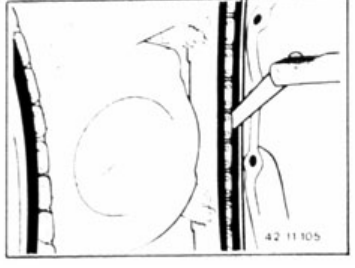
Pull sprocket off of the crankshaft.
Lift out woodruff key.



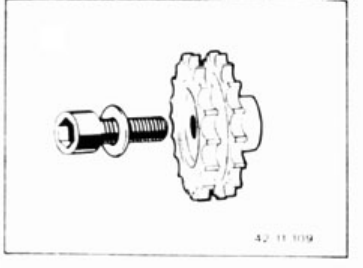
Remove chain guide.



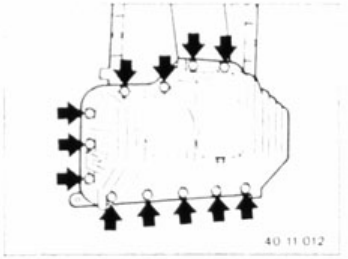
If applicable, remove reversing roller



Installation:
Align and bolt chain guide only after installation of the cylinder head and complete chain system.



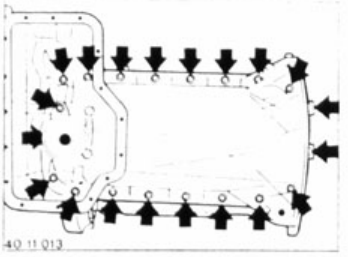
Note:
Reversing roller may be replaced only complete with the bearing.



o Removing Oil Pan:

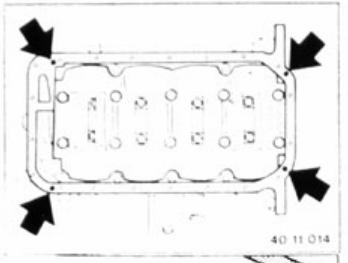
Unscrew bolts and take off lower oil pan section.

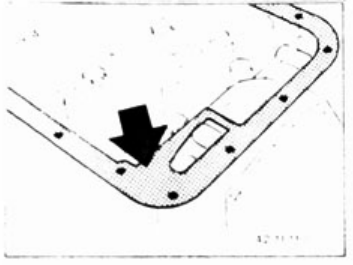
Installation:
Replace gasket.
Tightening torque = 9 Nm (6.5 ft. lbs.).



Unscrew bolts and take off oil pan.

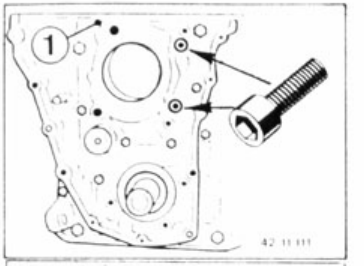
Installation
Replace gasket.
Fill in transitions to the timing case at front end and end cover at rear end with a permanently elastic sealing compound, 3 Bond 1207 B black**.
Tightening torque = 9 Nm (6.5 ft. lbs.).

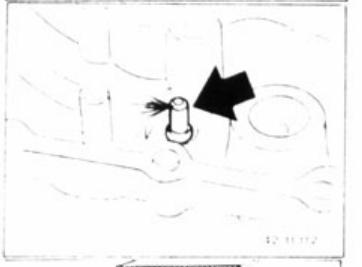


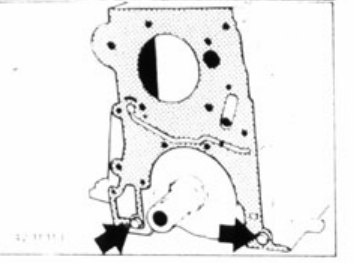


Installation:
Make sure gasket is positioned correctly (not inversed).

** Source of Supply: HWB







o Removing Timing Case and Oil Pump:

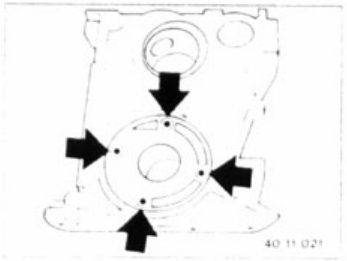
Unscrew all bolts.
Lift off timing case.

Installation:
Check location of socket head bolts.
Upper left bore (1) is not used.
Tighten all bolts uniformly.
Tightening torque*.

Installation
Chain lubrication spray jet faces bolt

Installation
Replace gasket.
Check dowel sleeves.

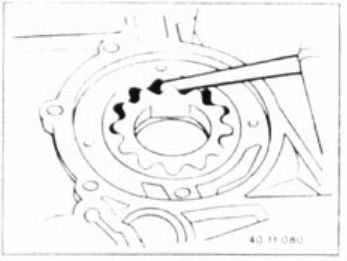
* See Specifications



o Removing - Checking Oil Pump

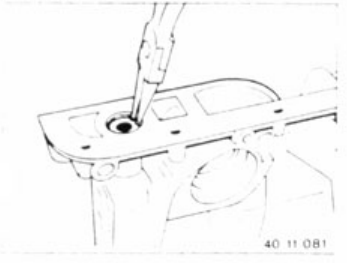
Unscrew bolts and remove cover.

Installation:
Bolt holes will only be aligned when cover is in correct installed position.
Tightening torque*.



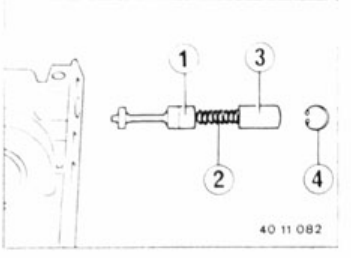
Measure play between pump body - outer rotor and outer rotor - inner rotor*.

Note:
Insert rotors in same position (inner rotor with guide facing the body).
Marks on inner and outer rotors face up.



Press down sleeve slightly using a suitable punch.
Lift out circlip and remove pressure valve.

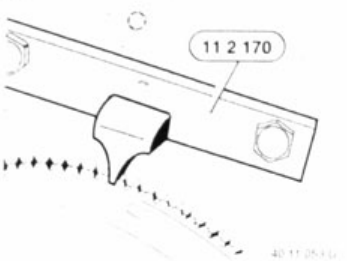
Caution!
Strong spring force.



Installation:
1 Piston
2 Spring
3 Sleeve
4 Circlip

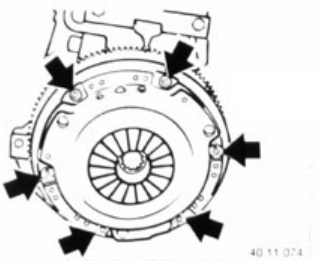
Measure length of unloaded spring (2).
Specification: 84.1 mm.

* Refer to Specifications



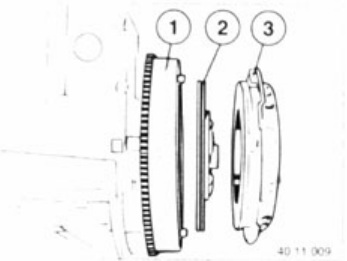
o Removing Clutch / Flywheel:

Hold flywheel using Special Tool 11 2 17



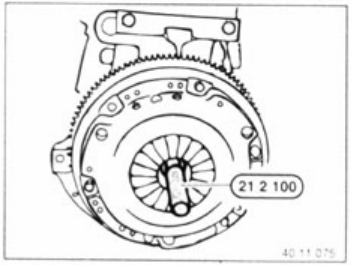
Unscrew bolts uniformly.
Remove pressure plate and drive plate.

Installation:
Check for dowel pins.



Installation:
1 Flywheel
2 Drive plate
3 Pressure plate

Flat side of drive plate (2) faces flywheel (

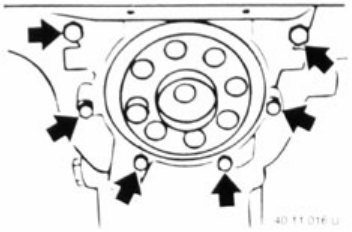


Center drive plate using Special Tool 21 2 100 and tighten bolts.
Tightening torque*.

* Refer to Specifications

Unscrew bolts and remove flywheel.

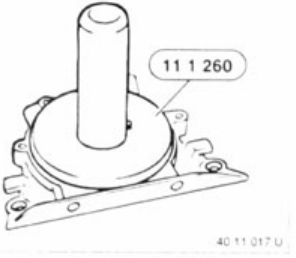
Installation:
Clean threads and install bolts using bolt cement**.
Tightening torque*.



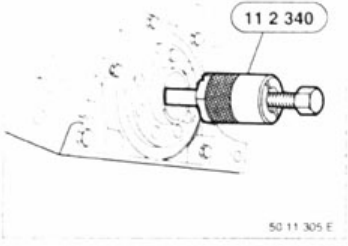
o Removing Rear End Cover

Unscrew bolts and remove cover.

Installation:
Check for dowel sleeve.

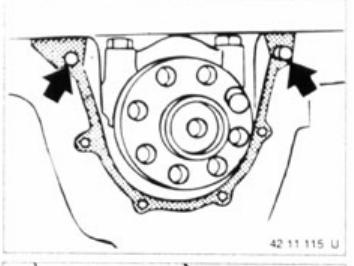


Installation:
Lift out radial oil seal and drive in new seal using Special Tool 11 1 260.

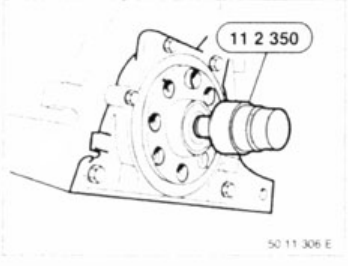


o Replacing Pilot Bearing in Crankshaft

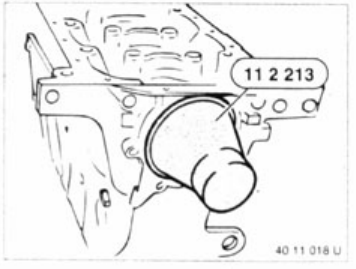
Remove pilot bearing using Special Tool 11 2 340 or 11 2 010.



Installation:
Replace gasket.
Check for dowel sleeves.

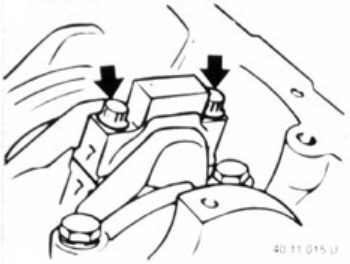


Installation:
Insert and drive in pilot bearing as far as stop using Special Tool 11 2 350 or 11 2 030.



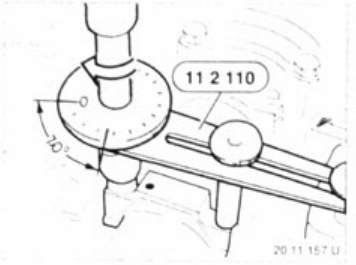
Installation:
Apply Special Tool 11 2 213 on crankshaft
Lubricate sealing lip of radial oil seal with oil.
Mount and bolt cover.

* Refer to Specifications
** Source of Supply: BMW Parts



o Removing Connecting Rod and Piston

Unscrew conrod bearing cap.
Pull out connecting rod and piston to the cylinder head end.



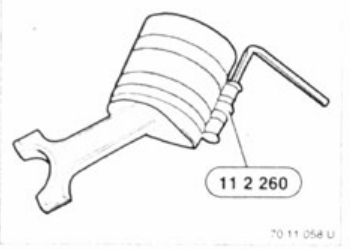
Installation:
Conrod bolt tightening procedures:
Lubricate conrod bearing shells with oil.
Mount bearing cap that pair numbers are aligned.

Install new conrod bolts.

Tighten conrod bolts in two steps using Special Tool 00 9 120 or 11 2 110.

Tightening torque*.

Important!
Reinstall piston, connecting rod and bearing shells in the same installed position.
Connecting rods and bearing caps are marked with the same pair number and must not be mixed up.



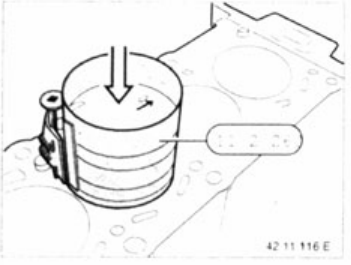
Installation:
Lubricate piston and piston rings lightly with oil.
Align gaps of piston rings (offset approx. 120°, but not above the piston pin eye).
Compress piston rings using Special Tool 11 2 260.

o Removing / Checking Connecting Rod

Lift out circlip and press out piston pin.

Important!
Pistons and piston pins are matched and must not be mixed up.

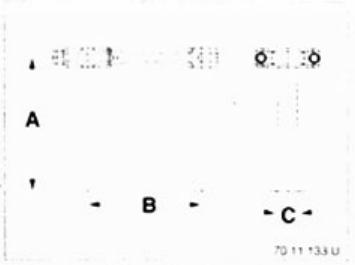
Installation:
Insert circlip in such a manner that its gap is opposite the opening.



Installation:
Insert piston that arrow points to camshaft drive.
Compressing tool must bear flat on crankcase all around.
Press in piston with light knocks (e.g. from handle of a hammer).
Guide crankshaft journal and connecting rod together at same time.

Installation:
Install connecting rod in such a manner that when the pair number is visible the installed direction arrow on the piston points to the right.

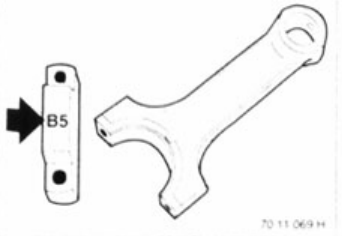
* Refer to Specifications



Checking Connecting Rod:

Check connecting rod for deviation in parallelism and distortion.

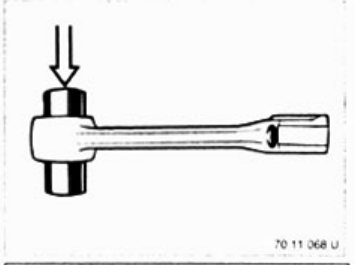
A Testing distance*
B Permissible parallel deviation at distance A*
C Max. permissible distortion to each side*



Replacing Connecting Rod:

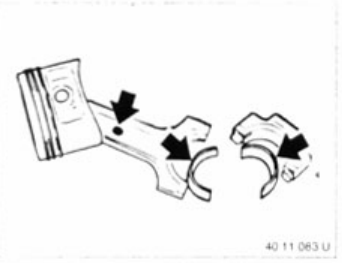
Only connecting rods of the same weight class (stamped on bearing cap) may be installed in one engine.

Consequently only complete sets are available from Parts.



Checking Piston Pin Bush:

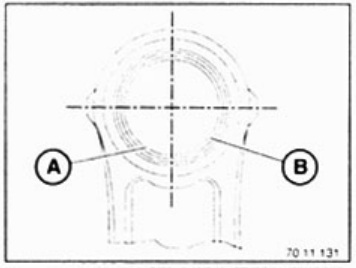
It should be possible to push the piston pin through the bush by hand with slight force and there must not be noticeable play.



o Replacing Conrod Bearing Shells

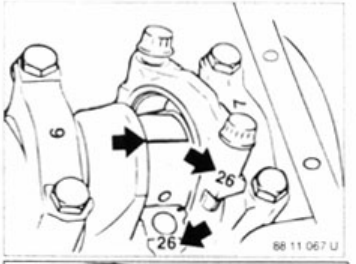
Select new bearing shells to conform with paint mark on connecting rod.

Important!
Check ground size of the crankshaft - also refer to "Replacing Main Bearing Shells".



Replacing Piston Pin Bush:

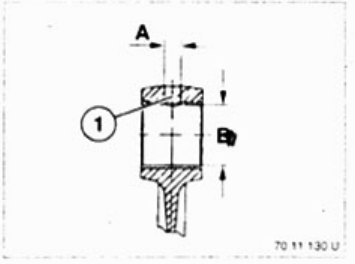
Press out old bush using a suitable punch.
Press in new bush with bush gap located optionally at A or B.



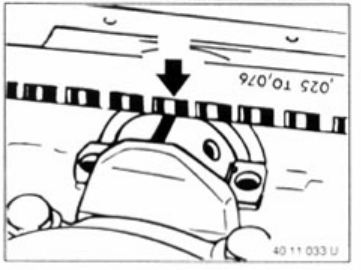
Installation:
Checking conrod bearing play.
Only carry out for control purposes.

With piston in BDC place Type PG1 Plastigage (Special Tool 00 2 590) on crankshaft wiped clean of oil.
Mount bearing cap and secure with old conrod bolts tightened to specifications.

Important!
Don't turn the connecting rod or crankshaft



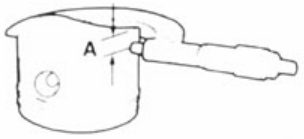
Drill oil bore (1).
Diameter A = 6 mm.
Remove burrs from both ends of bore.
Ream out bush to specified diameter* using a reamer.



Remove bearing cap and read bearing play by measuring width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by install new bearing shells or bearing shells with a different paint mark.

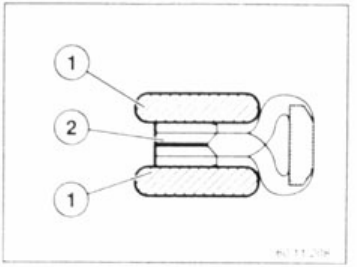
* Refer to Specifications

* Refer to Specifications

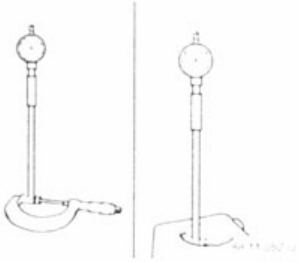


o Replacing Checking Piston

Installation:
Measure the piston installed clearance before installing.
Measure the piston diameter at distance A = 13 mm from the bottom edge of the piston using a micrometer.

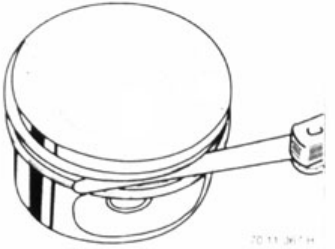


Installation:
The oil scraper ring consists of two steel band rings (1) and one spring ring (2).
Install all parts separately.
Offset gaps about 120°.



Set internal caliper to zero on micrometer with the measured piston diameter.
Measure cylinder bore at bottom, middle and top diagonally.

New piston installed clearance*.
Max. permissible total wear clearance*.



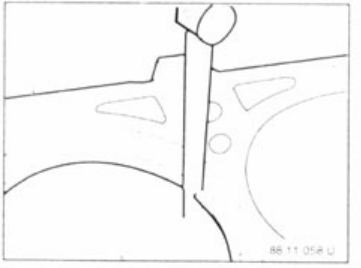
Measure side clearance.

Specification*.

o Replacing Checking Piston Rings

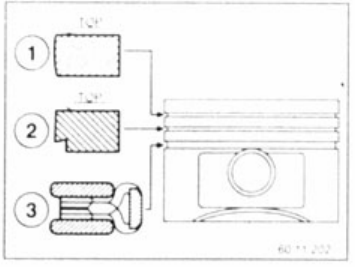
Remove piston rings using a piston ring compressing pliers.

Note:
Identification might not be visible on used piston rings.
Lay piston rings aside in correct sequence and position of installation.



Measure end clearance.

Specification*.



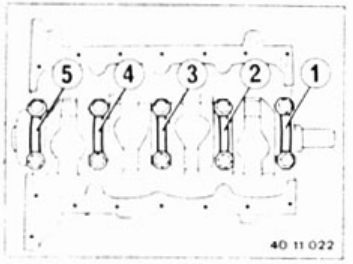
Installation:
Insert piston rings with "TOP" facing piston crown.

1 Plain compression ring
2 Stepped taper face ring
3 Steel band oil scraper ring

Offset piston ring gaps about 120° to each other, but not above the piston pin eye.

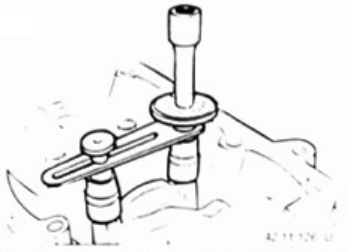
* Refer to Specifications

* Refer to Specifications



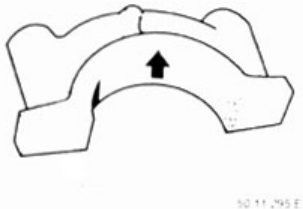
o Removing Crankshaft (Replacing Crankshaft - refer to 11 21 501)

Unscrew main bearing caps (1 .... 5) and lift out crankshaft.



Main Bearing Tightening Procedures:

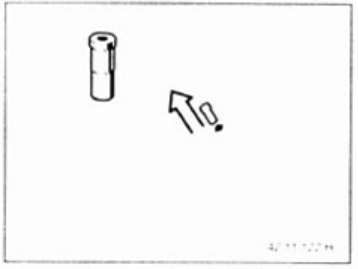
Tighten bolts (washed and lubricated with oil) in two steps.
Tightening torque*.



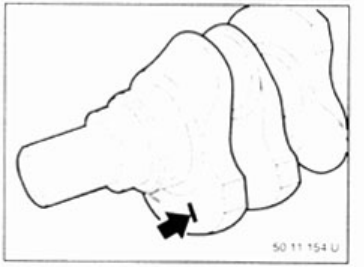
Installation
Bearing caps 1 ... 3 are marked with die-stamped numbers.
Bearing cap 4 has a shoulder on the cap side.
Bearing cap 5 is not marked.

o Replacing Main Bearing Shells

The crankshaft is marked with yellow, green or white paint depending on main bearing journal tolerances.



Installation
Ensure that oil spray jets are used at bearings 2 .... 5.

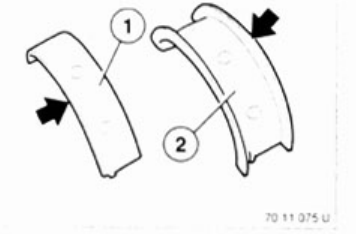


Important!
Check ground size* of the crankshaft.

1 paint stripe — Size 1*
2 paint stripes — Size 2*

Installation
Lubricate bearing shells with oil.
Install crankshaft.
Mount bearing caps 1 .... 5 (bearing no. 1 at camshaft drive end) in such a manner that grooves of the bearing shell guide are on one side.
Align bearing caps precisely.

Note:
The thrust bearing shell is installed only in the crankcase at bearing no. 4.

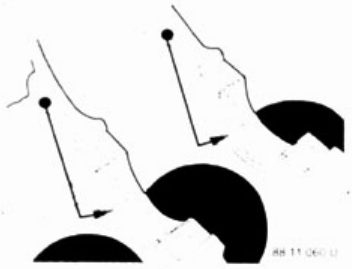


Bearing shells are marked with yellow, green or white paint.

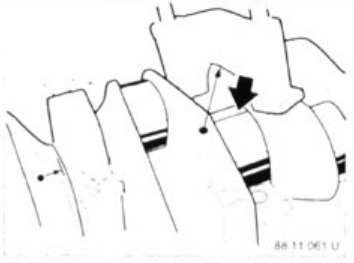
1 Bearing shell 1-2-3-4-5 (5 only cap)
2 Bearing shell 4 (thrust bearing only crankcase)

Check ground size of main bearing journal

* Refer to Specifications

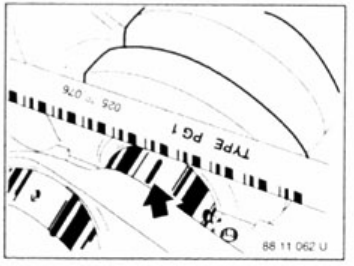


Place bearing shell in crankcase having same paint mark color as dot of paint on crankcase.
If paint mark has been washed off of crankcase, install both bearing shells according to the crankshaft paint mark color.
Install bearing shells in bearing caps having same paint mark color as that of the crankshaft.

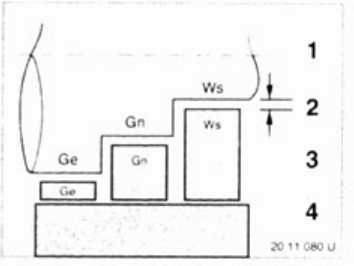


Check bearing clearance.
Only carry out this step for control purposes.

Install crankshaft.
Place Type PG 1 Plastigage (Special Tool 00 2 590) on crankshaft wiped clean of oil and tighten bearing cap bolts as specified.
Tightening torque*.
Don't turn the crankshaft.



Remove bearing cap and read bearing play* by measuring width of the flattened Plasti- gage with help of the supplied scale.
Correct the bearing play by installing new bearing shells or bearing shells with a different paint mark.

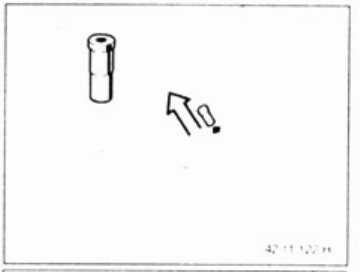


Color Code Shaft Diameter Bearing Shell Thickness* Survey

Triple Classification Color Codes:
Ge = Yellow
Gn = Green
Ws = White

1 = Crankshaft diameter
2 = Bearing play
3 = Bearing shell thickness
4 = Journal diameter

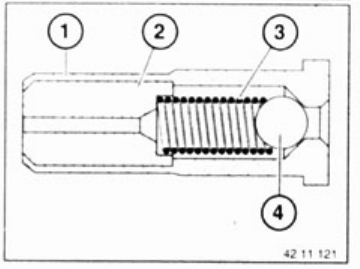
* Refer to Specifications



o Replacing Spray Jets in Crankcase

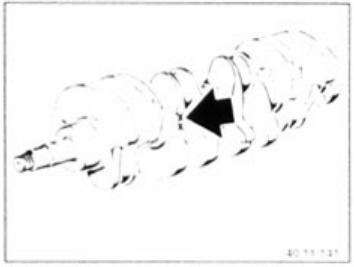
Note:
Spray jets are installed in bores of crankcase for bearings 2-3-4-5 and serve lubrication of piston pins and cooling of pistons

Pull spray jet out of crankcase.



Spray Jet Assembly:

1 Jet body
2 Jet
3 Spring
4 Ball



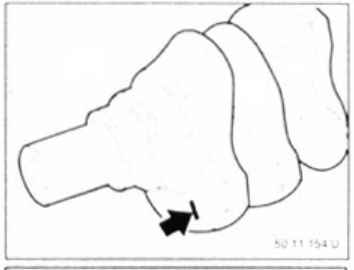
11 21 501 REPLACING CRANKSHAFT
– Crankshaft Removed –

Note:
Replacement crankshafts are supplied complete with corresponding bearing shells for main and conrod bearings.

Crankshaft Identification (cast in crank web):

Engine	Stroke (mm)
M42 B18	81

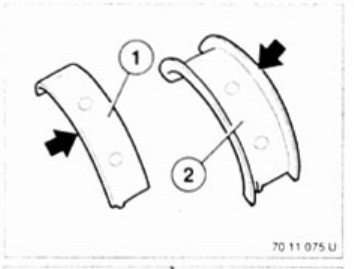
The crankshaft is marked with yellow, green or white paint depending on main bearing journal tolerances.



The crankshaft is surface treated and may only be reground in the factory.

Reground crankshafts are marked with stripes of paint.

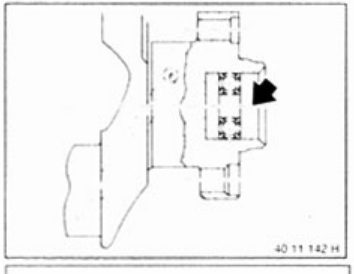
1 paint stripe	Size 1 *
2 paint stripes	Size 2 *



Bearing shells are marked with yellow, green or white paint.

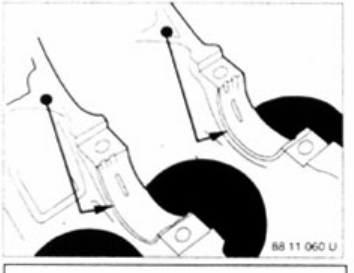
1 Bearing shell 1-2-3-4-5 (5 only cap)
2 Bearing shell 4 (thrust bearing only crankcase)

Check ground size of main bearing journal



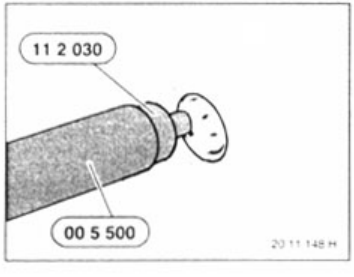
Models with Manual Transmission.

Install pilot bearing for transmission's main shaft.

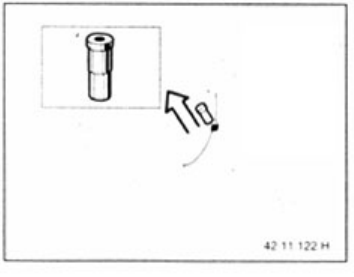


Installing Procedures:

Only place "yellow" color code bearing shells in crankcase (regardless of paint mark still visible on crankcase).
Install "yellow-green-white" color code bearing shells in bearing caps depending on the crankshaft bearing journal paint mark color

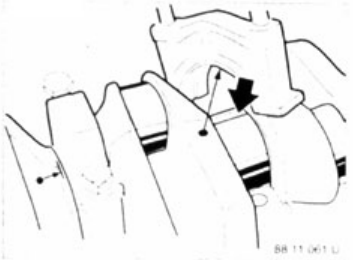


Knock in pilot bearing using Special Tool 11 2 350 or 11 2 030 and Special Tool 00 5 500.



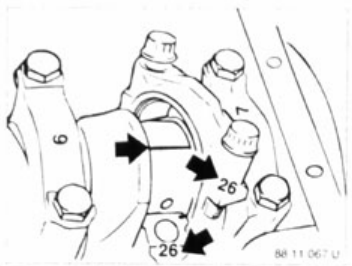
Installation:
Ensure that oil spray jets are used at bearings 2 ... 5.

* Refer to Specifications



Check bearing clearance.
Only carry out this step for control purposes.

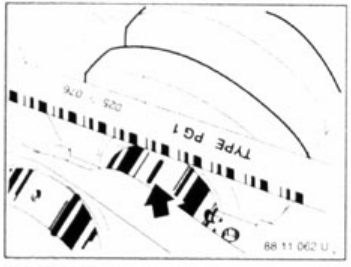
Install crankshaft.
Place Type PG 1 Plastigage (Special Tool 00 2 590) on crankshaft wiped clean of oil and tighten bearing cap bolts as specified.
Tightening torque*.
Don't turn the crankshaft.



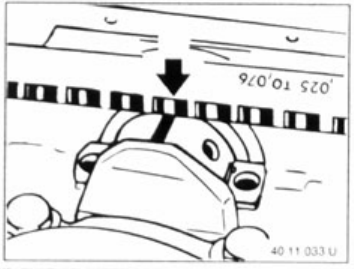
Installation
Check conrod bearing clearance.
Only carry out this step for control purposes.

With piston at BDC place Type PG 1 Plastigage (Special Tool 00 2 590) on crankshaft wiped clean of oil and tighten bearing cap bolts as specified.
Tightening torque*.

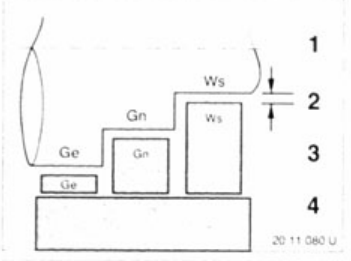
Important!
Don't turn the connecting rod or crankshaft



Remove bearing cap and read bearing play* by measuring width of the flattened Plasti- gage with help of the supplied scale.
Correct the bearing play by installing new bearing shells or bearing shells with a different paint mark.



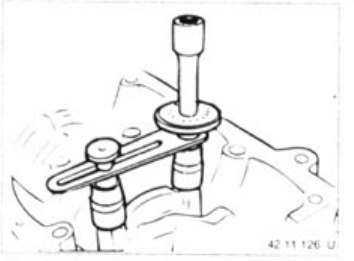
Remove bearing cap and read bearing play by measuring width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells or bearing shells with a different paint mark.



Color Code Shaft Diameter Bearing Shell Thickness* Survey

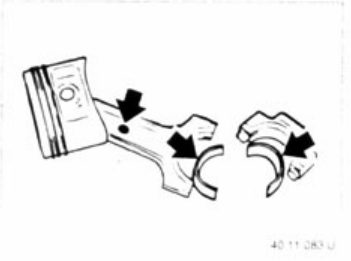
Triple Classification Color Codes:
Ge = Yellow
Gn = Green
Ws = White

1 = Crankshaft diameter
2 = Bearing play
3 = Bearing shell thickness
4 = Journal diameter



Main Bearing Bolt Tightening Procedures:

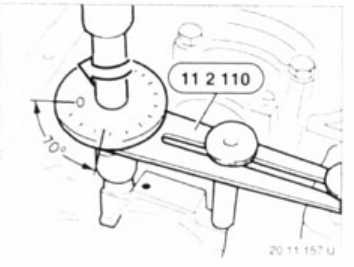
Tighten bolts (washed and lubricated with oil) in two steps.
Tightening torque*.



Replacing Conrod Bearing Shells:

Red or blue conrod bearing shells are installed standard depending on paint mark color on connecting rod for pertinent ground size or crankshaft.

Only install red bearing shells of pertinent ground size when replacing crankshaft.



Conrod Bolt Tightening Procedures:

Lubricate conrod bearing shells with oil.
Mount bearing cap that pair numbers are aligned.

Install new conrod bolts.

Tighten conrod bolts in two steps using Special Tool 00 9 120 or 11 2 110.
Tightening torque*.

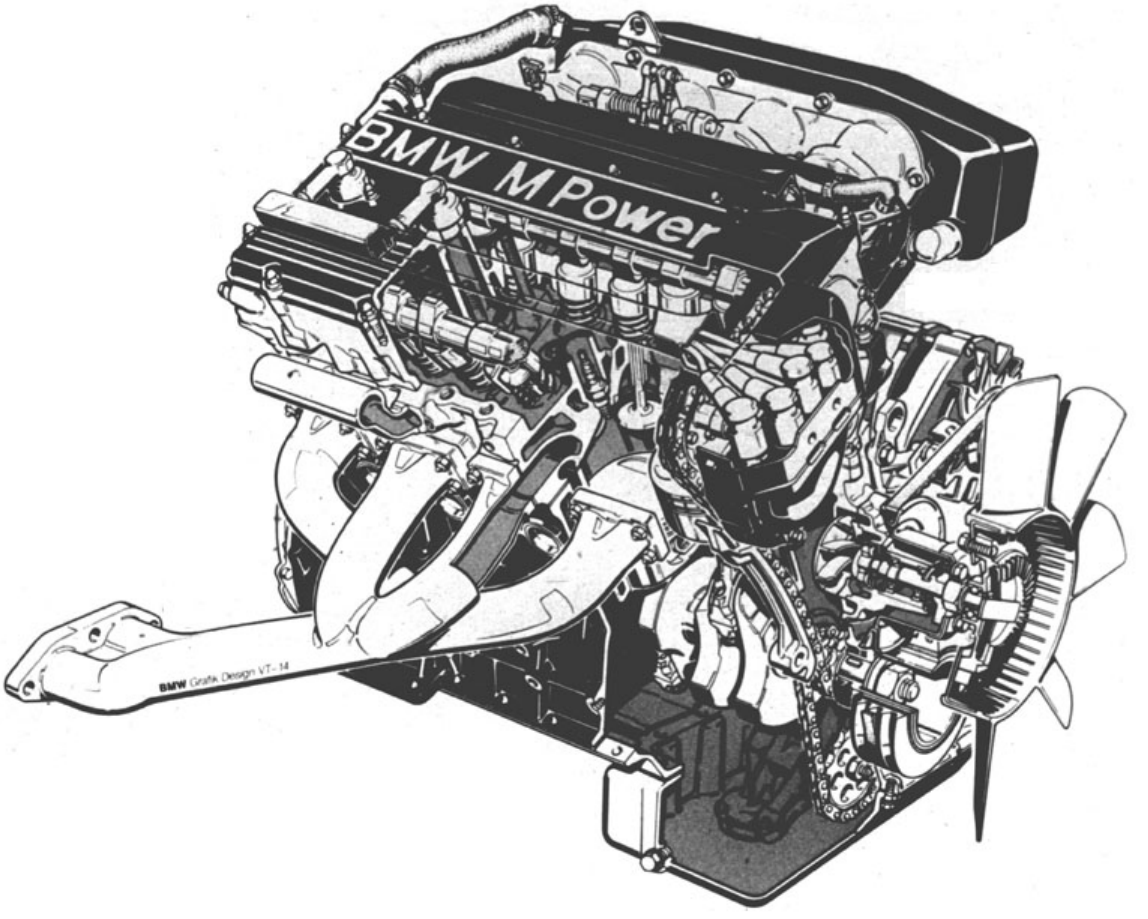
* Refer to Specifications

* Refer to Specifications

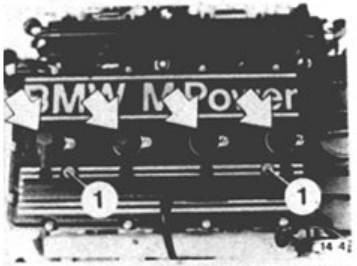
Constrution group 11 Engine S14

S14 = 4 Cylinder M-Power Engine

	Engine view	11-	50
11 12 000	Cylinder head cover – remove and install	11-	51
101	Cylinder head gasket – replace	11-	51
500	Cylinder head – remove and install – engine removed	11-	52
595	Valve guide – inspect for wear – valve removed	11-	54
600	Valve guide – ream – valve removed	11-	54
607	Valve seats and valves – machine – valves removed	11-	54
719	Cylinder head sealing surface – grind – cylinder head disassembled This job is not approved for S14 engines.	11-	55
729	Cylinder head – inspect for cracks in water test – cylinder head disassembled	11-	55
11 14 105	Radial oil seal in distributor housing – replace	11-	56
110	Lower timing case cover – remove and install / seal	11-	56
141	Radial oil seal in lower timing case cover – replace	11-	58
605	Radial oil seal in clutch end cover – replace	11-	58
11 21 000	Crankshaft – remove and install	11-	59
120	Crankshaft pulley – remove and install	11-	60
501	Crankshaft – replace – crankshaft removed	11-	61
531	Crankshaft main bearing shells – replace – engine disassembled	11-	61b
571	Pilot bearing in crankshaft – replace	11-	62
11 22 000	Flywheel – remove and install	11-	63
541	Starter gear ring – replace	11-	63
11 24 521	Connecting rods – replace – pistons removed	11-	64
571	Conrod bearing shells – replace – disassemble engine	11-	64
11 25 000	Pistons – remove and install – engine removed	11-	65
651	Piston rings of one piston – replace	11-	66
11 31 000	Camshaft – remove and install	11-	67
051	Timing chain – replace	11-	70
061	Timing chain sprocket set – replace – timing chain removed	11-	71
090	Timing chain tensioner piston – remove and install	11-	72
11 34 004	Valve clearance – adjust	11-	73
509	Valves – check for leaks – cylinder head removed	11-	73
550	Valves – remove and install – cylinder head removed	11-	74
11 40 000	Engine oil pressure – check	11-	75
11 41 000	Oil pump – remove and install	11-	75
151	Oil pump drive chain – replace	11-	76
11 42 021	Full flow oil filter – replace	11-	77
11 43 101	Oil dipstick guide tube	11-	78
11 51 000	Water pump – remove and install	11-	78
11 52 000	Fan – remove and install	11-	79
020	Fan clutch – replace	11-	79
11 53 000	Coolant thermostat – remove and install	11-	79

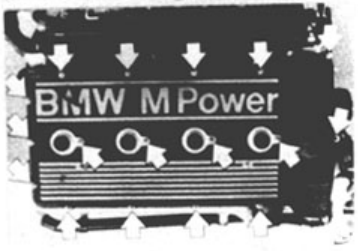


S 14 B 20 – BMW 320 is
S 14 B 23 – BMW M 3

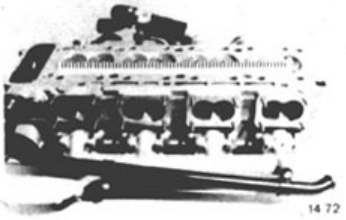


11 12 000 REMOVING CYLINDER HEAD COVER

Unscrew ignition lead tube (1) and pull out spark plug connectors.

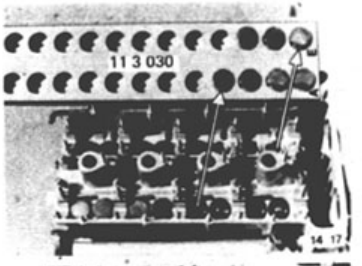


Unscrew cylinder head cover.
Installation:
Check gaskets, replacing if necessary.



11 12 101 REPLACING CYLINDER HEAD GASKET

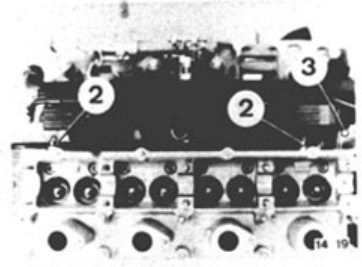
Remove cylinder head – see 11 12 500.
Clean sealing surfaces on cylinder head and crankcase thoroughly – use a sealant remover** and hard wood scraper.
Check levelness with a standard steel ruler.



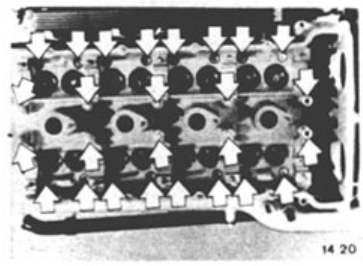
11 12 500 REMOVING AND INSTALLING CYLINDER HEAD
– Engine Removed –

Remove camshaft – see 11 31 000.
Pull out tappets and place them on the tray, Special Tool 11 3 030.
Installation:
Insert tappets in the same position.

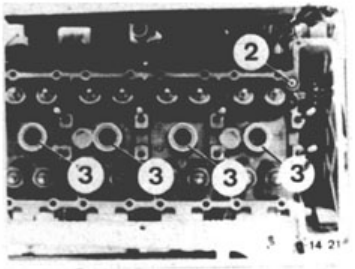
Unscrew bolts.
Installation:
Longer bolt (1) is used to lock the shaft for the upper tensioning rail.



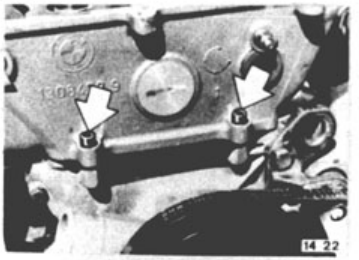
Unscrew pipe (2).
Unscrew bolt (3).



Unscrew timing case.

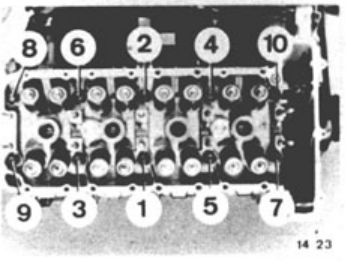


Installation:
Replace O-ring (2) in oil bore.
Check O-rings (3), replacing if necessary.
Coat sealing surfaces with Three Bond 1207**.
Tighten bolts uniformly.
Tightening torque:
M 7 = 15 +/- 2 Nm (11 +/- 1.5 ft. lbs.)
M 8 = 21 +/- 1 Nm (15 +/- 1 ft. lbs.)

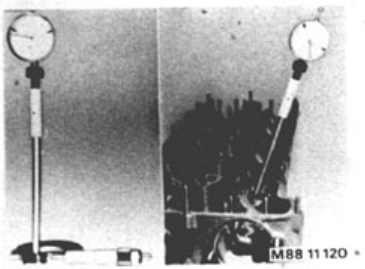


Unscrew bolts.

Measuring Tappet Clearance:
Measure tappet diameter with a micrometer.



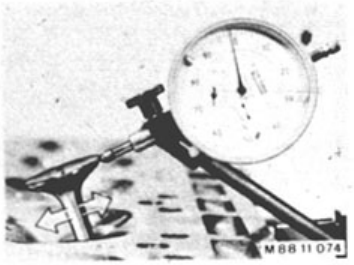
Unscrew cylinder head bolts in order of 10 through 1 and lift off cylinder head.
Installation:
Clean cavities in crankcase and cylinder head bolts.
Lubricate cylinder head bolts with oil.
Replace cylinder head gasket.



Set internal calipers to zero on the micrometer with the measured tappet diameter.
Measure tappet bore diameter.
Compare measured tappet clearance with the specified clearance.
Tappet Clearance/Installed Clearance:
0.025 to 0.066 mm (0.0010 to 0.0026").

Check tensioning rail arrangement while mounting the cylinder head.
Tighten bolts in order of 1 through 10 in three steps.
Step 1: 50 +/- 2 Nm (36 +/- 1.5 ft. lbs.)
Step 2: 80 +/- 2 Nm (58 +/- 1.5 ft. lbs.)
Wait 15 minutes.
Step 3: 100 +/- 2Nm (72 +/- 1.5 ft. lbs.)
Check and adjust engine idle speed - see 13 00 054.

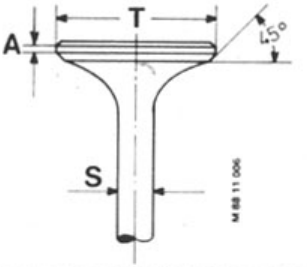
** Source of Supply: HWB



11 12 595 CHECKING VALVE GUIDE FOR WEAR
– Valve Removed –

To measure, insert a new valve that end of valve stem is flush with valve guide.
Mount the dial gage and measure tilt play.
Max. permissible tilt play:

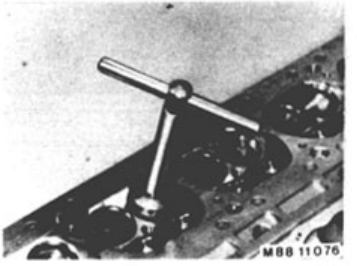
Intake valve	0.65 mm (0.025")
Exhaust valve	0.80 mm (0.031")



11 12 607 MACHINING VALVE SEATS AND VALVES
– Valves Removed –

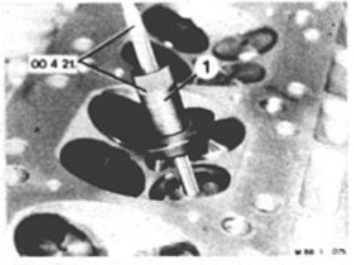
Valve must be replaced, if minimum edge thickness "A" is not held.

"A" Intake valve	0.50 mm (0.020")
"A" Exhaust valve	0.95 mm (0.037")
"T" Intake valve	37 – 0.1 mm (1.457 – 0.004")
"T" Exhaust valve	32 – 0.1 mm (1.260 0.004")



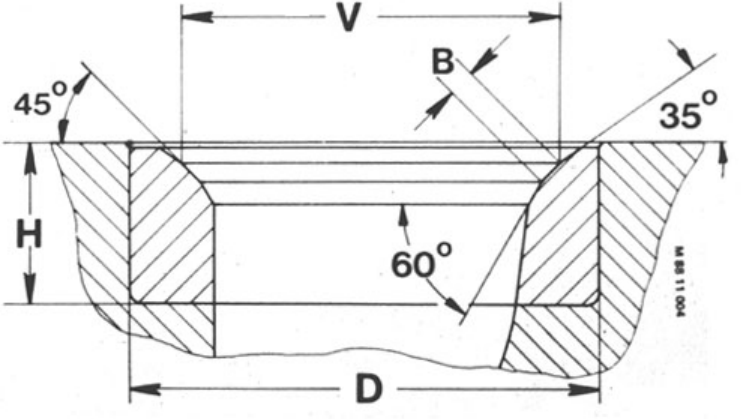
After machining the valve seat angle (45°), produce valve seat diameter V and valve seat width B by machining correction angles (35°/60°). Grind in valves with grinding paste and check for leaks – see 11 34 509.

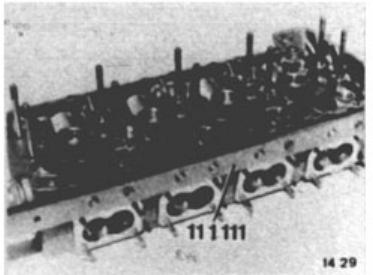
"V" Intake valve	36.6 + 0.1 mm (1.441 + 0.004")
"V" Exhaust valve	31.4 + 0.1 mm (1.236 + 0.004")
"B" Intake valve	1.2 + 0.1 mm (0.047 + 0.004")
"B" Exhaust valve	1.4 + 0.1 mm (0.055 + 0.004")



11 12 600 REAMING OUT VALVE GUIDE
– Valve Removed –

If there is excessive play between the valve guide and valve stem, see 11 12 595, ream out the valve guide and install an oversize valve with stem diameter "S" = 7.1 or 7.2 mm (0.279 or 0.283").
The valve seat must then also be machined – see 11 12 607.
Press guide (1) against the valve seat and ream out the valve guide from the combustion chamber end – turn down the reamer once.

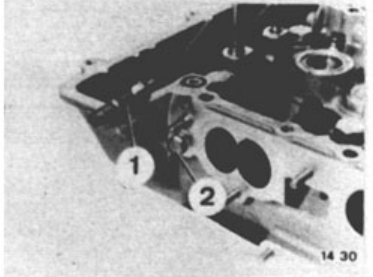




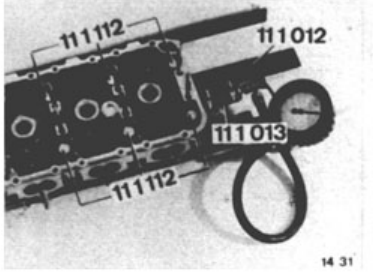
11 12 729 CHECKING CYLINDER HEAD FOR CRACKS IN A WATER TEST

- Cyl. Head Disassembled -

Bolt on Special Tool 11 1 111.

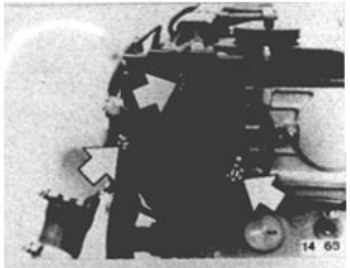


Unscrew connector (1).
Plug opening with bolt (2) - copper bolt from M 30 exhaust manifold.



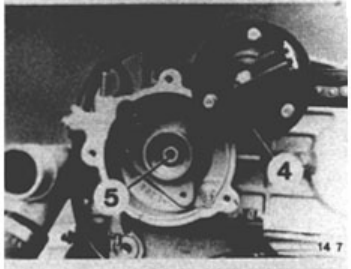
Bolt on Special Tools 11 1 012 with Special Tools 11 1 112.
Install Special Tool 11 1 113.
Fill cylinder head with air pressure - 2 bar (28 psi) testing pressure - and check for cracks (leaks) by placing it in a water bath.

Note:
Water bath can be relaxed with a detergent if necessary.



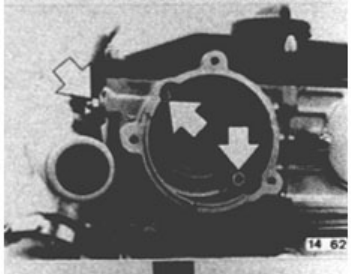
11 14 105 REPLACING RADIAL OIL SEAL IN DISTRIBUTOR HOUSING

Unscrew ignition lead tube.
Remove distributor cap.



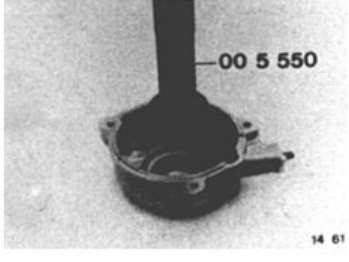
Unscrew distributor rotor (4).
Unscrew adapter (5).

Important!
Since 12.88 a high tension distributor cap with distributor rotor is installed, which has a fixed brass pin instead of a spring-loaded carbon pin.
The corresponding distributor rotor has a hole.
Mixed installation of both versions is not possible.

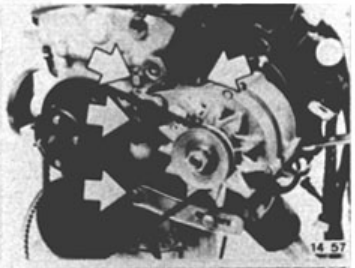


Unscrew distributor housing.

Installation:
Check O-ring, replacing if necessary.



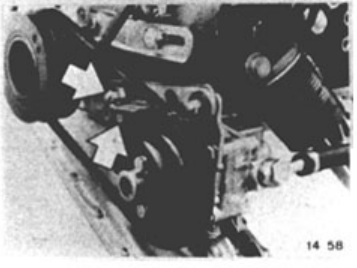
Lift out radial oil seal.
Drive in new radial oil seal with Special Tool 00 5 550.
Lubricate sealing lip with oil.



11 14 110 REMOVING AND INSTALLING / SEALING LOWER TIMING CASE COVER

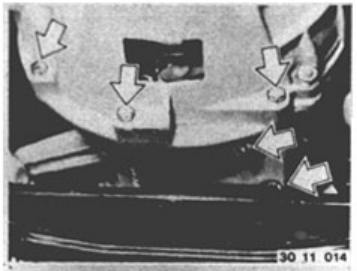
Unscrew alternator.

Installation:
Tension drive belt and check tightness with Special Tool 11 5 020.

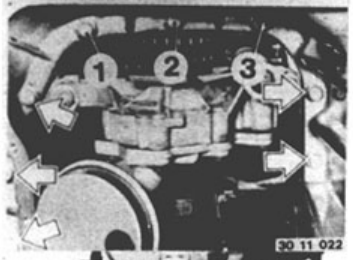


Unscrew hydraulic pump.
Hoses remain connected.

Installation:
Tension drive belt and check tightness with Special Tool 11 5 020.

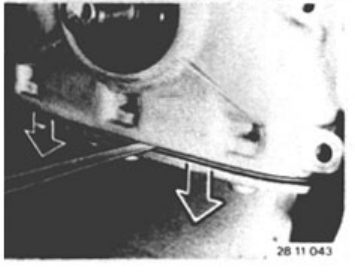


Unscrew reinforcement plate.
Remove lower oil pan section – see 11 13 020.



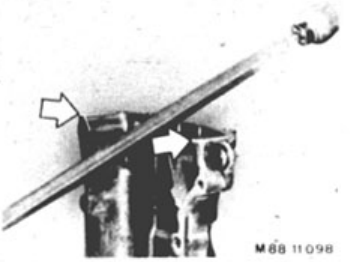
Unscrew and remove bolts (1 ... 3).
Loosen remaining oil pan bolts.
Installation:
Install bolts (1 ... 3) with Loctite No. 270**.

Remove water pump – see 11 51 000.
Remove pulley on crankshaft – see 11 21 120.
Remove piston for chain tensioner – see 11 31 090.
Unscrew bolts (4).
Unscrew remaining bolts on timing case cover.

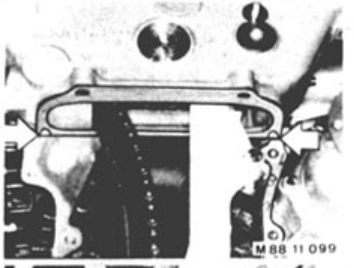


Loosen oil pan gasket on timing case cover carefully with a knife.
If oil pan gasket is damaged, remove oil pan and replace gasket – see 11 13 000.

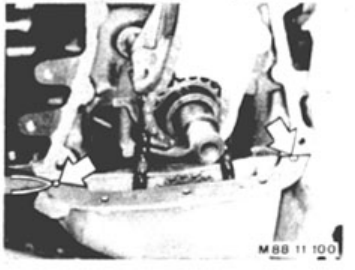
** Source: HWB



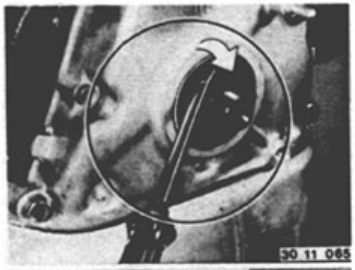
Take off timing case cover.
Installation:
Break upper edges with a file.
Coat sealing surfaces with Three Bond Silicone 1207**.



Installation:
Install new gaskets, coat with Three Bond Silicone 1207** and cut off ends.
Coat mating surfaces with Three Bond Silicone 1207**.
Guide in cover uniformly.



** Source: HWB



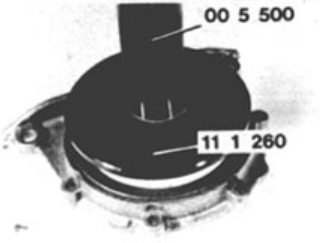
11 14 141 REPLACING RADIAL OIL SEAL IN TIMING CASE COVER

Remove pulley on crankshaft – see 11 21 120.
Lift out radial oil seal with a screwdriver.

Lubricate sealing lip of radial oil seal with oil.
Press in radial oil seal flush with Special Tools 11 1 273 and 11 1 271.

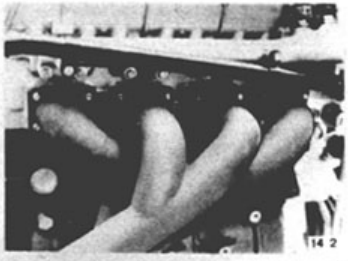
11 14 605 REPLACING RADIAL OIL SEAL IN CLUTCH END COVER – Transmission Removed –

Remove flywheel – see 11 22 000.
Drain engine oil.
Loosen oil pan.
Loosen gasket in area of end cover/oil pan joint carefully with a knife.
Remove end cover.
Press radial oil seal out of end cover.



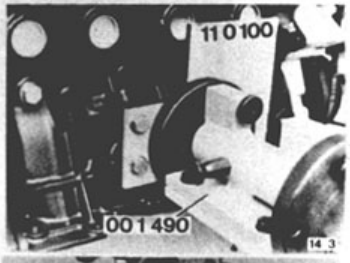
Installation:
Replace gasket.
Remove oil pan – see 11 13 000 if oil pan gasket was damaged.
Coat end cover/oil pan joint with Three Bond Silicone 1207**.
Use Special Tool 11 2 213 to avoid damaging the radial oil seal.
Add engine oil***.
Use Special Tools 11 1 260 and 00 5 500 to press in the radial oil seal.
Press in new radial oil seal with approx. 1 to 2 mm (0.039 to 0.079") offset toward the inside in contradiction to the standard seal, which was installed flush.
Lubricate sealing lip with oil.

** Source: HWB
*** See Service Information of Gr. 00

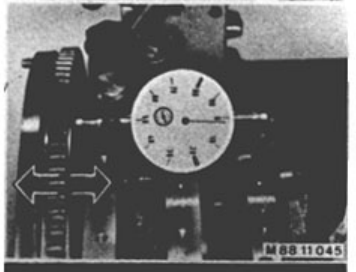


11 21 000 REMOVING AND INSTALLING CRANKSHAFT

Remove engine – see 11 00 050.
Remove exhaust manifold.
Installation:
Replace gaskets.
Tightening torque: 9 to 10 Nm (6.5 to 7.0 ft. lbs.).

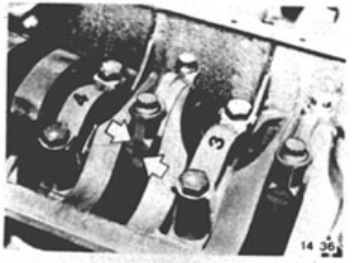


Unscrew engine mounts.
Mount crankcase on Special Tool 00 1 490 with help of Special Tool 11 0 100.

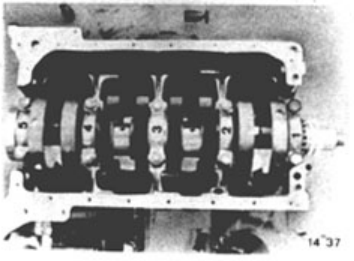


Remove clutch – see 21 21 000.
Remove cylinder head – see 11 12 100.
Remove timing chain – see 11 31 051.
Remove oil pump – 11 41 000.
Measure axial play before removing the crankshaft.
Nominal value: 0.085 to 0.174 mm (0.0033 to 0.0068").
Check/replace thrust bearing, if maximum permissible play is exceeded.

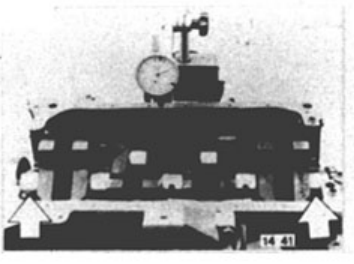
Remove flywheel – see 11 22 000.
Unscrew end cover.
Installation:
Replace gasket.
Use Special Tool 11 2 213 to avoid damaging the radial oil seal.
Cut off gasket along oil pan sealing surface.



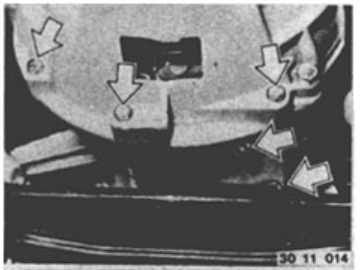
Unscrew conrod bearing caps.
Installation:
Replace conrod bearing shells and measure conrod bearing play – see 11 24 571.
Pair code (0 ... 99) must be the same on connecting rods and conrod bearing caps.



Unscrew crankshaft bearing caps and lift out the crankshaft.
Installation:
Bearing cap no. 1 is on the sprocket end.
Install bearing shells and check the bearing play – see 11 21 531.
Installation:
Measure axial play with installed crankshaft - loosen thrust bearing no. 3 again.
Center the thrust bearing by applying knocks on the front and rear ends of the crankshaft with a plastic hammer.
Tighten thrust bearing as specified.
Measure axial play.
Nominal value: 0.085 to 0.174 mm (0.0033 to 0.0068").
If the crankcase is replaced, clean oil and water bores again thoroughly to remove casting sand.

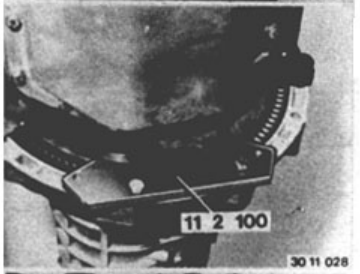


Checking Runout:
Install bearing shells 1 and 5.
Apply dial gage on center bearing and measure the runout while turning the crankshaft.
Nominal value: max. 0.1 mm (0.004").



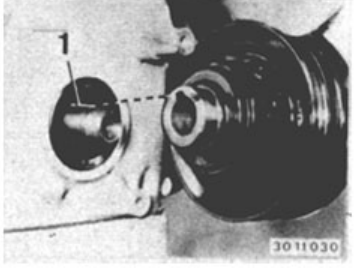
11 21 120 REMOVING AND INSTALLING PULLEY ON CRANKSHAFT

Unscrew reinforcement plate.



Hold flywheel with Special Tool 11 2 100.

Unscrew nut on pulley.
Pull off pulley.
Installation:
Tightening torque*.

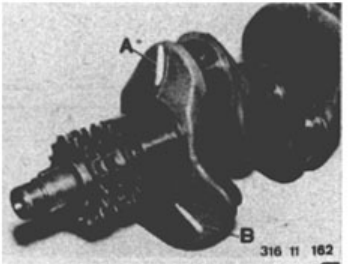


Installation:
Check for correct installed position of woodruff key (1).

* See Specifications

11 21 501 REPLACING CRANKSHAFT – Crankshaft Removed –

Note:
A replacement crankshaft is supplied complete with corresponding bearing shells for main and conrod bearings.

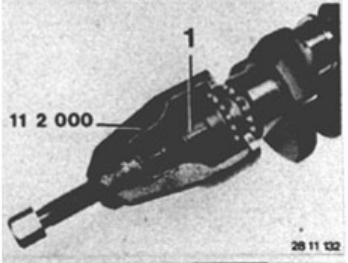


Crankshaft is surface treated and may only be reground in the factory.

Reground crankshafts are marked with stripes of paint.

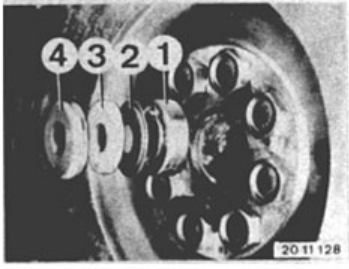
Conrod Bearing Journal (A)
1 paint stripe Size 1 *
2 paint stripes Size 2 *

Main Bearing Journal (B)
1 paint stripe Size 1 *
2 paint stripes Size 2 *



Transferring Sprocket:
Lift out woodruff key (1).
Pull off sprocket with Special Tool 11 2 000.

Installation:
Heat sprocket to max. 200° C (390° F) for installation.

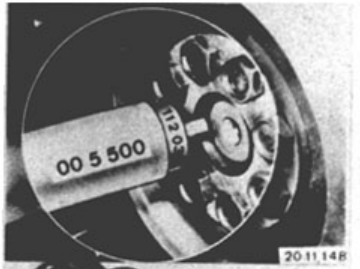


Cars with Manual Transmission:
Install pilot bearing for the transmission main shaft.

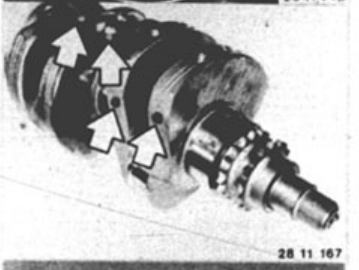
Installed Order:
Ball bearing (1), cover (2), felt ring (3) and capsule (4).

Insert cover (2) with embossment facing out.

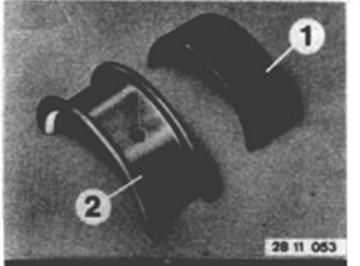
*** See Specifications**



Fill bore in crankshaft with approx. 1 gram (0.035 oz.) of lubricating grease. Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.



Replacement crankshafts are only supplied with bearing shells of double classification.
A crankshaft is marked with red or blue paint because of the main bearing journal tolerances.

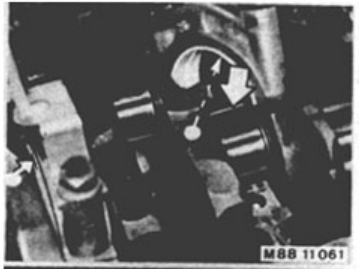


1 = Bearing shell 1–2–4–5
2 = Bearing shell 3 (pilot bearing)

The color code is located on the side of a bearing shell.

Check the ground size of main bearing journals.

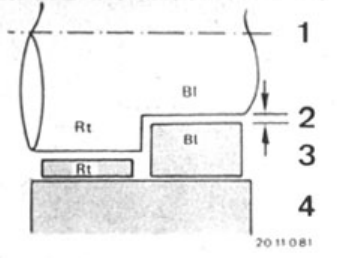
Installing Instructions:
Only place bearing shells with "red" marks in the crankcase (regardless of the old color code mark on the crankcase).
Install bearing shells in bearing caps depending on the color code of the crankshaft main bearing journals – "red" or "blue".



Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with the correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct the bearing play by installing new bearing shells, bearing shells of a different machined size or with different color code marks.



Survey of Color Code/Shaft Diameter/ Bearing Shell Thickness*

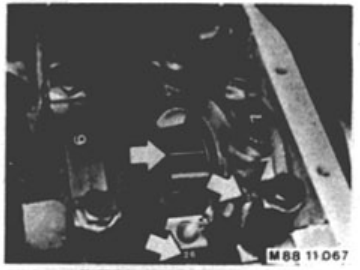
Double Classification Color Codes:
Rt = red
Bl = blue

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

Replacing Conrod Bearing Shells:
Red or blue conrod bearing shells are installed standard depending on the color code mark on the connecting rod for a pertinent crankshaft ground size.

Only install the red bearing shells of a pertinent ground size supplied with a replacement crankshaft.

* See Specifications



Place Type PG-1 Plastigage on conrod bearing journals wiped clean of oil in BDC position.
Mount conrod caps – pair codes and grooves of bearing shells are on the outside.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Tighten bolts (use old conrod bolts).
Do not turn the crankshaft.
Remove conrod bearing caps.

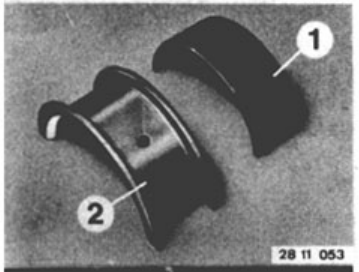
Tightening Torque of Conrod Bolts:
Step 1 10 Nm (7 ft. lbs.)
Step 2 30 Nm (22 ft. lbs.)
Step 3 60° + 2° torque angle
Conrod bearing play: 0.024 to 0.064 mm (0.0009 to 0.0025").
Installation:
Use new conrod bolts for final installation.

Check conrod bearing play by measuring width of the flattened Plastigage with help of the supplied scale.

28 11 167

11 21 531 REPLACING CRANKSHAFT MAIN BEARING SHELLS
– Engine Disassembled –

A crankshaft is marked with red or blue paint depending on main bearing journal tolerances.



28 11 053

1 = Bearing shell 1–2–4–5
2 = Bearing shell 3 (pilot bearing)

Color code mark is located on the side of a bearing shell.

Check the ground size of main bearing journals.

M88 11 060

Install bearing shells in crankcase with same color code as the dot of paint on the console.
Install both bearing shells according to the crankshaft color code, if the color code mark on the crankcase is washed off.
Install bearing shells in bearing caps with the same color code as for the crankshaft.

M88 11 061

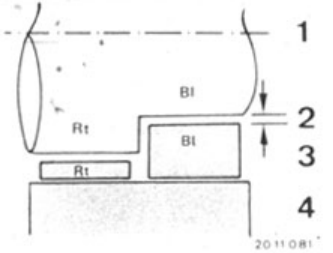
Install crankshaft.
Place Type PG-1 Plastigage on crankshaft wiped clean of oil and tighten bearing caps with correct torque*.
Do not turn the crankshaft.

Source of Supply for Plastigage:
CARTOOL
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

* See Specifications

M88 11 062

Remove bearing caps.
Read bearing play* by measuring the width of the flattened Plastigage with help of the supplied scale.
Correct bearing play by installing new bearing shells, bearing shells of different machined size or with different color code.



2011 081

Survey of Color Code/Shaft Diameter/Bearing Shell Thickness*

Double Classification Color Codes:
Rt = red
Bl = blue

1 Crankshaft diameter
2 Bearing play
3 Bearing shell thickness
4 Console diameter

* See Specifications

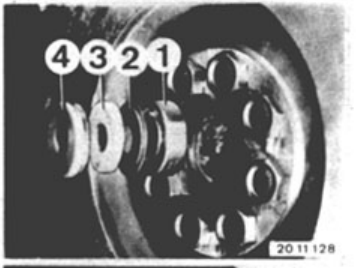
11 21 571 REPLACING PILOT BEARING IN CRANKSHAFT

Remove clutch – see 21 21 000.
Pull out ball bearing with Special Tool 11 2 010.



Installed Order:
Ball bearing (1)
Cover (2)
Felt ring (3)
Capsule (4)
Install cover (2) with embossment facing out.

Pack bore in crankshaft with approx. 1 gram of lubricating grease.
Drive in pilot bearing with Special Tools 11 2 030 and 00 5 500.

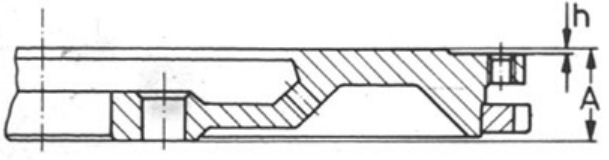
11 22 000 REMOVING AND INSTALLING FLYWHEEL

Remove clutch – see 21 21 000.
Hold flywheel with Special Tool 11 2 160.
Unscrew bolts and take off the flywheel.
Installation:
Clean tapped bores.
Install new expansion bolts with Loctite No. 270**.
Tightening torque: 105 ± 4 Nm (76 ± 3 ft. lbs,).

Check axial runout of flywheel.
Nominal value: max. 0.1 mm (0.004").

Friction surface may be machined to the minimum distance A = 29.1 – 0.1 mm (1.146 – 0.004").
If machining the friction surface reduces distance "h" to zero, the flange surface has to be machined.

M 88 11 072

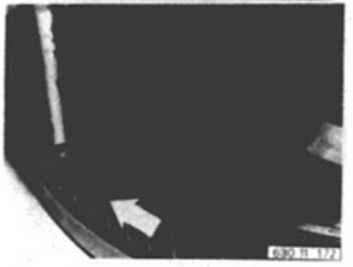


** Source: HWB

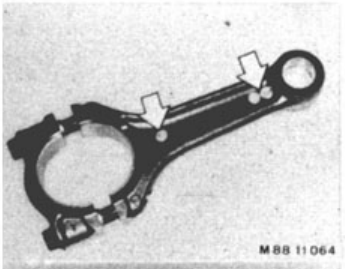
11 22 541 REPLACING STARTER GEAR RING

Drill a 6 mm (0.236") diameter hole approx. 8 mm (0.315") deep below a tooth gap to make breaking the ring gear easier.

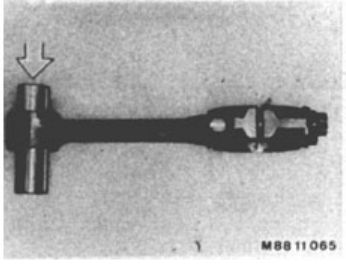
Break ring gear at drilled point with a chisel.



Installation:
Heat new starter gear ring to 200 ... 230° C (395 to 445° F).
Measure temperature with a thermo-color pencil.
Tooth bevel faces the engine.
Knock on starter gear ring to fit firmly all around with a brass mandrel.



M88 11 064



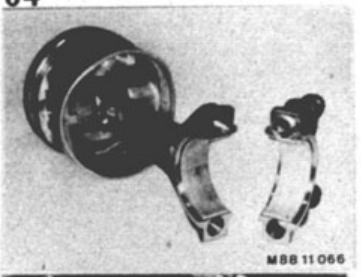
M88 11 065

11 24 521 REPLACING CONNECTING RODS
– Pistons Removed –

Note:
Only install connecting rods of same weight class (die-stamped on bearing caps) in one engine.

Consequently only sets of connecting rods are available from Parts.

Piston pin must slide through conrod bushing under light pressure.
Install conrod bearing shells – see 11 24 571.



M88 11 066

M88 11 067

M88 11 068

11 24 571 REPLACING CONROD BEARING SHELLS
– Engine Disassembled –

Install one each bearing shell in connecting rod and conrod bearing cap

or

one blue bearing shell in connecting rod and one red bearing shell in cap.
Check machined size (conrod bearing dia.).

Place Plastigage (Type PG - 1) on conrod bearing journals wiped clean of oil in BDC position.
Mount conrod bearing caps — pair code and grooves of bearing shells must be on the outside.

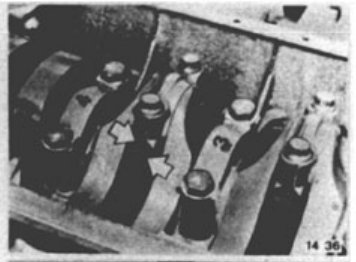
Source of Supply for Plastigage:
Cartool
Alfred-Brehm-Str. 5
D-8070 Ingolstadt

Tighten bolts — use old conrod bolts.
Turn crankshaft slightly.
Remove conrod bearing caps.
Read conrod bearing play from supplied scale by measuring width of the flattened Plastigage.

Install new bearing shells, bearing shells of different machined size or different color code to correct the bearing play.
Replace conrod bolts for final installation.
Conrod bolt tightening torque:

Step 1:	**10 Nm**
Step 2:	**30 Nm**
Step 3:	**60 + 2° torque angle**

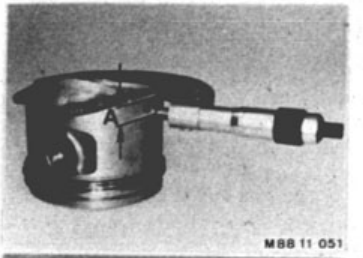
Conrod bearing play: 0.024 ... 0.064 mm.



11 25 000 REMOVING AND INSTALLING PISTONS

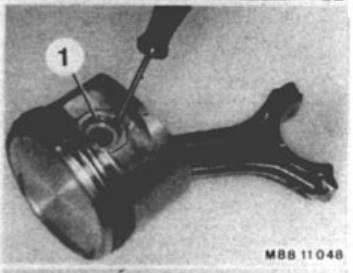
– Engine Removed –

Remove cylinder head – see 11 12 100.
Remove oil pump – see 11 41 000.
Remove conrod bearing cap and press out piston with connecting rod upwards.

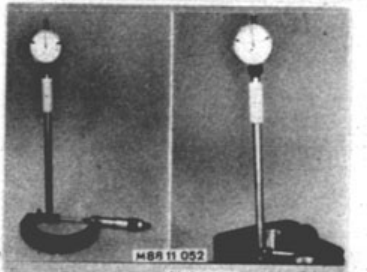


Measuring Piston Installed Clearance:
Measure piston diameter* at checkpoint "A" with a micrometer.

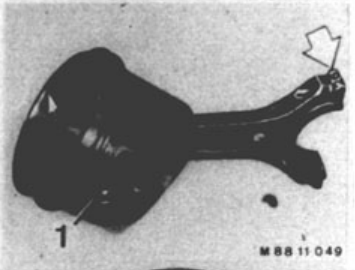
Engine	Make	Checkpoint "A"
S 14	Mahle	6 mm (0.236")



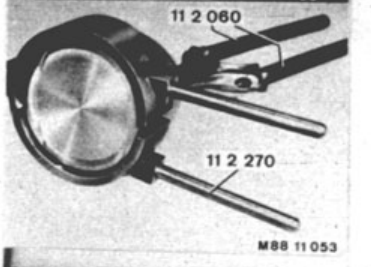
Remove circlip (1).
Press out piston pin.
Installation:
Piston pin is matched with piston and must not be mixed up.



Set internal calipers to zero on the micrometer with the measured piston diameter.
Measure cylinder bore diameter at bottom, center and top with the internal calipers in forward and turning directions.
Compare measured piston installed clearance with specified piston installed clearance/max. total wear play.
Installed clearance: 0.03 to 0.06 mm (0.0012 to 0.0024").
Max. permissible total wear play: 0.15 mm (0.006").



Installation:
Pairing code and grooves of bearing shells are on the exhaust side.
Install circlip (1) with gap facing down.



Bolt Special Tool 11 2 060 on connecting rod.
Lubricate piston and piston rings with oil.
Offset piston ring end gaps by 120° to each other.
Compress piston rings with Special Tool 11 2 270 ...

Only install pistons of same make and same weight class.
Weight class is specified on piston crown with "+" or "–".
Identification:

Engine	E	Diameter
S 14	10.5	93.4 mm (3.677")

Check the machined size* (piston diameter).

... install piston that arrow faces timing chain.
Turn pertinent conrod bearing journal to BDC for installation of piston.

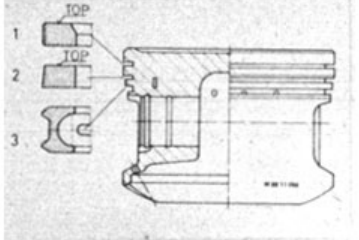
* See Specifications

* See Specifications

11 25 651 REPLACING PISTON RINGS OF ONE PISTON
– Piston Removed –

Remove piston rings with a piston ring compressing pliers.

Note:
The identification of used piston rings might not be visible.
Lay piston rings aside in correct sequence and installed position.



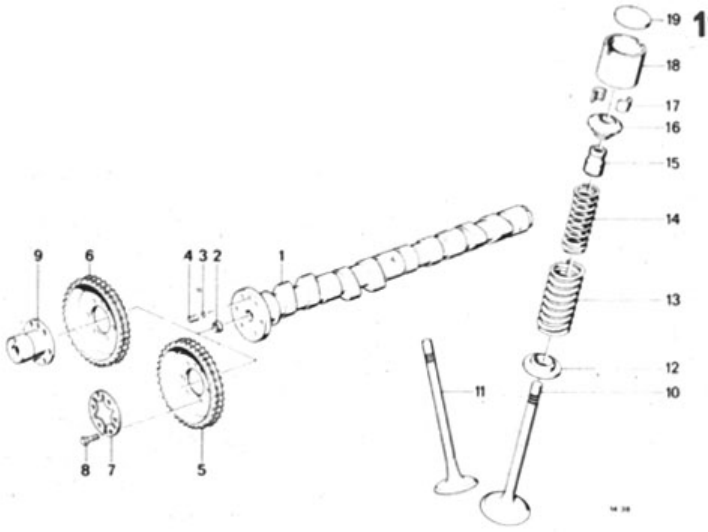
Installation:
Install piston rings with the word "TOP" facing the piston crown.

1 Plain compression ring
2 Bevelled face compression ring
3 Oil scraper ring with rubber lined spring

Measure side clearance*.

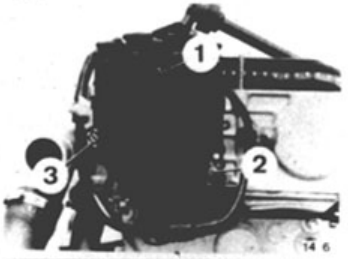
Measure end clearance*.

* See Specifications



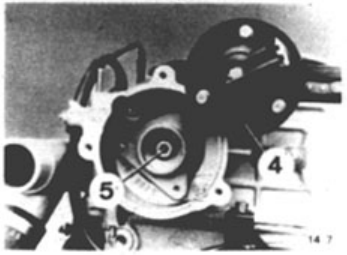
Valve Timing

1 Camshaft 248°
2 Plug for oil bore in camshaft
3 Lockwasher
4 Dowel pin
5 Sprocket - intake "E"
6 Sprocket - exhaust "A"
7 Lockplate
8 Hexagon head bolt M 6 x 16
9 Adapter for distributor rotor
10 Intake valve – 37 mm (1.457") dia.
Oversize valves with larger stem diameters are available
11 Exhaust valve – 32 mm (1.260") dia.
Oversize valves with larger stem diameters are available
12 Spring retainer, lower
13 Valve spring, outer – 41 mm (1.614") long
14 Valve spring, inner – 38.5 mm (1.516") long
15 Valve stem seal
16 Valve spring retainer, upper
17 Valve collet
18 Tappet
19 Shims from 3.00 to 4.25 mm (0.118 to 0.167")

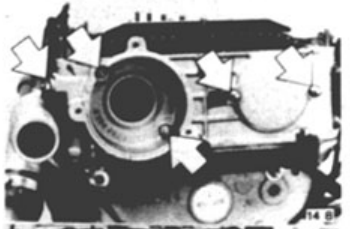


11 31 000 REMOVING AND INSTALLING CAMSHAFT

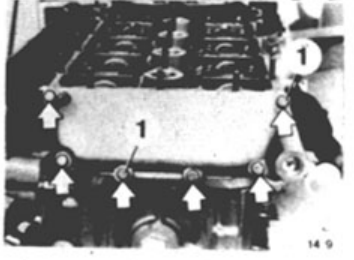
Remove cylinder head cover – see 11 12 000.
Unscrew bolts (1 ... 3) and take off distributor cap.



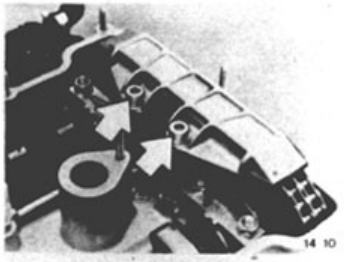
Unscrew distributor rotor (4).
Unscrew adapter (5).
Installation:
Tightening torque:
23 ± 1 Nm (16.5 ± 0.5 ft. lbs.).



Unscrew and remove distributor housing and plug.
Installation:
Check O-rings, replacing if necessary.

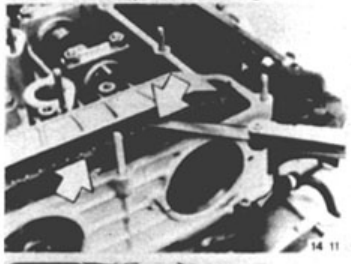


Remove end cover.
Installation:
Replace gasket.
Use longer bolts in bore with a dowel sleeve (1).

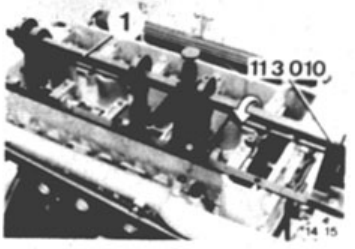


Unscrew guide rail.

Mount Special Tool 11 3 010 on timing case. Turn shaft (1) up to the arrest – camshaft is held down for removal of bearing caps. Unscrew camshaft bearing caps.



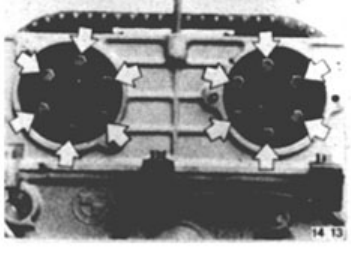
Installation:
Center guide rail with a feeler gage.



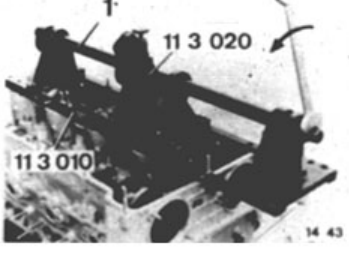
Loosen the arrest and relax the camshaft.
Remove Special Tool 11 3 010.
Mark camshafts "E" or "A" and remove.
Installation:
Camshafts are identical for exhaust and intake sides.
Install an used camshaft in the same position.

Turn crankshaft with Special Tool 11 3 020 to position cylinder no. 1 to TDC – cylinder no. 4 overlaps.
Caution!
Never crank the engine after removing the timing chain.

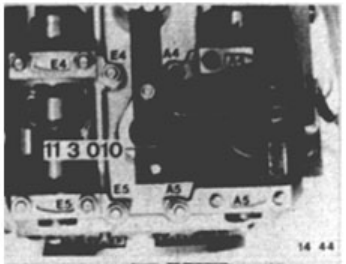
Installation:
Turn crankshaft to TDC.
Install camshaft that one each groove faces up and in – TDC position.



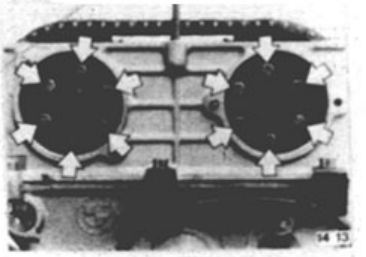
Remove chain tensioner – see 11 31 090.
Open lockplates and unscrew sprockets.
Installation:
Tightening torque: 9 + 1 Nm (6.5 + 0.5 ft. lbs.).



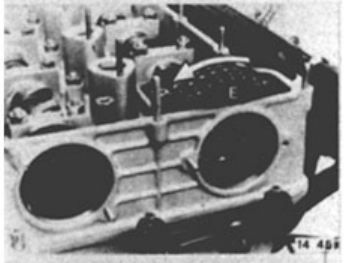
Mount Special Tool 11 3 010 on timing case. Hold camshaft in TDC position with Special Tool 11 3 020 and turn shaft (1) up to the arrest – camshaft is held down for installation of bearing caps.



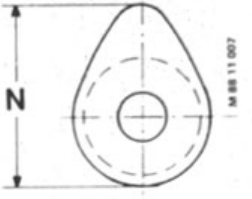
Install camshaft bearing caps on timing case according to lettering.
Tightening torque: 22 ± 2 Nm (16 ± 1.5 ft. lbs.).



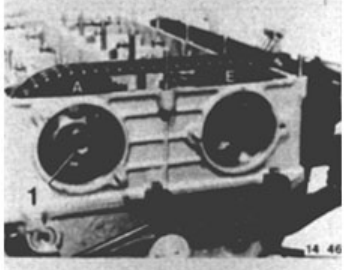
Lock sprocket mounting bolts with a lockplate.
Adjust valve clearance – see 11 34 004.



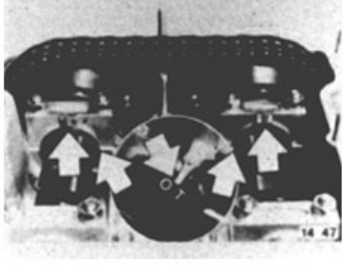
Tighten the timing chain in opposite direction of engine rotation and mount on the intake side sprocket "E" first.
Install lockplate and bolt down the sprocket.
Tightening torque: 9 + 1 Nm (6.5 + 0.5 ft. lbs.).



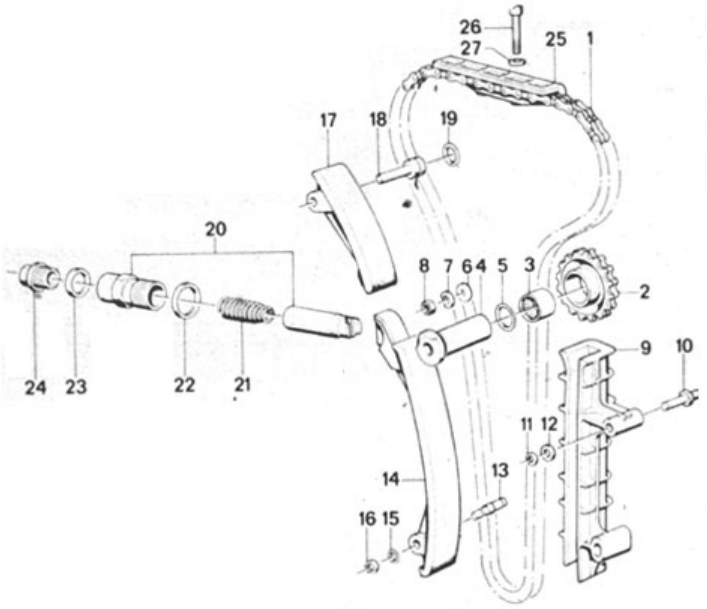
Cam distance "N"
Nominal value: 43.713 mm (1.721")



Installation:
Install exhaust side sprocket "A".
Install adapter (1).
Install lockplate and bolt down the sprocket.
Tightening torque: 9 + 1 Nm (6.5 + 0.5 ft. lbs.).



Install chain tensioner – see 11 31 090.
Turn engine once in direction of rotation and recheck the timing.
- Crankshaft at TDC
- One each camshaft groove faces in
- One each camshaft groove faces cast boss on bearing cap



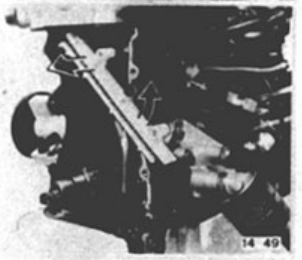
Valve Timing

1 Double-row timing chain
2 Sprocket (guide wheel)
3 Needle sleeve
4 Shaft
5 O-ring
6 Washer
7 Spring washer
8 Hexagon nut
9 Guide rail
10 Shaft bolt
11 Lockwasher
12 Washer
13 Shaft bolt
14 Tensioning rail, lower (head removed)
15 Lockwasher
16 Circlip
17 Tensioning rail, upper (chain removed)
18 Shaft bolt
19 O-ring
20 Chain tensioner piston and cylinder (matched)
21 Spring
22 Seal
23 Seal
24 Plug
25 Guide rail
26 Bolt
27 Washer

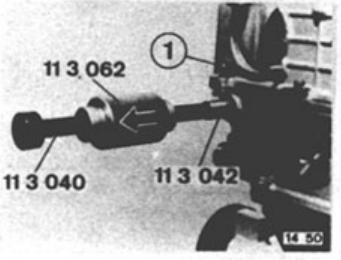
11 31 051 REPLACING TIMING CHAIN

Remove lower timing case cover – see 11 14 110.
Remove sprockets on camshafts – see 11 31 000.

Remove lockwashers.

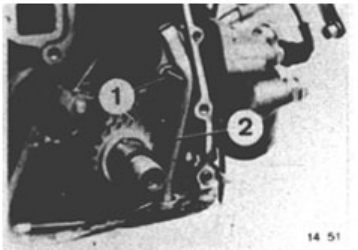


Pull guide rail forward and swing aside.
Remove timing chain.
Installation:
Timing chain is pre-stretched.



11 31 . . . REMOVING AND INSTALLING UPPER TENSIONING RAIL

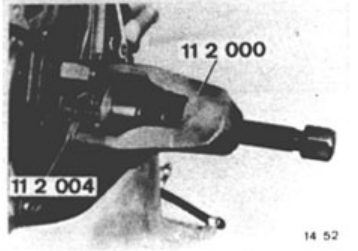
Remove timing chain – see 11 31 051.
Unscrew bolt (1) partially.
Screw on Special Tools 11 3 040, 11 3 042 and 11 3 062.
Knock out the shaft.
Installation:
Check O-ring, replacing if necessary.
Check tensioning rail arrangement!



14 51

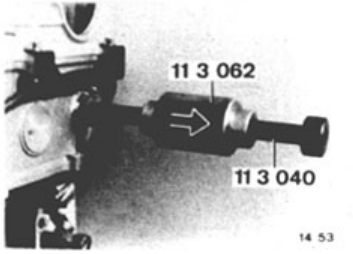
11 31 061 REPLACING SPROCKET SET
– Timing Chain Removed –

Remove oil pump drive chain – see 11 41 151.
Unscrew shaft bolt (1) and take off oil pipe (2).
Installation:
Check O-rings, replacing if necessary.



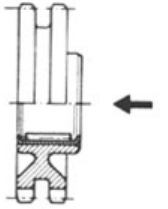
14 52

Pull off sprocket with Special Tools 11 2 000 and 11 2 004.
Installation:
Heat sprocket to max. 200° C (390° F) for installation.
Tighten oil pump drive chain – see 11 41 000.



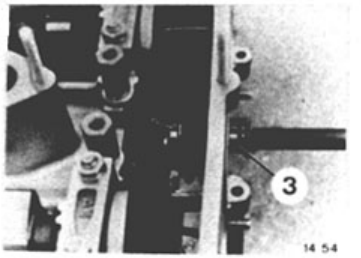
14 53

Mount Special Tools 11 3 040 and 11 3 062 on shaft of guide sprocket.
Knock out the shaft.



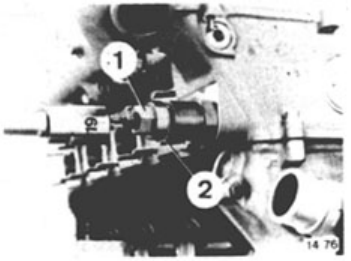
14 1

Installation:
Check needle sleeve in sprocket, replacing if necessary.
← Forward direction and pressing-in direction for needle sleeve.



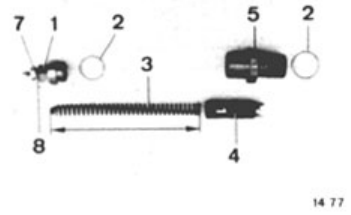
14 54

Installation:
Replace O-ring (3).
Drive in shaft partially with bore facing up.
Slide on the guide sprocket.
Drive in shaft against the stop.

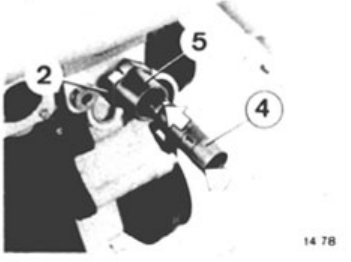


11 31 090 REMOVING AND INSTALLING PISTON FOR CHAIN TENSIONER

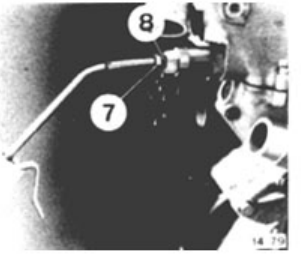
Unscrew plug (1).
Caution!
Strong spring pressure.
Remove spring (3) and piston (4).
Installation:
Replace seal (2).



Installation:
Check length of spring (3).
Nominal value: 159 ± 0.5 mm (6.260 ± 0.020").
Conically wound end of spring faces plug (1).
Tightening torque for:
– plug (1) 40 ± 2 Nm (29 ± 1.5 ft. lbs.)
– cylinder (5) 50 ± 2 Nm (36 ± 1.5 ft. lbs.)



Piston (4) and cylinder (5) are matched* – code 1 or 2.
Only install parts with same code.
Install cylinder with groove facing back (as seen looking forward in car) and piston with groove facing up.
Guide piston opening into tensioning rail.

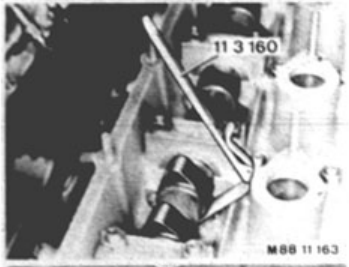


Unscrew nipple (7) – replace O-ring (8) if necessary.
Add engine oil, until oil runs out of nipple (7).
Tighten nipple (7).

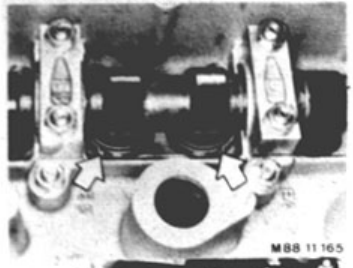
* See Specifications

11 34 004 ADJUSTING VALVE CLEARANCE

Remove cylinder head cover – see 11 12 000.
Crank engine with Special Tool 11 3 020.



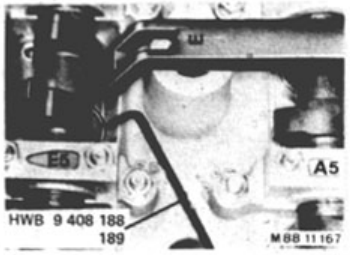
Measure valve clearance of cams facing up.
Compare measured valve clerance with specified valve clearance.
Nominal value:
0.26 to 0.35 mm (0.010 to 0.014") – cold*
0.31 to 0.40 mm (0.012 to 0.016") – warm*



Turn openings of tappets as shown in picture in case measured valve clearance is not within specified tolerances.

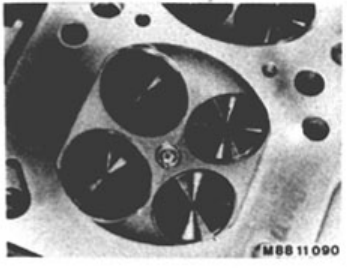
Guide in Special Tool according to camshaft "A" or "E" and press tappet down.

* See Specifications



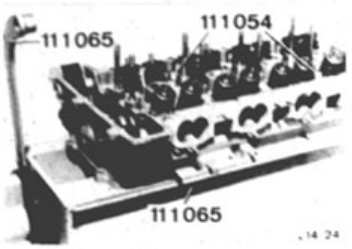
Blow out valve shim with compressed air.

Measure thickness of removed valve shim.
Install shim of required thickness with lettering facing down.



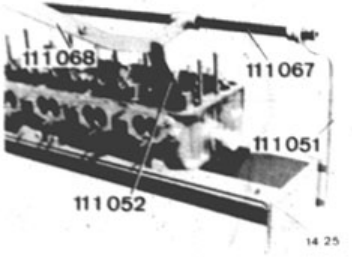
11 34 509 CHECKING VALVES FOR LEAKS – Cylinder Head Removed

Spark plugs remain screwed in.
Fill combustion chamber with gasoline outdoors or indoors with conformance of fire prevention regulations.
Valves and valve seats must be inspected, if gasoline runs past the valve heads.
Remove valves – see 11 34 550.
Machine valve seats – see 11 12 607.

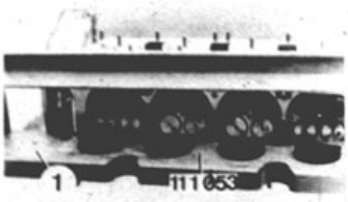


11 34 550 REMOVING AND INSTALLING VALVES
– Cylinder Head Removed –

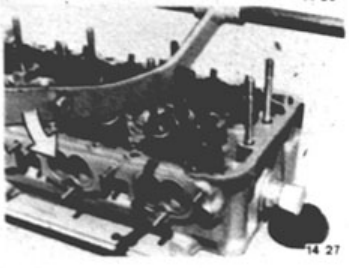
Unscrew spark plugs.
Mount cylinder head on Special Tool 11 1 065 with Special Tools 11 1 054.
Screw on Special Tool 11 1 065.
Installation:
Tightening torque for spark plugs: 20 ± 5 Nm (14.5 ± 3.5 ft. lbs.).



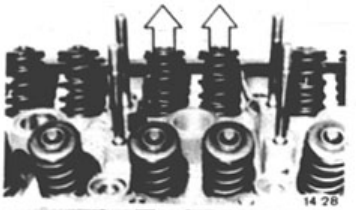
Screw on Special Tool 11 1 051.
Mount Special Tools 11 1 068, 11 1 052 and 11 1 067.



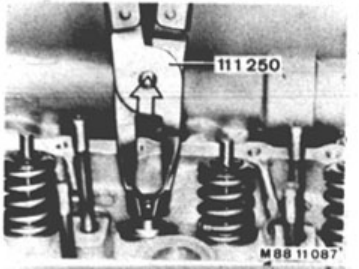
Place Special Tool 11 1 053 (tray) in assembly stand – pull out rubber part (1)!



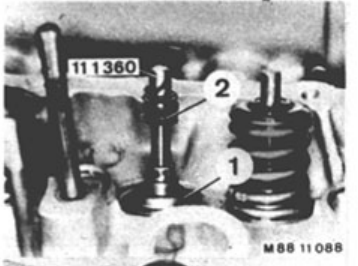
Compress valve springs and remove valve collets.



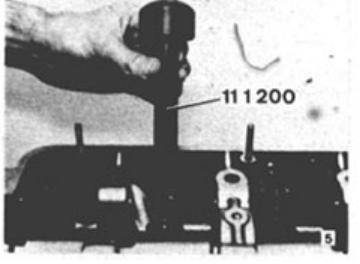
Remove upper spring retainer and double spring set.
Take tray out of assembly stand and pull out valve.
Installation:
Lubricate valve guide and valve stem with oil.



Pull off valve stem seal with Special Tool 11 1 250.
Check valve guide for wear – see 11 12 595.



Install valve and insert Special Tool 11 1 053 (tray).
Insert lower spring retainer (1).
Use Special Tool 11 1 360 to avoid damaging the valve stem seal.
Lubricate valve stem seal (2) with oil and install.
Source for Special Tool Sleeves:
CARTOOL
Alfred-Brehm-Str. 5
D–8070 Ingolstadt

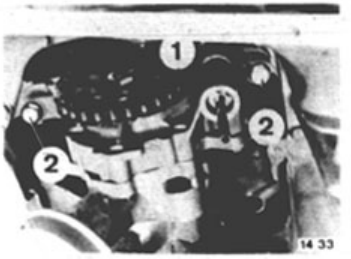


Press on valve stem seal with Special Tool 11 1 200 by hand.
Special Tool 11 1 200 has two diameters for 7 and 8 mm (0.275 and 0.315") valve stem seals.

11 40 000 CHECKING ENGINE OIL PRESSURE

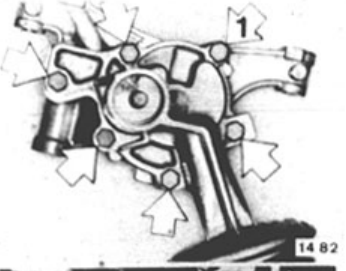
Remove air cleaner with air flow sensor.
Pull off plug on oil pressure switch.
Unscrew oil pressure switch (1).
Installation:
Check seal (2), replacing if necessary.

Screw in Special Tool 11 4 060.
Connect 10 bar (142 psi) pressure tester of BMW Service Tester.
Install air cleaner.
Measure oil pressure*.



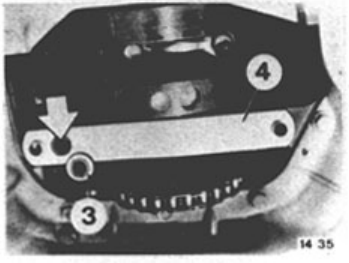
11 41 000 REMOVING AND INSTALLING OIL PUMP

Remove lower oil pan section -- see 11 13 020.
Unscrew nut (1) and take off sprocket.
Unscrew bolts (2).



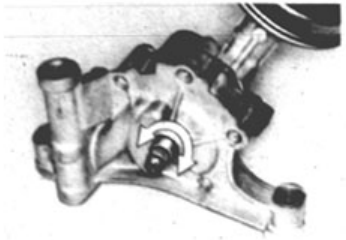
Note:
If bolt (1) has a shorter head than the others, convert from the old one to a new one when replacing the oil pump.

Installation:
Push on sprocket with mounted oil pump.
Tightening torque of nut:
25 to 30 Nm (18 to 22 ft. lbs.).

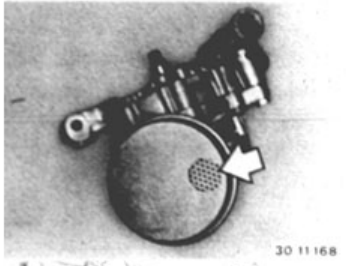


Installation / Chain Tightness:
Check installed position of O-ring (3) between housing and pressure pipe.
Adjust chain tightness with shim (4) in such a manner, that chain gives under light thumb pressure.
Check position of oil bore in shim.

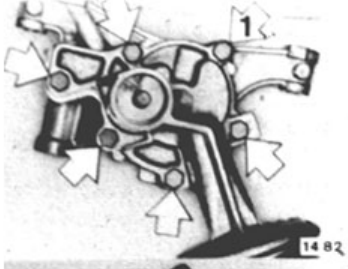
* See Specifications



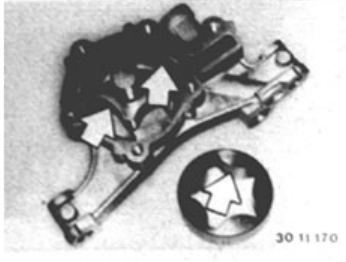
Testing and Servicing:
Check whether oil pump runs easily by turning the drive shaft.



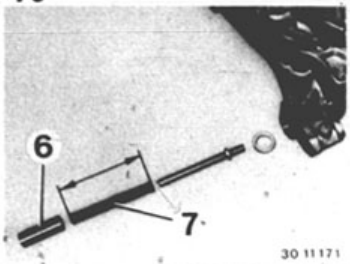
Clean oil filter screen.



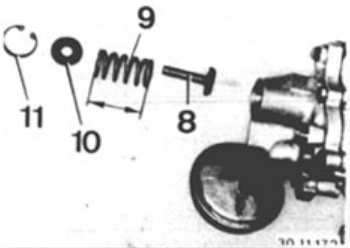
Diassemble oil pump.
Installation:
If bolt (1) has a shorter head than the others, it is absolutely essential to install it in the same location.



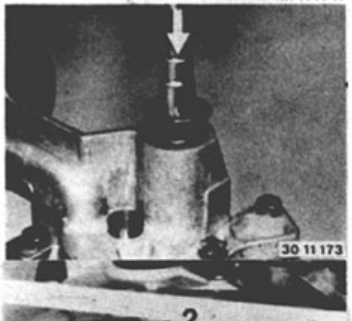
Check oil pump for wear.
– Scoring in body
– Wear on rotors



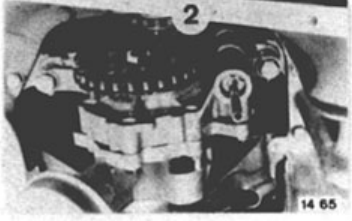
The pressure safety valve is located in the main bore and regulates the engine oil pressure* – see 11 40 000.
Check whether piston (6) moves easily.
Check length of spring (7) = 68 mm (2.677").



Pressure safety valve (8 bar = 114 psi) regulates the oil pressure in front of the oil filter and prevents oil filter leakage.
Check seat of piston (8).
Check length of spring (9) = 44 ± 0.4 mm (1.732 ± 0.016").



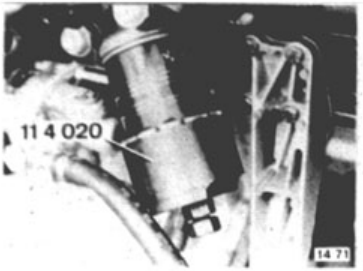
Installation:
Press in spring (9) and washer (10) with a wrench socket and install circlip (11).



11 41 151 REPLACING OIL PUMP DRIVE CHAIN

Remove lower oil pan section – see 11 13 020.
Remove timing chain – see 11 31 051.
Unscrew nut (2) and take off sprocket.
Installation:
Check sprockets for wear.
Adjust chain tightness – see 11 41 000.
Chains with green code are longer than chains with red code.
Tightening torque: 25 to 30 Nm (18 to 22 ft. lbs.).

* See Specifications



11 42 021 REPLACING FULL FLOW OIL FILTER

Unscrew filter with Special Tool 11 4 020.

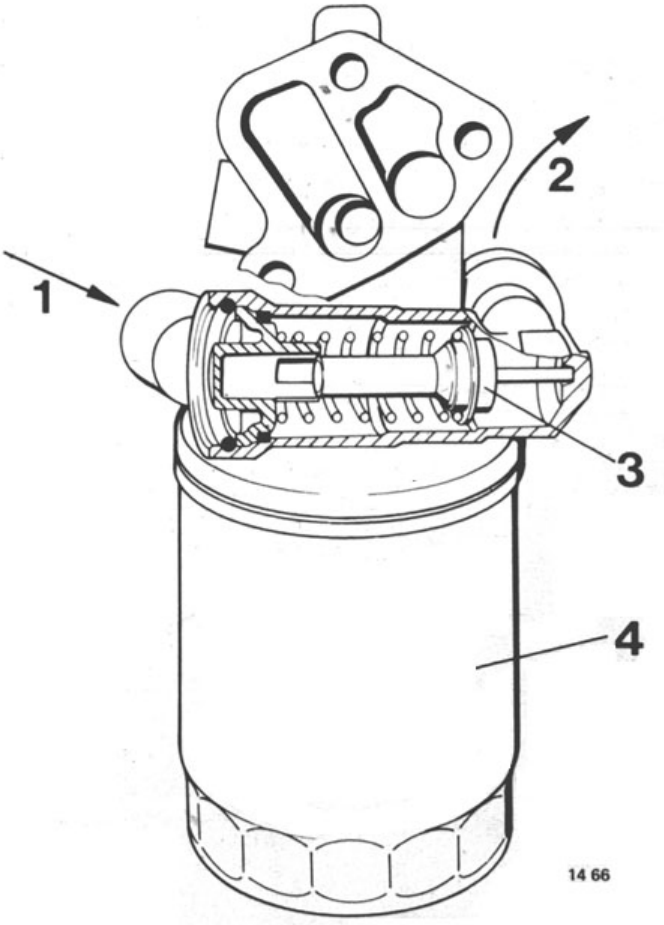
Installation:

Lubricate gasket with light coat of oil.

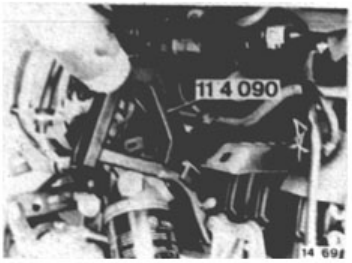
Tighten oil filter by hand until the gasket bears on surface – then tighten filter by hand one half turn more.

Add oil, start engine and check oil level as well as for leaks.

If engine no longer builds up oil pressure after replacement of the oil filter cartridge, stop the engine, turn the filter cartridge approx. 90° and tighten it again after starting the engine and waiting until a small amount of oil escapes from the filter (bleeding procedures).

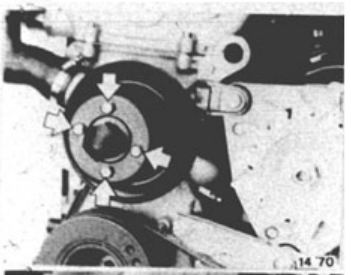


1 From oil cooler
2 To oil cooler
3 Temperature regulator – switches off oil cooler as of approx. 95° C (203° F)
4 Oil filter



11 43 101 REPLACING GUIDE TUBE FOR OIL DIPSTICK

Install guide tube with Loctite No. 270** and drive in against the stop.



11 51 000 REMOVING AND INSTALLING WATER PUMP

Drain coolant.
If applicable, remove fan cowl and fan – see 11 52 000.
Take off drive belt and remove pulley.
Installation:
Add coolant***.
Tighten drive belt – check tightness with Special Tool 11 5 020.

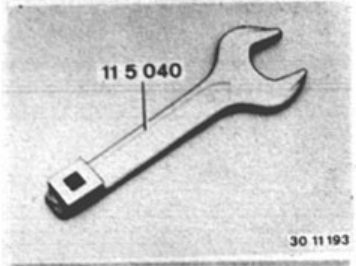
Loosen hose clamps.
Remove water pump.
Installation:
Replace gasket.

** Source: HWB

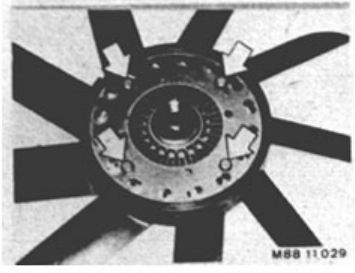
*** See Service Information of Gr. 00

11 52 000 REMOVING AND INSTALLING FAN

Hold pulley with Special Tool 11 5 030 and unscrew coupling nut (1).
Important!
Left-hand threads – nut must be turned clockwise to unscrew.
Tightening torque:
40 + 10 Nm (29 + 7 ft. lbs.).



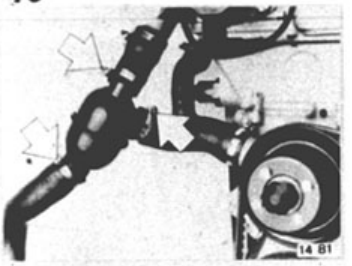
Installation:
Tighten fan with Special Tool 11 5 040.
40 Nm (29 ft. lbs.) tightening torque is equal to 30 Nm (22 ft. lbs.) setting on torque wrench.



11 52 020 REPLACING FAN CLUTCH

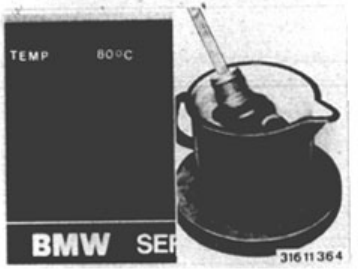
Remove fan – see 11 52 000.
Fan clutch must be replaced, if
a) hub has seized (fan of stopped engine cannot be turned or is hard to turn),
b) fan clutch has axial or radial play, or is losing oil.

Check switching points* with Vibrocard***.
Unscrew fan mounting bolts and take off fan clutch.



11 53 000 REMOVING AND INSTALLING COOLANT THERMOSTAT

Drain coolant.
Loosen hose clamps.
Remove thermostat.
Installation:
Bleed cooling system – see 17 11 000.



Checking Thermostat:
Place thermostat in water and heat the water.
Measure beginning of opening temperature and opening distance with a steel ruler.
Opening Temperature/Travel:
80 ± 2° C (176 ± 3° F) / 0.1 mm (0.004").
Testing Temperature/Travel:
95° C (203° F) / 8 mm (0.315").

* See Specifications
*** See Workshop Equipment Catalog

12 64 . . .	Fuel filter heater – check	12-	364
005	Heating element for fuel filter heater – replace	12-	364
10 70 500	External safety path – check	12-	365

INSTRUCTIONS FOR WORKING ON ENGINE ELECTRIC AND IGNITION SYSTEMS

- Always disconnect battery or interrupt power supply to ignition control unit and ignition coil when working on the electrical system – dangerous high voltage in engine and electrical system components (e.g. on the tachometer)!

- Never start the engine after removing the distributor cap or disconnecting wires on ignition coil term. 4 – pull off plug on ignition control unit and also stop the delivery of fuel in cars with catalytic converter.

- Never disconnect battery or wires on alternator and starter while engine is running.

- Only use specified genuine BMW components.

- Never connect a shielded capacitor or test lamp on term. 1 of the ignition coil.

- Never connect wire of ignition coil term. 1 on ground or B +. Consequently the ignition coil term. 1 must not be used to prevent starting when service installing a burglar alarm system.

- Pull off plug on control unit for TCI or fuel injection master relay (relay 2) for DME and stop fuel delivery in cars with catalytic converter, when checking compression.

- The secondary side (high voltage side) of the ignition system must be shielded with at least 4 k-ohms, whereby the original distributor rotor with 1 k-ohm shielded resistor must be installed. Do not use 5 k-ohm distributor rotors for the shielding of radio and/or communication equipment!

TROUBLESHOOTING TRANSISTOR COIL IGNITION (TCI)

Testing Requirements:
- Battery charged (voltage > 12 V)
- Specified fuel in tank (octane rating)
- Ambient temperature approx. 20° C (68° F); considerable deviation would change the measured values

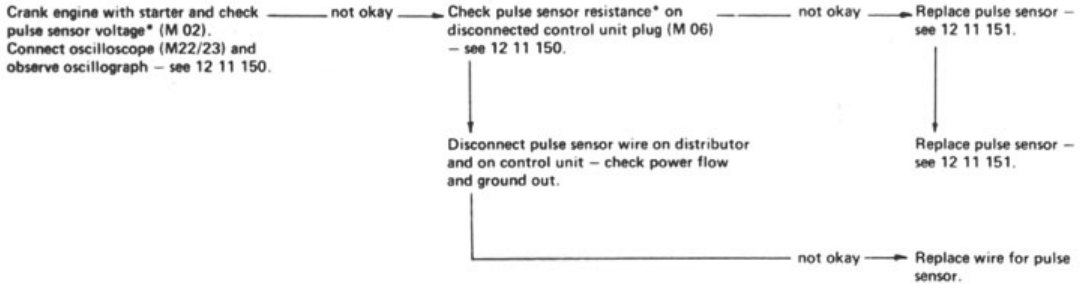
Testing instructions refer to the BMW SERVICE TEST, e.g. engine test / test step 05 (P 05) or multimeter 02 (M 02). Make connections according to operating instructions.

Important!

Refer to instructions for working on TCI and DME – see page 12 - 0.

Faults in TCI will be indicated by: a) Engine not running or running incorrectly
b) Misfiring in different operating conditions
c) Poor engine output

Test 1 – PULSE SENSOR in Distributor



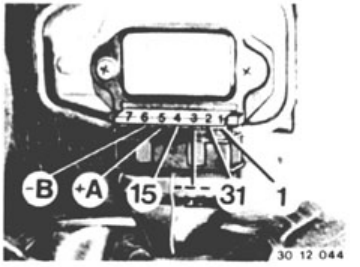
* See Specifications and Repair Manual/Group 12

Test 2 – Voltage Supply for TCI-i Control Unit and Ignition Coil

Pull off plug on control unit and turn on ignition.
Check voltage (approx. 12 V) on specified connections (term. 15 and 31 as shown in figures) of plug.

Not okay

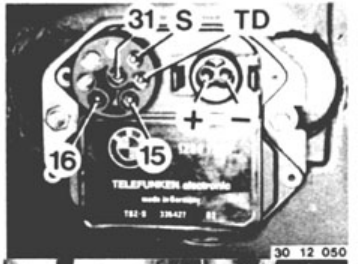
Routing of terminal u wire*:
Ignition lock – plug connection on wire harness of car electric system – connector (soldered point) in wire harness – engine wire harness plug connection –
for 4 cyl. engines: – connector (soldered point) engine wire harness
– ignition coil
– TCI control unit
for 6 cyl. engines: – ignition coil – TCI control unit
The ground wire is routed to ground point on intake manifold or to battery negative pole – see engine electrical equipment layout.

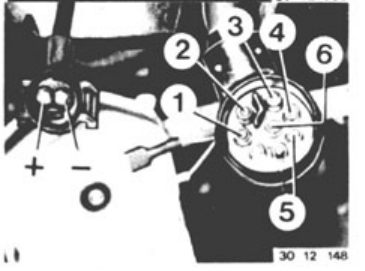


TCI-i Control Unit
(Bosch)

No.	Term.	Description
1	1	To ignition coil
2	31	Ground
3	– – –	Shielding
4	15	Power supply
5/6	A+/B–	Pulse sensor

For the 2.8 liter M 30 engine voltage supply* (term. 15) is provided via the TCI-R control unit (R = ignition return or retard control).
TCI will not function if this control unit fails.
Bridge terminals 15 E and 15 A on control unit plug for brief test.





TCI-i-S Control Unit
(S = ignition retard while starting)
(Siemens/Telefunken)

No.	Term.	Description
1	–	–
2	1/16	To ignition coil
3	15	Power supply
4	TD	– to fuel pump relay – to L-Jetr. control unit – to tachometer
5	S	To starter term. 50
6	31	Ground
	+/–	Pulse sensor

* See Wiring Diagram for Car and Engine Electrical Systems

Test 3 – Ignition Coil and Power Supply Lead

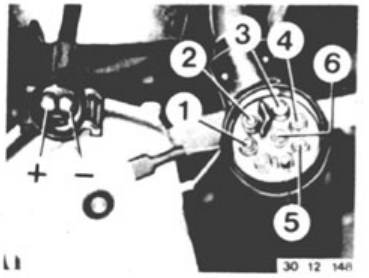
Turn on ignition.
Check voltage(> 10 V) on control unit pin 2 (M 01).
Also contained in engine test (P 01).

not okay → Check wire from ignition coil (terminal 1) to control unit for breaks and ground out (M 06).

↓

Check ignition coil – see 12 13 009.
Check resistance* of primary and secondary coils.

not okay → Replace ignition coil.
If casting compound has run out or the plug is missing, also replace TCI control unit.



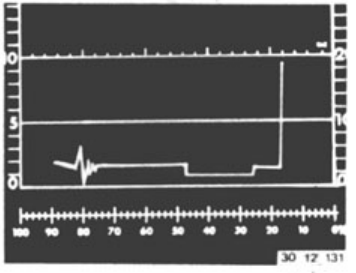
Test 4 – TCI Control Unit

Requirement: Tests 1 through 3 completed and no malfunction.

Connect car for engine test (P 05).
Crank engine with starter or start engine.
Primary display on oscilloscope should conform with that illustrated here – if necessary, replace control unit.

↓

Check primary current (M 03) – this is only necessary when the primary oscillograph deviates.
Connect ammeter in power supply lead (term. 15) on plug for engine wire harness.
Run engine at 1000 ± 50 rpm.
Value should be 1.2 to 1.7 A – if necessary, replace control unit.



* See Specifications

Test 5 – Distributor Cap / Rotor and Ignition Leads.

Bend ignition leads in a tight radius and check for cracks and traces of burning. Check connection and tightness of plugs and connections. — not okay → Replace ignition leads or repair connections.

↓

Check distributor cap and distributor rotor for cracks and traces of burning. Measure resistance* in distributor rotor. — not okay → Replace distributor cap and/or rotor – see 12 11 091/111.

Test 6 – Spark Plugs and Connectors

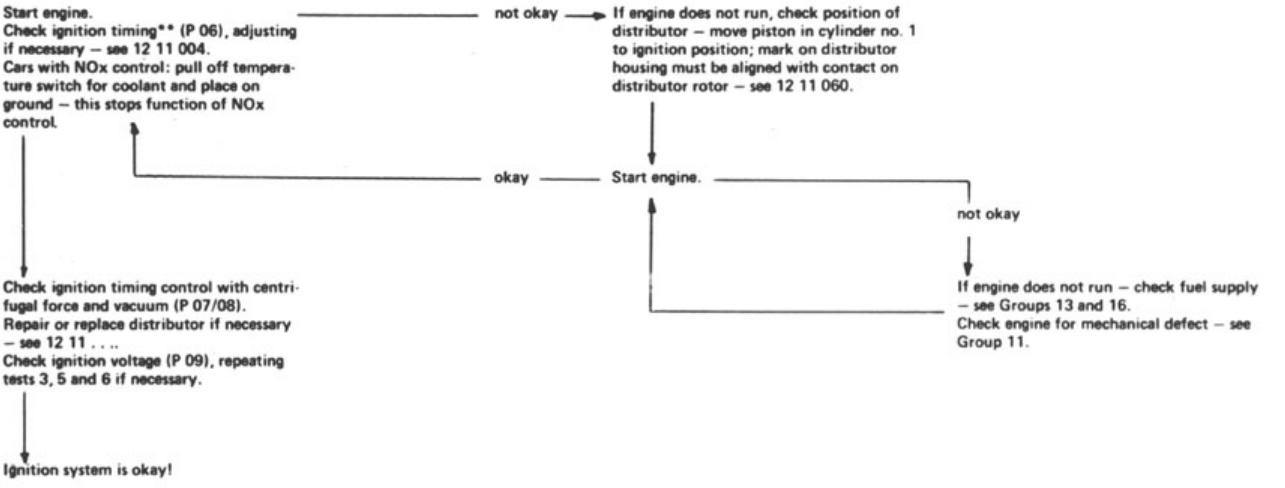
Measure resistance* of shielded and spark plug connectors. Check for cracks and traces of burning. — not okay → Replace shielded and/or spark plug connectors – see 12 12 072.

↓

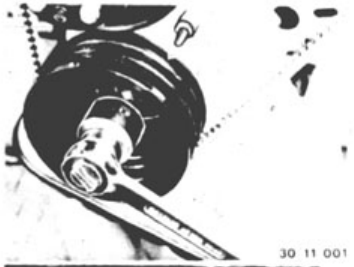
Check spark plugs for electrode erosion and electrode gap*. Check insulator for traces of burning. — not okay → Replace spark plugs – only install specified types.

* See Specifications

Test 7 – IGNITION TIMING / IGNITION TIMING CONTROL

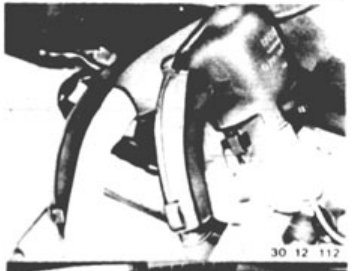


* See Specifications
** See Nominal Value Microfiche

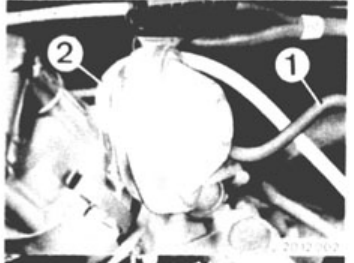


12 11 060 REMOVING AND INSTALLING DISTRIBUTOR

Four Cylinder M 10 Engines:
Turn engine to TDC mark (ignition for cylinder no. 1) with a 30 mm wrench socket.



Disconnect retaining strap.
Pull off ground wire.
Remove protective cap.
Pull off hose for vacuum box.

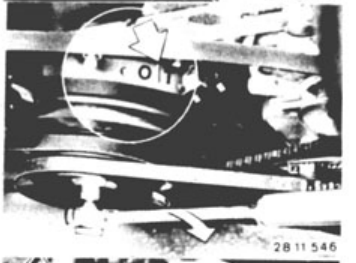


Vacuum Box with Two Connections:
1 = Hose for advance control (black)
2 = Hose for retard control (white or black/white)

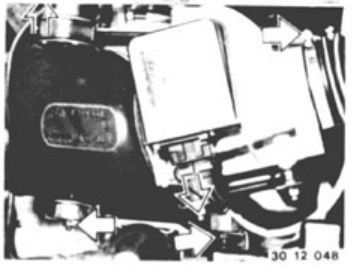
Take off distributor cap.
Check position of distributor rotor – it should point to notch in distributor; turn crankshaft if necessary.
Loosen and pull off plug for pulse sensor.
Unscrew mounting screw.

Pull out distributor while turning at same time.
Caution!
Retainers must not block the pulse sensor gear.
Hub can be turned in relation to the pulse sensor gear.

Installation:
Turn distributor rotor 30° opposite the running direction.
Install distributor – notch must be aligned with distributor rotor contact.
Repeat installation if necessary.
After finishing installation, adjust ignition timing – see 12 11 004.

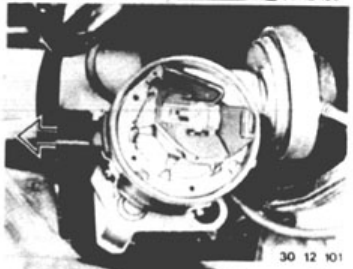


Six Cylinder M 20 Engines:
Unscrew spark plugs.
Turn crankshaft up to TDC mark



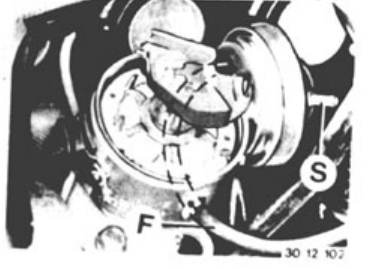
Remove air cleaner with air flow sensor.

Loosen, press and turn both distributor cap retainers.
Pull off ground strap.
Take off distributor cap.

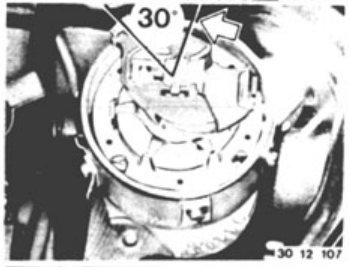


Loosen and pull off plug.
Pull off vacuum hoses.

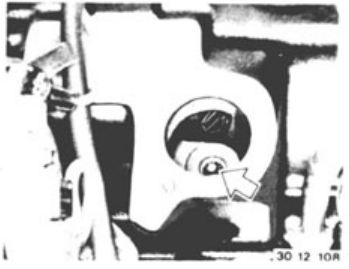
Installation:
F = Advance control (black)
S = Retard control (black/white)
Connection (S) is not used in cars with automatic transmission.
Important!
In case of vacuum control with connector diameter of 4 mm and 8 mm:
F = Advance control
(4 mm dia., black)
S = Retard control
(8 mm dia. black/red)



Unscrew bolt and take off holder.
Pull out distributor.
Installation:
Check seal on distributor shaft, replacing if necessary.



Installation:
Turn distributor rotor approx. 30° from mark opposite the normal running direction.

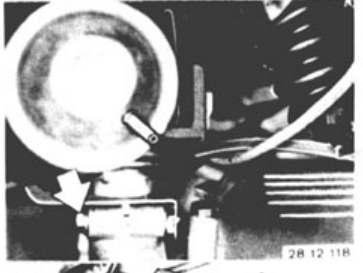


Turn distributor shaft slightly during installation so that the oil pump drive (arrow) engages.
Notch must be aligned with distributor rotor contact, repeat installation if necessary.
After finishing installation, check ignition timing – see 12 11 004 in repair manual for pertinent model series.

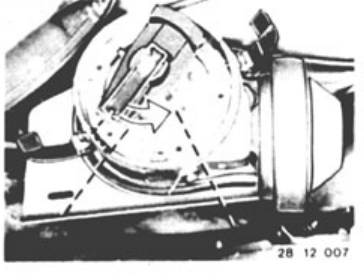
Distributors are supplied without the drive gear.
If the old drive gear is in good condition, it can be used again on the new distributor.
If the drive gear is defective, the complete gear set must be replaced – see 11 35 020.

Six Cylinder M 30 Engines:
Take off cap.
Loosen retainers and remove distributor cap.

Pull off pulse sensor plug and hoses.
1 Black hose for advance control
2 Black/white hose for retard control



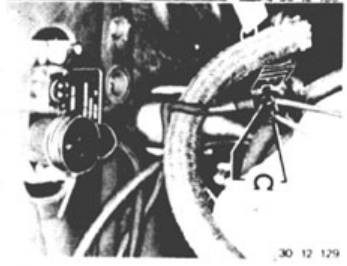
Set piston of cylinder no. 1 to TDC – mark on vibration damper.
Unscrew bolt and pull out distributor.



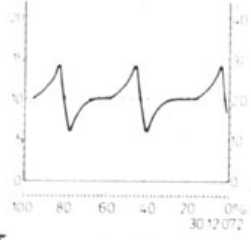
Installation:
Turn distributor shaft approx. 60° from mark in counterclockwise direction.
Insert distributor – mark must be aligned with distributor rotor contact.
Adjust ignition timing – see 12 11 004.

12 11 150 CHECKING PULSE SENSOR IN DISTRIBUTOR

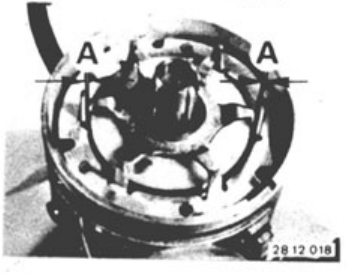
Cars with TCI-i Control Unit (Bosch):
Pull off plug.
Measure pulse sensor resistance* on pins (5 and 6) with BMW service test unit (M 06).



Cars with TCI-S Control Unit (Siemens / Telefunken):
Pull off pulse sensor plug and measure resistance*.

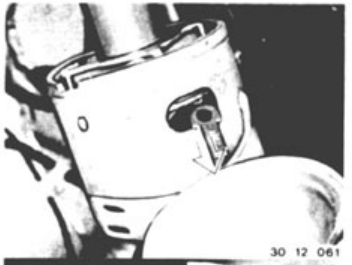


Afterwards connect oscilloscope (M 22/23) on same pins and crank engine with the starter – approx. 250 to 300 rpm.
Oscillograph should be as illustrated.
Pulse sensor voltage will then be 1.0 to 2.0 V (M 02).



Check pulse sensor distance*, correcting if necessary.
Press distributor shaft with finger in direction of pulse sensor tooth (stator) – there should be a gap of at least 0.2 mm (0.008"), loosen and center carrier plate if necessary.

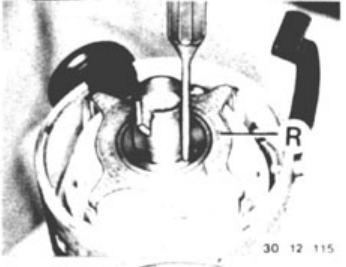
* See Specifications



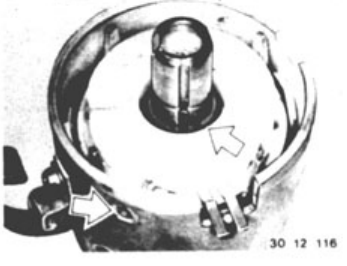
12 11 635 REPLACING PULSE SENSOR IN DISTRIBUTOR – Distributor Removed –

Four Cylinder M 10 Engines:
Unscrew vacuum control and let it hang down.
Installation:
Lubricate connecting rod in opening with grease.

Remove circlip.
Installation:
Check pulse sensor distance (A)*, correcting if necessary.

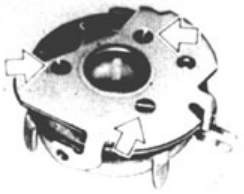


Knock down dowel pin with an impact manidrel and take off pulse sensor gear (rotor).



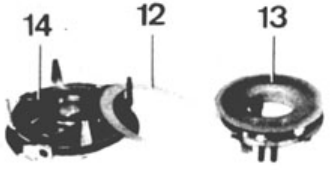
Remove circlip.
Remove plug receptacle and mounting screws.

* See Specifications



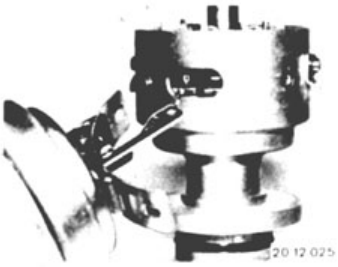
30 12 117

Unscrew pulse sensor on carrier plate.
Installation:
Check arrangement of connections on carrier plate (see figure).



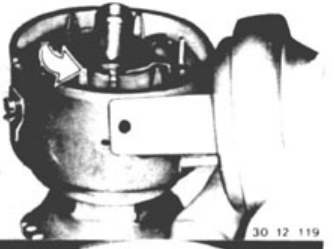
320 12 047

Arrangement:
12 Insulator
13 Pulse sensor
14 Carrier plate
After finishing installation, adjust ignition timing – see 12 11 004.



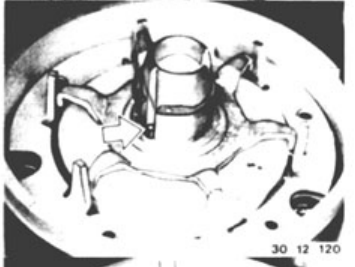
320 12 025

Six Cylinder M 20/M 30 Engines:
Remove distributor – see 12 11 060.
Unscrew vacuum control and let it hang down.



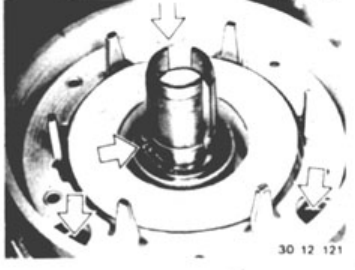
30 12 119

Installation:
Lubricate connecting rod in opening with grease. Turn carrier plate (stator) counterclockwise all the way and attach connecting rod from below at an angle.



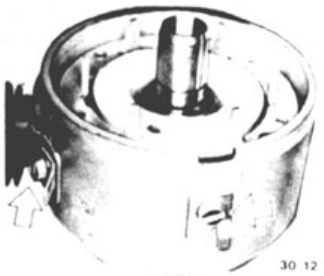
30 12 120

Remove circlip.
Knock down dowel pin with an impact mandrel and take off pulse sensor gear (rotor).



30 12 121

Unscrew carrier plate screws.
Remove circlip.

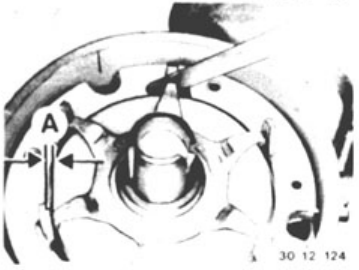


30 12 122

Disconnect plug receptacle and unscrew screws.
Remove carrier plate with pulse sensor.

30 12 123

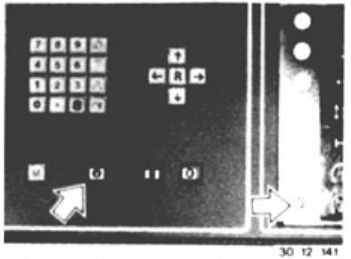
Unscrew pulse sensor on carrier plate.
Installation:
Check arrangement of connections on carrier plate (see figure).



30 12 124

Installation:
After installation, adjust pulse sensor distance (A)*.
Press distributor shaft with finger in radial direction – gap between pulse sensor spider and stator should be at least 0.2 mm (0.008").
If necessary, loosen and center carrier plate.

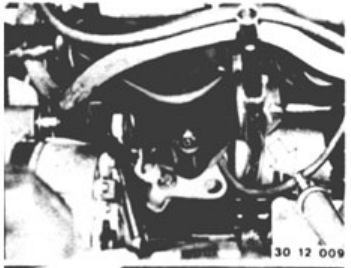
* See Specifications



30 12 141

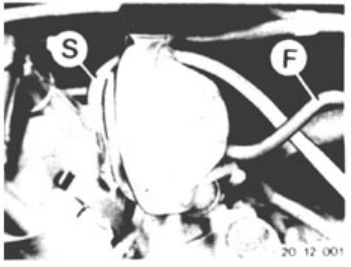
12 11 . . . CHECKING VACUUM CONTROL

Connect BMW service test unit or BMW digital tester and perform engine test (P 08)*.
Vacuum supply and restriction are by way of the vacuum pump and orifice valve.



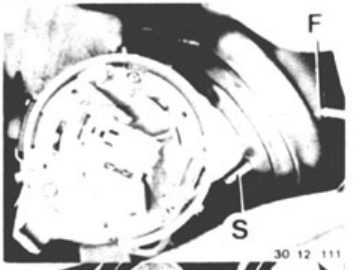
30 12 009

Models with Pressure Converter or Solenoid Valve in Front of Vacuum Control:
Connect vacuum supply hose direct on vacuum control.



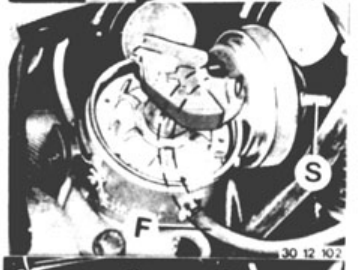
20 12 001

Four Cylinder M 10 Engines:
Pull off retard control hose (S) when checking "advance control" or vice versa when checking "retard control".
F = Advance control hose (black)
S = Retard control hose (black/white)
Accelerate engine to test speed* and compare test values* against nominal values* with specified vacuum*.



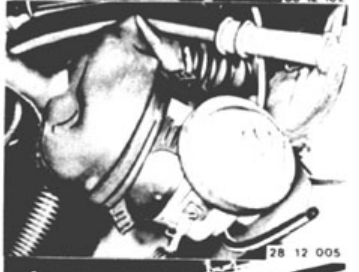
30 12 111

Six Cylinder M 20 Engines:
Pull off retard control hose (S) when checking "advance control" or vice versa when checking "retard control".
F = Hose for advance control (black)
S = Hose for retard control (black/white)
Connection (S) for retard control is not used in cars with automatic transmission.



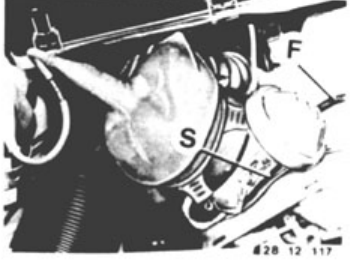
30 12 102

Important!
Vacuum control with connector diameter of 4 mm or 8 mm:
F = Advance control (4 mm dia.)
S = Retard control (8 mm dia.)



28 12 005

Six Cylinder M 30 Engines:
Connect BMW service test unit or BMW digital tester and perform engine test (P 08)*.
Accelerate engine to test speed* and compare test values* against nominal values* with specified vacuum*.



28 12 117

Pull off retard control hose (S) when checking "advance control" or vice versa when checking "retard control",
F = Hose for advance control (black)
S = Hose for retard control (black/white)

* See Nominal Value Microfiche

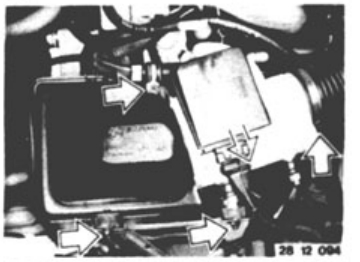
* See Nominal Value Microfiche

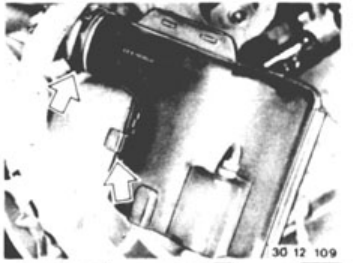
12 11 209 CHECKING DISTRIBUTOR CAP. IGNITION LEADS AND IGNITION LEAD PLUGS

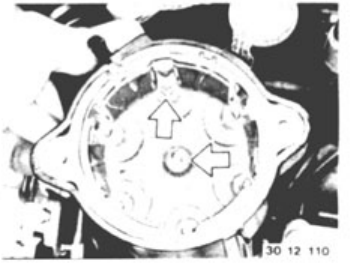
Four Cylinder M 10 Engines:
Disconnect retaining strap.
Pull off ground wire on distributor.
Take off protective cap.

Installation:
Engage clips correctly.
Connect retaining strap.

Take off distributor cap.
Check inside and outside of distributor cap for cracks and traces of burning.
Pull off shielded plugs on distributor cap and ignition coil and check contact (oxidation, dirt).
Check resistance* from distributor contact to spark plug connector or shielded connector of ignition coil.
Bend ignition lead in area of spark plug connector in a tight radius and check for cracks, replacing all leads if necessary.







Six Cylinder M 20 B 20 / B 23 Engines:
Remove air cleaner with air flow sensor.

Open both retainers for distributor cap.
Pull off ground wire and remove cap.
Check protective cap (installation, sealing sleeve).

Check inside and outside of distributor cap for cracks and traces of burning.
Pull off shielded plugs on distributor cap and ignition lead and check contact (oxidation, dirt).
Check resistance* from distributor contact to spark plug connector or shielded connector of ignition coil.
Bend ignition lead in area of spark plug connector in a tight radius and check for cracks, replacing all leads if necessary.

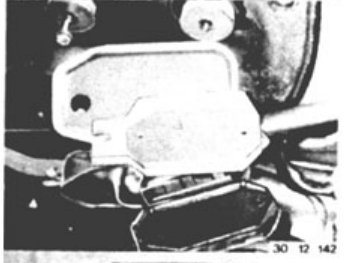
* See Specifications

* See Specifications

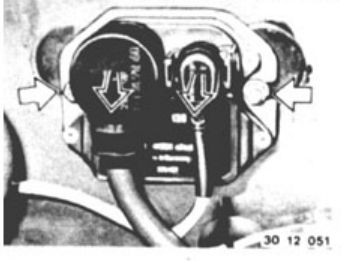
12 14 010 REMOVING AND INSTALLING/ REPLACING CONTROL UNIT FOR TCIi

Important!
Instructions for working on ignition systems – see page 12 - 0.

TCIi Control Unit (Bosch):
Take off protective cap.
Unlock locking wire and pull off plug.
Unscrew bolts.

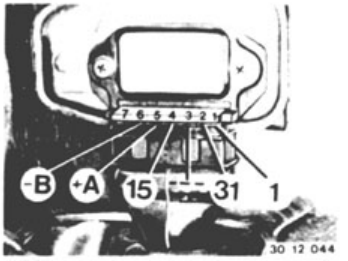


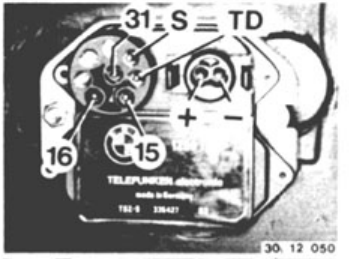
Installation:
Clean cooler, smoothing with sandpaper if necessary to guarantee good heat transition.
Also coat back with Curil K 2** before installing control unit.
Check and, if necessary, correct ignition timing* after installation.

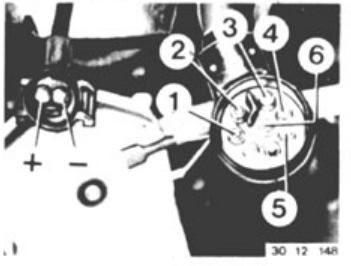


TCIi/S Control Unit (Siemens/Telefunken):
Pull off connecting plug.
Unscrew nuts.
Installation:
Check and, if necessary, correct ignition timing* after installation.

* See Nominal Value Microfiche
** Source: HWB







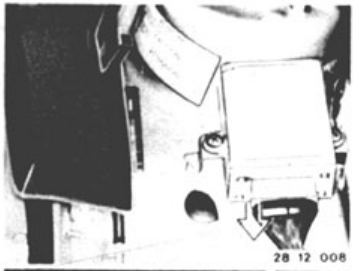
CONNECTING PLAN

TCIi Control Unit (Bosch):

No.	Terminal	Description
1	1	To ignition coil
2	31	Ground
3	–––	Shielding
4	15	Power supply
5/6	A+/B–	Pulse sensor

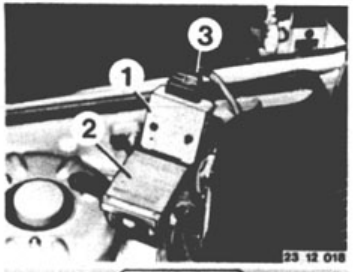
TCIi/S Control Unit (Siemens/Telefunken):

No.	Terminal	Description
1	–	
2	1/16	To ignition coil
3	15	Power supply
4	TD	– to fuel pump relay – to L-Jetr. control unit – to tachometer
5	S	To starter term. 50
6	31	Ground
	+/–	Pulse sensor

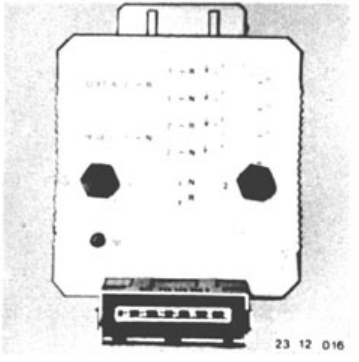


12 14 . . . **CHECKING CONTROL UNIT FOR IGNITION CONTROL (TCI-R)**

Take off cover and pull off plug (as for TCI control unit).



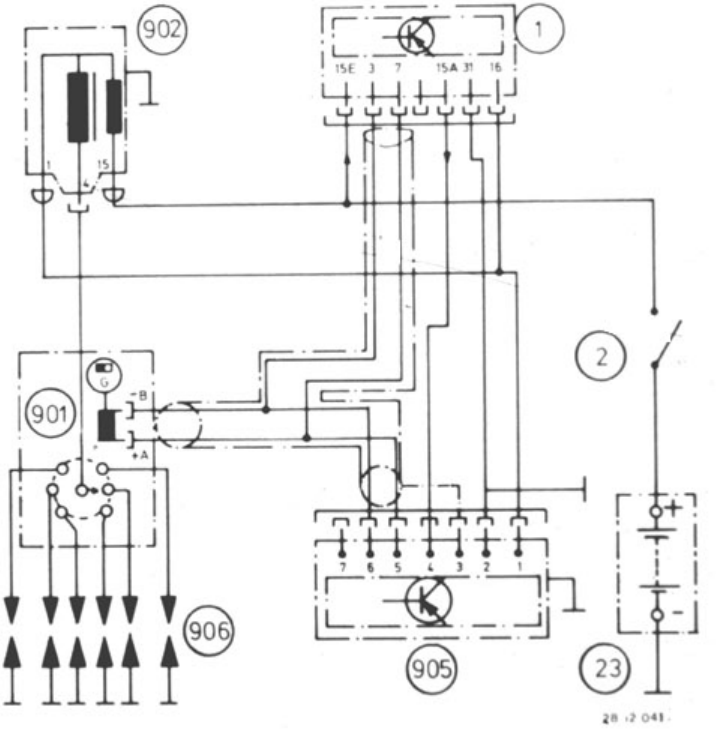
Connect ignition timing reset simulator 12 1 450 on control unit (TCI-R).
Connect BMW service tester or BMW digital tester.



Switch 1 positioned at N – otherwise no engine running.
Switch 2 positioned at R.
Start engine and run to operating temperature.
Increase engine speed slowly to 5,000 rpm.
Ignition timing is reduced* from about 3,500 rpm on.
A difference of approx. 3° on crankshaft will be displayed by turning switch 2 from R to N.

Connecting Plan for TCI System in M 30 B 28 Engines with Control Unit for Ignition Control (TCI-R)

1 Control unit for ignition control (TCI-R)
2 Ignition switch
23 Battery
901 Distributor
902 Ignition coil
905 Control unit for TCI
906 Spark plugs



* See Nominal Value Microfiche

INSTRUCTIONS FOR WORKING ON ENGINE ELECTRIC AND IGNITION SYSTEMS

- Always disconnect battery or interrupt power supply to ignition control unit and ignition coil when working on the electrical system – dangerous high voltage in engine and electrical system components (e.g. on the tachometer).

- Never start the engine after removing the distributor cap or disconnecting wires on ignition coil term. 4 – pull off plug on ignition control unit and also stop the delivery of fuel in cars with catalytic converter.

- Never disconnect battery or wires on alternator and starting motor while engine is running.

- Only use specified genuine BMW components.

- Never connect a shielded capacitor or test lamp on term. 1 of the ignition coil.

- Never connect wire of ignition coil term. 1 on ground or B +. Consequently the ignition coil term. 1 must not be used to prevent starting when service installing a burglar alarm system.

- Pull off plug on control unit for TCI or fuel injection master relay (relay 2) for DME and stop fuel delivery in cars with catalytic converter, when checking compression.

- The secondary side (high voltage side) of the ignition system must be shielded with at least 4 l-ohms, whereby the original distributor rotor with 1 k-ohm shielded resistor must be installed. Do not use 5 k-ohm distributor rotors for the shielding of radio and/or communication equipment!

- Only work on the electrical system with the ignition turned on when the heating time control unit is disconnected, to prevent destruction of heater plugs.

SURVEY FOR TROUBLESHOOTING ENGINE ELECTRIC SYSTEM WITH DIGITAL MOTOR ELECTRONICS (DME)

See next page for information on application.
Testing Requirements:
Engine in perfect condition (timing, compression, carbon deposits, etc.).
Starting system in perfect condition (battery voltage, starter, ignition lock, etc.).
Perfect gasoline in tank (octane rating, leaded/unleaded etc.).
Connections, plugs and ground points as on wiring diagram.
See "Troubleshooting Fuel Injection" in Group 13 for other test positions.

1) Cold engine cannot be started (oil temp. below 20° C/68° F)
2) Engine can be started, but stalls again
3) Cold engine hard to start (oil temp. below 20° C/68° F)
4) Warm engine cannot be started
5) Warm engine hard to start
6) Erratic idling during warm-up phase
7) Idle speed not correct
8) Splashing in intake tank
9) Shaking while accelerating
10) Hesitation while accelerating
11) Hesitation during coasting
12) Misfiring with constant misfiring
13) Poor acceleration/final output
14) Fuel Consumption
15) Exhaust values (CO/HC) not correct

TEST POSITIONS TO TROUBLESHOOT DIGITAL MOTOR ELECTRONICS

Application Information:

This survey can be applied for troubleshooting and consequently finding sources of defect more quickly.

The points have been compiled on the basis of greatest probability, so that under certain circumstances it could be possible that additional tests would be necessary.

Testing instructions refer to the BMW SERVICE TEST, e.g. engine test/test step 05 (P 05) or a multimeter function (M). See operating instructions for connections.

Test 1 – SPEED AND REFERENCE MARK SENSORS

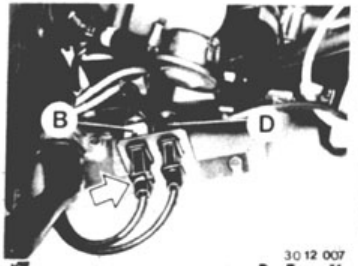
Check wires for tight fit and damage.
Check connections and arrangement of plug connections.
Reference mark sensor is marked with a ring – see 12 14 510/515.

↓

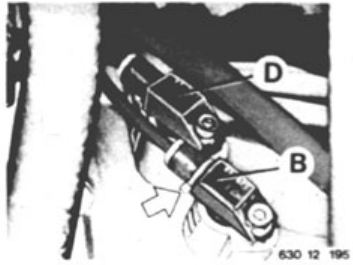
Turn engine with the starter. Check resistance (M 06) and oscillograph (M 22/23) on disconnected plug with BMW service test unit, see 12 14 510.

↓

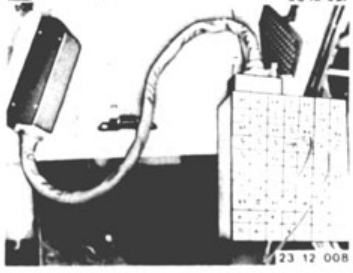
Check wires leading to DME control unit:
See engine electrical wiring diagram for routing and terminal designations. Pull off plug on control unit and connect universal adapter** (35 pins).
Measure resistance and insulation (M 06) of wires on specified pins.



30 12 007



630 12 195

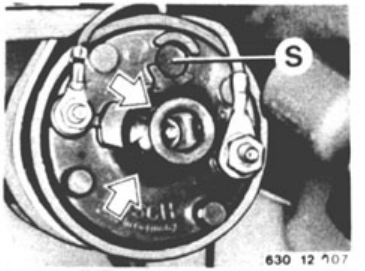


23 12 008

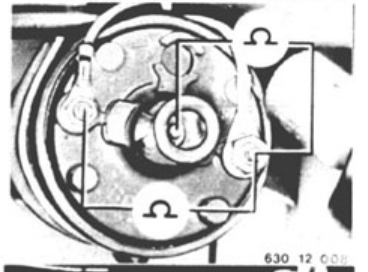
* See Specifications
** Source: HWB

Test 2 - IGNITION COIL

Check code number* of ignition coil.
Check ignition coil for damage, whether plug (S) is installed and contact of electric lead connections.



Check resistance* (M 06) and inductivity* (M 07) of primary and secondary coils - also refer to 12 13 009.



Test 3 - SPARK PLUGS

Check spark plugs for tight fit (leakage).
Check insulators for surface current leakage.
Check spark plug type* and electrode gap*.

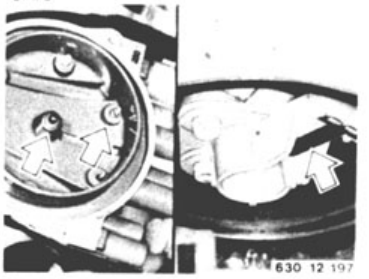
* See Specifications

Test 4 – HIGH VOLTAGE DISTRIBUTOR

Check distributor cap and rotor for correct fit, damage and hairline cracks. Check wire connections for good contact – see 12 11 091 / 111.

Check resistance* (M 06) from distributor peak to corresponding contact in distributor cap.
Resistance must be approximately 0 ohm.

Check resistance* (M 06) of distributor rotor.



Test 5 – IGNITION LEADS AND CONNECTORS

Check spark plug connectors and shielded connectors for damage, tightness and good contact.
Bend ignition leads in a tight radius and check for cracks.

Check resistance* (M 06) of spark plug connectors, ignition leads and connectors.

* See Specifications

Test 6: DME Control Unit and Power Supply, Ignition Timing and Control

Check code* and manufacturing date on DME control unit – see Group 13.

↓

Check power supply**:
Pull plug off of control unit and connect on universal adapter* (35 pins).
Turn on ignition and check voltage on pins**, e.g. on conn. 17 (–) and 35 (+).

→ Pull off relay 2 and bridge term. 87 and 30. This supplies power to control unit.
Check activation** for relay 2:
Turn on ignition.
Term. 85 (–) and 86 (+) should have power (approx. 12 V).

↓

Reconnect control unit and start engine.

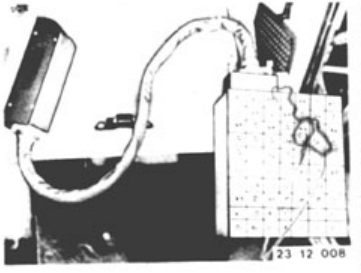
→ Pull off plug on DME control unit.
Connect universal adapter* (35 pins) and perform periphery test.
Control units before 12/86 may not be installed in cars after 1986.

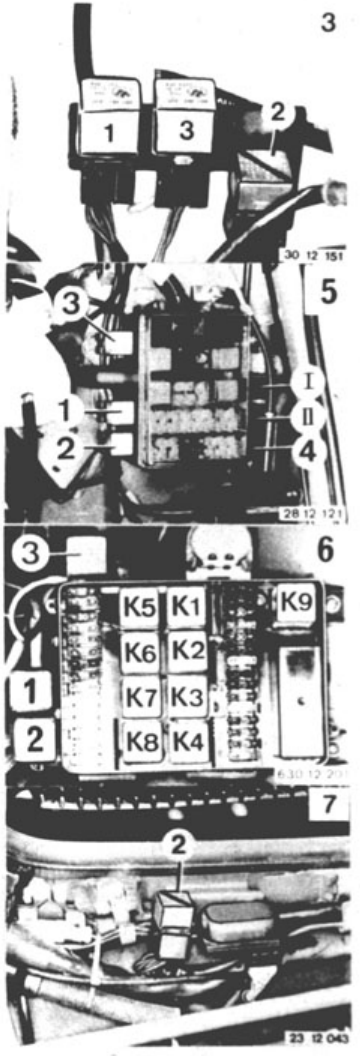
↓

Check ignition timing** and ignition control** (P 06/07).

↓

Not okay. → Replace DME control unit.





* Source of Supply: HWB
** See Nominal Value Microfiche
* See Specifications
** See Engine Electric Wiring Diagram

Test 12 – KNOCK CONTROL (Only BMW 745 i since 5.83)

a) Checking Power Supply**:

Pull off plug on control unit.
Connect 25-pin universal adapter*.
Turn on ignition.
Check voltage (approx. 12 V) on pins 12 (–) and 25 (+).
Connection 17 should have voltage (approx. 12 V) while starting (term. 50).

→ Pull off relay 2 and bridge terminals 87 and 30.
This will supply power to the control unit.
Check activation** for relay 2:
Turn on ignition.
Term. 85 (–) and 86 (+) should have voltage (approx. 12 V).

b) Checking Cylinder Identifying Pulse Sensor:

Pull off plug on control unit.
Connect 25-pin universal adapter*.
Measure resistance (0.8 to 1.1 ohms) between pins 18 and 19, replacing sensor if necessary.

→ Check wire** and plug connection for sensor.

c) Checking Knock Sensor:

Pull off plug on control unit.
Connect 25-pin universal adapter.
Measure resistance (280 to 310 k-ohms) each time between pins 9 and 10 (sensor 1) as well as 6 and 10 (sensor 2).

→ Check wires** and plug connections for sensors.

d) Throttle Potentiometer – See Group 13:

Troubleshooting Fuel Injection.

* Source: HWB
** See engine wiring diagram

Test 13 – TANK VENT

Refer to repair manual of pertinent model series for arrangement of wires.

Check flow in lines from fuel tank to expansion tank.
Check flow in vent line from expansion tank to outside discharging. → Repair connections; replace bent or crushed lines.

↓

Check rollover valve in expansion tank. → Replace expansion tank.

Test 14 – CHARGING PRESSURE CONTROL (Only BMW 745 i since 5.83)

a) Checking Electric Switching Valve for Charging Pressure Control

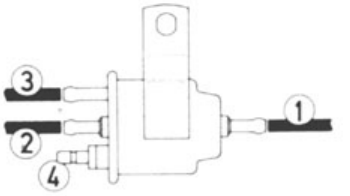
Pull off plug on switching valve (4) – there must be power flow between connections 2 and 3.
If battery voltage is supplied to the switching valve via a test lead, there must be power flow from connection 1 to 2 and no power flow between connections 2 and 3 – replace switching valve if necessary.

↓

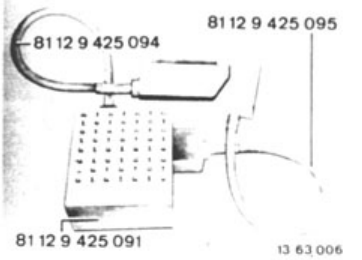
The switching valve is supplied with electric power by turning on the ignition (15 u and term. 10 engine plug).
Ground is only activated while operating car via the knock control unit (with activated knock control).

↓

Pull off plug on knock control unit.
Connect 25-pin universal adapter*.
Check wire** on pin 2 to switching valve.



2313 020



13 63 006

* Source: HWB
** See Engien Wiring Diagram

Test 15 – FUEL SUPPLY

Check fuel feed to electric fuel pump. → Check filter screen in fuel intake – also refer to Group 16.

↓

Check electric fuel pump, fuel lines, pressure regulator and fuel pressure – refer to "Troubleshooting Fuel Injection" in Gr. 13.

Test 16 – INTAKE SYSTEM

Check intake manifold pipes and air cleaner for tight connections and damage.
Check tightness of connections and bolts.
Check for leaks.
Replace a contaminated air filter cartridge.

Test 18 – EXHAUST SYSTEM

Check exhaust system for damage, tight fit and leaks.

Test 19 – CRANKCASE VENT

Check crankcase vent and oil dipstick for tight fit and leaks.

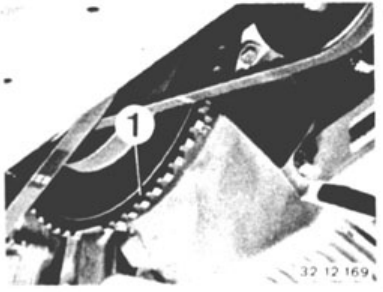
Test 20 – COOLING SYSTEM

Check level and grade** of coolant, filling and bleeding cooling system if necessary – also refer to Group 17.

** See Service Information of Gr. 00

TROUBLESHOOTING ENGINE ELECTRIC SYSTEM AND DME

Accomplished with a BMW Diagnosis Tester since introduction of M 1.1.



Can be recognized on the increment wheel (1) for sender-type Motronic.

Digital Motor Electronics (DME) M 1.7 / Four Cylinder M 42 Engines

New in Comparison with Old DME Control Units:

- 88-pin plug
- Stationary ignition distribution
- Camshaft sender
- Throttle valve potentiometer
- Air conditioner compressor shutoff

Description of DME 1.7 Operation:

DME permit precise control and regulation of fuel injection and ignition even under variable operating conditions. It works additionally in conjunction with other systems, namely

- burglar alarm,
- instrument cluster and
- on-board computer,

which can influence the entire engine timing depending on requirements.

DME performs the following operations, which will be described in detail later.

- Fuel injection timing
- Ignition timing
- Ignition distribution
- Cold start control
- Adaptive idle speed regulation
- Adaptive oxygen sensor regulation
- Adaptive tank venting
- Accelerating enrichment
- Dynamic coasting shutoff
- Catalytic converter protection
- Anti-knock
- Emergency running
- Family curve switchover with EH transmission
- Relay controls
- Self-diagnosis with fault memory

Components Delivering Input Signals to DME Control Unit:

- Pulse sender (speed/position)
- Pulse sender (cylinder identification) camshaft sender
- Air flow sender
- Oxygen sensor
- Idle speed CO potentiometer (without catalytic converter)
- Throttle valve potentiometer
- Temperature sensor (intake air)
- Temperature sensor (engine)
- Road speed sender
- Burglar alarm
- Air conditioner switch
- Air conditioner compressor
- Battery
- Terminal 15
- Programming voltage (version coding)

Outputs on DME Control Unit Wired via Final Stages to Deliver Signals to Following Components:

- Fuel injectors (cylinders 1 + 3)
- Fuel injectors (cylinders 2 + 4)
- Ignition coil 1
- Ignition coil 2
- Ignition coil 3
- Ignition coil 4
- Idle speed control
- Air flow sensor
- Throttle valve potentiometer
- Tank venting valve
- Master relay (control unit power supply)
- Fuel pump relay
- Oxygen sensor heating relay
- Fault lamp (only USA)
- Economy control (instrument cluster)
- Instrument cluster (TD and ti signals)

IDLE SPEED CONTROL, SPEED LIMIT, COLD START CONTROL

Refer to E 34 diagnosis test plan in chapter 1210 DME M 1.3.

TYPES OF INJECTION

Each group of fuel injectors (2 + 4 or 1 + 3) is activated by a final stage (current amplifier). It is therefore possible to divide the injection cycle into groups of cylinders. This guarantees limited engine operation even when one group fails.

Semi-sequential injection:

There is injection in one group of cylinders (2 + 4 or 1 + 3) only once every 720 crankshaft degrees as from an engine speed of 600 rpm. This timing can function only when the DME control unit receives a signal from the camshaft sender (on camshaft sprocket of exhaust valves). Timing remains in semi-sequential injection if the signal is received later.

Parallel injection:

Parallel injection means simultaneous activation of all fuel injectors for each crankshaft revolution and takes place only when the camshaft sender has not put out any signals since starting the engine.
If a signal is put out later, the system switches over to semi-sequential injection as soon as an engine speed of 2500 rpm is exceeded.

IGNITION

Stationary Ignition Distribution:

Each cylinder has its own ignition coil. In this manner the system of rotating ignition distribution is omitted. DME activates each ignition coil separately.

Double Ignition:

Double ignition means activation of the spark plugs for each crankshaft revolution and takes place only when the camshaft sender does not put out signals. Switching over from normal to double ignition, or vice versa, takes place immediately in contradiction to fuel injection.

ANTI-KNOCK FUNCTION

The ignition timing is retarded depending on intake air and engine temperature, in order to prevent self-ignition of the fuel/air mixture in the combustion chamber (knocking).

CATALYTIC CONVERTER PROTECTION

There is danger of overheating the catalytic converter when the catalytic converter protection is active over a long period of time. For this reason the fuel / air mixture is enriched to reduce the exhaust gas temperature.

THROTTLE VALVE POTENTIOMETER

A throttle valve potentiometer is installed instead of a throttle valve switch with idle and full load contacts. This potentiometer must no longer be adjusted, since DME learns the idle speed ignition timing (idle speed switching point) on its own. DME adds a determined value to the learned value. This value must go from the potentiometer to DME in order to be processed as a full load signal in DME.

AIR CONDITIONER COMPRESSOR SHUTOFF

In order to have the entire engine power for drive while moving off, the air conditioner compressor is switched off for up to 7 seconds at road speeds of < 8 km/h (5 mph) and simultaneous full load state.

TANK VENTING FOR MODELS WITH CATALYTIC CONVERTER

OXYGEN SENSOR CONTROL FOR MODELS WITH CATALYTIC CONVERTER

DRIVE AWAY PREVENTION

SELF-DIAGNOSIS

Refer to E 34 diagnosis test plan in chapter 1210 DME M 1.3 for information about the BMW diagnosing system.

ABBREVIATIONS

AG	Automatic transmission
DK	Throttle valve
DME	Digital motor electronics
DWA	Burglar alarm
EH	Electronic / hydraulic
EGS	Electronic transmission control
EKP	Electric fuel pump
EV	Fuel injector
HG	Manual transmission
KD	Kickdown
KW	Crankshaft
LL	Idle speed
LLS	Idle speed control
LMM	Air flow sensor
MF	Micrtofiche
MV	Solenoid
NW	Camshaft
RxD	Dagnosing sensing line
TD	Speed signal once each ignition
TE	Tank venting
ti	Injection time (duration)
TL	Partial load
tL	Load signal
TR	Speed signal once each revolution
TxD	Diagnosing data line
SG	Control unit
U-Batt	Battery voltage
U-Vers	Power supply
VL	Full load

PIN CONNECTIONS

Connections of 88 Pin Plug on DME Control Unit

Engine is running at idle speed, if there is no other testing instruction.

Pin	Type	Description / Function	Type of Signal	Testing Information

A = Output
M = Ground

TROUBLESHOOTING

Note:
Always conform with safety and accident prevention regulations for all tests and work on the engine electric and electronic system.

Caution!
Dangerous high tension on primary and secondary circuits of ignition.

The battery should not be disconnected whenever possible, since otherwise this would cancel the faults stored in memories of all control units.

Disconnect control units on wire harness only with the ignition turned off.

Test electric leads only with disconnected control unit or component plugs.

Testing Aids:

Wiring diagrams are filed in the "General Electric System - 3 Series" binder.

Presentation of a memory-stored fault on screen.

Location of Fault:
The number of a fault refers to the pin connection on the control unit. A fault could be on a component, concerned electric leads or in the control unit.

Type of Fault:
Shorts, breaks, exceeding of ranges or implausible functions are displayed.

Frequency:
Information whether or not (brief fault) a fault exists at the moment of time. Also display of how often the fault was recognized. If the fault no longer exists, the number of times the engine had been started since the last recognition of the fault is displayed.

Recognition During:
Additional fault information about the operating conditions during recognition of a fault.

List of Faults:

Faults stored in memories can be displayed on the tester by selecting 900 (Fault Memory).

No faults stored in memories.

Function disturbed: engine operation not possible.

Troubleshooting:

Requirements:
- Starting system okay (battery charged, ignition switch and starter okay, etc.).
- Ground connections on battery, engine and body okay.
- Specified gasoline in tank.
- Engine in perfect operating condition (timing, compression, etc.).

a) Check power supply for DME control unit according to wiring diagram.

b) Measure input signals.
- Speed signal from inductive pulse sender 200 at starting speed.
- Air flow sensor signals 200.

c) Measure output signals.
- Activation of fuel pump relay according to wiring diagram.
- Ignition final stage with help of ENGINE TEST test step 09.
- Fuel injectors with 300.

d) Test fuel pressure.
Technical data – see component testing chapter.

FAULT 1

900 fault memory: 1 electric fuel pump relay

Explanation:
This fault is stored when a short occurs on relay 1 (electric fuel pump) or in control lead to DME control unit pin 1. This fault is recognized only when at least one additional final stage is faulty.

Troubleshooting: as displayed on screen.

FAULT 3

900 fault memory: 3 fuel injectors cyl. 1 + 3

Explanation:
This fault is stored when shorts or breaks occur on fuel injectors for cyl. 1 + 3 or their power supply leads.

Note: The entire fuel injector group is stopped with a short on one fuel injector or its power supply lead. Two cylinders remain in operation.

Troubleshooting: as displayed on screen.

FAULT 8

900 fault memory: 8 fault lamp

Explanation: Only applicable for US models.
This fault is stored when shorts occur on fault lamp or its power supply lead.

Troubleshooting: as displayed on screen.

FAULT 12

900 fault memory: 12 throttle valve potentiometer

Explanation: This fault is stored when shorts or breaks occur on potentiometer or its power supply leads.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 16

900 fault memory: 16 camshaft sender

Explanation: This fault is stored when faulty signals from camshaft sender occurr at speed of 2500 rpm.

Troubleshooting: as displayed on screen.

FAULT 29

900 fault memory: 29 idle speed control

Explanation: This fault is stored when a short occurs on lead to pin 29.

Troubleshooting: as displayed on screen.

FAULT 32

900 fault memory: 32 fuel injectors - cyl. 2 + 4

Explanation: see Fault 36.

FAULT 36

900 fault memory: 36 tank venting valve

Explanation: This fault is stored when a short or break occurs on tank venting valve or its power supply lead.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 37

900 fault memory: 37 oxygen sensor heating relay

Explanation: Fault is stored when a short or break on relay or power supply lead from DME control unit pin 37 is recognized.

Troubleshooting: as displayed on screen.

FAULT 41

900 fault memory: 41 air flow sensor

Explanation: This fault is stored when shorts or breaks occur on air flow sensor or its leads (power supply or signal lead).
Also recognition when Up/Uv value of LMM is no longer in the normal operating range of 0.02 to 0.95.
DME control unit then works with determined replacement values, load signal tL = 3.5 ms (partial load) and 6.0 ms (full load) and ignition timing = 20 crankshaft degrees before TDC.

Troubleshooting: as displayed on screen.
Test air flow sensor with status call 200. Up/Uv value shows the relation betw. potentiometer voltage (slider) and power supply voltage (5 V) in air flow sensor.
Specifications – see component testing.

FAULT 54

900 fault memory: 54 control unit power supply

Explanation: This fault is stored when power supply exceeds 16 V. A drop below 9 V is recognized 3 minutes after starting at the earliest.

Possible Fault Causes:
- Contact resistance on lead connections
- Incorrect drive belt tightness
- Voltage regulator or alternator faulty

Troubleshooting: as displayed on screen.

FAULT 70

900 fault memory: 70 oxygen sensor

Explanation: This fault is stored when a short or break occurs on oxygen sensor or its leads, or when no oxygen senor is installed (cars prepared for catalytic converter). It requires an engine temperature of 70° C (158° F) and a load signal of 4.5 ms for 5 seconds.

Troubleshooting: as displayed on screen.
Test values for oxygen sensor – see component testing.

FAULT 73

900 fault memory: 73 road speed signal

Explanation: This fault is stored by DME when following conditions are fulfilled simultaneously.

Engine speed	4500 rpm
Load signal	4.0 ms
Road speed signal	3 to 5 km/h (2 to 3 mph)

Troubleshooting: as displayed on screen.

FAULT 76

900 fault memory: 76 idle speed CO potentiometer

Explanation: Valid only for cars without catalytic converter. This fault is stored when shorts or breaks occur on potentiometer or its leads. Replacement value of 1.99 V is used.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 77

900 fault memory: 77 intake air temperature sensor

Explanation: This fault is stored when shorts or breaks occur on temperature sensor or its leads. Recognition of a break requires 3 minutes time after starting and idle speed for at least 30 seconds. Replacement value of 50° C (122° F) is used after recognition of fault.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 78

900 fault memory: 78 engine temperature sensor

Explanation: This fault is stored when shorts or breaks occur on temperature sensor or its leads.
Intake air temperature is used as a replacement value in case of fault, but only for the first 3 minutes after starting when air temperature is < 20° C (68° F). A replacement value of 80° C (176° F) is ready for use in other conditions.

Troubleshooting: as displayed on screen. Test values – see component testing.

FAULT 85

900 fault memory: 85 air conditioner compressor

Explanation: This fault is stored when control unit receives "compressor in operation" (battery voltage on pin 85) and "A/C switch not operated" (0 V on pin 86) signals simultaneously. In this case either pin 86 has a break or there is a short between battery voltage and pin 85.

Troubleshooting: as displayed on screen.

FAULT 100

900 fault memory: 100 final stage

Explanation: This fault is stored when a loose contact occurs on a final stage output. If another final stage fault (Fault Codes 1, 3, 18, 29, 32, 36 or 37) occurs additionally, it can be assumed that fault 100 is identical with one of these faults.

FAULT 200

900 fault memory: 200 DME control unit

Explanation: This fault is stored when the internal self-test finds a fault in the memory modules.

Possible causes: programming fault or disturbed program run-off in DME control unit.

Correction: Test drive car after cancelling the fault memory. DME control unit must be replaced if the fault occurs again.

FAULT 201

900 fault memory: 201 oxygen sensor control

Explanation: This fault is stored in case of excessive deviation in the fuel/air mixture (excessively rich or lean mixture for longer than 8 seconds). It requires an oxygen sensor ready for operation.

Possible Causes of Fault:
- Wrong fuel pressure
- Faulty or carbonized fuel injectors
- Faulty engine temperature sensor
- Wrong air in intake
- Faulty tank venting system

Troubleshooting: as displayed on screen. Test values – see component testing and technical data microfiche.

COMPONENT TESTING

Note:
Always conform with safety and accident prevention regulations for all tests and work on the engine electric and electronic system.

Caution!
Dangerous high tension on primary and secondary circuits of ignition.

Important!
The battery should not be disconnected whenever possible, since otherwise this would cancel the faults stored in memories of all control units.

Disconnect control units on wire harness only with the ignition turned off.

Test electric leads only with disconnected control unit or component plugs.

Testing Aids:

Wiring diagrams are filed in the "General Electric System - 3 Series" binder.

Only use specified test leads, terminals and test points.

Test values for component testing are listed in the appendix. Refer to technical data microfiche for other specifications.

Removal and installation are described in the repair manual.

SURVEY OF FAULT CODES AND COMPONENT TESTS

Component / Function	Brief Test Input	Fault Code in Memory
DME control unit	–	200
Ignition coils	–	–
Fuel pump relay (relay 1)	100	1
Throttle valve potentiometer	200	12
Tank venting valve	100, 300	36
Air flow sensor	200	41
Camshaft sender	100	16
Oxygen control	100	201
Fault lamp	–	8
Fuel injectors	300	3/32
Sensor heating relay	300	37
Oxygen sensor	100	70
Road speed signal	200	73
Kickdown prevention solenoid	–	48
Master relay (relay 2)	100	–
Power supply	200	54
A/C compressor	100	85
Intake air temperature sensor	200	77
Engine temperature sensor	200	78
Speed/position pulse sender	200	–
Ignition timing tap	100	64
Converter clutch	–	63

DME CONTROL UNIT

Function Test:
Different function blocks such as, for example, ignition, injection, oxygen control, etc. can only be tested when necessary input signals are receivede on the control unit first – see pin connections.

FUEL PUMP RELAY (DME Relay 1)

Function Test:
100 - electric fuel pump relay must switch on while starting or running engine (display: ON).

Possible Causes of Fault:
- **Lead to DME control unit pin 1 faulty**
- **Relay 1 or power supply faulty**
- **Power supply for DME control unit faulty**
- **No signals from speed/position pulse sender**
- **No ground potential put out on DME control unit pin 1 while starting and running engine, although above points are okay = control unit is faulty**

IDLE SPEED CONTROL (LLS)

Function Test:
300 - Idle speed control is activated with second cycle – plate on idle speed control must open and close fully.

Resistance Test:
Resistance of coil can be measured direct on the component.
See appendix for specifications.

TANK VENTING VALVE

Electric Function Test:
300 - Valve is activated with second cycle. Cycling can be felt with hand.

Leak Test:
Disconnect hoses on valve, connect vacuum supply from Service Tester on the 8 mm connection (note flow direction arrow). Regulate vacuum to 600 mbar and supply 12 V to valve.
Switch off vacuum pump – pressure drop must not exceed 50 mbar after 20 seconds.
In a state without electric current the valve is closed by a check valve to to intake pipe vacuum of 20 mbar.

Activating Phase Test:
100 - Valve is activated at idle speed (display: OFF) and therefore closed. Gradual opening can be observed as soon as oxygen control is active and the speed increased (display: OPEN).
The valve is still kept closed for 3 to 5 seconds after stopping the engine.

AIR FLOW SENSOR (LMM)

LMM Signal Test:
100 - Up/Uv value (Up = potentiometer voltage, Uv = power supply voltage 5 V) indicates the voltage relation resulting from the sensor plate position in LMM. At idle speed the value should be 0.2 to 0.3; at full load it rises to 0.9. A value of 0.02 is displayed when power supply or control lead has a break.

Power Supply Test:
5 V power is supplied to LMM from DME control unit pin 59 (+) and pin 14 (–) with the ignition ON. See wiring diagram for connections on LMM.

CAMSHAFT SENDER

Function Test:
100 - Full bank injection is switched over to semi-sequential injection and double ignition switched off as soon as the control unit receives camshaft sender signals. If the signal comes later, semi-sequential injection is maintained. Switching over from normal to double ignition, or vice versa, takes place immediately in contradiction to fuel injection.
Further testing with multimeter test 23/24. Connect oscilloscope on component plug and operate engine at idle speed. An alternating voltage curve with positive and negative half-waves should appear on the screen.

Resistance Test:
Resistance can be measured direct on the component plug. See appendix for specifications.

OXYGEN CONTROL

Function Test:
100 - Oxygen sensor at operating temperature is required for calling. Engine must be run 30 to 40 seconds before regulation cuts in.
Regulation can compensate wear-caused deviations in fuel/air mixing to a great extent and consequently hide other faults. If applicable, disconnect the oxygen sensor while troubleshooting the fuel/air mixture.

FAULT LAMP "CHECK ENGINE" (only USA)

Function Test:
Fault lamp receives 12 V power supply from control unit as soon as an exhaust relevant fault is detected. It lights up continuously after ignition is turned ON for controlling.

FUEL INJECTORS

Electric Function Test:
300 - Fuel injectors are activated with a frequency of 10 Hz. Pulse time is 1 ms to avoid the ejection of fuel. Activation can be felt with a hand. Pulses can be checked with a multimeter on the fuel injector plug.

Resistance Test:
Resistance of a fuel injector must be measured direct on the component. Only a complete fuel injector group (e.g. 2 injectors of four cyl. engine) can be measured on DME control unit plug. See appendix for specifications.

SENSOR HEATING RELAY

Function Test:
300 - This activation takes place in second cycles. Relay remains switched on in normal operation for so long, until high speeds or load occur.

Possible Causes of Fault:
- Lead to DME control unit pin 37 faulty
- Relay or power supply faulty

OXYGEN SENSOR

Function Test:
200 - Requirement for calling is oxygen sensor at operating temperature. The displayed voltage signal is tapped in steps and fluctuates between 0.02 and 0.85 V. A constant value of 0.45 V is displayed when the oxygen sensor is not working or lead to DME control unit has a break. This value is also displayed when no oxygen sensor is installed.

CONTROL MASTER RELAY (DME Relay 2)

Function Test:
100 - Master relay is activated on terminal 85 with ground potential after ignition is turned ON or engine runs (display: ON). Relay switches on and supplies rest of control unit with power.

Possible Causes of Fault:
- Lead to DME control unit pin 54 faulty
- Relay 2 or power supply faulty
- Power supply for DME control unit faulty
- Control unit faulty when ground potential is not put out on control unit pin 54, although above points are okay

CONTROL UNIT POWER SUPPLY

100 - Control unit has the voltage displayed at the moment. It should not be less than 10 V.

INTAKE AIR TEMPERATURE SENSOR (in LMM)

Function Test:
200 - Intake air temperature of engine at operating temperature is 50 to 70° C (122 to 158° F) – ambient air temperature 23 ± 5° C (73 ± 9° F).
A display below – 40° C (– 40° F) indicates a break in the temperature sensor or lead to the DME control unit.

Resistance Test:
Connect universal adapter. Measure resistance on connections 77 and 14. Or direct on air flow sensor pins 4 and 5. See appendix for specifications.

ENGINE TEMPERATURE SENSOR (Coolant)

Function Test:
200 - Displayed engine temperature should correspond with the coolant temperature. A value below – 40° C (– 40° F) indicates a break in the temperature sensor or lead to the DME control unit.

Resistance Test:
Connect universal adapter on engine wire harness. Measure resistance on connections 45 and 19. See appendix for specifications.

SPEED / POSITION PULSE SENDER

Function Test:
200 - Speed signals can be called at starting speed on from running engine. Further testing with multimeter test 23/24. Connect oscilloscope on component plug and crank the engine. An alternating voltage curve with positive and negative half-waves should appear on the screen.

Resistance Test:
Resistance can be measured direct on the component plug. See wiring diagram for connections. See appendix for specifications.

Possible Cause of Fault:
If lead, plug and resistance are okay, check distance of pulse sender to incremental wheel on the vibration damper – 0.15 to 1.5 mm (0.006 to 0.059"). Adjusted distance with adjustable holder: 1.0 ± 0.3 mm (0.039 ± 0.012").

THROTTLE VALVE POTENTIOMETER

Function Test:
200 - Operate throttle valve and observe the voltage value. Voltage values between 0.6 (idle speed) and 5.0 (full load) volts.

Resistance Test:
See appendix for specifications.

IGNITION COIL

See 12-212.

Status Call 100	Nominal State
101 Electric fuel pump relay	While starting or running engine = ON
116 Camshaft sender	After increasing speed once = ON
127 Master relay	While starting or running engine = ON
136 Tank venting valve	Idling = OFF or ON until timing begins
137 Oxygen sensor heating	With high speed and load = OFF
163 Converter clutch (only EGS)	Speed dependent in 3rd + 4th gear = ON
164 Ignition timing tap (only cars with manual transmission)	At idle speed = OFF, only for downshifts ON briefly
165 Range P/N (only automatics)	Selector lever in P or N = ON
171 Oxygen control	Engine running = ON, if oxygen sensor has operating temperature
181 Burglar alarm switch	Burglar alarm not activated = OFF
185 Compressor control	Compressor relay switched on = ON
186 Air conditioner switch	Switch operated and air volume control wheel not set to 0 = ON

Status Call 200	Nominal Values
212 Throttle valve potentiometer	0.6 V (idle) to 5.0 V (full load)
241 LMM Up/Uv relation [1]	0.2 to 0.3, break = 0.02
254 Control unit power supply	10 V
270 Oxygen sensor voltage (cat) [1]	0.02 to 0.85 V, with break or faulty oxygen sensor = 0.45 V
273 Road speed	Depending on road speed
276 CO potentiometer (no cat.)	Basic setting = 2.0 V
277 Intake air temperature	Depending on ambient temperature, approx. – 40° C (– 40° F) = break
278 Engine temperature	Depending on engine operation, approx. – 40° C (– 40° F) = break
225 Ign. timing in crankshaft degrees before TDC [1]	11 ± 3
274 Engine speed in rpm [1]	
Idle speed	850 ± 40
Shutoff speed	6500 ± 40
217 Inj. signal ti in ms [1] [2]	3.5 to 3.9
290 Load signal tL in ms [1]	1.3 to 1.6
CO volume % [1] [3]	0.7 to 0.5

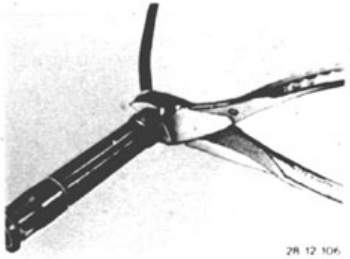
1) Oil temperature 60° C (140° F) or coolant temperature 80° C (176° F), no electric power consuming equipment switched on, at idle speed.

2) Valid with semi-sequential injection.

3) Measured ahead of the catalytic converter – engine test, test step 09.

M 42 TECHNICAL DATA
Resistance measured at 23 ± 5° C (73 ± 9° F)

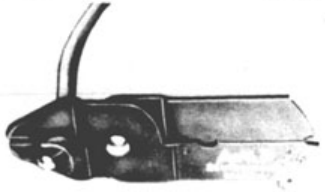
Idle speed control (one coil)	8 ± 2 ohms
Fuel injector	15 to 17 ohms
Fule injector group (2 injectors)	8 ± 0.5 ohms
Speed/position pulse sender	540 ± 60 ohms
Cylinder identifying pulse sender	1.15 to 1.41 k-ohms
Engine temperature sensor	
at 20 ± 3° C (68 ± 5° F) coolant temp.	2.3 to 2.7 k-ohms
at 80 ± 3° C (176 ± 5° F) coolant temp.	0.3 to 0.36 k-ohm
Intake air temperature sensor	
at 20 ± 3° C (68 ± 5° F) air temp.	2.2 to 2.7 k-ohms
at 50 ± 3° C (122 ± 5° F) air temp.	0.76 to 0.91 k-ohm
Tank venting valve	45 ± 20 ohms
Ignition coil	
primary coil	0.4 ± 0.1 ohm
secondary coil	not measurable
Throttle valve potentiometer	
idle speed position	4 ± 0.8 k-ohms
full load position	1 ± 0.2 k-ohm



28 12 106

12 12 072 REPLACING ONE SPARK PLUG CONNECTOR

Cut off ignition lead close to plug connector.



23 12 031

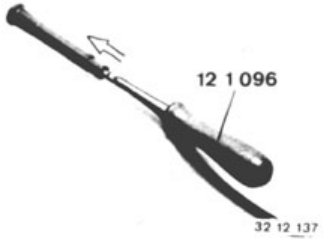
Strip ignition lead insulation by 6 mm (0.236") with a stripping pliers* (1.5 mm wire cross section size).

32 12 135

Install connection on ignition lead and squeeze tight on wire end first with pliers 12 1 080/081.

32 12 136

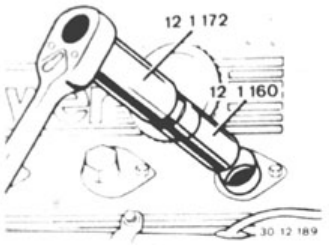
Position connection flush with pliers and squeeze on.



32 12 137

Place ignition lead in Special Tool 12 1 096 and slide into spark plug connector until connection is heard to engage.
If necessary, spray with lubricant 12 1 098.

* Source: HWB

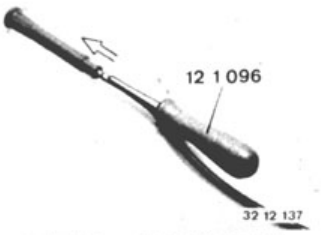


12 12 071 REPLACING ONE SPARK PLUG CONNECTOR (1987 Plant Shutdown On)

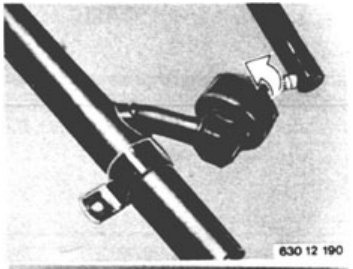
M 3 / M 5 / M 6 Models:
Unscrew ignition lead pipe.
Pull out spark plug connector.

Testing:
Measure shielded resistance*.

12 1 160 = special spark plug wrench.
12 1 172 = torque governor.

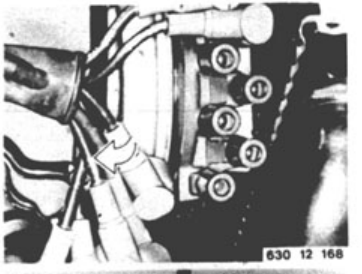


Place ignition lead in Special Tool 12 1 096 and push into spark plug connector until the connector is heard to engage.
Spray a lubricant** on Special Tool 12 1 096 if necessary.



Pull off rubber cap toward rear.
Unscrew spark plug connector.

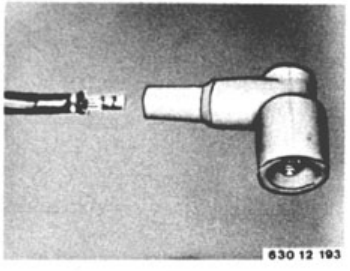
Installation:
Apply a thin coat of lubricant** to make installation of the rubber cap easier.



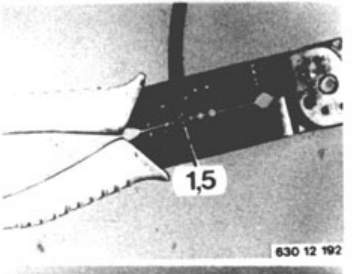
12 12 151 REPLACING SHIELDED PLUG AND IGNITION LEAD CONTACT (On Ignition Lead for Ignition Coil or Distributor)

M 3 / M 5 / M 6 Models:
Pull off shielded plug and unscrew on ignition lead.

Testing:
Measure shielded resistance*.

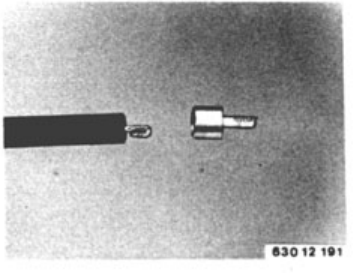


Replacing Connector (Screwed) for Ignition Lead:
Strip ignition lead about 12 mm (0.472") with a stripping pliers** after cutting off the connector.
Bend wires at length of 6 mm (0.236").



Strip ignition lead with a stripping pliers** after cutting off the old lead contact.

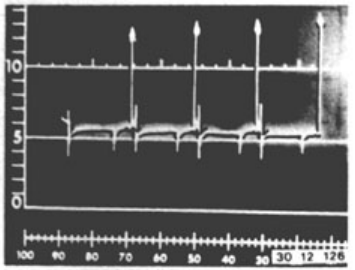
Position connector flush with the pliers and knock on.



Install new lead contact with ignition lead contact pliers**.
Perform tearing out test.
Apply a thin coat of lubricant** to make installation easier.
Screw shielded plug on the ignition lead.

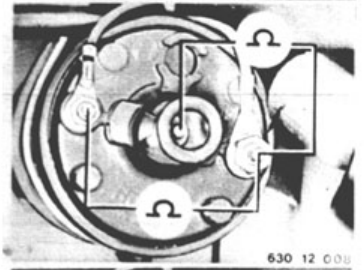
* See Specifications
** Source of Supply: HWB

* See Specifications
** Source of Supply: HWB

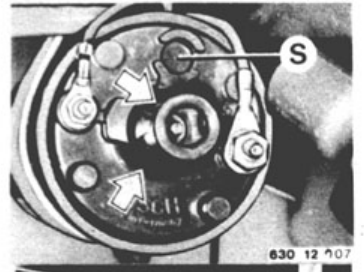


12 13 009 CHECKING IGNITION COIL

Connect BMW SERVICE TESTER.
Perform step 09 of engine test.
Observe oscilloscope - ignition voltage and ignition voltage deviation must conform with the nominal values.**
M 70:
Manual testing / not with test step 09 for cylinders 7 ... 12.



Multimeter Test (M 06):
Measure resistance* of primary coil (term. 1/15) and secondary coil (term. 15/4).



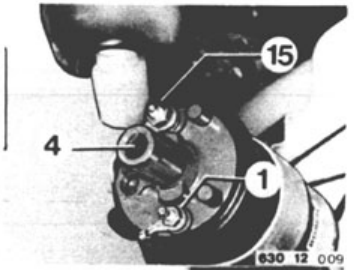
Check connection plate for hairline cracks and traces of burning.
Check whether plug (S) fits tight - if pressed out, replace ignition coil.

Multimeter Test
M 30 / 1988 Model
Same test as above.

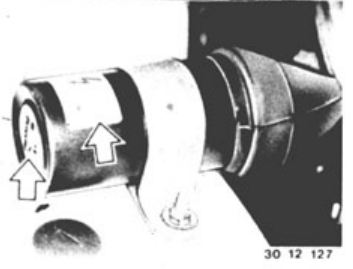
* See Specifications
** See Nominal Value Microfiche

12 13 011 REPLACING IGNITION COIL

Caution!
Always turn off the ignition before working on the ignition system - very dangerous high voltage.
Refer to instructions for working on ignition systems on page 12 - 0.

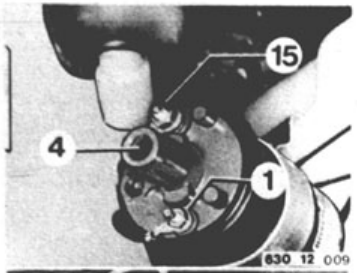


Pull off protective cap and ignition lead (term. 4).
Unscrew connections (terminals 1 and 15).
Unscrew holder and take off ignition coil.



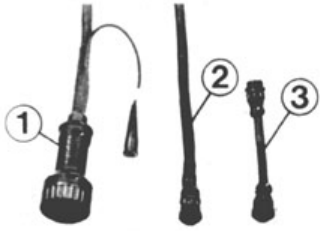
Installation:
Check new ignition coil for correct code number* and color code label*.

* See Specifications

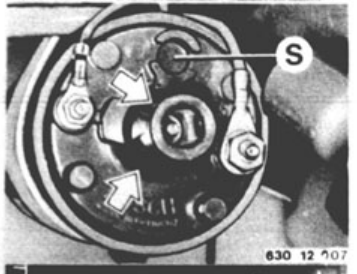


12 13 009 CHECKING IGNITION COIL

Multimeter Test (M 06):
Measure resistance of primary coil
- term. 1/15 = 0.5 ohm + 10 %
and of secondary coil
- term. 15/4 = 6 k-ohms + 10 %.

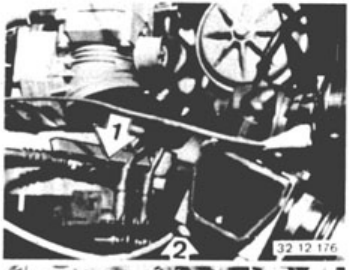


M 70:
Measure left cylinder bank 7 - 12 with adapter lead (3), HWB No. 81 12 9 428 906, and an universal diagnosing lead (2), HWB No. 81 12 9 408 013.
Note:
Take off left distributor protective cap.
Remove air flow sensor intake hose - only to connect the test leads.

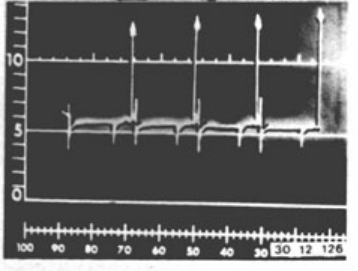


Check connection plate for hairlinf cracks and traces of burning.
Check plug (S) for tight fit - if pressed out, replace ignition coil.

T 109



Connections:
High tension clip (2) on ignition coil lead (4) close to the distributor wire plug.
Red trigger clip (1) on ignition lead (7) for cylinder no. 7.
The numbering of ignition leads for cylinder bank 7 - 12 corresponds with cylinder bank 1 - 6, i.e.
cylinder 7 = ignition lead 1,
cylinder 8 = ignition lead 2,
and so on.

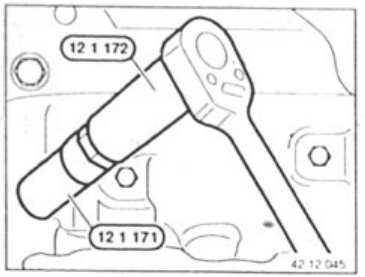


Connect BMW SERVICE TESTER on diagnosis plug.
Perform step 09 of engine test.
Observe oscilloscope - ignition voltage = 6 to 14 kV.
Check ignition voltage deviation - up to 3 kV.

Connections:
Ignition coil on left side
- black clip on terminal 1 and
- brown clip on car ground.

M 70:
Cylinder Bank t - 12
Perform test with adapter lead (14 - 16 pins), HWB No. 81 12 9 428 906, and an universal diagnosing connection lead.
Black connection on ignition coil term. 1.
Brown connection on car ground.

Note:
Cylinder identifying sender for left side on cylinder 12 ignition lead and
for right side on cylinder 6 ignition lead.
Firing Order:
M 70: 1-7-5-11-3-9-6-12-2-8-4-10
(If necessary, make up adapter lead for ignition coil lead 4 - high tension distributor locally in order to be able to perform the test faster.)

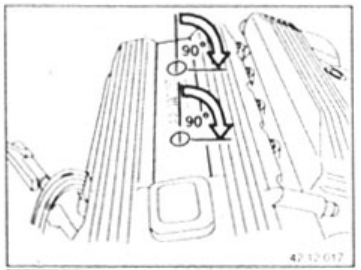


12 12 011 REPLACING SPARK PLUGS

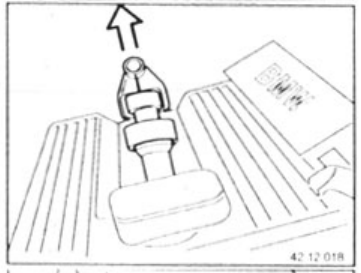
M 70:
Unscrew cyl. 7 ... 12 wire rail.
Lift off engine plug.
Remove cyl. 1 ... 6 washing fluid tank.
Tighten spark plugs with Special Tools 12 1 171 and 12 1 172.
Check tightening torque* when working without Special Tool 12 1 172.

* See Specifications

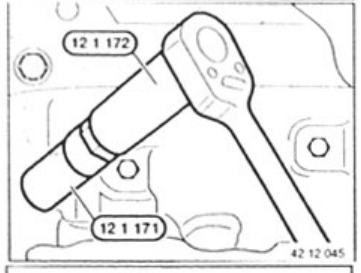
12 12 011 REPLACING SPARK PLUGS



M 42:
Unscrew wire duct cover.

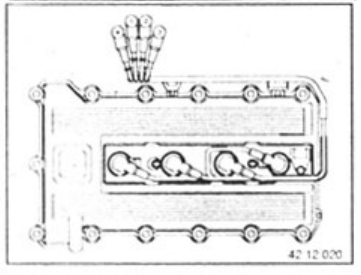


Pull off spark plug connectors.



Unscrew spark plugs.
Use Special Tool 12 1 171.

Installation:
Tighten spark plugs with Special Tools 12 1 172 and 12 1 171.



Routing of electric leads in cylinder head cover.

INSTRUCTIONS FOR WORKING ON STATIONARY IGNITION DISTRIBUTION (RZV) OF M 42 ENGINE

Caution!
Ignition must always be turned off before working on the ignition system. Dangerous high tension occurs when working with the ignition turned on.

Location of Dangerous Tension:
- **Ignition coil terminal 4**
- **Ignition lead**
- **Spark plug connector**
- **Spark plug**
- **Ignition coil term. 1 lead to DME control unit**

Ignition must always be turned off before connecting the service or digital tester, primary or secondary adapter and replacing parts of the ignition system.

Testing instructions:

The engine may not be started without a connected secondary circuit, i. e. after disconnection of spark plug connectors on spark plugs and ground connection 4a.

Master relay of DME must be pulled off for the compression test.

Shielded capacitors may not be connected on terminal 1 of the ignition coil.

Terminal 1 of the ignition coil may not be connected with ground or B + (danger of shorting the ignition final stages in the DME control unit).

Multimeter or test lamp may not be connected on terminal 1 while the engine is running.

Caution!
Approx. 350 V tension.

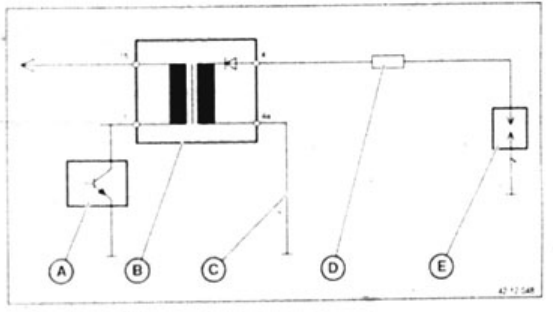
WIRING DIAGRAM FOR STATIONARY IGNITION DISTRIBUTOR OF M 42 ENGINE

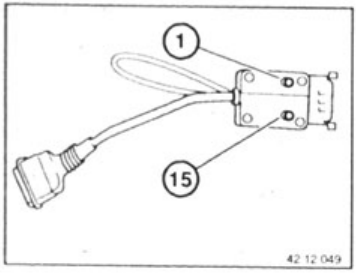
A = Control signal for ignition coil from DME

B = Ignition coil

C = Secondary coil ground connection

D = Ballast resistor for ignition lead, spark plug connector





CHECKING PRIMARY SIGNAL FOR STATIONARY IGNITION DISTRIBUTOR

Engine Test Step 05

Connect universal adapter lead on tester.
Connect brown clip on vehicle ground.

Connect primary lead adapter 12 7 020 on pertinent ignition coil being tested.

Connect black clip of universal adapter lead on pin 1 of adapter.

Produce stationary signal on oscilloscope by pressing button R on the tester.

CHECKING SECONDARY SIGNAL FOR STATIONARY IGNITION DISTRIBUTOR

Engine Test Step 10

Connect diagnosing lead on tester.

Connect capacitive clip (blue) on pertinent ignition lead being tested.

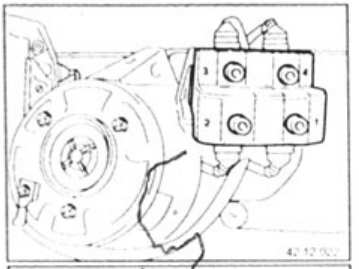
If pin 1 of the diagnosis socket is not used, connect primary adapter lead 12 7 020 on ignition coil 1.

Connect black clip on primary adapter lead pin 1.

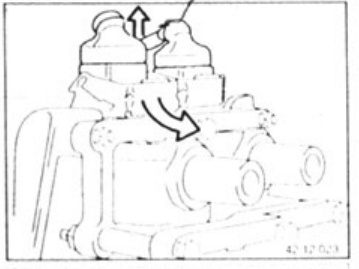
Produce stationary signal on oscilloscope by pressing button R on the tester.

Note:
Neighboring ignition leads could cause disturbance on the screen of the oscilloscope.

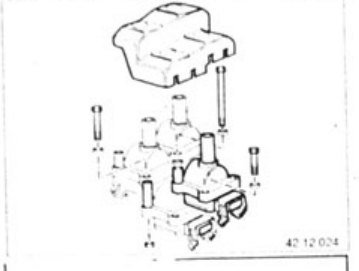
12 13 011 REPLACING ONE IGNITION COIL (Stationary Ignition Lead)

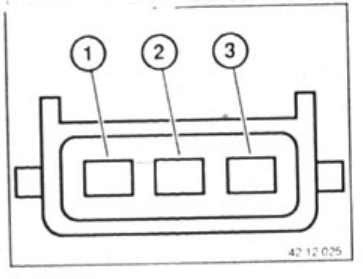


Arrangement of Ignition Coils



Pull off high tension lead.
Take off cap.
Unlock plug.
Pull off plug.





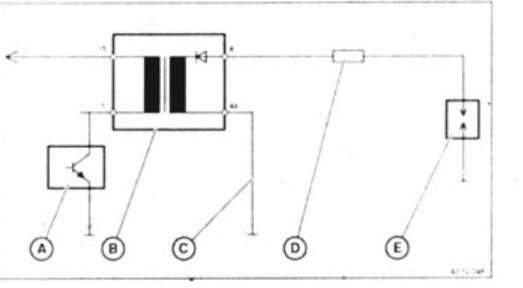
Ignition Coil Plug Pin Connections

1 = Terminal 15

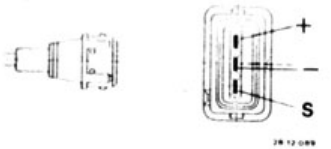
2 = Terminal 4a

3 = Terminal 1

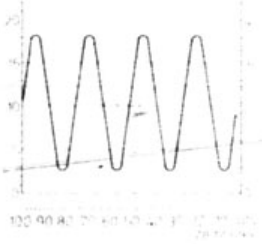
Wiring Diagram of Ignition Coil, Stationary Ignition Distributor



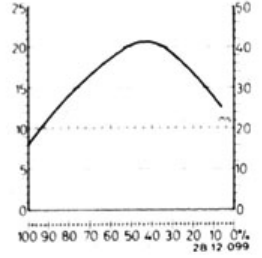
12 14 . . . CHECKING SPEED AND REFERENCE MARK SENDERS



Disconnect plug.
Connect BMW Service Tester to operating instructions (M 06 / 22 / 23).
Use universal test leads.
Measure resistance* of sender coil (M 06) on + and – of plug.
Check insulation* on + / S and – / S of plug.



Connect oscilloscope on + and – connections of speed sender (M 22 / 23).
Crank engine with the starting motor.
This signal should appear on the screen.

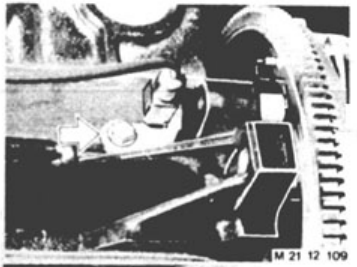


Repeat same test on the reference mark sender.
If oscillograph deviates, remove and check sender for dirt (grease, burrs, dust), cleaning if necessary.
Check the reference mark.

* See Specifications

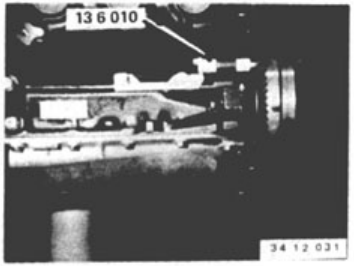
12 14 160 REPLACING AND ADJUSTING SPEED SENDER (M 21)

Disconnect plug.
Disconnect electric lead.

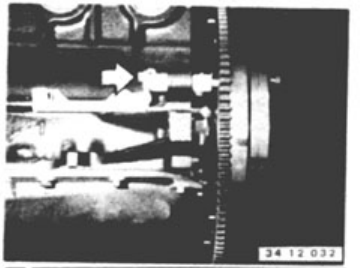


Unscrew holder.

Adjusting:
Turn crankshaft 40 mm (1.575") past the TDC mark.
Check whether the dowel pin of the flywheel can be seen through the take-up bore for the speed sender.



Mount Special Tool 13 6 010 on the holder.
Mount holder on the crankcase and push it forward against the stop.
Tighten holder.



Unscrew Special Tool 13 6 010 on the holder and pull it out.

Important!
The holder must no longer be loosened on the engine block – only unscrew and pull out the special tool.

Push speed sender into the holder.
Screw on speed sender.

TROUBLESHOOTING PREHEATING SYSTEM
(M 21)

Test Requirements:
- Charged battery.
- Correct wire connnections on control lamps, control unit and heater plugs.

Turn ignition key to "Drive" prior to each test.

Yellow and green control lamps do not light up.

Check fuse (80 A) on heating time control unit.

Check light bulb(s) in instrument carrier, replacing if necessary – refer to 62 99 . . ..

Disconnect small plug on heating time control unit.
Connect female plugs LA 1 (for yellow lamp) and LA 2 (for green lamp) with ground – the control lamps must light up. If not, check power supply for control lamps.

Yellow and green control lamps do not light up – coolant temperature < 60° C.

Check coolant temperature sensor, replacing if necessary – refer to 13 62 . . ..

Yellow control lamp does not light up.

Engine hard to start in cold state.

One or more faulty heater plugs.
Disconnect control unit plug (connections G1 ... G6). Connect BMW Service Tester (M 03), supply battery voltage to each connection G1 to G6 for 5 seconds (324 td max. 4 seconds) and measure current consumption*.
Replace faulty heater plugs – refer to 12 23 . . ..

Yellow control lamp flashes.

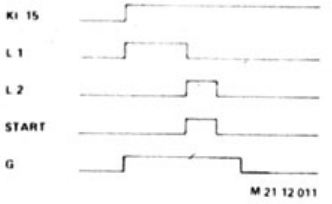
Disconnect heating time control unit plug (connections G1 ... G6).

Check heater plugs, replacing if necessary – refer to 12 23 . . ..
Replace control unit.

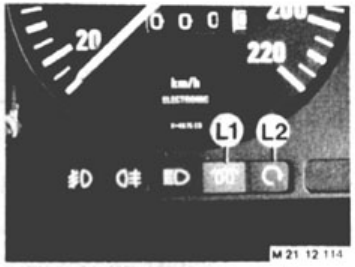
* Refer to Specifications

12 21 ... CHECKING PREHEATING SYSTEM (M 21)

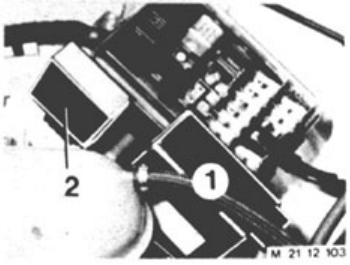
Normal Operation:
After turning the ignition key to "DRIVE" (term. 15) preheating (G) begins and yellow control lamp (L 1) in dash panel lights up. Green control lamp (L 2) lights up to indicate that engine may be started. Preheating continues during the starting phase and ends shortly afterwards. Green control lamp (L 2) lights up immediately when coolant temperature is > 60° C.



M 21 12 011



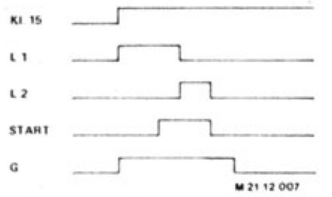
M 21 12 114



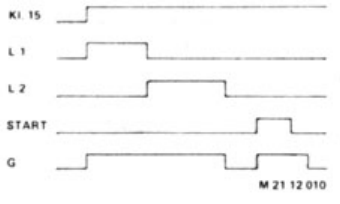
M 21 12 103

Preheating Without Start:
Preheating is switched off by a safety circuit in control unit (1) after 8 ... 11 seconds.

Preheating With Premature Start:
The time for starting the engine will be longer if it is not waited until lamp (L 2) lights up.

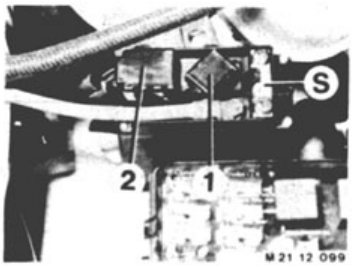


M 21 12 007



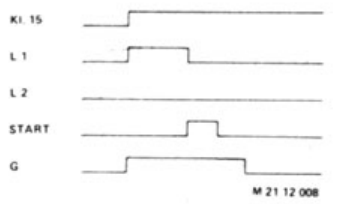
M 21 12 010

Preheating With Subsequent Start:
If engine is started after lamp (L 2) has gone out again, the safety circuit permits preheating during the starting phase and switches it off after a brief delay.



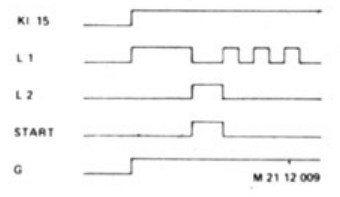
M 21 12 099

The yellow control lamp will not light up if the 80 ampere fuse (S) has blown or the control unit is faulty (coolant temperature below 60° C).



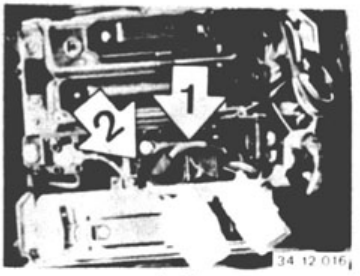
M 21 12 008

Green control lamp (L 2) will no longer light up in case of one or more faulty heater plugs.



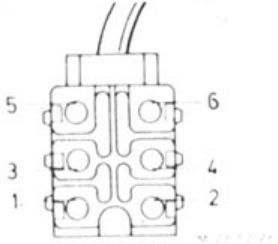
M 21 12 009

A flashing yellow control lamp (L 1) indicates continued perheating of the heater plugs – replace control unit and check heater plugs.



12 23 000 CHECKING HEATER PLUGS (M 21)
– Installed –

Take cover off of heating time control unit.
Disconnect plugs (1 and 2).



Note:
Plug No. 2 Pin Connections

Wire Color

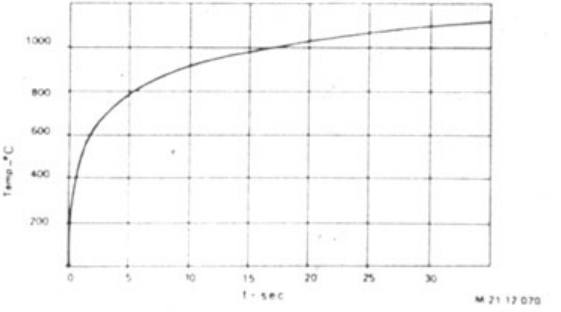
G1 - black/green	for cyl. 1
G2 - black/violet	for cyl. 2
G3 - black/yellow	for cyl. 3
G4 - black/red	for cyl. 4
G5 - black/white	for cyl. 5
G6 - black/brown	for cyl. 6

Important!
Up to the middle of 1986 G1 ... G6 do not have to be identical with cylinders 1 ... 6 (free plug pin use).

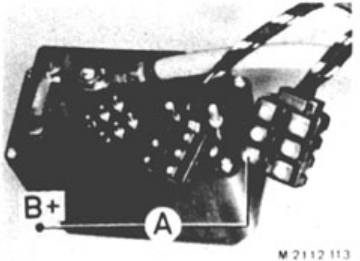
M 21 12 074

Caution!
Never operate removed heater plugs – danger of injury and fire!

Refer to diagram for temperature curve.



M 21 12 070

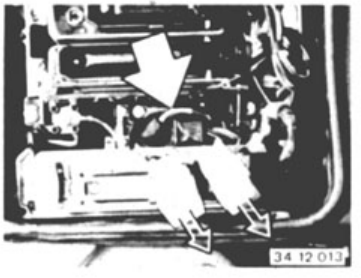


M 21 12 113

Current Test:
Connect test lead from battery positive to all female plugs G1 ... G6 each for 5 seconds.
Connect BMW Service Tester (M 03) or ammeter and measure current consumption*.

Note:
1988 model 324 td/524 td have different heating time (4 seconds). Max. testing time: 4 to 5 seconds. 324 td has modified heater plugs (design); current consumption and resistance are identical.

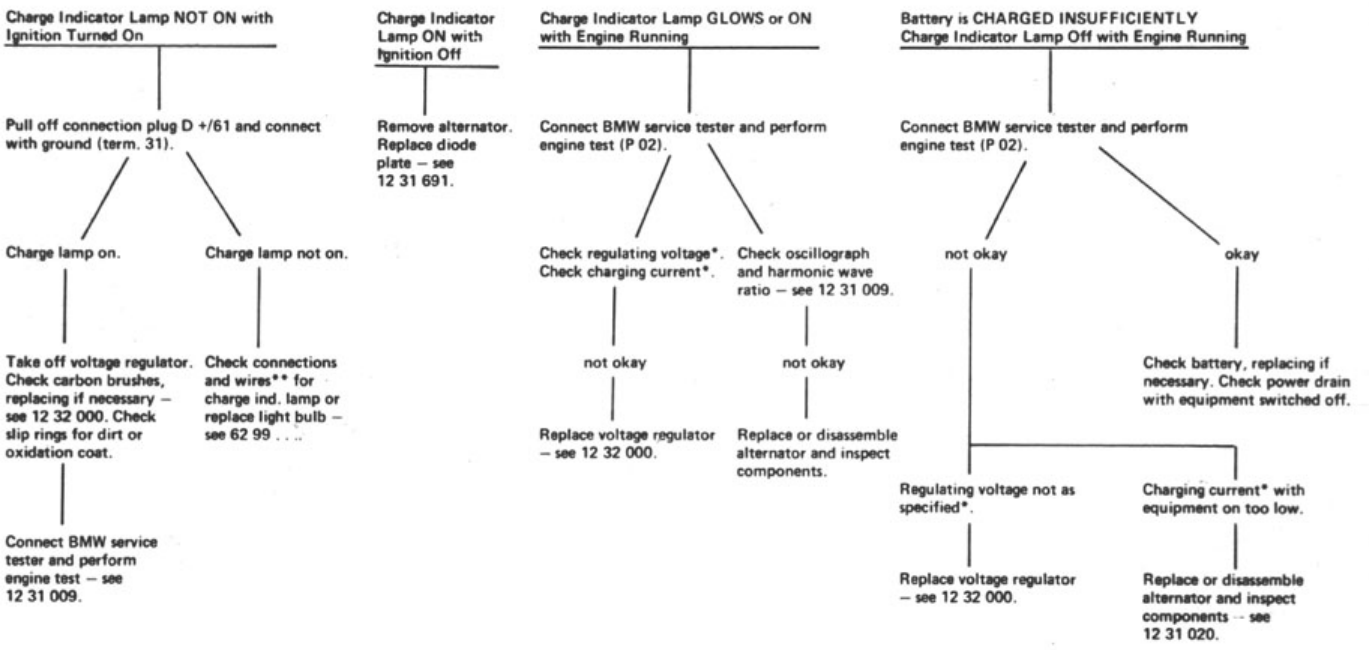
* **Refer to specifications**



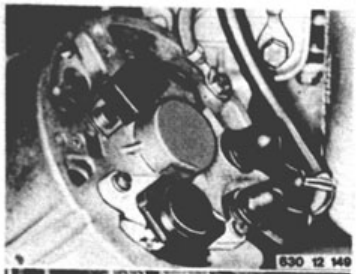
Heating time control unit 1988 model 524 td

TROUBLESHOOTING ALTERNATOR

Test Requirements: – Correct connections on battery, starter and alternator.
– Good ground connection between engine and body.
– Tight drive belt.



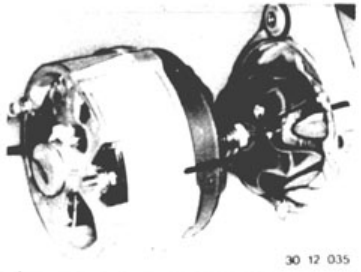
* See Nominal Value Microfiche or M 21 Technical Data
** See Wiring Diagram



630 12 149

12 31 009 CHECKING ALTERNATOR AND VOLTAGE REGULATOR

Test Requirements:
- Correct connections on charged battery.
- Correct connections on alternator and starting motor.
- Good ground connection between engine and body.
- Tight drive belt.

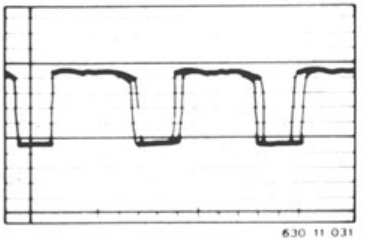


30 12 035

If specified charging current is not reached, remove and disassemble alternator and inspect components – see 12 31 020 / 513.

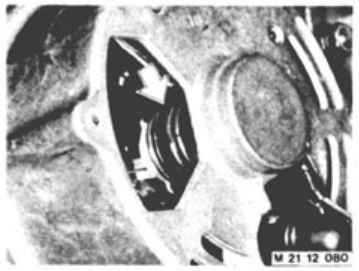
630 12 150

Charge Indicator Lamp on Continuously:
Remove voltage regulator and check carbon brushes, replacing if necessary – see 12 31 200.
Min. length "V" = 5 mm (0.197").



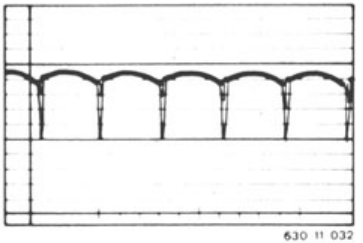
630 11 031

Oscillographs of Faulty Alternator:
Faulty power or exciter diode.



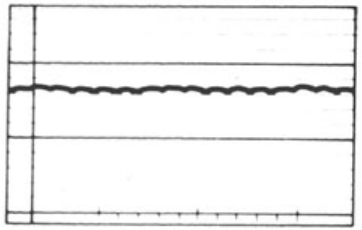
M 21 12 080

Installation:
Check slip rings for wear, fine grinding and polishing if necessary.
Connect BMW service tester.
Start engine and compare measured values with nominal values*.
M 21 Engine:
Measured values (regulating voltage – charging power).



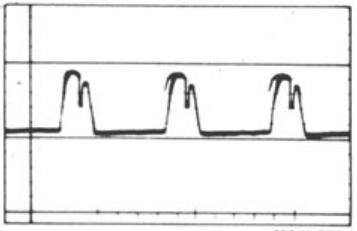
630 11 032

Shorted turn in stator coil.



630 11 025

If battery charge indicator lamp goes out with engine running and the regulating voltage* is not reached (while harmonic wave ratio* and oscillograph are okay as shown), the voltage regulator must be replaced – see 12 32 000.



630 11 027

Break in exciter diode.

* See Nominal Value Microfiche
** See Specifications

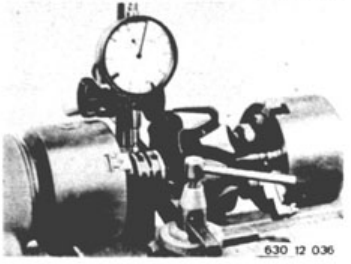
M 21 12 034

12 31 200 REPLACING CARBON BRUSHES – Bosch Alternator –

Remove voltage regulator – see 12 32 000 in repair manual of pertinent model series.
Unsolder leads on carbon brush holder.
Note:
Only use small amount of solder for soldering to avoid hardening of leads.

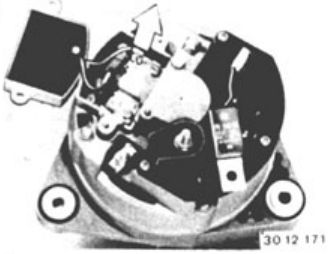
M 21 12 080

Installation:
Check slip rings for wear, disassembling alternator and fine grinding as well as polishing slip rings, if necessary.



630 12 036

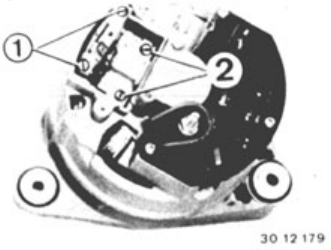
Check for out-of-true.
Max. out-of-true for slip rings is 0.03 mm (0.0012").



30 12 171

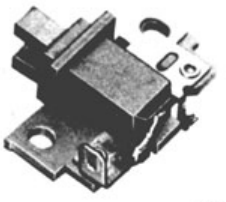
12 32 205 REPLACING CARBON BRUSHES – Motorola Alternator –

Remove alternator and voltage regulator see repair manual of pertinent model series.



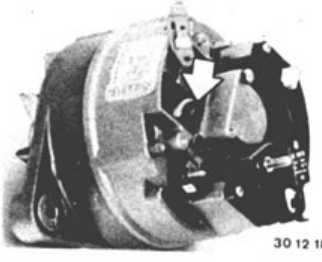
30 12 179

Unscrew screws (1 and 2) and take off carbon brush holder.



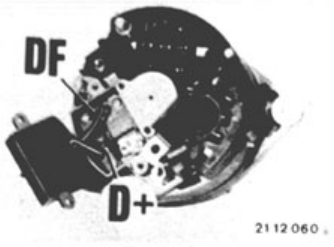
21 12 071

Carbon brush holder is replaced complete.



30 12 180

Installation:
Check slip rings for wear, disassembling alternator to fine grind and polish slip rings if necessary.
Max. out-of-true for slip rings is 0.03 mm (0.0012").



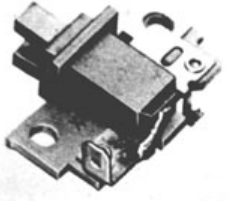
2112060

12 31 205 REPLACING CARBON BRUSHES – Motorola Alternator –

Remove alternator and voltage regulator – see repair manual of pertinent model series.

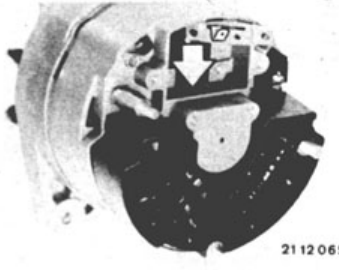
2112063

Unscrew screws (1 and 2) and take off carbon brush holder.



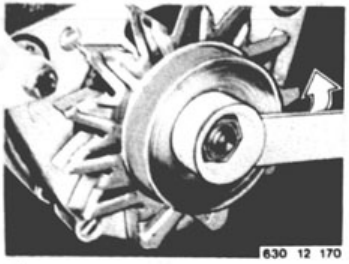
2112071

Carbon brush holder is replaced complete.



2112065

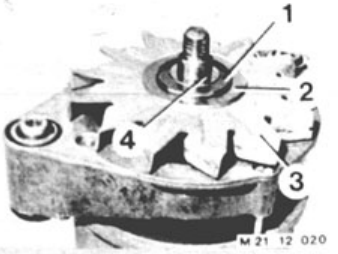
Installation:
Check slip rings for wear, disassembling alternator to fine grind and polish slip rings if necessary.
Max. out-of-true for slip rings is 0.03 mm (0.0012").



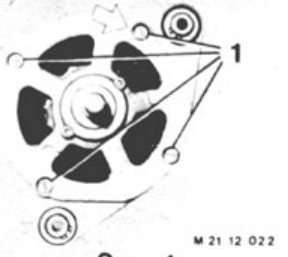
12 31 513 DISASSEMBLING/ASSEMBLING ALTERNATOR

– Alternator Removed –

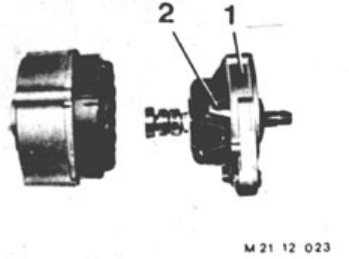
Alternator 65 A:
Remove voltage regulator – see 12 32 000.
Remove pulley and fan, using Special Tool 12 31 000.
Installation:
Tightening torque*.



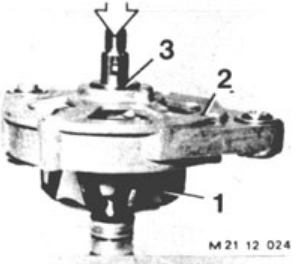
Remove washers (1 and 2), fan (3) and woodruff key (4).



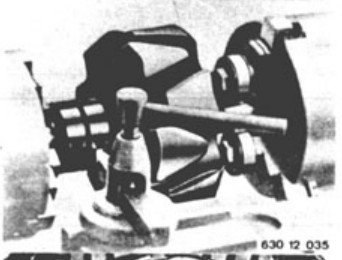
Unscrew screws (1).
Mark location of housing sections to each other.
Installation:
Install longer screw for ground wire in correct position.



Pull out bearing plate (1) with rotor (2).

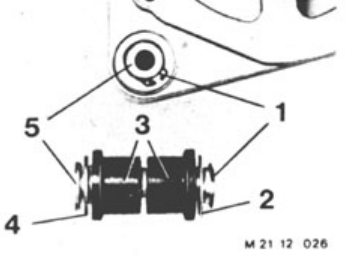


Press on rotor (1) and take off washer (3).
Check installed position of washer (3).



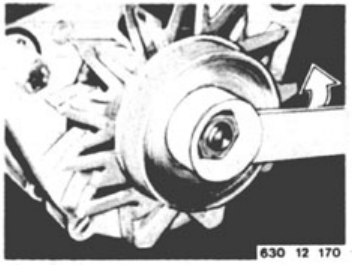
Check slip rings for wear, fine grinding and polishing if necessary – see 12 31 201.

Unsolder stator coil on diode plate.
Caution!
Excessive heat from soldering iron would destroy the diodes.



If necessary, press rubber mount out of housing.
Order:
1 Circlip
2 Washer
3 Rubber mount
4 Washer
5 Bushing

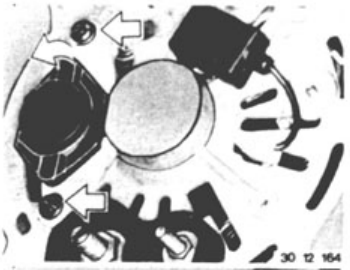
*** See Specifications**



630 12 170

12 31 513 DISASSEMBLING/ASSEMBLING ALTERNATOR

– Alternator Removed –

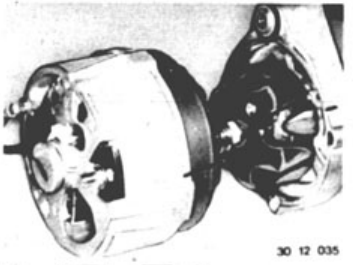


30 12 164

Unscrew voltage regulator.

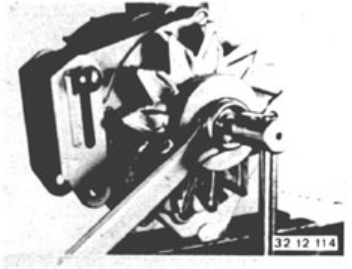
630 12 181

Arrangement of washers.



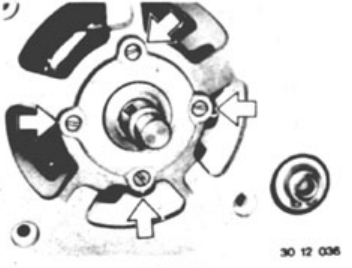
30 12 035

Mark position of housing sections to each other.
Unscrew bolts and pull housing sections apart.



32 12 114

Bosch 80 A Alternator (with Fan Clutch):
Unscrew nuts, counterholding with a socket wrench.
Installation:
Tightening torque*.

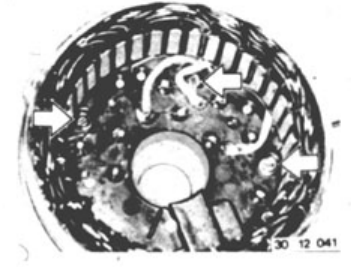


30 12 036

Unscrew bolts for bearing cover and take off bearing bracket.

32 12 173

Take off pulley and fan.
Note correct order.



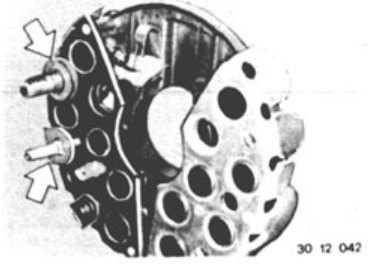
30 12 041

Unscrew screws for diode plate.

* See Specifications

30 12 040

Unscrew shielded capacitor.
Unscrew nuts on B + and D + pins.
Take off diode plate with stator coil.



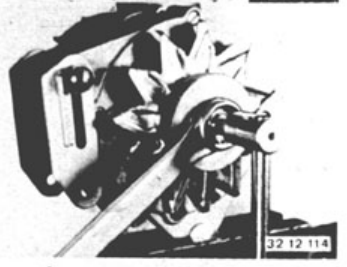
30 12 042

Installation:
Check condition of insulating sleeves and insulators, replacing if necessary.

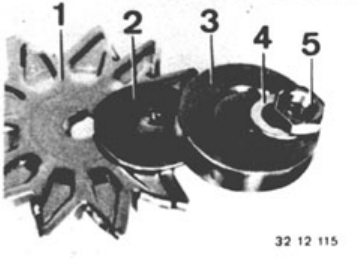
12 31 513 DISASSEMBLING AND ASSEMBLING ALTERNATOR – Alternator Removed –

Bosch 90 A/115 A/140 A Alternator:
Unscrew cover.

Remove voltage regulator.

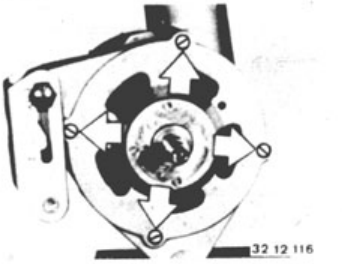


Mark position of housing parts to each other.
Unscrew nut while counterholding with a socket wrench.
Installation:
Tightening torque*.



Assembly:
1 Fan
2 Washer
3 Pulley
4 Washer
5 Nut

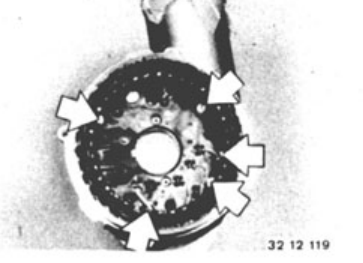
* See Specifications



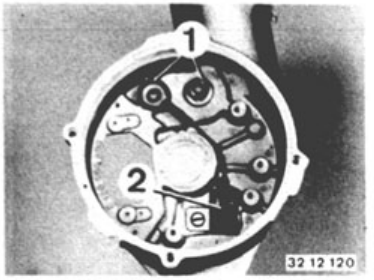
Unscrew bolts – pull housing sections apart.

Unscrew bearing cover.
Remove wedge (1).

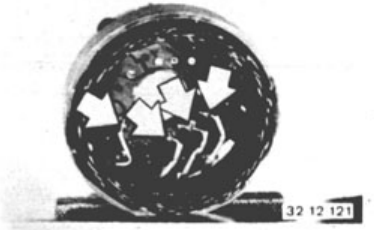
Unscrew nuts – take off plastic part.



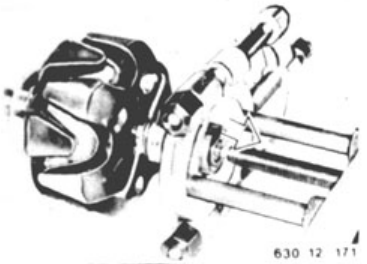
Unscrew screws.



Installation:
Mount insulators (1) and capacitor (2).
Measure capacity of capacitor – replace the capacitor when measured value deviates from the specified value by 50 %.



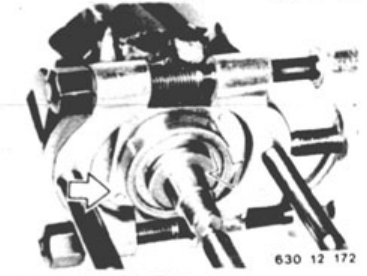
Mark and unsolder wires for diode plate.



630 12 171

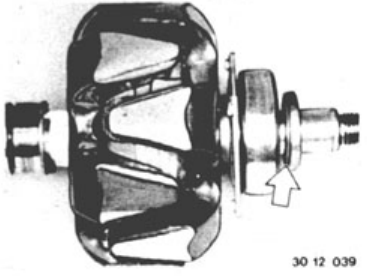
12 31 581 REPLACING BALL BEARING – Alternator Removed and Disassembled –

Bosch Alternator:
Pull off bearing with Special Tool 00 7 500.



630 12 172

Installation:
Replace cover for bearing, if it had been damaged through application of the special tool.



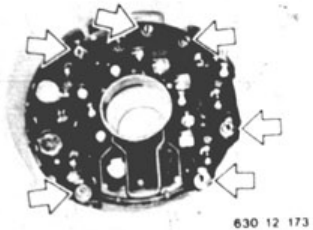
30 12 039

Installation:
Check installed position of washer – collar faces bearing.

630 12 178

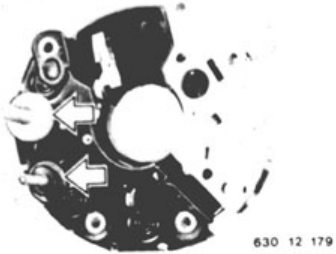
12 31 691 REPLACING DIODE PLATE – Alternator Removed and Disassembled –

Bosch Alternator:
Unsolder stator coil on diode plate.
Caution!
Excessive heat from soldering iron would destroy the diodes.



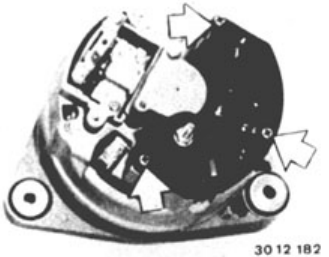
630 12 173

Unscrew bolts.
Remove diode plate.



630 12 179

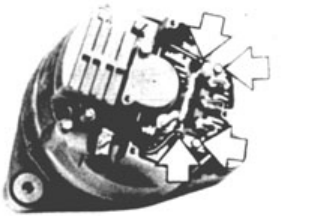
Installation:
Check condition of insulating sleeves and insulators.



30 12 182

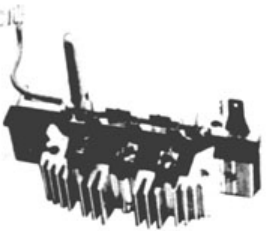
12 31 695 REPLACING DIODE PLATE – Alternator Removed –

Unscrew capacitor and cover.



30 12 195

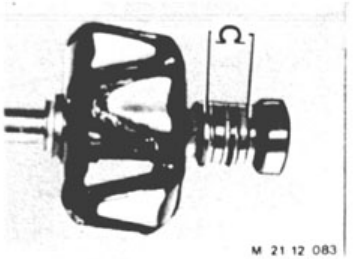
Motorola 65 A Alternator:
Unsolder stator coil on diode plate.
Caution!
Excessive heat from the soldering iron could destroy the diodes.



30 12 196

Unscrew bolts.
Remove diode plate.

Installation:
Install insulator again.

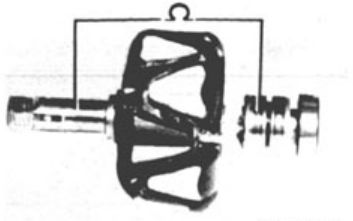


M 21 12 083

12 31 . . . ELECTRIC TEST ON BOSCH ALTERNATOR
– Alternator Disassembled –

Make tests with a BMW Service Tester.
Checking Stator Coil for Breaks and Shorted Turns:
Place test leads for resistance testing on slip rings.

Alternator	80 A – 2.80 ohms ± 10 %
	65 A – 3.40 ohms ± 10 %
	90 A – 2.90 ohms ± 10 %
	115 A – 2.65 ohms ± 10 %
	140 A – 2.65 ohms ± 10 %

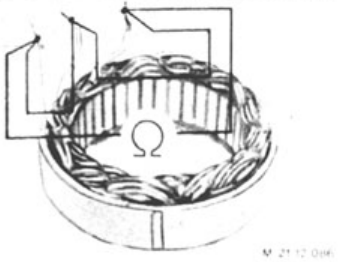


M 21 12 084

Checking Rotor Coil for Ground Contact:
Connect test leads for resistance test on slip ring and rotor shaft.
Nominal value: ∞ = 999 k-ohm display.

M 21 12 085

Checking Stator Coil for Ground Contact:
Connect test leads for resistance test on solder point and stator (coil carrier).
Nominal value: ∞ = 999 k-ohm display.

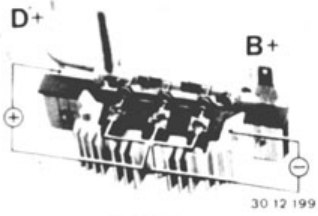


M 21 12 086

Checking Stator Coil for Breaks:
Compare resistance values of wires 1/2, 1/3 and 2/3 with an ohmmeter – they must be identical.
The shorted turn test can be performed with a standard tester.

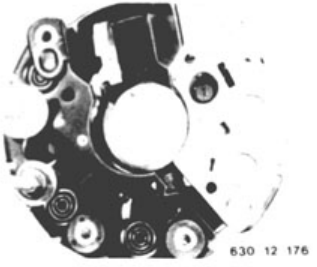
630 12 177

Checking Negative Diodes:
Connect test leads for diode test.
Negative lead on cooler and positive lead on one of the negative diode connections.
Display with perfect condition diodes: polarity "–".



30 12 199

Checking Positive Diodes:
Connect negative lead on B + connection pin and positive lead on one of the positive diode connections.
Display with perfect condition diodes: polarity "+".



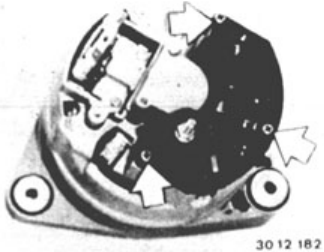
630 12 176

If a diode is faulty, replace the entire diode plate – see 12 31 691.

12 31 513 DISASSEMBLING AND ASSEMBLING ALTERNATOR – Alternator Removed –

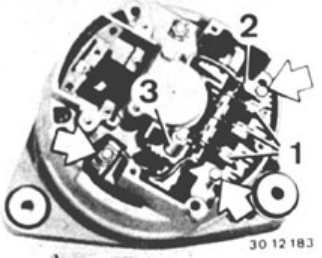
30 12 181

Motorola 65/80 A Alternator:
Remove pulley and fan.



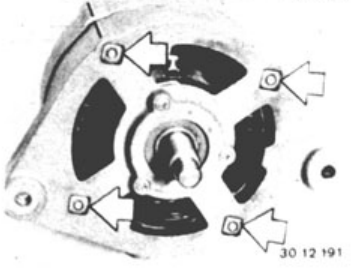
30 12 182

Remove voltage regulator and carbon brush holder – see 12 31 205.
Unscrew B + connection and cover.



30 12 183

Unsolder wires in connections (1 and 2).
Unscrew diode plate screws.
Installation:
Reinstall sleeve (3) and insulator (4).

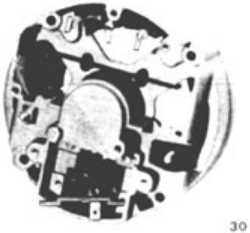


30 12 191

Mark housing sections, unscrew bolts and pull housing sections apart.

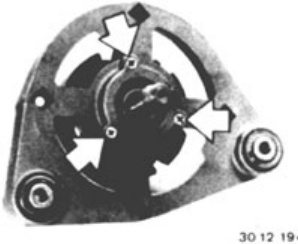
30 12 192

If hard moving from the face (through the regulator opening) drive out rotor toward rear with brief knocks from a piece of hard wood and plastic hammer.



30 12 193

Disconnect stator coil on housing.



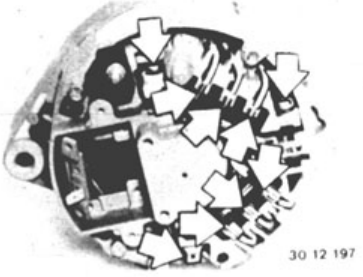
30 12 194

Unscrew bearing cover.

30 12 300

12 31 695 REPLACING DIODE PLATE
– Alternator Removed –

Motorola Alternator:
Unscrew capacitor and cover.

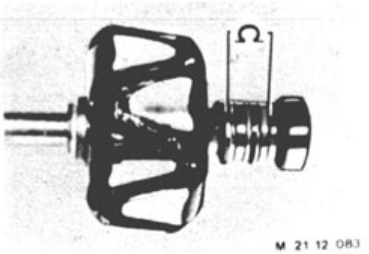


30 12 197

Unsolder stator wires on the diode plate.
Unscrew screws and take off diode plate.
Caution!
Excessive heat from the soldering iron could destroy the diodes.

30 12 198

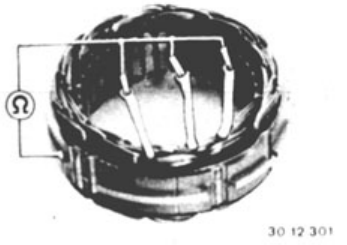
Installation:
Check condition of insulators.



M 21 12 083

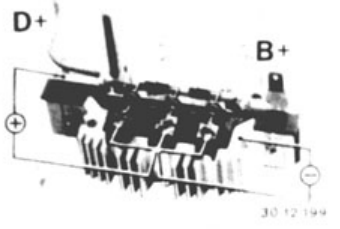
12 31 . . . ELECTRIC TEST ON 65/80 A MOTOROLA ALTERNATOR
– Alternator Disassembled –

Make tests with a BMW Service Tester.
Check rotor coil for breaks, ground contact and shorted turns.
Coil resistance = 4 ohms ± 10 %.



30 12 301

Check stator coil for ground contact and breaks.
Use a standard shorted turn tester.

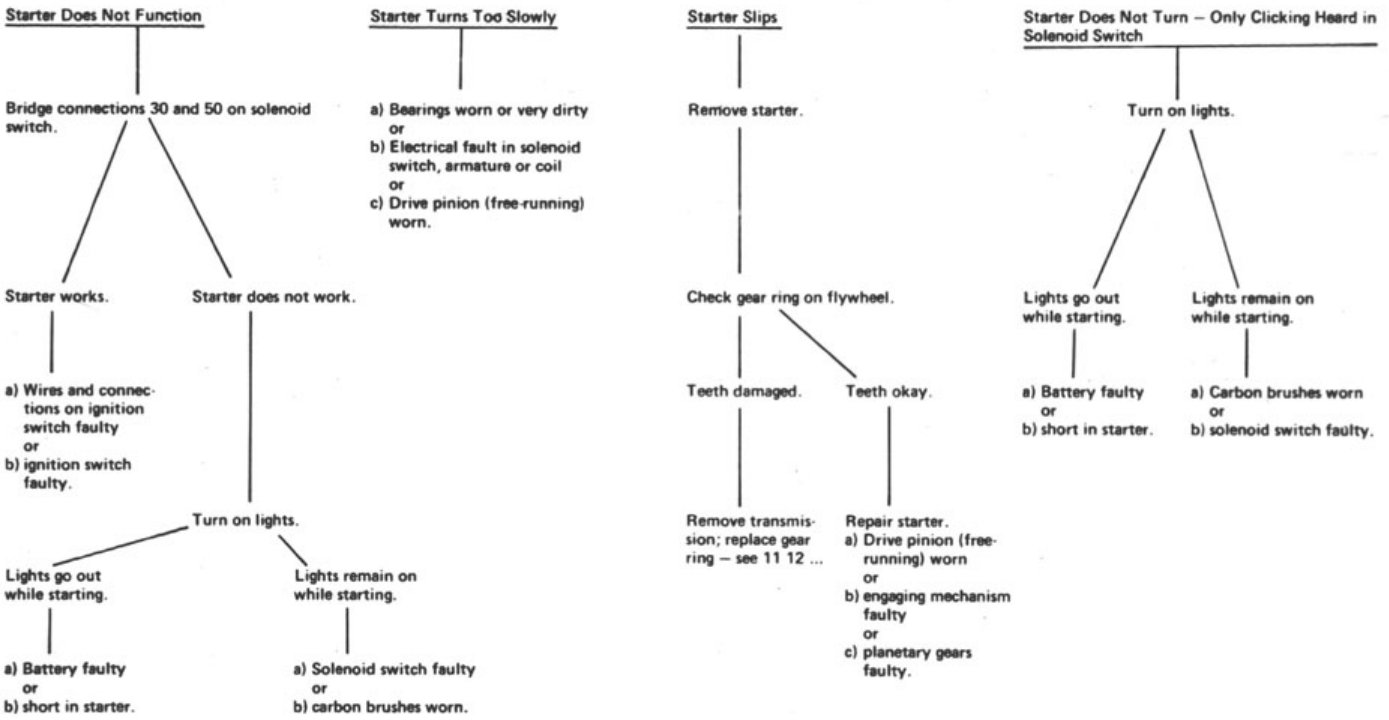


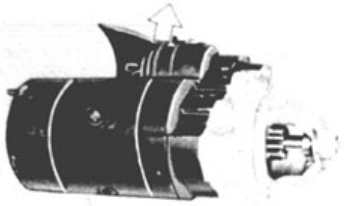
30 12 199

Check diodes – note the polarity.
Replace the entire diode plate in case of a faulty diode – see 12 31 695.

TROUBLESHOOTING STARTING MOTOR

Test Requirements: – Correct connections on battery and starting motor.
– Good ground connection between engine and body.
– Charged battery.

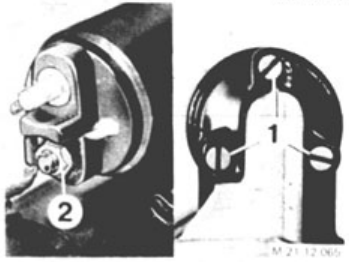




M 21 12 095

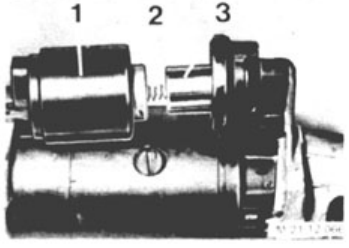
12 41 041 REPLACING SOLENOID SWITCH

Remove starting motor – 12 41 020.
Take off cover.



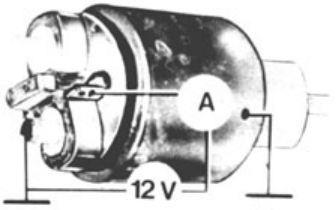
M 21 12 065

Unscrew solenoid switch (1 and 2).
Installation:
Do not turn wire connector while tightening – danger of short circuit.

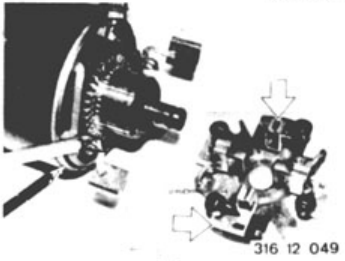


M 21 12 064

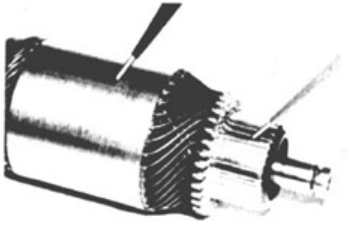
Remove solenoid switch (1) and spring (2).
Disconnect pin (3).
Installation:
Check pin (3) for wear and lubricate with grease.



630 12 186



316 12 049



316 12 053

12 41 . . . CHECKING COMPONENTS OF STARTING MOTOR (Electric Test)

Check power input* of engaging and holding coils in solenoid switch.

Check exciter coil, carbon brush holder and armature coil for ground contact.
Check armature for shorted turns.
Use a standard tester.
Checking the exciter coil is not necessary with permanent magnets.

* See Specifications

630 12 052

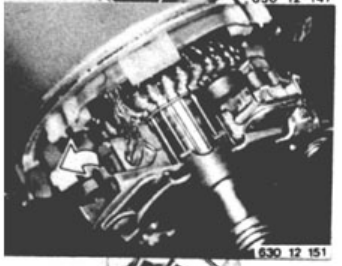
12 41 513 DISASSEMBLING AND ASSEMBLING STARTING MOTOR

– Starting Motor Removed –

Remove solenoid switch – see 12 41 041.
Unscrew dust cap (2).
Take off circlip (3), shims (4) and seal (5).
Installation:
Check axial play* of armature, correcting with shims if necessary.

630 12 147

Unscrew housing bolts and take off cover.
Installation:
Align openings for housing bolts and insulator to each other.
Check bearing sleeve, lubricating with oil before installing.

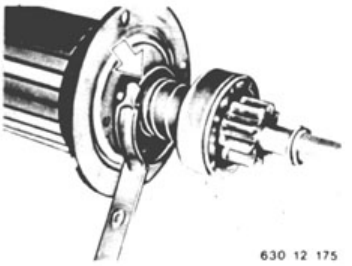


630 12 151

Lift springs and pull out carbon brushes.
Remove holder.
Installation:
Check carbon brushes and commutator for wear, repairing if necessary – see 12 41 551.

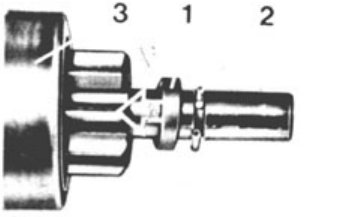
630 12 174

Remove pole housing.
Unscrew engaging lever bolt and remove rubber seal.



630 12 175

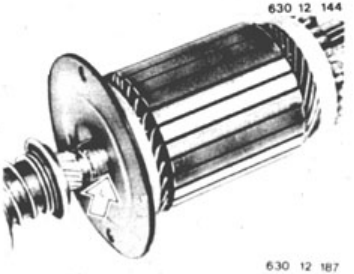
Lift out armature with drive pinion and engaging fork.
Installation:
Lubricate guide for engaging fork with grease.
Check bearing sleeve in drive bearing bracket, lubricating with oil before installing.



28 12 049

Push back bearing race (1) with a piece of suitable pipe.
Pry circlip (2) apart and pull it off of the shaft.
Remove burrs with a file.
Take off drive pinion (3).
Installation:
Use new circlip (2).
Lubricate bearing surface for drive pinion with grease*.

Installation:
Check pinion for wear (on teeth, bearings, one-way clutch), replacing if necessary.

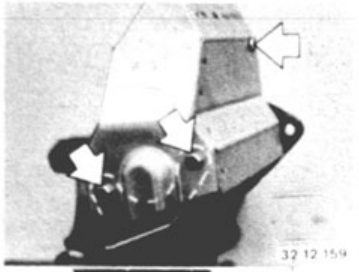


630 12 187

Check sleeve in intermediate bearing, replacing if necessary.

* See Specifications

* Source: HWB



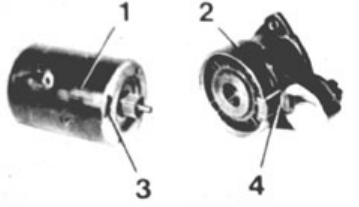
32 12 159

12 41 513 DISASSEMBLING AND ASSEMBLING STARTER INTERMEDIATE SHAFT
- Starter Removed -

Unscrew heat shield (if installed).
Unscrew bracket.
Check spacers.

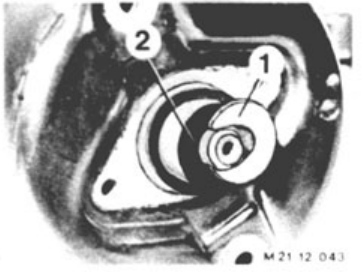
M 21 12 039

Remove solenoid - see 12 41 041.
Unscrew both studs.
Installation:
Clean all parts thoroughly before assembling.



M 21 12 040

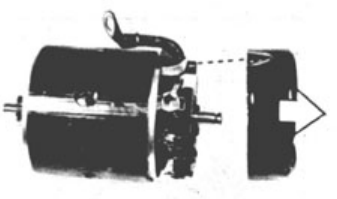
Separate motor (1) and gearbox (2).
Installation:
Groove (3) should be aligned with rubber part (4).



M 21 12 043

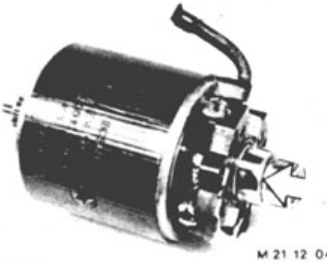
Take off protective cap.
Remove retainer (1) and shims (2).
Installation:
Check axial clearance*, correcting if necessary.

* **See Specifications**



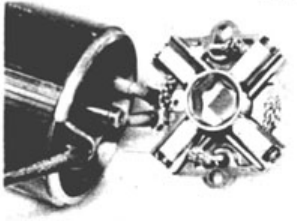
M 21 12 044

Check armature shaft, removing burrs if necessary.
Take off cover.



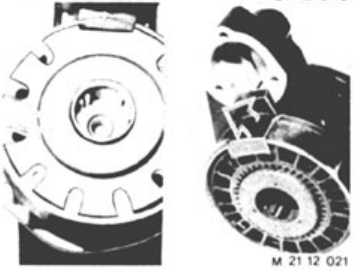
M 21 12 045

Insert a 22 mm wrench socket or piece of pipe with an outside diameter of approx. 30 mm (1.181"), in order to prevent the carbon brushes from springing out.



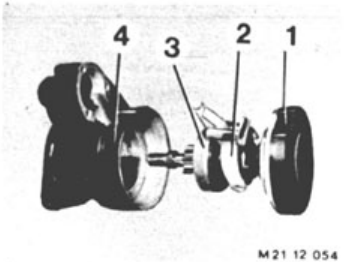
M 21 12 046

Installation:
Use wrench socket or pipe again to make installation easier.
Mount entire assembly on transmission case and then tighten the wire connector.



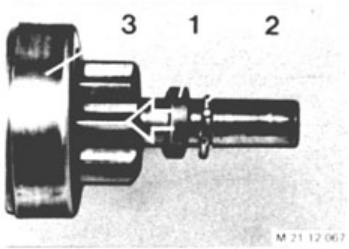
M 21 12 021

Take off cover and rubber block.



M 21 12 054

Pull out gearbox unit.
Take toothed ring off of planetary gearbox and release.
1 Planetary gearbox
2 Release
3 Pinion
4 Gearbox case

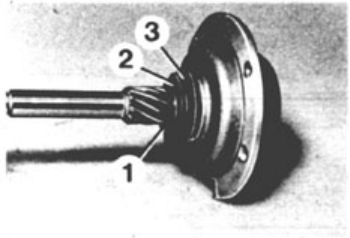


M 21 12 067

Knock back thrust ring (1).
Pull off retainer (2) forward.
If applicable, remove burrs and then take off drive pinion.
Installation:
Clean bearing surface of pinion thoroughly and lubricate with grease.

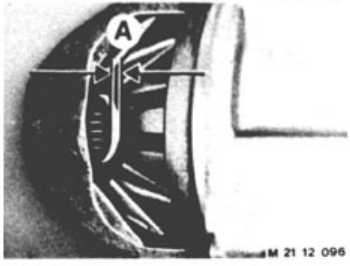
M 21 12 057

Installation:
Openings and bores must be aligned.



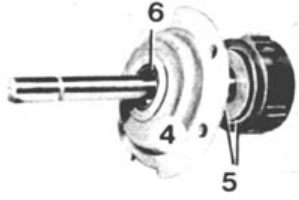
M 21 12 059

Pull off circlip (1) and take off washers.
2 Metal washer
3 Plastic washer



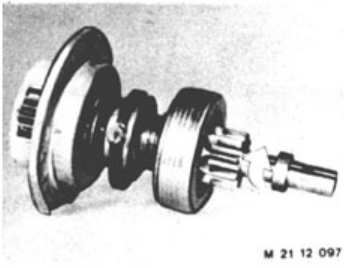
M 21 12 096

Check bearing and, if necessary, drive it out with a suitable mandrel.
Installation:
Lubricate new bearing with grease and press it in to distance A = approx. 1 mm (0.039").



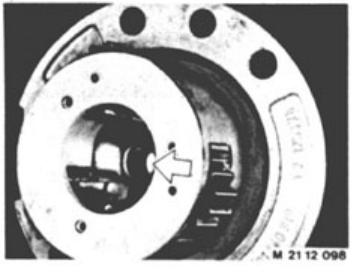
M 21 12 060

Take off bearing cover (4) and washers (5).
Check bearing sleeve (6), replacing if necessary.
Installation:
Lubricate sleeve with oil after pressing it in.



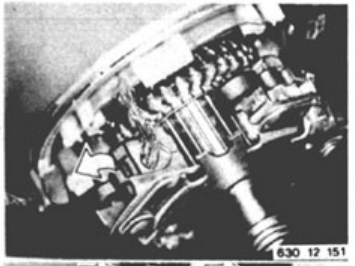
M 21 12 097

Turn drive pinion against stop.
Pinion will be very easy to turn, if the one-way clutch is worn.
Check bearing sleeve and teeth of pinion for wear.



M 21 12 098

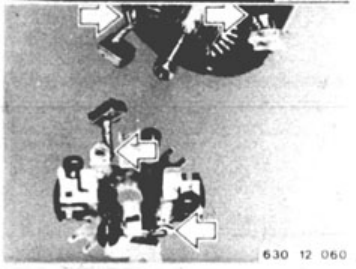
Check bearing sleeve and, if necessary, remove it with a suitable puller.
Check planet gears for wear.
Installation:
Lubricate sleeve with oil after pressing it in.



630 12 151

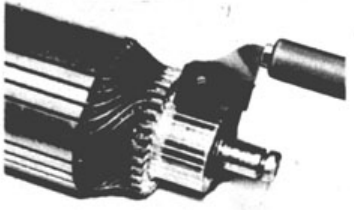
12 41 551 REPLACING CARBON BRUSHES
-- Starting Motor Removed and Disassembled --

Lift springs and pull out carbon brushes.



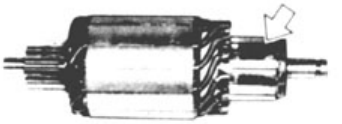
630 12 060

Remove holder and pole housing.
Unsolder or cut off all carbon brushes.
When soldering in new carbon brushes, make sure that copper leads are not hardened with flowing solder.



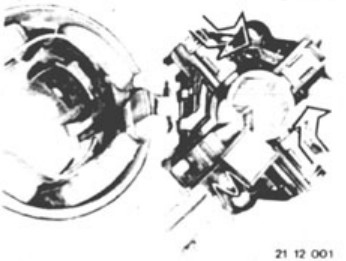
630 12 065

Check commutator for wear, fine grinding if necessary.
Diameter must be at least 33.5 mm (1.319").
Machine insulation between plates approx. 0.5 to 0.7 mm (0.020 to 0.028") deep.



21 12 008

Fine grind and polish commutator.
Machine or file insulation between plates of commutator 0.5 to 0.7 mm (0.020 to 0.027") deep.
Check for shorted turns after machining.



21 12 001

Slide carbon brush holder to center and lift off.

M 21 12 050

Installation:
Engage hooks of carbon brush holder completely.

21 12 002

Two slip ring carbon brushes must be cut off on the leads.
Solder in new slip ring carbon brushes.

12 41 551 REPLACING CARBON BRUSHES
-- Starting Motor and Gearbox Disassembled --

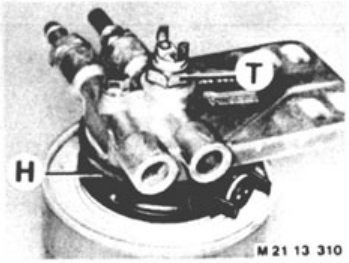
12 62 . . . **CHECKING / REPLACING COOLANT TEMPERATURE SENSOR (Glow Time/Temperature Gage)**

Connections:
G 1 = For coolant temperature display (temperature gage)
G 2 = For glow time control (to glow time control unit)

Dip removed temperature sensor in warm coolant up to hexagon.
Check resistance values* on G 1 / G 2 and ground at specified temperature*.

Installation:
Use a new seal.
Tightening torque*.

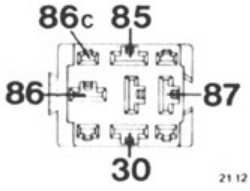
* See Specifications



M 21 13 310

12 64 . . . CHECKING FUEL FILTER HEATING

Fuel is heated at temperatures below + 5.5° C (+ 42° F) starting with "DRIVE" ignition key position.
Temperature switch (T) activates a relay, which delivers power to heating element (H) – see engine electric wiring diagram.



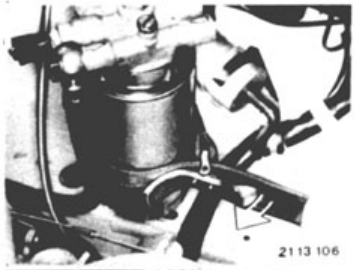
2112 040

Pull off relay (see engine electric wiring diagram).
Measure power input* between terminals 30 and 87 – should drop as heating element temperature rises.

2113 134

Measure resistance* of coil with ohmmeter, replacing heating element if necessary.

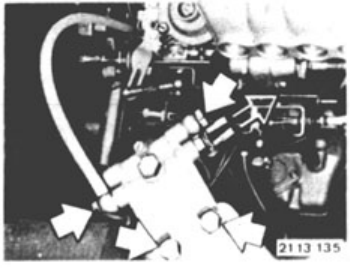
* See Specifications



2113 106

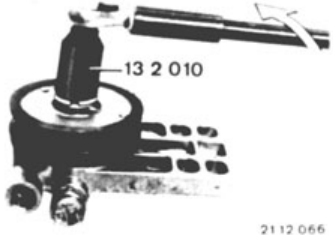
12 64 005 REPLACING HEATING ELEMENT FOR FUEL FILTER HEATING

Unscrew filter cartridge.



2113 135

Unscrew fuel pipes.
Pull off plug for temperature switch.
Unscrew filter head.



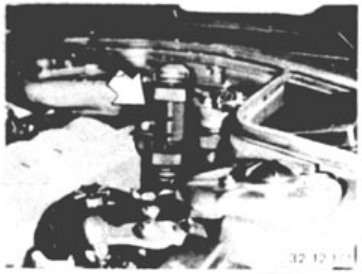
2112 066

Unscrew heating element with Special Tool 13 2 010.

2112 067

Installation:
Install seal (1) correctly – check dowel pins.
Tightening torque* for nut (2).

* See Specifications



TOP

12 70 500 CHECKING EXTERNAL SAFETY PATH

Note:
Read EML fault memory before installation of a testing adapter.

Ignition turned off.
Disconnect EML plug and install testing adapter, Special Tool 12 7 010.

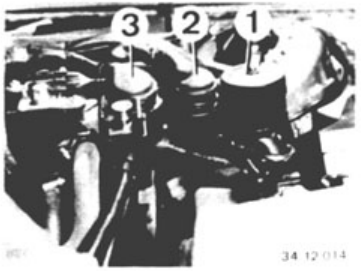
Check installed direction of testing adapter.
Knurled wheel in "–" position.
Start engine and regulate its speed to approx. 2,500 rpm with the knurled wheel.

EML Testing Adapter:
Special Tool 12 7 010.

Now operate the brake pedal, whereby the engine speed must be reduced "immediately" by the coasting shutoff function.
External path is okay.

Remove adapter.
Connect EML plug.

Note:
If applicable, cancel fault memories in diagnosing memories of EML and DME – see BMW Diagnosing Test by putting in 999.



EML Plug:
535 I (only special equipment

750 I (arrangement since 1987 plant shutdown)

1 = Diagnosing socket
2 = EML plug
3 = Engine plug

Note:
Read the EML fault memory first should it be necessary to replace the instrument cluster.
Make sure that the warning lamp functions correctly after installation.
Check safety path - see 12 70 500.

Caution!
Always turn off the ignition before disconnecting the multiple pin plug, in order to avoid damaging the DME, EML and ABS control units.

007	Full load smoke – correct (324d, 524td, 524td E28)	13- 16
008	Acceleration smoke – correct (524td E28)	13- 16
300	Electric fuel shutoff – check	13- 19
310	Electric cold start valve – check	13- 20
340	Injection pump operating lever – check / adjust – automatic transmission	13- 21
800	Injection nozzle – check – combination fuel injector removed	13- 22
13 53 . . .	Injection nozzle – flush – installed	13- 23
	Injection nozzle – clean	13- 24
	Injection nozzle – disassemble	13- 25
	Injection nozzle – adjust	13- 25
	Seal of injection nozzle assembly – replace	13- 26
	DDE – troubleshoot	13- 30
13 00 050	Idling speed – check (324td, 524td – E34)	13- 31
13 51 300	Electric shutoff valve – check (324td, 524td – E34)	13- 31
13 31 028	Fuel delivery pressure – check (324td, 524td – E34)	13- 32
13 51 002	Internal injection pump pressure – check (324td, 524td – E34)	13- 33
13 61 000	Control units – remove and install	13- 35

INSTRUCTIONS

concerning cleanliness when working on fuel systems.

- Clean area around repair point thoroughly – for example before disconnecting lines, switches, etc..

- Always place removed parts on a clean surface and cover with plastic sheet – never use rags losing lint!

- Close off or insert plugs in open lines or components immediately.

- Only install cleaned parts.
  Take new spare parts out of their packaging only shortly before installation.

- Never let diesel fuel drip on coolant hoses – if applicable, wash off with water immediately.

TROUBLESHOOTING ENGINE ELECTRIC, FUEL AND INJECTION SYSTEM

1. Engine cannot be started
2. Engine hard to start (coolant 20° C / 68° F)
3. Engine surges in idle
4. Erratic idling on warm engine
5. Engine backfiring while driving
6. Performance unsatisfactory
7. Fuel consumption too high
8. Engine cannot be stopped
9. Engine runs hard, black smoke in full load range
10. Fogging exhaust gas
11. Unsatisfactory idling of cold engine
12. Engine does not race in cold state
13. Distributor injection pump too hot
14. Excessive black smoke in constant full load driving
15. Excessive black smoke in acceleration phase

Requirements:
- Starting system okay (battery voltage, starter, ignition lock, etc.)
- Engine in perfect running condition (timing, compression)
- Specified fuel in tank (without contamination, winterproof)
- Connections, plugs and ground points according to wiring diagram

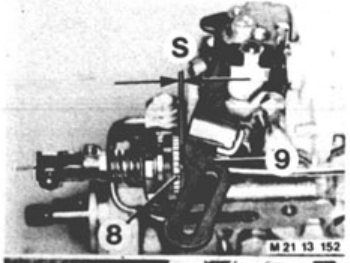
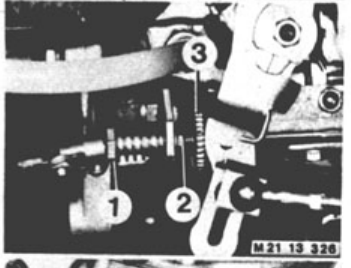
13 00 050 CHECKING / ADJUSTING IDLE SPEED

Requirements:
- Engine at operating temperature (oil temp. > 60° C/140° F)
- Valve clearance correct
- All electric equipment switched off
- Speed lever bears on adjusting screw



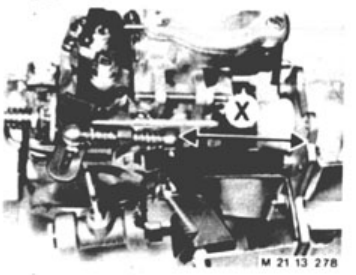
Check for play "S" = 0.5 ± 0.3 mm (0.020 ± 0.012") between knurled head screw (8) and lever (9), correcting if necessary.



Counterhold on hexagon (1) and unscrew nut (2).
Turn knurled head screw (3) until play "S" is reached.

Start engine and check idle speed* by reading on tachometer in the instrument cluster.
If necessary, loosen nut (1) and turn adjusting screw (2) until correct idle speed* is reached.
Tighten nut (1).
Recheck play "S", correcting if necessary.

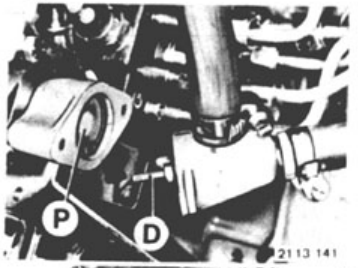
* See Specifications



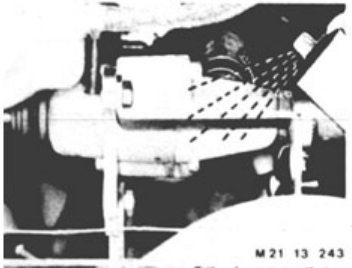
Cars with Automatic Transmission:
Check distance "X" in idle position, correcting if necessary – basic linkage adjustment, see 13 51 340.

13 00 550 CHECKING / ADJUSTING COLD IDLE SPEED DEVICE

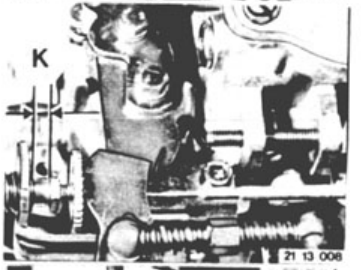
Requirements:
– Coolant temp. < 20° C (68° F)
– Idle speed (warm) correct



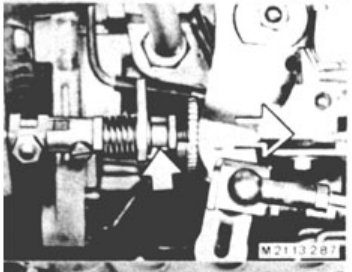
Spring force must keep plate (P) on the circlip.
Installation:
Check for correct seating of expansion element (D).



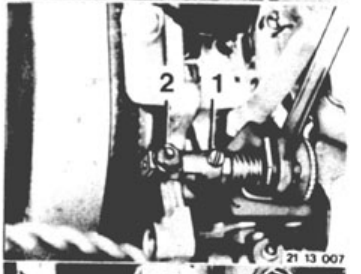
Checking Operation of Expansion Element:
Spray refrigerating spray** on expansion element housing about one minute.



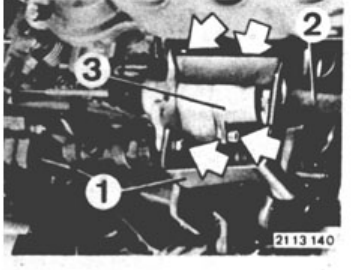
The control device must now be pulled out.
Distance "K" is 5.5 ±0.4 mm (0.216 ±0.016").



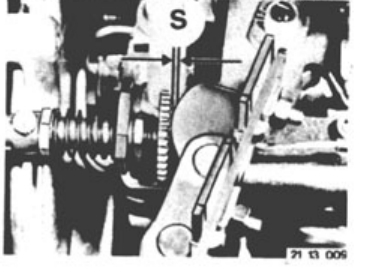
Pull back speed lever by hand slightly.
Operation of the expansion element should pull back the piston with knurled head screw approx. 2 to 3 mm (0.079 to 0.118").
Replace expansion element, if necessary.



Correcting:
Unscrew clamps (1 and 2) and reposition them until distance "K" is reached.
Apply a 10 mm fork wrench to make adjusting easier.
First tighten clamp (2) and then (1).

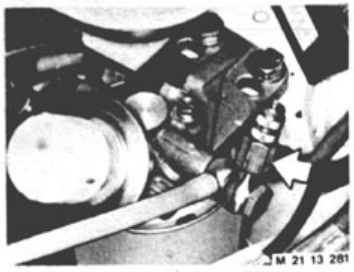


Checking Adjustment:
Unscrew holder (1) for cable.
Pinch hoses (2) shut with clamps.
Unscrew housing (3).



Check play "S" = 0.5 ±0.3 mm (0.020 ±0.012") after correcting, correcting play "S" if necessary.
Check idle speed, correcting if necessary see 13 00 050.

** Source: HWB

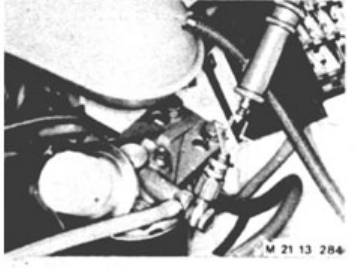


13 31 028 CHECKING FUEL DELIVERY PRESSURE

Unscrew hollow union bolt on filter and install adapter 13 5 360.
Use seals.

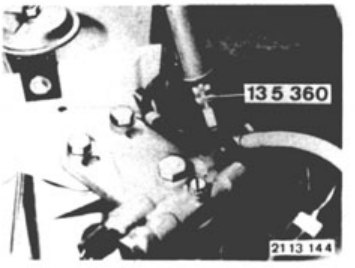
Insert connector from adapter in handle for vacuum hose (service tester).

Start and run engine at idle speed until the feed line has been bled.



Connect vacuum hose.
Perform multimeter test (M 21).
Read vacuum* at specified test speed*.

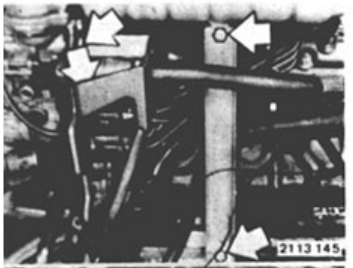
* See Specifications



Max. Vacuum* Exceeded:
Check
– fuel filter,
– lines to fuel tank and
– fuel intake.

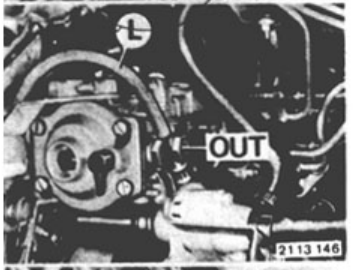
Remove adapter after checking.
The system is bled automatically after starting the engine.

* See Specifications

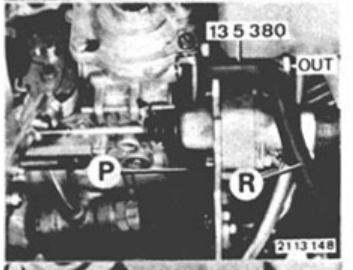


13 51 002 CHECKING INJECTION PUMP INTERNAL PRESSURE

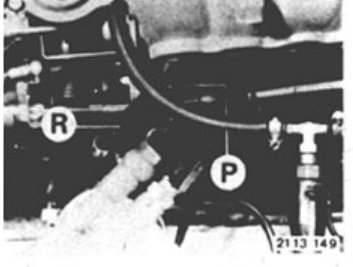
Remove prop for intake manifold (only 324 d).
Unscrew and swing away expansion tank (only 524 td).
Unscrew holder for cable.



Pull off leak oil hose (L) on injection nozzle.
Unscrew hollow union bolt for return hose (OUT).

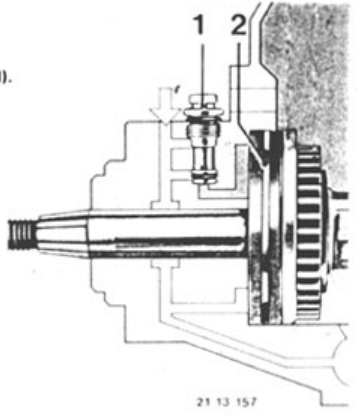


Unscrew and pull out return hose (R) downward.
Install test hose (P) with adapter 13 5 380 and seals.
Route return hose via the cold idle speed device to the adapter and mount with bolt (OUT).



Connect BMW Service Tester on test hose (P) – perform multimeter test (M 19).
Start engine and read pump internal pressure* at test speed*.

* See Specifications



Diagnosing Information:
Internal Pressure Too Low
- Pressure control valve (1) faulty.
- Fuel delivery pump (2) performance insufficient.

Remedy:
Replace injection pump.

Internal Pressure Too High
- Hollow union bolt (OUT) for return hose plugged – clean, if necessary.
- Pressure control valve faulty, replace injection pump if necessary.

Incorrect internal pressure will cause displacement of the injection timing.
This will be noticed on insufficient pressure due to inadequate power or on excessive pressure with hard engine running.

13 51 007 / 008

Correct on the volume adjusting screws of the injection pump in case of excessive black smoke development in the accelerating phase or constant full load driving.

The corrective measures described below require that clear difference is made between

1. acceleration smoke in a range of 1000 to 2500 rpm (only BMW 524 td/ E 28) and
2. full load smoke in the entire speed range (BMW 324 d, 524 d and 524 td - E 28).

Procedures are different accordingly.

Blow deposits of soot out of the exhaust assembly by racing the engine of a stopped car at least five times prior to making corrections on the injection pump.

The tests described below must be performed, insofar as it would not be better to perform them in the course of an inspection.

- Diesel fuel must conform with DIN standards (brand name fuel).
- Check fuel filter for cleanliness and correct intake vacuum.
- Check reference pressure box for correct vacuum (BMW 324 d, 524 d).
- Static basic adjustment.
- Toothed drive belt tightness.
- Coolant and oil must reach normal temperature.
- Check valve clearance.
- Air filter clean.
- Idle speed adjustment.
- Pump internal chamber pressure.
- Oil trap for crankcase breather (unrestricted oil return flow).
- Opening pressure of injection nozzles.
- Check charge pressure (524 td).
- Check compression.
- Contact surfaces of welded sleeve on the full load adjusting screw must be perpendicular to the pump axis and may not be turned clockwise.

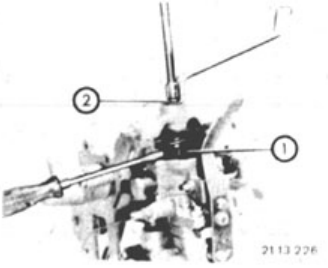
13 51 008

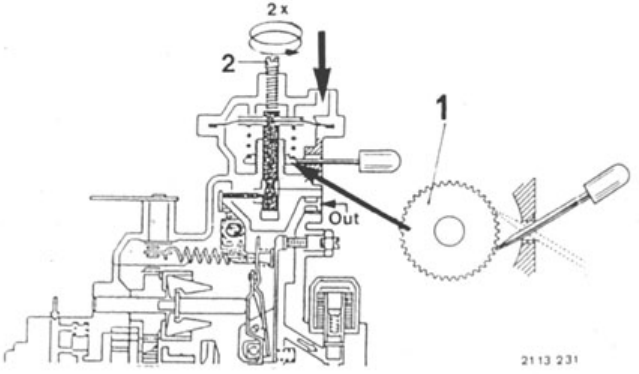
1.1 Correcting Acceleration Smoke
(Only BMW 524 td - E 28)

Pull out the rubber grommet for the diaphragm venting located above the "out bolt" and unscrew the hollow union bolt located behind it, in order to adjust the charge pressure dependent full load stop of 524 td cars.

Mark one tooth in the middle of the tapped bore on the spring retainer with wwhite paint afterwards.

Gear wheel (1) located in the pump can be adjusted by one turn with a screwdriver as shown in the sketch below. Unscrew the locknut and loosen the adjusting screw (2) located on the upper pump cover by two turns afterwards.
Tighten locknut again.
Reinstall rubber grommet with corresponding hollow union bolt.





13 51 007

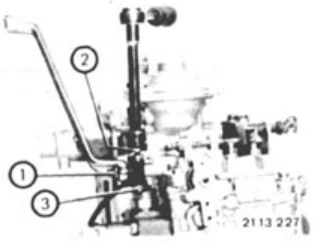
1.2 Correcting Full Load Smoke

If there is excessive black smoke emission during constant full load driving (engine speed greater than 2,500 rpm) in addition to acceleration smoke, proceed to steps described in point 2.2 instead of point 1.1.

Note:
If corrections had been made to the procedures described here, it is not necessary to make another adjustment to point 1.1.

2. Injection Pump Correction (BMW 324 d, 524 d)

Adjustments differ on injection pumps in cars with a naturally aspirated diesel engine.



2.1 Adjusting Screw with Fine Control Gearing (Worm)

Unscrew locknut (1) with a 13 mm ring wrench.
Turn screw (2) only in clockwise direction by max. six turns.
Tighten locknut (1).

Caution!
Turning counterclockwise could damage the worm!
Self-locking nut (3) must not be loosened or tightened!

2.2 Adjusting Screw without Fine Control Gearing

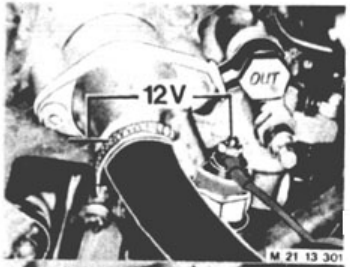
In case of injection pumps without a worm, loosen locknut (1) approx. 1/4th of a turn with a 13 mm ring wrench and simultaneously hold screw (2) in its position (first note position of the screw!).

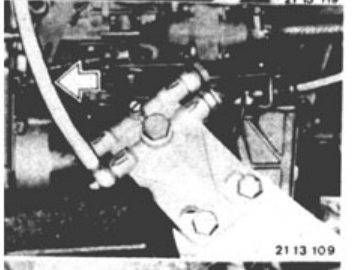
Turn screw (2) counterclockwise by 20° to max. 40° afterwards (equal to max. 1/8th of a turn).

Note:
Evaluate smoke emissions after making corrections.

In so doing a compromise must be found between smoke reduction and power reduction within specifications.

All turned adjusting screws must be sealed again with the special BMW paint, HWB Order No. 81 22 9 407 404.





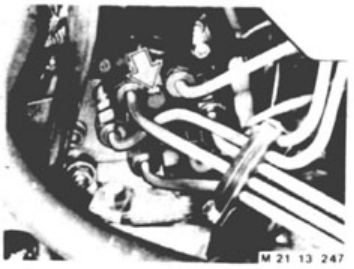
13 51 300 CHECKING ELECTRIC FUEL SHUTOFF

The shutoff receives electric power starting with the "DRIVE" ignition key position. This will be noticed by a loud click when switching on.

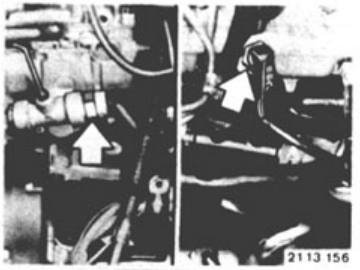
The manual shutoff lever (12) must be used when the electric shutoff fails.

Testing Requirements:
- Fuel in tank
- No visible air bubbles in feed line

1. Turn on ignition and check, whether the shutoff is receiving electric power (approx. 12 volts).

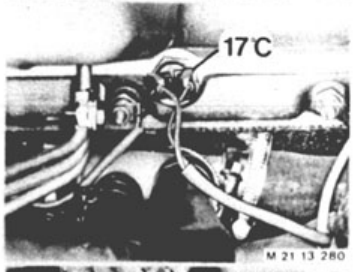


2. Loosen plug on high pressure section about two turns.
   Crank engine with starter and check, whether fuel is running out.
   If necessary, replace shutoff – see repair manual of pertinent model series.

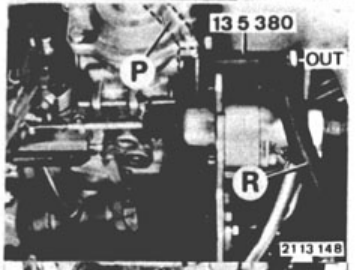


13 51 310 CHECKING ELECTRIC VALVE FOR COLD START SYSTEM (COLD START BOOSTER)

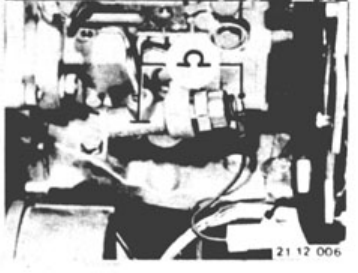
Description:
The electric valves receives electric power from a temperature switch during the cold running phase.
This results in higher pump internal pressure, which "ADVANCES" the injection timing.



Checking:
Bridge temperature switch on a warm engine.
The engine will run much harder due to the advanced injection timing.

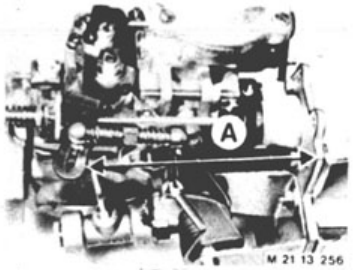


If necessary, check pump internal pressure with the bridged temperature switch.
Replace electric valve, if the pump internal pressure is not higher.



Disconnect wires on valve.
Measure resistance*.

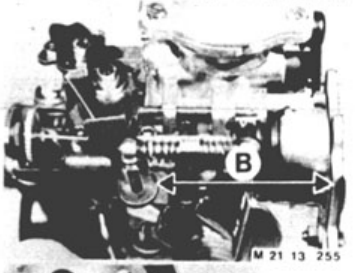
* See Specifications



13 51 340 CHECKING / ADJUSTING OPERATING LEVER ON INJECTION PUMP
– Cars with Automatic Transmission –

Requirements:
– Coolant temp. > 20° C (68° F)
– Idle speed correct

Measure and note distance "A".



Press speed lever against full load stop.
Measure distance "B" and subtract it from distance "A", which gives distance "Y".

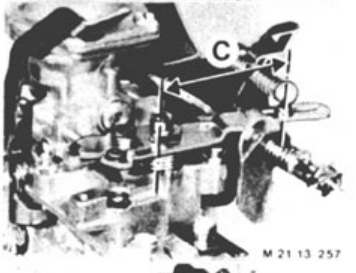
ADJUSTMENT TABLE
Dimensions in millimeter

Y	41	41.5	42	42.5	43	43.5	44	44.5	45	45.5	46	46.5
C	78.1	77.0	76.0	74.9	73.9	73.0	72.0	71.1	70.3	69.4	68.6	67.8
Y	47	47.5	48	48.5	49	49.5	50	50.5	51	51.5	52	52.5
C	67.0	66.3	65.6	64.9	64.2	63.5	62.9	62.3	61.6	61.0	60.5	59.9
Y	53	53.5	54	54.5	55	55.5	56	56.5				
C	59.4	58.8	58.3	57.8	57.3	56.8	56.4	55.9				

Example:

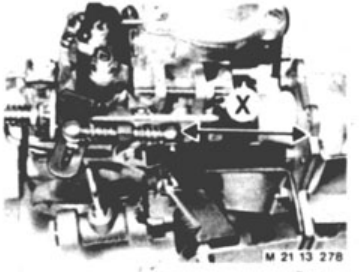
	A	128.7 (5.067")
–	B	72.5 (2.854")
	Y	56.2 (2.213")

Distance "C", measured from pivot point of speed lever to ball socket, is 56.4 mm (2.220").



Adjusting distance "C" can be found in the table with help of distance "Y".
Distances can be rounded to the values in the table.

To correct distance "C", loosen the ball head and reposition accordingly.



In idle position distance "X" should be 68 ± 0.5 mm (2.677 ± 0.020").
If necessary, correct by changing length of the pull rod.

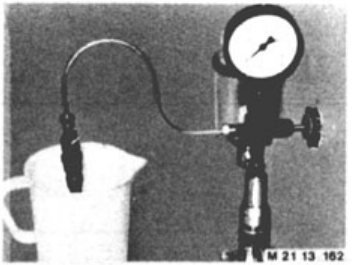
In full load position distance "Z" should be 29.1 ± 0.5 mm (1.146 ± 0.020").
After finishing adjustments, check throttle cable adjustment for automatic transmission – see 24 00 . . ..

2113 346

13 53 800 CHECKING INJECTION NOZZLE

– Combination Fuel Injector Removed –

Set up tester 00 2 540 on stand.
Plug open line connections with caps when it is necessary to clean the injection nozzles.



M 21 13 162

Mount combination fuel injector on pressure line of tester.
Fill tank with test oil**.
Caution!
Never use gasoline – danger of explosion!

21 13 348

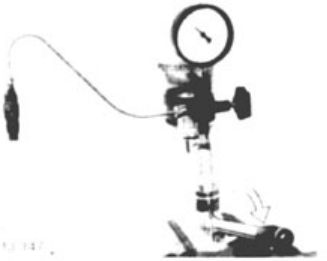
a) Opening Pressure Test

Caution!
Keep hands away from nozzle opening in all tests – danger of injury!
Bleed the line or nozzle by pumping quickly at least 5 times with the manual wheel on the pressure gage closed prior to testing.
If necessary, disconnect the line briefly to bleed roughly.

21 13 348

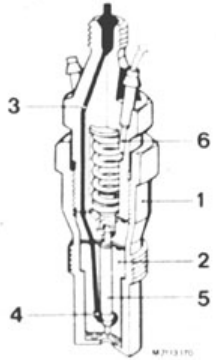
Open manual wheel on pressure gage.
Press down manual lever slowly until the injection nozzle ejects.
Read injection pressure* (bar display, inner scale) on pressure gage.
Pressure must not be lower than the minimum injection pressure.
The max. difference in opening pressure of all six (already used) injection nozzles is 15 bar (213 psi).

* See Specifications
** Source: HWB



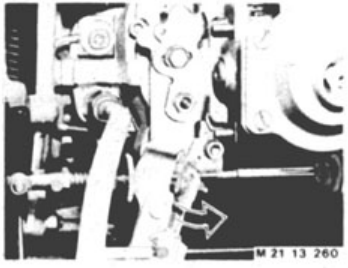
b) Injection Nozzle Leak Test

Press down manual lever slowly and hold at point 20 bar (285 psi) below opening pressure.
No drop of fuel should drip from the nozzle within 10 seconds.
Also check for leaks between the nozzle holder upper section and clamping nut.



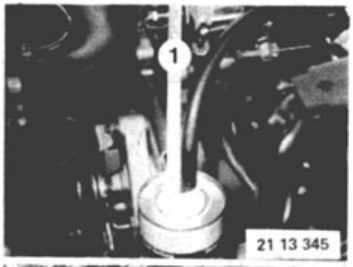
13 53 . . . FLUSHING INJECTION NOZZLES
– Installed in Car –

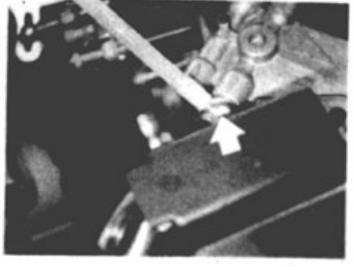
A nozzle needle (5), which is not closing completely because of combustion residue, will be noticed on a loud knocking noise in the engine.



Finding Faulty Injection Nozzle:
Start engine and unscrew the coupling nut on each injection line separately with Special Tool 13 5 020.
The knocking noise will stop, when the coupling nut is loosened on the faulty nozzle.

Remedy:
Accelerate engine having operating temperature from idle speed to high speed several times.
This will flush out the nozzles.
If necessary, clean or replace the combination fuel injector.





13 53 . . . FLUSHING INJECTION NOZZLES
– Installed in Car –
(Only with Mech. Injection Pump)

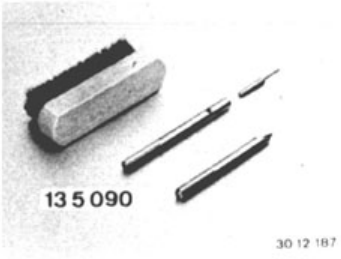
Important!
NOT for application on an electronically regulated injection system (DDE).
Engine at operating temperature.
Disconnect transparent fuel feed hose (1) on fuel filter and insert end of hose without bends in can filled with flushing concentrate**.

Connect pump return hose on the hose connection point about 20 cm (7.874") away from the return or OUT bolt with a 1 meter (3 ft.) long fuel hose having an inside diameter of 8 mm (0.315").
Also insert end of hose extension in the can filled with flushing concentrate**.
Important!
Make sure of absolute cleanliness.

Pull pump relay out of the socket in cars with a subsequently installed intank delivery pump.
Start engine and let it run at different speeds (max. 3000 rpm) until the contents of the can is used up.

Mount fuel lines in their original position again.
Start engine and check for leaks on connections.
Refer to an enclosure of Technical Information 2.87 for instructions on installation of the metering device.

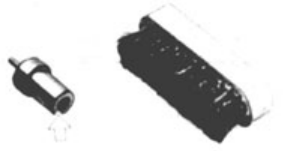
** Source: HWB



30 12 187

Cleaning Nozzles with Scraper Set (13 5 090)
– Nozzle Removed and Disassembled –
(Refer to "Disassembling and Assembling Combination Fuel Injector".)

Do not disassemble a nozzle with an injection begin sender.
Clean the face of a nozzle body with completely pushed in nozzle needle, using a brass brush.



21 13 151

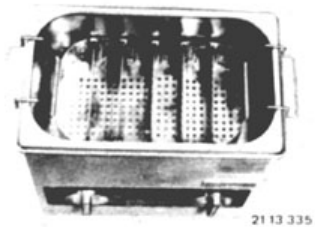
Pull out nozzle needle.
Important!
Nozzle needles and nozzle bodies are matched and must not be mixed up.

21 13 332

Run seat cleaner into the nozzle body and clean the seat by turning.

21 13 333

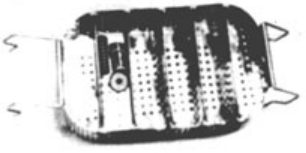
Run injection bore cleaner into the nozzle body and clean the injection bore in the nozzle body.
Wash the intermediate washer, nozzle body and nozzle needle with clean diesel fuel prior to assembling.



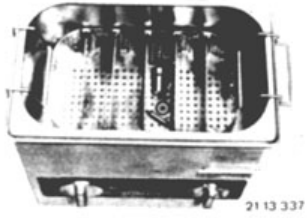
21 13 335

Ultrasonic Cleaning
– Nozzle Removed and Disassembled –
(Refer to "Disassembling and Assembling Combination Fuel Injector".)

Do not disassemble a nozzle with an injection begin sender.
Place the disassembled nozzle body and nozzle needles with thrust pad, springs and washers belonging to a set in a compartment of the cleaning tray.
Important!
Don't mix up components of combination fuel injectors.



21 13 336



21 13 337

Clean parts in the ultrasonic bath 10 to 20 minutes to operating instructions of the equipment with cleaner 13 6 202*.

21 13 338

Wash all cleaned parts including the nozzle body and nozzle needles with clean diesel fuel prior to assembling.

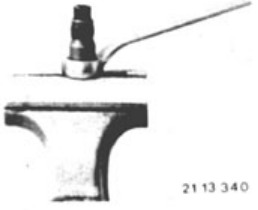
* Source of Supply: Cartool

2113 342

Disassembling and Assembling Combination Fuel Injector:
Important!
There is still no approval for disassembling an injection nozzle with an injection begin sender (DDE) due to the complicated adjustment of the inductive sender.

2113 339

Clamp the upper section (2 flat surfaces) of a combination fuel injector in a vise fitted with aluminum jaws.



2113 340

Loosen and unscrew lower section, lift off carefully and leave nozzle with washers on the upper section.

2113 341

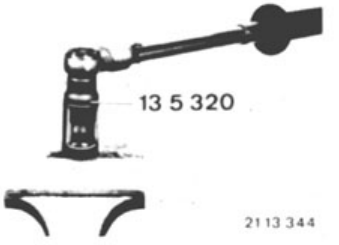
Important!
Protect all parts from getting dirty.
Clean parts.
All parts of one combination fuel injector must remain together and not be mixed up.
Replace heat shield each time an already used nozzle is disassembled.

2113 338

Adjusting Injection Nozzle:
Assemble the combination fuel injector with the old shim.

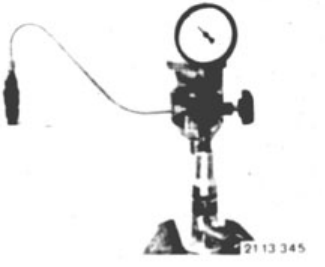
2113 343

Installed Order:
1 Nozzle holder upper section
2 Nozzle holder lower section (clamping nut)
3 Shim
4 Spring
5 Thrust pad
6 Intermediate washer
7 Nozzle needle
8 Nozzle body
9 Heat shield



2113 344

Important!
Make sure parts are absolutely clean when assembling.
Screw on nozzle holder lower section with Special Tool 13 5 320.
Tightening torque*.



2113 345

Check opening pressure – see "Checking Injection Nozzle" in 13 53 800.
Disassemble the combination fuel injector and replace the shim, if there is deviation from the nominal value*
Shims are available in thicknesses from 1.0 to 2.0 mm (0.039 to 0.079") in steps of 0.05 mm (0.002").
A 0.1 mm (0.004") thicker shim will increase the opening pressure by about 10 bar (142 psi).

* See Specifications

Replacing Seal of Combination Injection Nozzle:
Check condition of seal on injection nozzle and replace at the latest after nozzle had been removed and installed several times.

Clamp nozzle on surfaces of the upper section in a vise fitted with aluminum jaws.

Pry up seal with a screwdriver.

Cut off seal with a side snippers.

Push on new seal with inside curve facing up.

Prevent new seal from falling out prior to installation of the combination injection nozzle with a small amount of copper paste (1).**

Install combination injection nozzle in cylinder head carefully.

Seal can no longer be lost by tightening once with the specified torque*.

* See Specifications
** Source of Supply: HWB

TROUBLESHOOTING DIGITAL DIESEL ELECTRONICS (DDE)

1. Engine can not be started
2. Engine hard to start/coolant temp. 20° C (68° F)
3. Warm engine runs erratically at idle speed
4. Engine cuts out while driving
5. Unsatisfactory performance
6. Fuel consumption too high
7. Engine can not be stopped
8. Engine runs hard, black smoke in full load range
9. Foggy-type exhaust gas
10. Unsatisfactory idle from cold engine
11. Engine speed does not pick up in cold state
12. Distribution injection pump too hot
13. Engine stops on its own
14. Engine runs at fast idle speed
15. Engine runs max. 1200 rpm (or 1400 rpm with automatic)
16. Strong vehicle hesitation
17. Engine runs at fast speed
18. Warning lamp lights up

Requirements:
- Starting system okay (battery voltage, starter, ignition lock, etc.).
- Engine in perfect running condition (timing, compression).
- Specified fuel in tank (without contamination, winterproof).
- Connections, plugs and ground points according to wiring diagram.

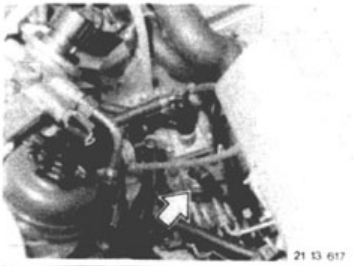
13 00 050 CHECKING IDLE SPEED

Requirements:
- Engine at operating temperature = oil temp. > 60° C (140° F)
- Valve clearance okay
- All electric equipment switched off

Read idle speed* on tachometer in the instrument cluster.
Read out fault memory of DDE self-diagnosis in case of deviation from nominal value.
If applicable, check basic adjustment of the pedal value sender.



13 51 300 CHECKING ELECTRIC FUEL SHUTOFF

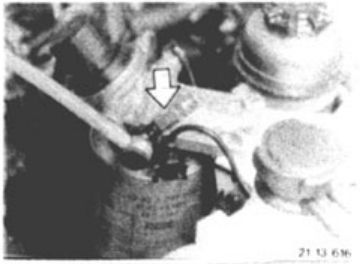
Power is supplied via the control unit to the shutoff from ignition key position DRIVE on. A loud click is heard as it is switched on to indicate this.

If no click is heard, check power supply to the control unit.
Further testing – see BMW diagnosing system.

It is possible to test the safety circuit with help of the BMW diagnosing system as from DDE II (1 control unit) on.
1. Select DDE (acknowledge).
2. Select 500 (acknowledge) – see BMW diagnosing system.

Check electric fuel shutoff in case of negative test results.
Check valve seat for dirt.

* See Specifications



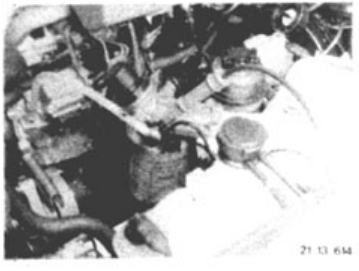
13 31 028 CHECKING FUEL FEED PRESSURE

Unscrew hollow union bolt on filter and install adapter 13 5 360.
Use seals.

M 21 13 282

Insert connector from adapter in grip for vacuum hose (service tester).

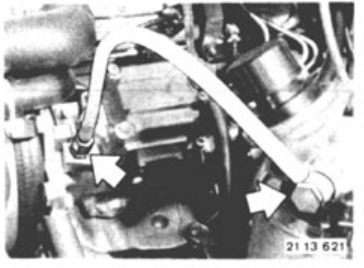
Start engine and check for leaks on connections.
Run engine at idle speed until the feed line has been bled.



Connect vacuum hose.
Perform multimeter test (M 21).
Read vacuum* at specified test speed*.

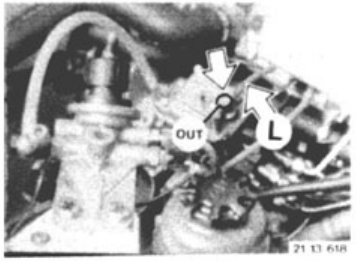
* See Specifications

Measured Vacuum* Exceeded:
Check
– fuel filter,
– lines to fuel tank and
– fuel intake.



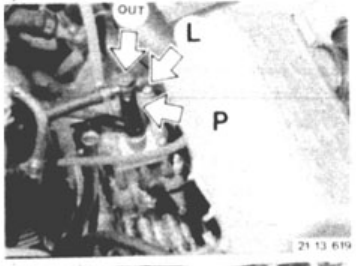
Remove adapter after testing.
System is bled automatically after starting the engine.
Check for leaks on feed line and connections.

* See Specifications

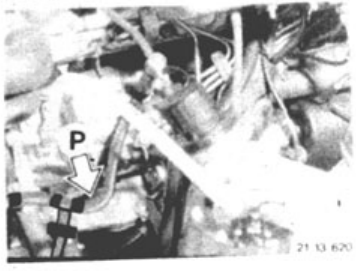


13 51 002 CHECKING INJECTION PUMP PRESSURE

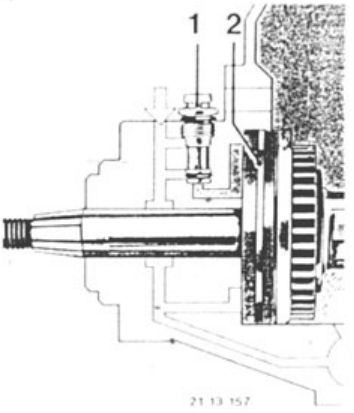
Pull off leak oil hose (L) on injection nozzle.
Unscrew hollow union bolt for return hose (OUT).



Mount test hose (P) with adapter 13 5 380 and gaskets.
Mount return hose on adapter with hollow union bolt "OUT".
Connect leak oil hose (L).



Connect BMW Service Tester on test hose (P).
Put in multimeter test M 19.
Start engine and check for leaks on connections.
Read pump internal pressure* at test speed*.



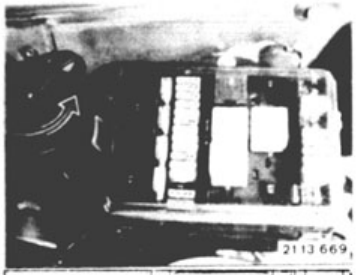
Information for Diagnosis:
Internal Pressure Too Low –
- Pressure control valve (1) faulty
- Insufficient delivery rate from fuel delivery pump

Remedy:
Replace injection pump.

Internal Pressure Too High –
- Hollow union bolt (OUT) for return hose plugged, clean if necessary.
- Pressure control valve faulty, replace injection pump if necessary

Wrong internal pressure will cause displacement of the injection timing.
Insufficient pressure will be noticed by lack of power and excessive pressure by hard engine running.

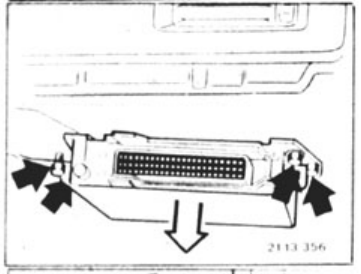
* See Specifications



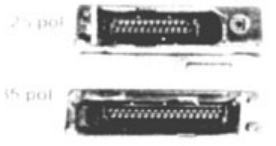
DDE
13 61 000 REMOVING AND INSTALLING CONTROL UNITS

Read fault memories – see BMW diagnosing system.

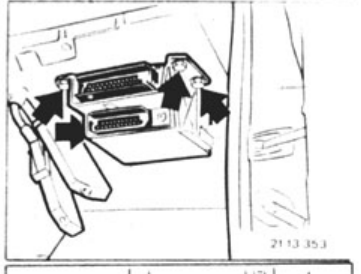
Note:
SB control unit
(25-pin connection)
responsible for:
- injection begin regulation
- self-diagnosis output
- exhaust gas recirculation



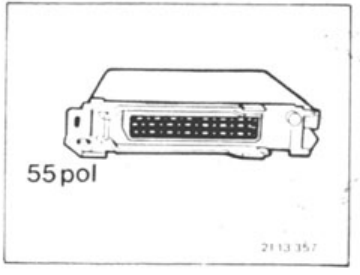
Unscrew cover in glove box.



ME control unit
(35-pin connection)
responsible for:
- start volume control
- volume regulation while driving
- smoke control
- fuel mass correction
- idle speed regulation
- road speed regulation
- automatic transmission activation
- charge pressure regulation
- hesitation control

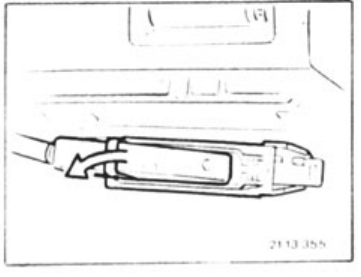


Unscrew screws and remove control units.



DDE II one control unit
(55-pin connection) with 2 computers
Computer I:
- injection begin regulation
- self-diagnosis output
- exhaust gas recirculation

Computer II:
- injection rate regulation with start volume control and full load volume limit
- speed regulation
- running regulation and hesitation control
- smoke control and overheating protection
- road speed regulation



Caution!
Turn off ignition before disconnecting or connecting multiple-pin plugs.

Construction group 13 Fuel system

2 BE Carburettor – 316 Model

	Component survey	13- 51
	Hose routing plan	13- 54
13 00 054	Engine idle speed and CO level – adjust	13- 55
13 11 100	Carburettor – remove and install	13- 56
111	Carburettor insulating flange – replace	13- 56
171	Carburettor cover gasket – replace (Job No. 13 11 241)	
241	Float needle valve	13- 57
. . .	Float level – adjust	13- 58
. . .	Idle speed correction jet – replace	13- 58
387	Compensating flap actuator – replace / check	13- 59
383	Throttle valve actuator – replace / check	13- 60
385	Throttle valve angle sender – replace / check	13- 63
389	Air valve – replace / check	13- 64
442	Vacuum box for stage II – remove and install	13- 64
13 31 009	Fuel pump pressure and float needle valve – check for leaks	13- 65
030	Fuel pump – replace	13- 65
. . .	Fuel filter screen – replace	13- 65
12 62 511	Intake pipe temperature sensor – replace / check	13- 65
13 61 000	Control unit – replace	13- 66
13 71 000	Air cleaner – remove and install	13- 66
13 72 001	Air filter cartridge – remove and install	13- 66
13 73 004	Warm air regulating throttle flap – check / adjust	13- 67
	2 BE carburettor – troubleshoot	13- 80
	Wiring diagram	13- 81
13 62 020	2 BE carburettor function check (electric periphery test)	13- 81

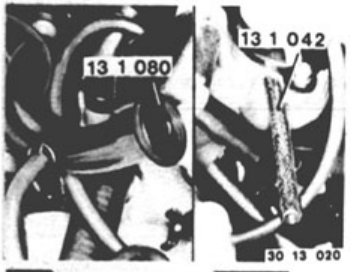
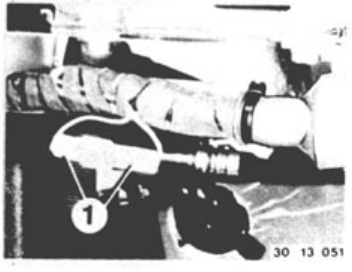
13 00 054 ADJUSTING ENGINE IDLE SPEED / CO TEST

Requirements for Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine in perfect running condition.
Air filter cartridge in perfect condition.
All extra equipment switched off.
BMW service test unit connected according to operating instructions.
Exhaust extraction system switched off for time of test.



Remove and install air cleaner 13 71 000.
Mount air cleaner simulator, Special Tools 13 1 042 and 13 1 080.

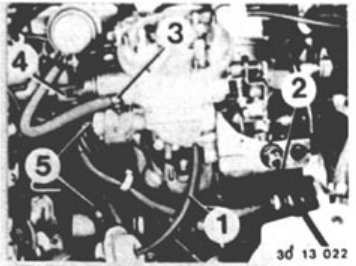


a) Idle Speed
Check engine idle speed*.
See "Troubleshooting" if nominal value is not reached.
Note:
There is no control screw for adjustment of the idle speed.
If customer desires, idle speed can be increased by connecting plug (1) on wire harness.

b) CO Test
Remove anti-tamper lock with Special Tool 13 1 011.
Adjust idle speed CO level* with screw located behind.
Replace anti-tamper lock after completing adjustments.

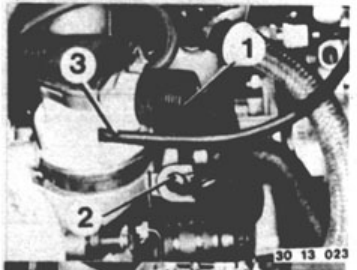
* See nominal value microfilm or Specifications

* See nominal value microfilm

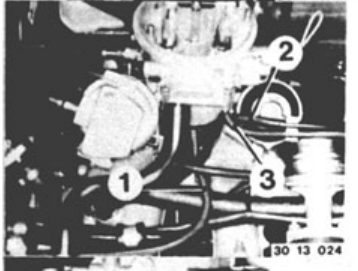


13 11 100 REMOVING AND INSTALLING CARBURETOR

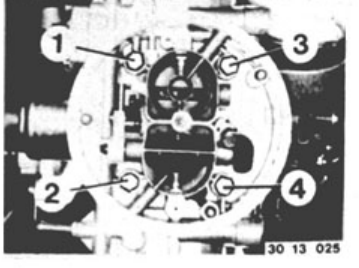
Remove and install air cleaner 13 71 000.
Pull off vacuum line (1).
Disconnect throttle cable (2).
See Groups 35, 24 and 65 for adjusting instructions.
Disconnect fuel line (3).
Pull off plugs (4 and 5).



Pull off plug (1).
Disconnect plug (2).
Pull off vacuum hose (3).
Make vacuum connections to hose routing plan on page 13 - 54.

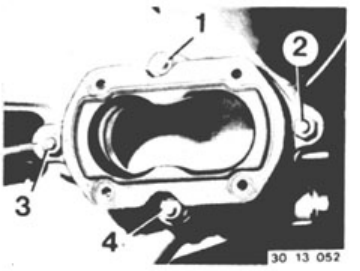


Pull off hoses (1 ... 3).
Make vacuum connections to hose routing plan on page 13 - 54.



Unscrew screws (1 ... 4).
Remove carburetor.
Installation:
Tightening torque*.
Check/adjust engine idle speed* and CO*.

* See Specifications

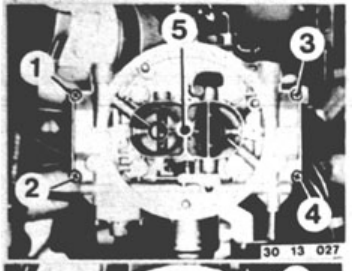


13 11 111 REPLACING INSULATING FLANGE FOR CARBURETOR

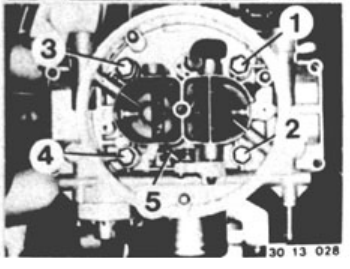
Remove and install carburetor 13 11 100.
Unscrew nuts (1 ... 4) and take off insulating flange.

13 11 241 REPLACING FLOAT NEEDLE VALVE

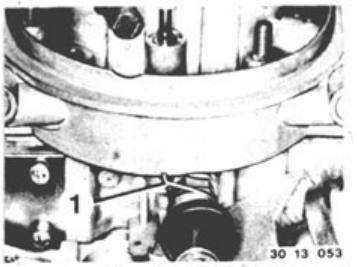
Remove and install air cleaner 13 71 000.
Disconnect fuel hose (1).



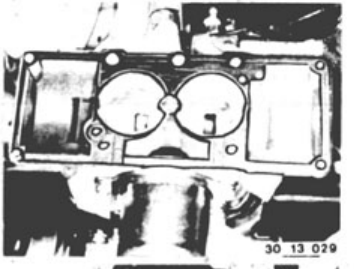
Unscrew screws (1 ... 4).
Unscrew screw (5).
Installation:
Tightening torque*.



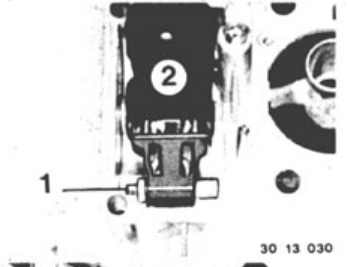
Unscrew screws (1 ... 4).
Disconnect connecting rod (5).
Installation:
Tightening torque*.



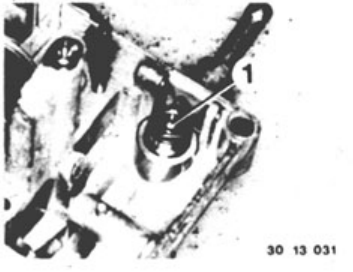
Remove carburetor cover and disconnect spring (1).
Connect spring with same preload (max. 1 turn) after finishing installation.



Installation:
Replace carburetor cover gasket.



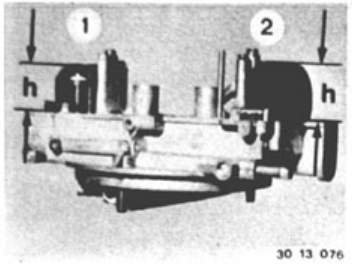
Pull out pin (1) and take off float (2).



Remove float needle valve (1).

* See Specifications

* See Specifications



30 13 076

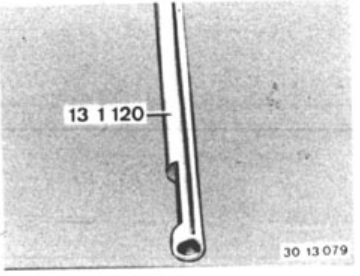
13 11 ... ADJUSTING (CHECKING) FLOAT LEVEL

Remove carburetor cover.
Check float level (h)* of float chambers I and II.
h = 27 to 29 mm (1.063 to 1.142") for float chamber stage I.
h = 29 to 31 mm (1.142 to 1.220") for float chamber stage II.
(The float needle valve must not spring in.)
If nominal value is not reached, check components and their installed position, replacing if necessary.
Check float weight* (5.9 to 6.5 grams), replacing if necessary.

* See Specifications

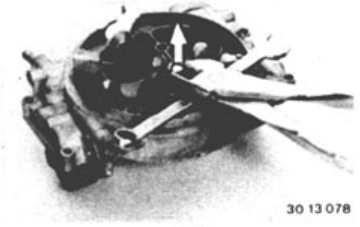
13 11 ... REPLACING IDLE SPEED CORRECTION JET

Remove carburetor cover (see "Replacing Float Needle").

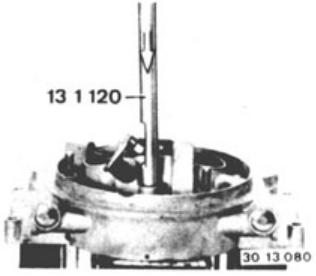


30 13 079

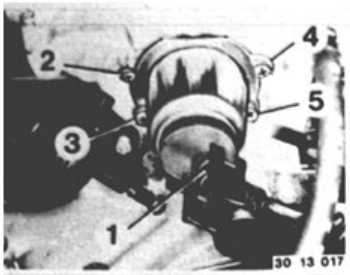
Place a flat iron bar or, for example, an open-ended wrench flat on the carburetor upper section, to avoid damaging the housing while pulling out the idle speed correction jet with a side snippers.
Never drive out the needle from underneath (carburetor would be damaged).
Drive in new idle speed air correction jet with Special Tool 13 1 120.
Check engine idle speed and CO level after assembling.



30 13 078

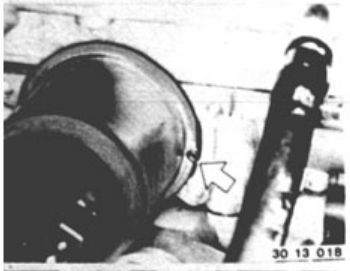


30 13 080

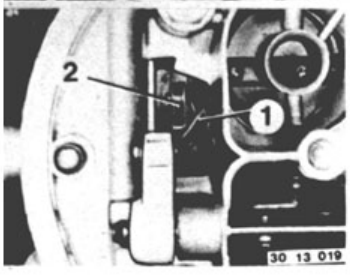


13 11 387 REPLACING INITIAL THROTTLE POSITIONER

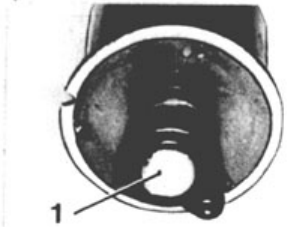
Remove and install air cleaner 13 71 000.
Pull off plug (1) on initial throttle positioner.
Unscrew screws (2 ... 5) and take off initial throttle positioner.



Installation:
Position of initial throttle positioner is given by shape.

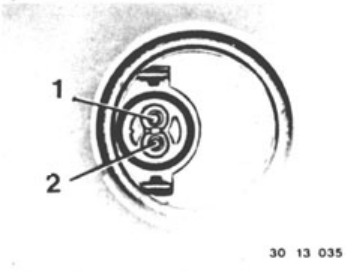


Installation:
Connect connecting rod (1) before tightening initial throttle positioner.
Check whether connecting rod (1) and lever (2) are positioned correctly.

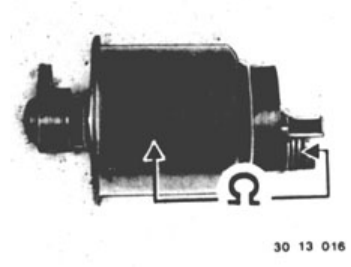


Checking Initial Throttle Positioner:
Check whether adjusting lever (1) moves easily and travels through complete angle range (320°).

Check movement of initial throttle positioner with initial throttle (1) and jet needle (2), repairing if movement is not easy.

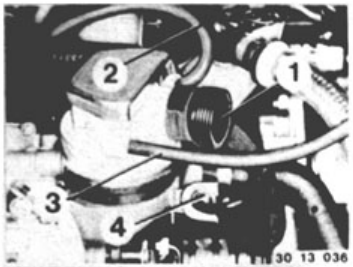


Electric Test:
Check resistance* between connections (1 and 2) with an ohmmeter.



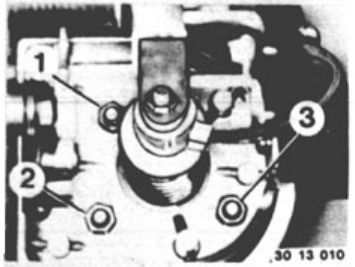
Insulating Resistance:
Check resistance* between housing and both plug connections.

* See Specifications

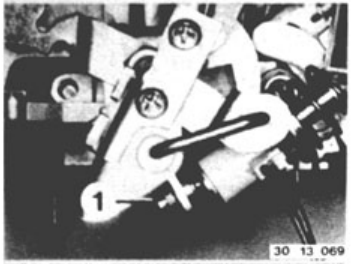


13 11 383 REPLACING / CHECKING THROTTLE POSITIONER

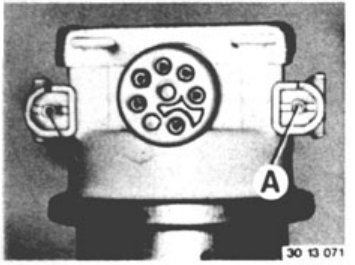
Remove and install air cleaner 13 71 000.
Pull off plug (1).
Pull off vacuum line (2/discharging) and vent line (3/charging).
Disconnect plug (4).



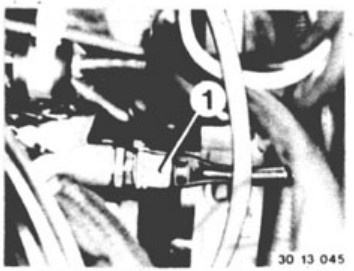
Unscrew nuts (1 ... 3) and take off throttle positioner.
Installation:
Make basic adjustment after finishing installation.



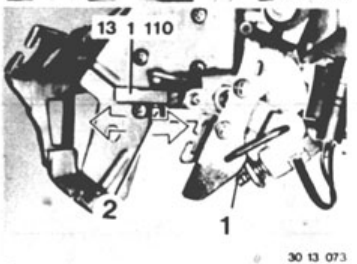
Throttle Positioner Basic Adjustment:
Screw a new adjusting screw (1) in lifting position.



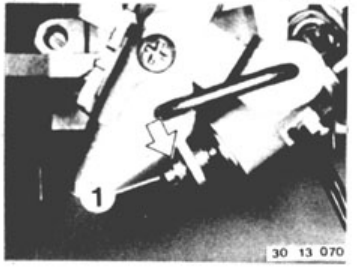
Apply vacuum of approx. 250 (at least 200) mbar on connection (A/discharging).
Vacuum must be held constant.



Pull off plug (1) on intake air pipe temperature sensor and install wire bridge in plug (1).
Turn on ignition.

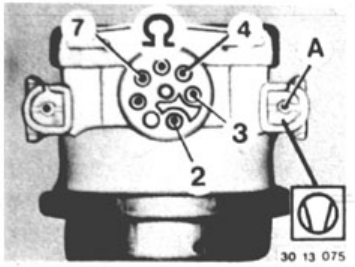


Screw in screw (1) so far until Special Tool 13 1 110 can be moved back and forth quickly between coasting stop (2) and throttle stop screw.
Throttle positioner should not operate when applying special tool.



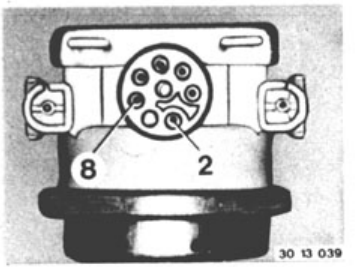
Cut off head of adjusting screw (1) after finishing adjustments.
Check/adjust engine idle speed* and CO*.

* See Specifications



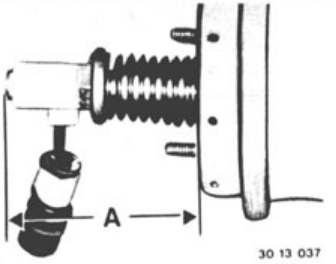
30 13 075

Checking Throttle Positioner
– Leak Test –
Apply voltage (B +) on plug socket (2).
Apply ground on plug socket (3).
Valve opens.
Connect vacuum on connection (A) (throttle positioner moves in) and keep discharging until ohmmeter displays a value between 500 and 700 ohms.
Remove ground from plug socket (3).
Valve closes.
Remove vacuum from connection (A).
Replace throttle positioner, if ohm value display changes by more than 200 ohms within 1 minute.



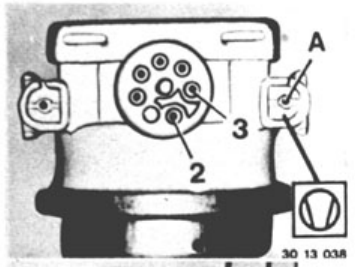
30 13 039

Apply voltage (B +) on plug socket (2).
Apply ground on plug socket (8).
Throttle positioner will be charged and moves out.
Max. moving out time: 1 second.



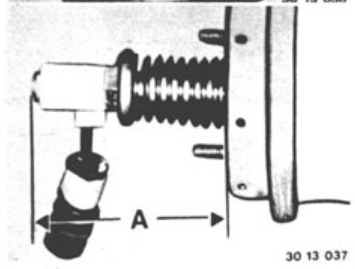
30 13 037

Check distance A = 69.5 ... 71.5 mm (2.736 ... 2.815") (with released idle speed switch).
Replace throttle positioner, if moving out distance (A) or moving out time is not correct.



30 13 038

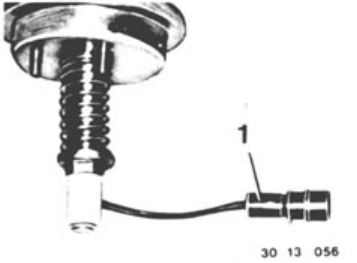
Checking Moving In Distance and Moving In Time:
Apply a constant vacuum of approx. 250 mbar on connection (A/discharging).
Apply voltage (B+) on plug socket (2).
Apply ground on plug socket (3).
Throttle positioner moves in quickly.
Max. moving in time: 1 second.
A check valve is located behind vacuum connection (A).
Check valve must keep fuel vapors away from the electric valve.



30 13 037

Remove voltage from throttle positioner.
Switch off vacuum pump.
Check distance A = 55.8 ... 59.1 mm (2.196 ... 2.327") (idle speed switch released).
Replace throttle positioner, if moving in time or distance (A) is not correct.

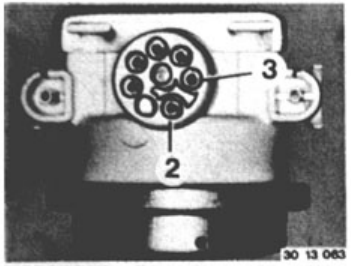
* See Specifications



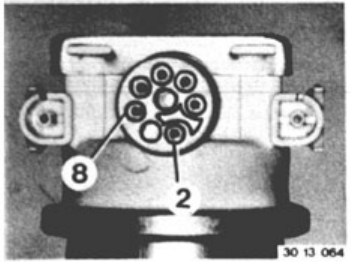
30 13 056

Check resistance* of idle speed switch between plug connections on plug (1).

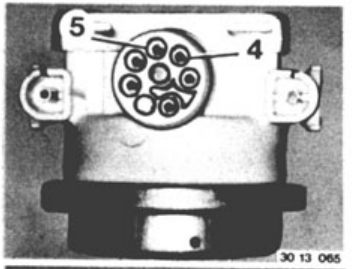
* See Specifications



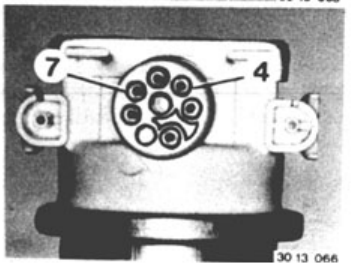
Checking Resistance of Valves
– Discharging Valve –
Check resistance* between plug connections (2 and 3).
Replace throttle positioner, if nominal value is not reached.



– Charging Valve –
Check resistance* between plug connections (2 and 8).
Replace throttle positioner, if nominal value is not reached.



Checking Potentiometer Resistance
– Total Resistance –
Check resistance* between plug connections (4 and 5).
Replace throttle positioner, if nominal value is not reached.

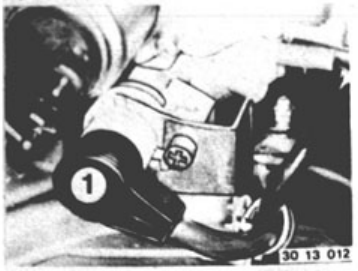


– Loop Resistance –
Check resistance* between plug connections (4 and 7).
Pull back throttle positioner slowly – resistance value should drop continuously.
Check resistance* between plug connections (4 and 7) in run in state.
Replace throttle positioner, if nominal values are not reached.

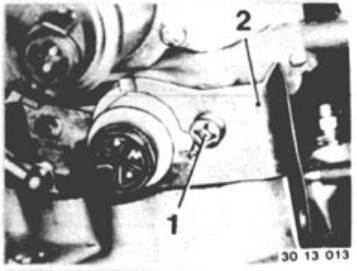
* See Specifications

* See Specifications

13 11 385 REPLACING / CHECKING THROTTLE POTENTIOMETER

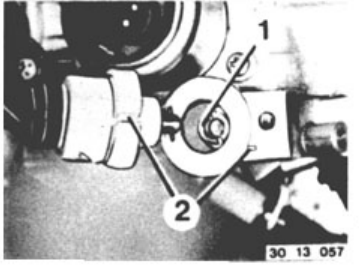


Pull off plug (1) on throttle potentiometer.



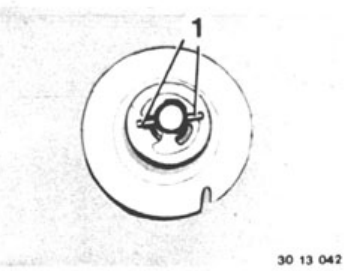
Unscrew bolt (1) and take off holder (2).
Remove throttle potentiometer.

Check coupling (1) between throttle potentiometer and throttle shaft, replacing if necessary.

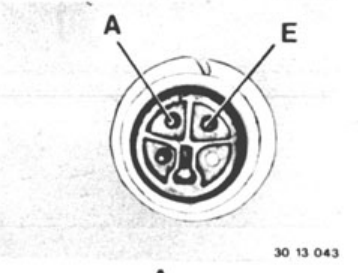


Installation:
Check for correct fit of coupling (1) and arresting slots (2).

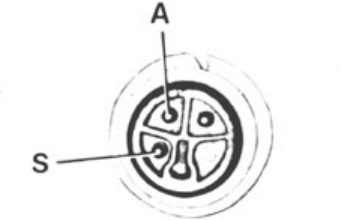
* See Specifications



Checking Throttle Potentiometer:
Check drag lever (1) for easy movement and full angular travel (approx. 90°).
Check spring force of return spring.

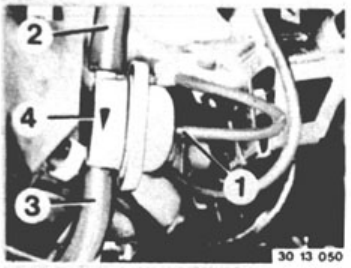


Electric Test:
– Total Resistance –
Check resistance* between plug sockets (E and A).
Replace throttle potentiometer, if nominal value is not reached.



– Loop Resistance –
Check resistance* between plug sockets (E and S) in coasting and full load positions while installed.

* See Specifications

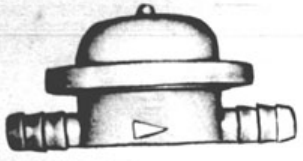


30 13 050

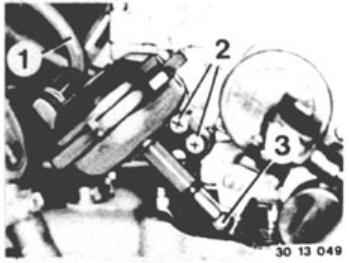
13 11 389 REPLACING / CHECKING COASTING AIR VALVE

Pull off vacuum control hose (1).
Pull off hoses (2 and 3).
Take off air valve (4).

Installation:
Check direction of flow (printed arrow).
Arrow must face toward the intake manifold.
Testing:
Coasting air valve installed.
Run engine.
Increase speed to about 3,000 rpm and shut the throttle valve quickly.
Coasting air valve must switch and open.



30 13 014

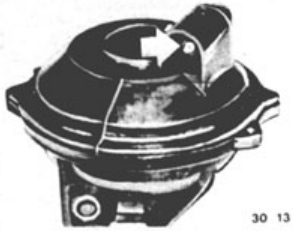


30 13 049

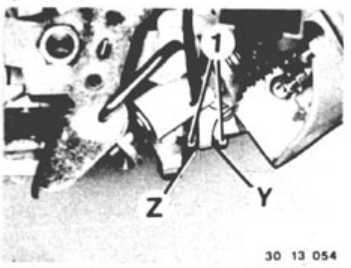
13 11 442 REMOVING AND INSTALLING VACUUM BOX FOR STAGE II

Pull off vacuum hose (1).
Unscrew screws (2).
Disconnect ball-head (3) and take off vacuum box.

Checking Vacuum Box:
Pull off hose on vacuum box.
Supply approx. 300 mbar vacuum to the vacuum box.
Replace vacuum box, if the vacuum drops.



30 13 055



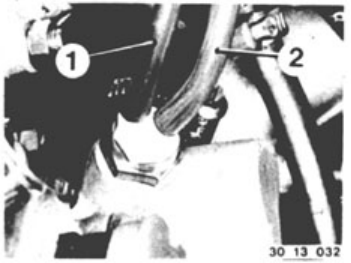
30 13 054

Checking/Adjusting Release and Return of Stage II:
Requirement: throttle valve drive in coasting position.
Vacuum box of stage II ventilated.
Throttle valve of stage II closed.
Adjust distances (Y and Z)* by bending fork (1).
Measure at tightest points.

Throttle Valve Drive Coasting Position:
Pinch the ventilating hose shut with Special Tool 13 3 010.
Start and stop engine again.
Throttle valve drive is in coasting position.

30 13 062

Checking Temperature Valve:
Supply vacuum to temperature valve.
Temperature $<45^{o}$ C (113° F) ⏀ valve closed.
Temperature $>61^{o}$ C (142° F) ⏀valve opened.
(Heat temperature valve to testing temperatures in a water bath.)
A restriction bore in the temperature valve opens a bypass even in closed state (slight leak air).



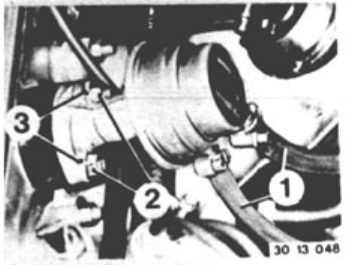
30 13 032

Removing and Installing Temperature Valve:
Disconnect vacuum hoses (1 and 2).
Unscrew and remove temperature valve.
Installation:
Tightening torque*.
See hose routing plan for vacuum connections.

* See Specifications

13 31 009 CHECKING FUEL PUMP PRESSURE AND FLOAT NEEDLE VALVE FOR LEAKS

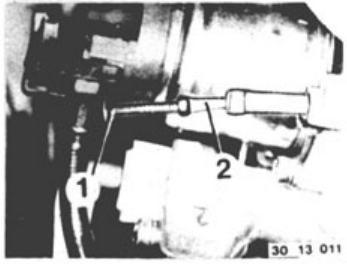
Remove air cleaner – see 13 71 000.
Connect 10 bar (142 psi) pressure tester (BMW Service Tester) between fuel pump and carburetor.
Run engine at idle speed.
Check fuel pressure*.



13 31 030 REPLACING FUEL PUMP

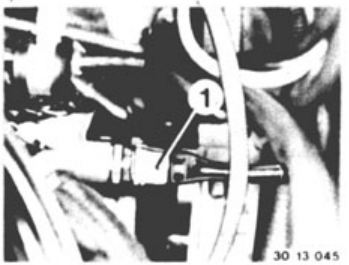
Remove air cleaner – see 13 71 000.
Unscrew fuel hoses (1).
Unscrew nuts (2).
Check insulators (3), replacing if necessary.

Fuel Filter Screen in Fuel Connection:
Remove air cleaner – see 13 71 000.
Loosen hose clamp and pull off fuel hose (1).



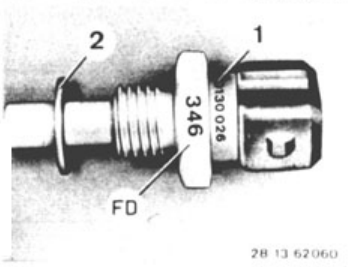
Pull out fuel filter screen with a M 3 screw.

* See Specifications

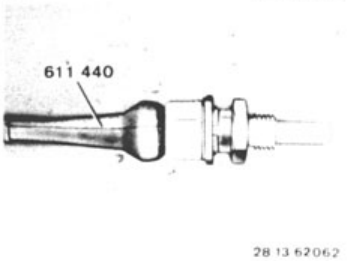


13 62 511 REPLACING / CHECKING INTAKE PIPE TEMPERATURE SENSOR

Pull off plug (1).
Unscrew temperature sensor.
Installation:
Tightening torque*.

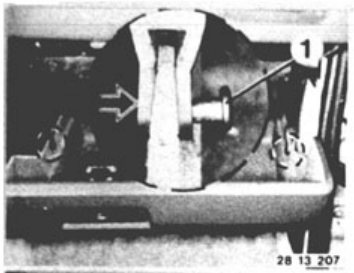


Installation:
Check seal (1), replacing if necessary.
Check code number (2)*.



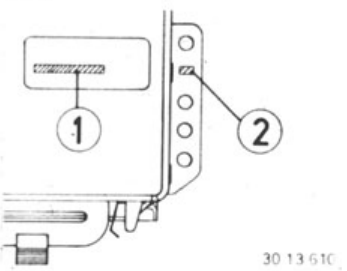
Checking Temperature Sensor:
Connect Jetronic test leads 61 1 440 on the temperature sensor.
Heat temperature sensor to testing temperature* in a water bath and check nominal values*.

* See Specifications

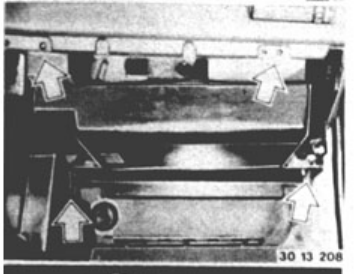


13 61 000 REPLACING CONTROL UNIT

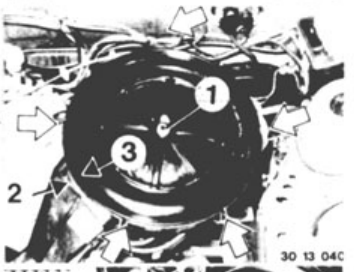
Disconnect battery on ground pole.
Open glove box.
Pull out pins (1) of both retaining straps.



Installation:
Check code number (1)* and manufacturing date (2)*.
Adjust engine idle speed* and CO level*.



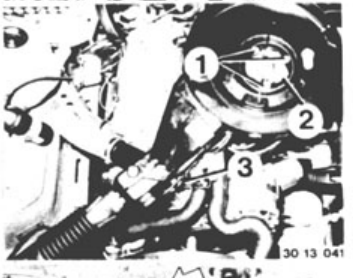
Unscrew bolts and lay cover aside.



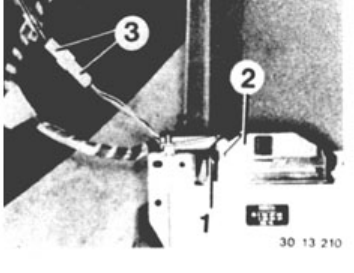
13 71 000 REMOVING AND INSTALLING AIR CLEANER

Unscrew nut (1).
Open clamps and take off cover.
Note:
Arrows (2 and 3) face each other.

Unscrew bolts.



Take out air filter cartridge.
Unscrew nuts (1) and take off retainer (2).
Unscrew nut (3).
Pull off hoses and take off air cleaner housing.
Installation:
See hose routing plan on page 13 - 54 for hose connections.



Push back retainer (1) and pull out multiple pin plug (2).
Installation:
Plugs (3) must be connected.
Check for correct connection of plugs (polarity).

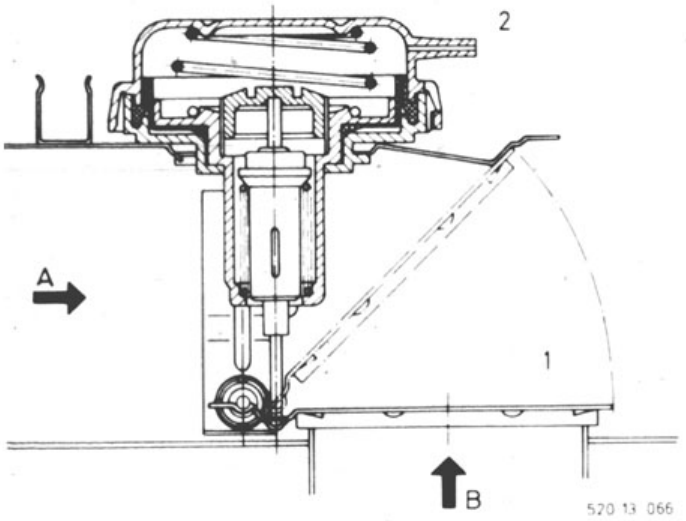
13 72 001 REMOVING AND INSTALLING AIR FILTER CARTRIDGE

See 13 71 000.

* See Specifications or Nominal Value Microfiche

13 73 004 CHECKING / ADJUSTING THROTTLE PLATE FOR WARM AIR REGULATION

1 = Air plate
2 = Vacuum connection
A = Cold air
B = Warm air



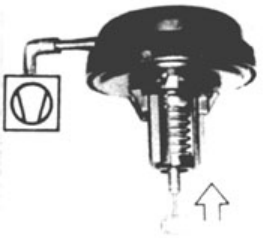
520 13 066

Function of Vacuum Box:
(without air flow and at ambient temperature of approx. + 5° C / 41° F)

Cold air closed as of vacuum of 140 ± 10 mbar.
Warm air closed as of vacuum of 70 ± 10 mbar.

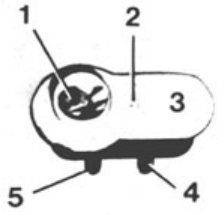
Function of Thermostats:
(with non-functioning vacuum box)

Cold air closed as of ambient temperature of – 20 to – 18° C (– 4 to 0° F).
Warm air closed as of ambient temperature of + 5 to + 3° C (+ 41 to + 37° F).



30 13 068

Checking Vacuum Box:
Supply approx. 300 mbar vacuum to the vacuum box.
The drive lever must move in completely and the vacuum must not drop.



30 13 058

The warm air bore must be closed by the air plate with the engine running and having operating temperature.
There is a fault in the temperature regulator (3), if this position is not reached.
Bores (1 and 2) must not be plugged (dirt).
Brass connection (4) for vacuum box.
Plastic connection (5) for intake pipe connection.

TROUBLESHOOTING FUEL SYSTEM 2 BE

Control Unit No. 0 260 200 002

Testing Requirements:
Engine in perfect running condition (timing, compression, etc.).
Ignition in perfect condition (ignition timing, ignition system, spark plugs, etc.).
Starting in perfect condition (battery voltage, starter, leads, etc.).
Fuel in tank.

1) Engine does not start or hard to start (engine temperature ≤ 20° C/68° F)
2) Engine does not start or hard to start (engine temperature ≥ 60° C/140° F)
3) Engine starts but stops again
4) Unsmooth idling during warm-up phase
5) Idle speed not correct
6) Acceleration hesitation
7) Constant speed hesitation
8) Driving behavior in coast
9) Poor engine pickup
10) Fuel consumption too high
11) Emissions too high at idle speed (CO/HC)
12) Emissions too low at idle speed (CO/HC)
13) Power output insufficient
14) Cold idle speed too high/too low
15) Carburetor floods

13 60 020 FUNCTION CHECK FOR 2 BE CARBURETOR (PERIPHERY TEST)

A periphery test for 2 BE systems is given on the following pages.
All measurements are made with test adapter 12 5 460.
Caution!
Do not check with test clips direct on wire harness plug – danger of damaging plug sockets.
Specified nominal values are in reference to testing with BMW service test unit and digital tester II.

Checking ground and voltage supply of control unit.

Connect test adapter on wire harness.
Connect ohmmeter between term. 5 or 16 and vehicle ground.
Ohmmeter must display approx. 0 ohm.
Ohmmeter displaying approx. 0 ohm?

no → Check and repair wires and wire connections.

yes ↓

Connect voltmeter between terminals 5 and 4.
Voltmeter must display battery voltage as from "ignition turned on".
Voltmeter displaying battery voltage?

no → Check and repair wires and wire connections of 3-pin wire harness branch.

yes ↓

Turn off ignition.
Bridge terminals 16 and 20 with piece of wire.
Is there battery voltage between 5 and 18 or 5 and 35?

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

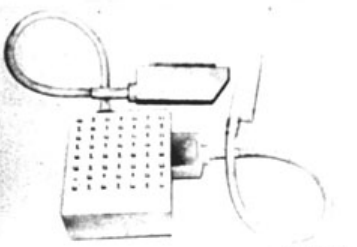
yes → Replace relay.

yes ↓

(Terminals 16 and 20 bridged.)
Is there battery voltage between terminals 33 or 34 and 5?

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

yes → Check throttle positioner.



13 63 007

Checking compensating flap actuator.

→ Connect test adapter on wire harness. Connect ohmmeter between terminals 14 and 15. Ohmmeter displaying nominal value*?

— no → Check and repair wires and wire connections. Are wires and wire connections okay?

— yes → Replace compensating flap actuator.

Compensating Flap Actuator Nominal Values:
0.9 ... (1.3) ... 1.7 ohms

Checking idle speed switch.

→ Connect test adapter on wire harness. Connect ohmmeter between terminals 2 and 5. Ohmmeter displaying nominal value*? (Idle speed switch pressed/accelerator pedal in idle position.)

— no → Check and repair wires and wire connections. Are wires and wire connections okay?

— yes → Replace throttle positioner (idle speed switch).

yes

↓

Operate accelerator pedal (lever lifts off of idle speed switch). Ohmmeter displaying nominal value*? (Idle speed switch released.)

— no → Check and repair wires and wire connections. Are wires and wire connections okay?

— yes → Replace throttle positioner (idle speed switch).

Idle Speed Switch Nominal Values:
Pressed = ∞ ohms
Released = approx. 0 ohm

* Also refer to Specifications

Checking throttle positioner. Potentiometer.

→ Connect test adapter on wire harness.
Pull off plug on throttle potentiometer.
Connect ohmmeter between terminals 6 and 9.
Ohmmeter displaying nominal value*?

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

yes → Replace throttle positioner.

yes ↓

Throttle positioner run out fully (shutting off function).
Connect ohmmeter between terminals 6 and 28.
Ohmmeter displaying nominal value*?

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

yes → Replace throttle positioner.

yes ↓

Throttle positioner in coasting position.
Install wire bridge between 16 and 20.
Install wire bridge between 5 and 33.
Apply approx. 250 (at least 200) mbar vacuum on discharging connection of throttle positioner – throttle positioner runs in.
Connect ohmmeter between terminals 6 and 28.
Ohmmeter displaying nominal value*?
Remove wire bridges.
Connect plug on throttle potentiometer.

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

yes → Replace throttle positioner.

Potentiometer Nominal Values:

Term. Contr. Unit	Term. Thr. Pos.	Coasting Position	Starting Position
6 ... 9	4 ... 5	1400 ... (2000) ... 2600 ohms	
6 ... 28	4 ... 7	0 ... 500 ohms	900 ... 1900 ohms

* See Specifications

Checking throttle positioner. Solenoid valves.

→ Connect test adapter on wire harness.
– Discharging Valve –
Connect ohmmeter between terminals 18 or 35 and 33.
Ohmmeter displaying nominal value*?

no → Check and repair wires and wire connections.
Are wires and wire connections okay?

yes → Replace throttle positioner.

yes

– Charging Valve –
Connect ohmmeter between terminals 18 or 35 and 34.
Ohmmeter displaying nominal value*?

no → Check and repair wires and wire connections.

yes → Replace throttle positioner.

Throttle Positioner Nominal Values:
Solenoid Valves

Terminals Control Unit	Terminals Throttle Positioner	
18/35 ... 33	3 ... 2	35 ... (52.5) ... 80 ohms
18/35 ... 34	8 ... 2	35 ... (52.5) ... 80 ohms

* See Specifications

Checking throttle potentiometer.

Connect test adapter on wire harness.
Pull off plug on throttle positioner.
Connect ohmmeter between terminals 6 and 9.
Ohmmeter displaying nominal value*?
Connect plug on throttle positioner.

no → **Check and repair wires and wire connections.** Are wires and wire connections okay?

yes → **Replace throttle potentiometer.**

yes

Throttle in coasting position.
Install wire bridge between 16 and 20.
Install wire bridge between 5 and 33.
Apply approx. 250 (at least 200) mbar vacuum on discharging connection (vacuum line to carburetor) of throttle positioner – throttle positioner moves in.
Pull off plug on throttle positioner.
Connect ohmmeter between terminals 6 and 7.
Ohmmeter displaying nominal value*?

no → **Check wires and wire connections, or repair.** Are wires and wire connections okay?

yes → **Replace throttle potentiometer.**

yes

Accelerator pedal in full throttle position (for cars with autom. transm. past kickdown point).
Connect ohmmeter between terminals 6 and 7.
Ohmmeter displaying nominal value*?
Connect plug on throttle positioner.
Remove wire bridges.
Disconnect vacuum pump.

no → **Check and repair wires and wire connections.** Are wires and wire connections okay?

yes → **Replace throttle potentiometer.**

Throttle Potentiometer Nominal Values:

Term.	or	Coasting Pos.	Full Thr. Pos.
6 — 9	E — A	1400 — (2000) — 2600 ohms	
6 — 7	A — S	0 — 250 ohms	1300 — 2500 ohms

* See Specifications

Checking ignition control valve. Ignition switching.

→ Connect test adapter on wire harness. Connect ohmmeter between terminals 35 or 18 and 21. Ohmmeter displaying nominal value*?

— no → Check and repair wire and wire connections. Are wires and wire connections okay?

— yes → Replace ignition control relay.

yes ↓

Ignition control still malfunctioning:
- Check idle speed switch
- Check intake pipe temperature sensor
- Check control unit
- Check vacuum lines

Ignition Control Relay Nominal Values:
20 — (31.5) — 50 ohms

Checking intake pipe temperature sensor.

→ Connect test adapter on wire harness. Connect ohmmeter between terminals 22 and 23. Ohmmeter displaying nominal value*?

— no → Check code number* (0 280 130 026). Check and repair wires and wire connections. Are wires and wire connections okay?

— yes → Replace intake pipe temperature sensor.

Intake Pipe Temperature Sensor Nominal Values:

°C (°F) : 1 (2)	= k-ohms
– 10 (+ 14)	= 8.2 — 10.5
+ 20 (+ 68)	= 2.2 — 2.7
+ 80 (+ 176)	= 0.3 — 0.36

* See Specifications

Construction group 13 Fuel system

M40 Engine – Models:
318i Cat. Conv. / Cat. Conv. Provisions and 316i since 9/88

13 00 060	Engine idle speed and CO level – check (cat. conv.)	13-	90
060	Engine idle speed and CO level – check (cat. conv. provisions)	13-	91
13 31 029	Fuel delivery pressure – check	13-	92
. . .	Fuel delivery rate – check	13-	92
030	Fuel pump – remove and install	13-	93
13 32 051	Fuel filter – remove and install	13-	94
13 41 000	Idle control valve – remove and install	13-	95
13 51 200	Fuel pressure regulator – remove and install	13-	96
. . .	Fuel pressure regulator (fuel injection pressure) – check	13-	96
13 54 030	Throttle valve neck – remove and install	13-	97
13 63 544	Throttle valve switch – adjust	13-	98
551	Throttle valve switch – remove and install	13-	98
13 64 501	Fuel injector – remove and install	13-	99
	Fuel injection system – troubleshoot	13-	900
	Pin allocation DME control unit	13-	930

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL

M 40
Engines with M 1.3 Motronic

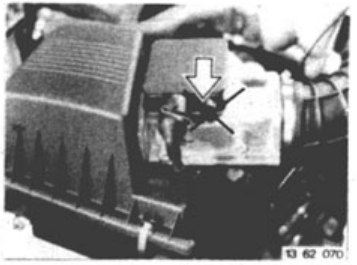
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Engine and ignition in perfect running condition.
Connect BMW Service Tester to operating instructions.
A routine check is not necessary.
Put in number of cylinders (4) for idle speed engine test step no. 5.

1) Engine Idle Speed
Check engine idle speed**.
See BMW diagnosing system, if nominal value is not reached.
Check intake system for leaks.

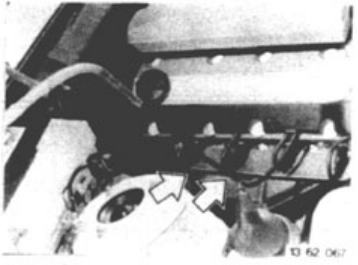
Note:
There is no adjusting screw for idle speed regulation.
Clicking of the idle control valve must be heard and felt when turning on the ignition.

2) Emission Test
Disconnect oxygen sensor plug (not in cars with cat. conv. provisions).
Unscrew bolts.
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Check the idle speed CO level**.
Switch off exhaust extraction for time of testing.
CO Level Too High:
Check fuel injectors, fuel pressure and coolant temperature sensor.
CO Level Too Low:
Check hoses and connections for idle speed control or find air leak points.

** See Nominal Value Microfiche



Important!
Adjustments may not be made on the air flow sensor adjusting screw, since this adjustment is the basis for oxygen sensor or idle speed drive control.

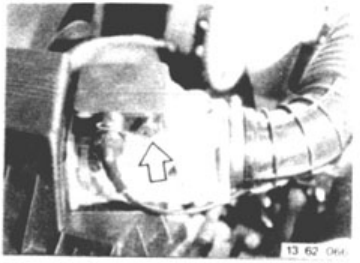


Checking Function of Oxygen Sensor (11 78 010):
Unscrew bolt (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction for time of emission testing.
Disconnect oxygen sensor plug.
Clamp the vacuum hose (not while engine is running).
Start the engine - CO level rises.
Connect oxygen sensor plug - CO level should go back to the nominal value.
Remove clamp.

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL (Cars with Provisions for Cat. Conv. Opration)

M 40
Engines with M 1.3 Motronic

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Engine and ignition in perfect running condition.
Connect BMW Service Tester to operating instructions.
Put in number of cylinders (4) for idle speed engine test step no. 5.
A routine check is not necessary.



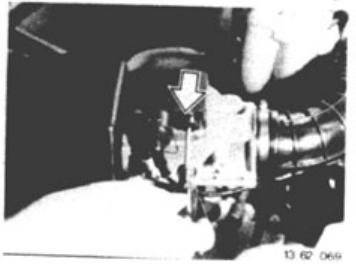
If the nominal value is not reached, first check whether there are faults in the engine, ignition or fuel injection systems before correcting the CO level.

CO Level Too High:
Check
- fuel injectors,
- fuel pressure and
- coolant temperature sensor.

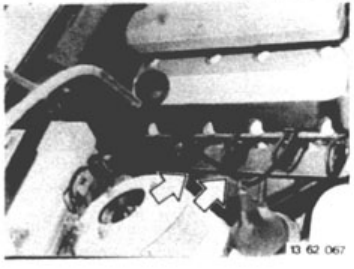
CO Level Too Low:
Check hoses and connections for idle speed regulation and find air leak points.
Also refer to BMW diagnosing system.

1) Engine Idle Speed
Check engine idle speed**.
See BMW diagnosing syste, if the nominal value is not reached.
Check intake system for leaks.

Note:
There is no adjusting screw for idle speed regulation.
Clicking of the idle control valve must be heard and felt while turning on the ignition.



Remove cap with Special Tool 13 1 011.
Adjust CO level** with a screwdriver applied on the adjusting screw in the air flow sensor.



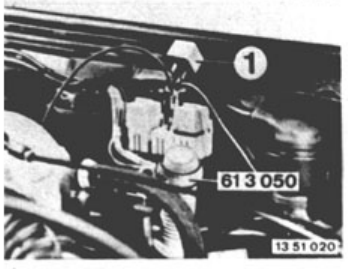
2) Emission Test
Unscrew bolts.
Connect Special Tool 13 0 100 in tailpipe or on exhaust manifold.
Chec the idle speed CO level**.
Switch off exhaust extraction for time of testing.
If the nominal value is not reached, the CO level** of cyl. 1 and 2 or cyl. 3 and 4 can also be tested separately for troubleshooting.

** See Nominal Value Microfiche

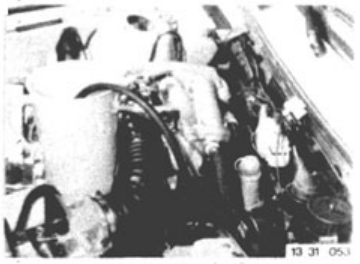
** See Nominal Value Microfiche

13 31 029 CHECKING FUEL DELIVERY PRESSURE

M 40:
Install pressure tester 13 3 060 with connecting hose and t-adapter 13 3 064 in the fuel feed hose – in front of the fuel pressure regulator.
Shut the fuel return hose with Special Tool 13 3 010.

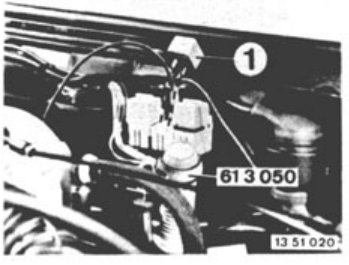


Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Check delivery pressure*.



13 31 ... CHECKING FUEL DELIVERY RATE

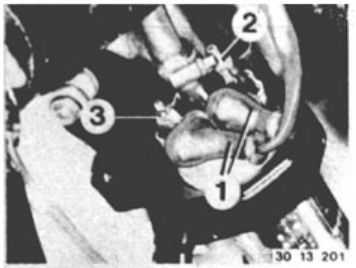
M 40:
Disconnect fuel return hose, install an extension hose and hold end of hose in measuring glass 13 3 020.



Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.

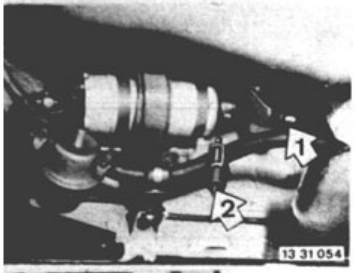
* See Specifications of Gr. 16

* See Specifications of Gr. 16



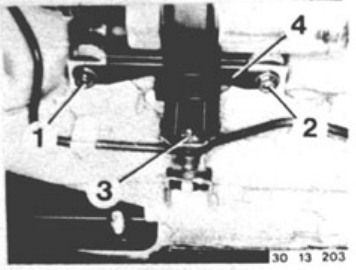
13 31 030 REMOVING AND INSTALLING FUEL PUMP

M 40:
Push back caps (1).
Unscrew nuts (2 and 3) and take off electric leads.



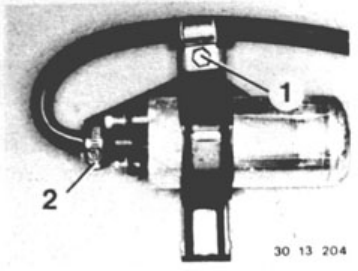
Clamp suction hose (1) and pressure hose (2) with Special Tool 13 3 010.
Loosen hose clamp (3) and pull off hoses.

Note:
Never use squeeze-hose clamps for installation of the pressure hose.

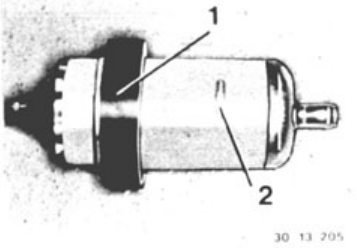


Unscrew nuts (1 ... 3) and take off holder (4).
Take off fuel pump with holder.

Installation:
Check rubber mounts, replacing if necessary.



Unscrew bolt (1).
Loosen hose clamp (2) and pull off fuel hose.
Take fuel pump off of holder.

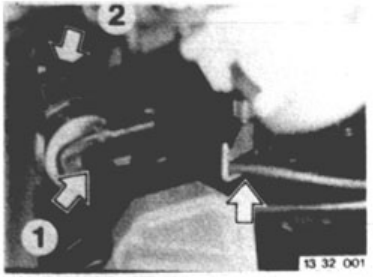


Pull off rubber ring (1).

Installation:
Check code number (2)*.

Intank fuel pump since 3/88 or 1989 models – see Group 16 in Model Repair Manual.

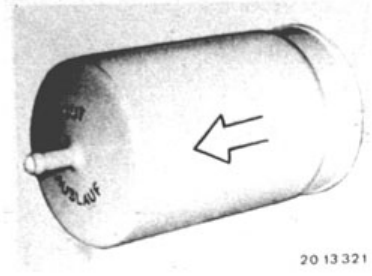
*** See Specifications**



13 32 051 REMOVING AND INSTALLING FUEL FILTER

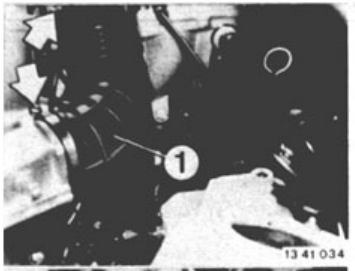
E 30 / M 40:
Pinch fuel feed hose shut in front of and behind the filter with Special Tool 13 3 010.
Unscrew bolts.
Loosen hose clamps (1 and 2).

Pull off fuel hoses.
Remove fuel filter.

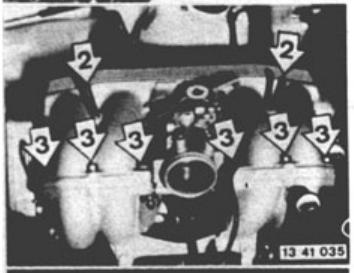


Installation:
Check direction of flow (arrow).

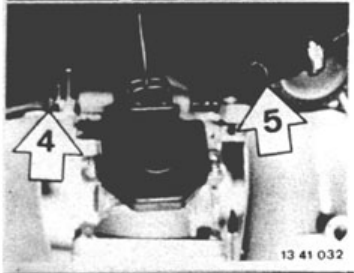
13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE



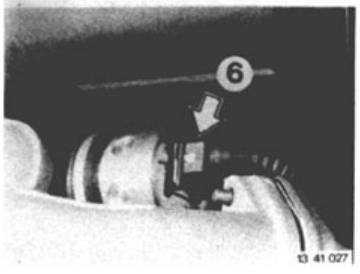
M 40:
Pull off hose (1).



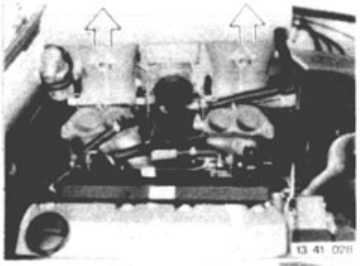
Unscrew bolts (2).
Unscrew nuts (3).



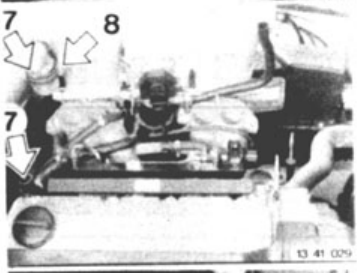
Disconnect hoses (4 and 5).



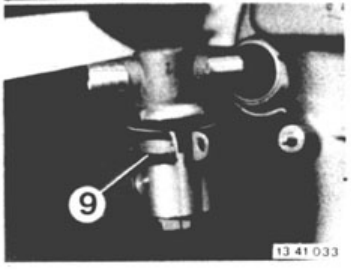
Pull off plug (6).



Pull out and fold up upper section of the intake manifold.
Installation:
Replace gasket.



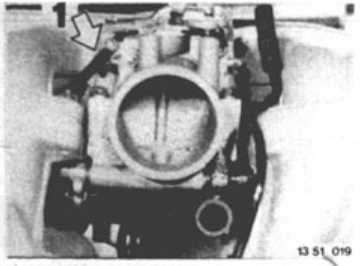
Disconnect hose (7).
Unscrew bolt (8).



Remove idle speed control valve.
Installation:
Check code number (9).
Check idle speed**.

Checking:
The clicking of the idle speed control valve must be heard and felt when turning on the ignition.
Check electric connections – see BMW self-diagnosis.

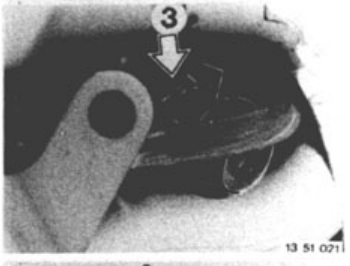
** See Nominal Value Microfiche



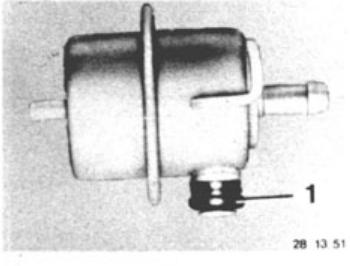
13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

M 40:
Pull off vacuum hose (1).

Unscrew bolts (2).
Pull out and turn fuel pressure regulator.



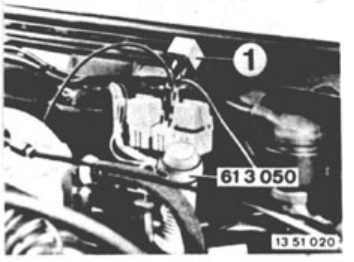
Disconnect fuel hose (3).
Take off fuel pressure regulator.



Installation:
Check seal (1), replacing if necessary.
Check code number and manufacturing date.

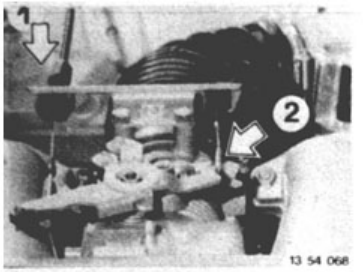
* See Specifications

Checking:
Install pressure tester 13 3 060 with connecting hose and t-adapter 13 3 064 in the fuel feed hose – in front of the fuel pressure regulator.



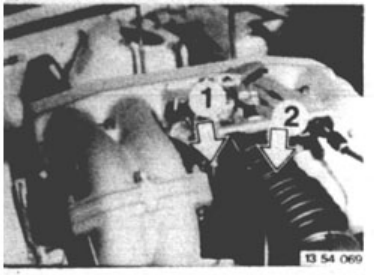
Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Read fuel ejection pressure*.

* See Specifications or Nominal Value Microfiche

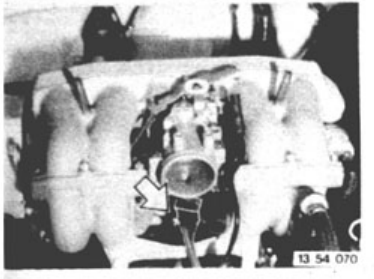


13 54 030 REMOVING AND INSTALLING THROTTLE VALVE NECKS

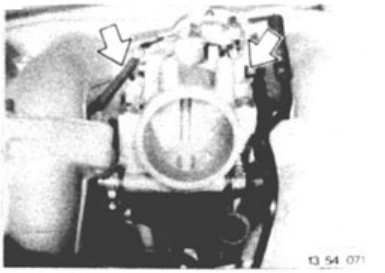
Pull off plastic cap.
Disconnect cables (1 and 2).
1 = For cruise control drive motor
2 = For accelerator pedal



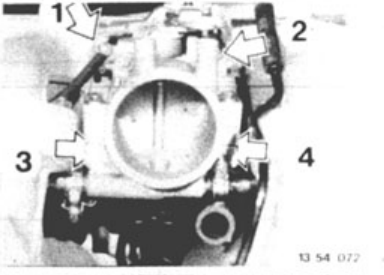
Loosen hose clamp (1) and remove hose (2).



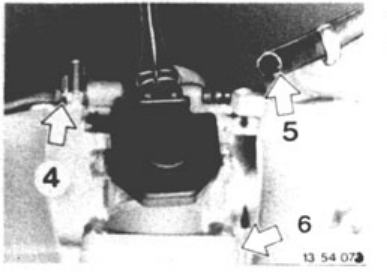
Pull off plug (3) on throttle valve switch.



Pull off vacuum hoses.



Unscrew bolts (1 ... 4).
Take off throttle valve neck.

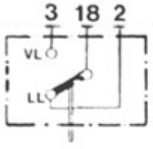


Installation:
Replace gasket (5).
Disconnect hoses (4 and 5).

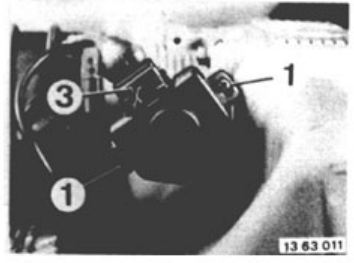
13 63 544 CHECKING / ADJUSTING THROTTLE VALVE SWITCH

Checking Throttle Valve Switch:
There should be approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
There should be approximately 0 ohm between connections 3 and 18 with the throttle valve wide open.
LL = Idle speed
VL = Full load

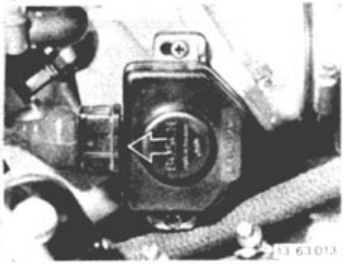
Schaltbild



Wiring diagram drawn with throttle valve in idle speed position.



Adjusting:
Remove throttle valve necks – see 13 54 030.
There must be approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
Adjust by loosening bolts (1) and turning the throttle valve switch.
Open throttle valve after finishing adjustment – resistance should rise immediately to infinite ohms.
Resistance should drop back to approximately 0 ohm when releasing the throttle valve.

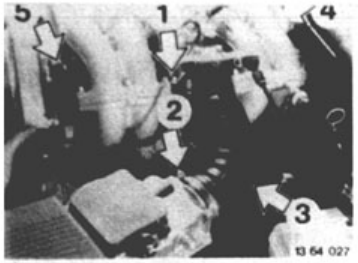


13 63 551 REMOVING AND INSTALLING THROTTLE VALVE SWITCH

Pull off multiple-pin plug (3).

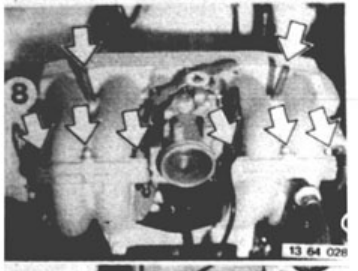
Remove throttle valve necks – see 13 54 030.
Unscrew bolts (1).
Take off throttle valve switch (2).

Installation:
Check code number (1)*.
Adjust throttle valve switch – see 13 63 544.

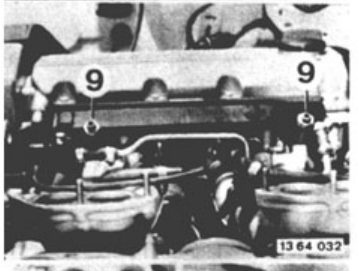


13 64 501 REPLACING ONE FUEL INJECTOR

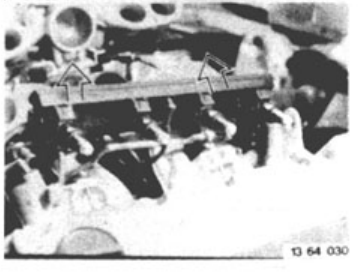
Pull off plastic cap.
Loosen hose clamps (1 and 2).
Pull off hose (3).
Remove hoses (4 and 5).



Unscrew bolts.
Unscrew nuts (8).

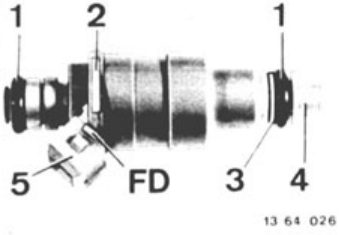


Pull out and fold up upper section of intake manifold.
Unscrew bolts (9).



Push up injection pipe (10) until fuel injectors are lifted out of the guide in the intake manifold.

Lift out circlip (2) and pull off fuel injector.



Installation:
Check O-ring (1), replacing if necessary.
Check code number (2)*.
Fd = Manufacturing date.
Check position of plastic washer (3).
Check color* of plug receptacle (5) or injector guard (4).
Only coat O-rings for installation with vaseline or SAE 90 gear lube.

* See Specifications

1) Cold engine does not start (oil temp. ≤ 20° C / 68° F)
2) Engine starts, but stops again
3) Cold engine hard to start (oil temp. ≤ 20° C / 68° F)
4) Warm engine does not start (oil temp. ≥ 60° C / 140° F)
5) Warm engine hard to start (oil temp. ≥ 60° C / 140° F)
6) Erratic idling during warm-up phase
7) Idle speed not correct
8) Splashing in intake
9) Hesitation while accelerating
10) Knocking while accelerating
11) Hesitation while coasting
12) Misfiring at constant engine speed
13) Poor acceleration/final power output
14) Fuel consumption too high
15) CO/HC values not correct

TROUBLESHOOTING FUEL INJECTION

– See application information on next page. –

Test Requirements:

Engine in perfect running condition (timing, compression, oil carbon deposits, etc.).

Starting system in perfect condition (battery voltage, starter, ignition lock, etc.).

Correct fuel in tank (octane rating, lead/leadless, dirt, etc.).

Connections and plugs okay according to wiring diagram.

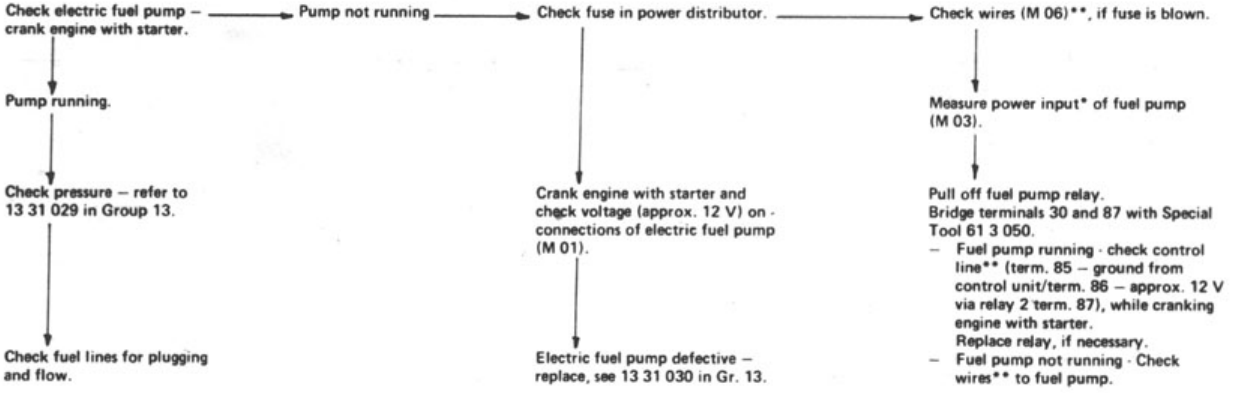
See Troubleshooting DME in Gr. 12 for other test positions.

TEST POSITIONS FOR FUEL INJECTION TROUBLESHOOTING CHART

Note:
Test points have been compiled on the basis of greatest probability, however, under certain circumstances other tests could also be necessary.

Testing instructions refer to the "BMW SERVICE TEST", e.g. engine test step 05 (P 05) or multimeter function (M).
Refer to "BMW service tester operating instructions" for connections.

Note:
Tests 1, 2 and 3 – FUEL PRESSURE
a) No Pressure



* See Specifications
** See Wiring Diagram

b) FUEL PRESSURE Too High

Vacuum hose to or on pressure regulator leaking or bent. → Check fuel return line – routing, flow. → Pressure regulator defective – replace, see 13 51 200 in Group 13.

c) FUEL PRESSURE Too Low

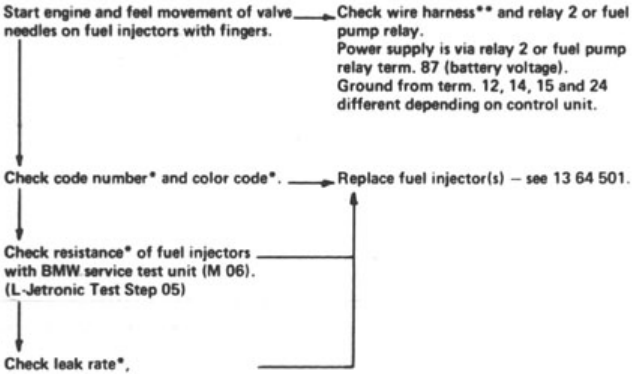
Check fuel feed line – routing and flow. → Check flow in fuel filter. → Check filter screen on fuel intake, cleaning if necessary – see 16 12 000 in Group 16.

↓

Check pressure regulator, replacing if necessary – see 13 51 200 in Gr. 13.

* See Specifications
** See Wiring Diagram

Test Position 6 – FUEL INJECTORS



* See Specifications
** See Wiring Diagram

Test Position 7 – COLD START VALVE

Check code number*. → Replace cold start valve.
Check resistance*.

↓

Power supply** via term. 50 (greater than 9 volts while starting).
Ground supply** via temperature time switch (and 0° C/32° F temp. switch).

↓

Remove cold start valve (fuel line remains connected). → Replace cold start valve.
Plug Jetronic test lead 61 1 440 on cold start valve and connect on B + or B –.
Hold cold start valve in measuring glass 13 3 020.
Operate electric fuel pump.
Cold start valve ejecting fuel?
Spray angle* and flow rate* okay?

↓

Pull off Jetronic test lead 61 1 440 on cold start valve while electric fuel pump is still running. → Replace cold start valve.
Cold start valve must stop fuel flow.
Does cold start valve stop fuel flow?

↓

Leak test: → Replace cold start valve.
A leak rate* of max. 0.3 cc per minute is permissible with electric fuel pump running and Jetronic test lead 61 1 440 disconnected.

* See Specifications
** See Wiring Diagram

Test Position 8 – THROTTLE BYPASS VALVE (ELECTRIC)

Check code number*.
Check tightness on engine (heat transfer). → Replace throttle bypass valve. Tighten throttle bypass valve.

↓

Check with engine running. → Replace throttle bypass valve.
After clamping air hose between "throttle bypass valve and intake manifold" there will be
– speed drop on a cold engine

– no speed drop on a warm engine.

↓

Check hoses for correct routing, tight fit, bends, leaks and porosity.
Check flow in hoses.

↓

Check power supply* (initial voltage with engine running).
Check plug pins for corrosion and good contact.
Check coil resistance* = 30 to 75 ohms.

Additional Information:
Job No. 13 63 060.

* See Specifications
** See Wiring Diagram

Test Point 9 – Temperature Time Switch

Code number*.
Tight fit, good contact of plug connections.
Check coolant level – see Group 17
(air bubbles).
→ Replace temperature time switch.
Repair plug contacts.

↓

Check resistance values* (see nominal value table) (possibly brought to test temperature in a water bath).
→ Replace temperature time switch.

↓

Check wires**.

Nominal Value Table			
Version	Temperature below °C	above °C	Resistance Measured in Ohms between Term. G and Ground (Housing) / Term. W and Ground (Housing)
15°C 8 s	+ 10	+ 20	50 ... 70 / 0 50 ... 70 / ∞
35°C 8 s	+ 30	+ 40	25 ... 40 / 0 50 ... 80 / 100 ... 200
35°C 12 s	+ 30	+ 40	25 ... 80 / 0 50 ... 100 / 200 ... 400

* See Specifications
** See Wiring Diagram

Test Position 10 – COOLANT TEMPERATURE SENSOR

Check code number*.
Check for tight fit, good contact of plug connections and correct level of coolant – see Gr. 17 (air bubbles).
→ Replace coolant temperature sensor.
Repair plug contact.

↓

Check resistance values*
(if necessary heat to test temperature in a water bath).
→ Replace coolant temperature sensor.

↓

Check wires**.

* See Specifications
** See Wiring Diagram

Test Position 12 – THROTTLE SWITCH

Check code number*. ——→ Replace throttle switch.
Check switching points – 13 63 544. Adjust throttle switch.
Check connections and wires**.

Test Position 13 – THROTTLE POTENTIOMETER

Check that throttle potentiometer fits tight.
Check that plug has good contact.
Check wires according to wiring diagram.

↓

Check throttle potentiometer adjustment – 13 63 544.

Test Position 14 – THROTTLE HOUSING

Check throttle cable adjustment. ——→ See Group 24 / 35 / 65.
Check full throttle position.
Eliminate leaks if applicable.
Check synchronization (only with multiple neck).
Check movement of throttle.
Check basic setting of throttle. ——→ See 13 54 051.

Test Position 15 – THROTTLE POSITIONER (If Applicable)

Check tight fit.
Check and adjust setting distances – see 13 54 130.

* See Specifications
** See Wiring Diagram

Test 16 – CONTROL UNIT

Check code number* and manufacturing date*. → Replace control unit, if necessary.
Check for tight fit of control unit plug.
Check for good contact of plug pins.

↓

Check tied back plug connections on wire harness close to control unit plug for conformance with wiring diagram.

↓

Only DME:
Check printed circuit switch position.
See pages 13-250 and 13 - 406a (technical data).

↓

Check power supply** and ground**.
(Check control unit with L-Jetronic testing program, not with DME.)

Test Position 17 – AIR FLOW SENSOR

Check code number* and manufacturing date*. → Replace air flow sensor.
Check contact of plug connections, fit of plug, movement and swinging range of sensor plate.

↓

Electric test: → Replace air flow sensor.
Check air flow sensor with universal test adapter and connecting wire harness (35 or 25 pins).
Test values*.

* See Specifications
** See Wiring Diagram

Test Position 24 – SPEED SWITCH

Check speed relay.
(745 i)

→ Check code number*.
Does installed speed relay have the specified code number*?

→ Replace speed relay.

↓

Check power supply of speed relay.
Plug socket 3 must have ground.
Plug socket 2 must have battery voltage with ignition turned on.
Plug socket 4 must have voltage with engine running.

→ Provide power supply according to wiring diagram.

↓

Connect ohmmeter between plug sockets 5 and 1 on speed relay socket.
Connect tachometer (BMW service test unit).
Speed relay remains installed.
Start engine and boost speed slowly.
Does ohmmeter display approx. 0 ohm up to engine speed of 3050 rpm?

→ Replace speed relay.

↓

Boost engine speed further.
Does ohmmeter display approx. ∞ ohms at engine speed of 3550 rpm?

→ Replace speed relay.

* See Specifications

Test Position 25 – SAFETY SWITCH

Check safety switch.

(745 i)

→ Disconnect wires on safety switch.
Connect ohmmeter on safety switch connection and car ground.
Ohmmeter should display approx. ∞ ohms.
Ohmmeter displaying approx. ∞ ohms?

→ Replace safety switch.

↓

Connect ohmmeter on safety switch connection and car ground.
Connect a regulable air pressure source on safety switch.
Increase pressure slowly.
Does ohmmeter display approx. ∞ ohms up to a pressure of max. 0.94 bar?

→ Replace safety switch.

↓

Ohmmeter should display approx. 0 ohm as from a pressure of at least 0.96 bar.
Ohmmeter displaying correct value?

→ Move ohmmeter connection from car ground to safety switch housing.
Ohmmeter now displaying correct value?

→ Replace safety switch.

↓

Make ground connection between safety switch and car body.

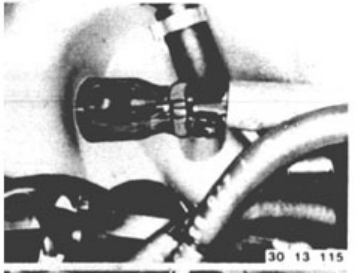
Construction group 13 Fuel system

1.8 lt. – Models:
318i / 318i (Catalytic Converter/US) / 318i (Catalytic Converter/ECE) / 518i

13 00 054	Engine idle speed / CO – adjust	13-	100
13 31 029	Fuel delivery pressure – check	13-	110
. . .	Fuel delivery rate – check	13-	110
030	Fuel pump – remove and install	13-	111
13 32 051	Fuel filter – remove and install	13-	113
13 41 000	Idle control valve – remove and install	13-	120
010	Control unit for idle control valve – remove and install	13-	121
. . .	Running-up safety relay	13-	122
. . .	Basic adjustment of VCO idle speed regulating system	13-	123
13 51 200	Fuel pressure regulator – remove and install	13-	130
. . .	Fuel pressure regulator (fuel injection pressure) – check	13-	130
13 54 030	Throttle housing – remove and install	13-	140
051	Throttle shaft return springs – remove and install	13-	142
13 61 000	Control unit – remove and install	13-	150
13 62 000	Air flow sensor – remove and install	13-	160
050	Temperature time switch – remove and install / check	13-	161
080	Pressure sensor – remove and install	13-	162
531	Coolant temperature sensor – remove and install / check	13-	163
13 63 060	Throttle bypass valve – remove and install / check	13-	170
544	Throttle switch – adjust	13-	171
551	Throttle switch – remove and install	13-	171
13 64 030	Cold start valve – remove and install	13-	180
501	Fuel injector – remove and install	13-	181
12 63 051	Temperature switch 0° C (32° F) – remove and install	13-	181

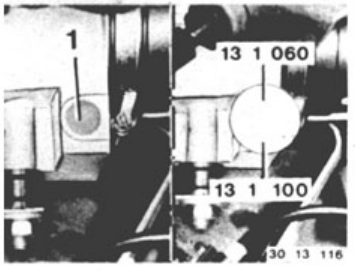
13 00 054 ADJUSTING ENGINE IDLE SPEED (M 10)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least + 60° C (140° F).
Ignition timing and valve clearance okay.
Air filter cartridge in perfect condition.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Exhaust extraction systems switched off for time of test.



1) Engine Idle Speed:

Adjust engine idle speed* with the air control screw in the bypass bore.



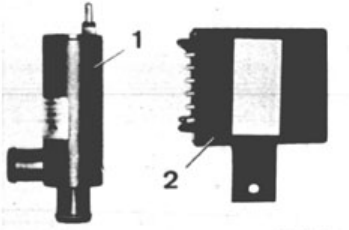
2) CO Test:

Make sure that there are no faults in the engine, ignition or injection systems (see Troubleshooting) before correcting the CO level.
Remove cap (1) with Special Tool 13 1 011.
Adjust CO level* with Special Tool 13 1 060 or 13 1 100 applied on the air control screw in the air flow sensor.

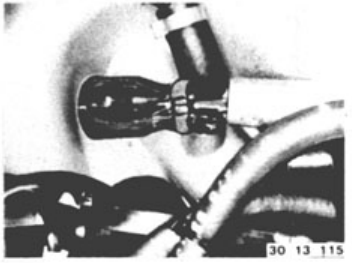
* See Nominal Value Microfiche

13 00 054 ADJUSTING ENGINE IDLE SPEED AND CO LEVEL (M 10 Cat. Conv./ECE)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance okay.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Outside temperature above 0° C (32° F).



30 13 004



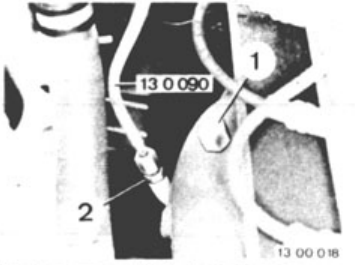
30 13 115

A) Engine Idle Speed:

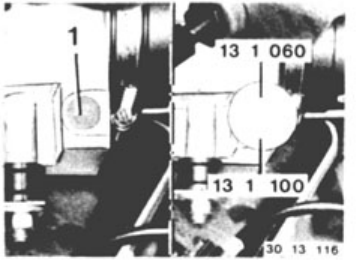
Check engine idle speed*.
If nominal value is not reached, check idle speed valve (1) and idle speed control unit (2) (see Troubleshooting Engine Idle Speed Control), replacing if necessary.
Note:
There is no control screw for idle speed adjustments.

B) Throttle Bypass Valve:

1) Engine Idle Speed:
Adjust engine idle speed* with air control screw in the bypass bore.



13 00 018



30 13 116

2) CO Level:
Disconnect oxygen sensor plug.

Unscrew nut (1).
Connect CO tester, Special Tool 13 0 090, on test connection (2).

Remove cap (1) with Special Tool 13 1 060.
Adjust CO level* with Special Tool 13 1 060 or 13 1 100 applied on air control screw in the air flow sensor.

Install a new anti-tamper lock after finishing adjustments.
Connect oxygen sensor plug.

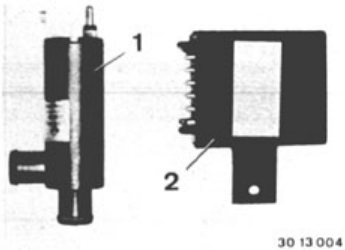
* See Nominal Value Microfiche

* See Nominal Value Microfiche

13 00 054 CHECKING ENGINE IDLE SPEED CHECKING/ADJUSTING INTEGRATOR VOLTAGE (CO TEST)

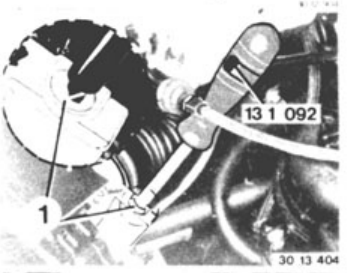
Testing Procedures:
Disconnect oxygen sensor wire.
Keep wire away from car ground.
Nominal value will now appear in display (3).
Connect oxygen sensor wire.
Actual value will now appear in display (3).
Correcting to nominal value is described below.
Nominal value tolerance: ± 0.3 V.

(US)
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance correct.
All electric equipment switched off.
BMW service test unit connected according to operating instructions.



30 13 004

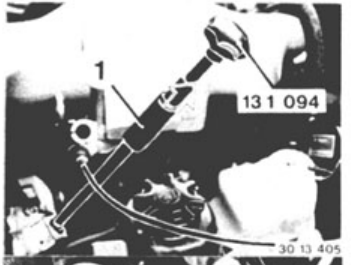
(BMW 318 i)
1) Checking Engine Idle Speed**:
If nominal value is not reached, check idle valve (1) and idle speed regulation control unit (2) (see troubleshooting idle speed regulation), replacing if necessary.
Note:
There is no adjusting screw for idle speed regulation.



30 13 404

Adjusting Integrator Voltage:
Drill hole in anti-tamper lock (1) with Special Tool 13 1 092.

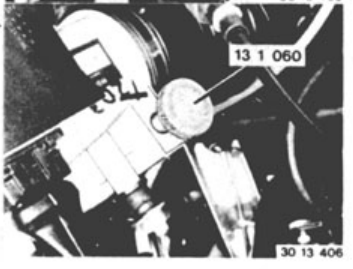
2) Checking/Adjusting Integrator Voltage (CO Test):
Testing Requirements:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance correct.
All electric equipment switched off.
BMW service test unit and mixture tester 12 6 400 connected according to operating instructions.
Hose from active carbon filter pulled off on throttle housing and no plugs inserted in open connections.



30 13 405

Screw Special Tool 13 1 094 in anti-tamper lock.
Drive special tool and anti-tamper lock out of air flow sensor with impact (1).

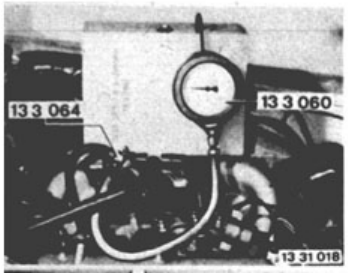
Oxygen sensor must have operating temperature.
Oxygen sensor has operating temperature by running engine at least 30 seconds at speed of approx. 3,000 rpm.
Oxygen sensor is good, if LED (1) starts flashing in at least 3 second intervals after approx. 10 seconds.
If LED does not flash, check oxygen sensor – 11 78 010.



30 13 406

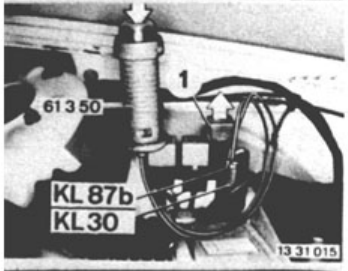
Adjust integrator voltage to nominal value ± 0.3 volt by turning the adjusting screw with Special Tool 13 1 060 or 13 1 100.
Install new anti-tamper lock after finishing adjustment.
Connect oxygen sensor wire.

** See Nominal Value Microfiche

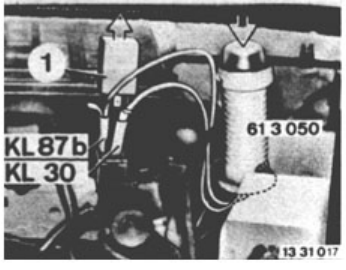


13 31 029 CHECKING FUEL DELIVERY PRESSURE

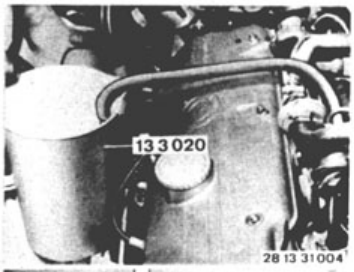
Install pressure tester 13 3 060 with connecting line and t-adapter 13 3 064 in fuel feed line, in front of fuel pressure regulator.
Plug fuel return line with Special Tool 13 3 010.



E 30:
Pull off fuel pump relay (1).
Bridge 87 b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

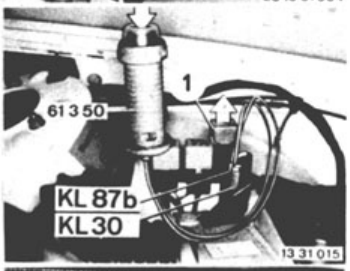


E 28:
Pull off fuel pump relay (1).
Bridge 87b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

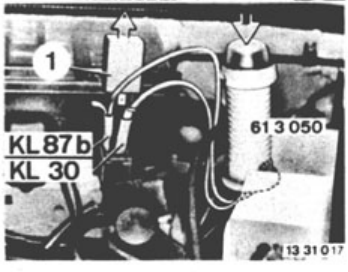


13 31 . . . CHECKING FUEL DELIVERY RATE

Unscrew fuel return line and hold end of line in measuring glass 13 3 020.

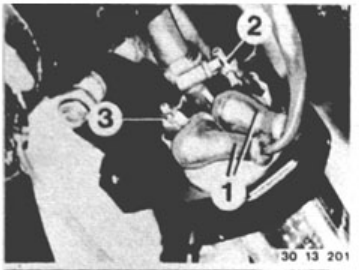


E 30:
Pull off fuel pump relay (1).
Bridge 87 b and 30 with Special Tool 61 3 050.
Check delivery rate*.



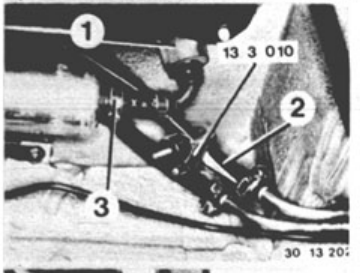
E 28:
Pull off fuel pump relay (1).
Bridge 87b and 30 with Special Tool 61 3 050.
Check delivery rate*.

* See Specifications of Gr. 16

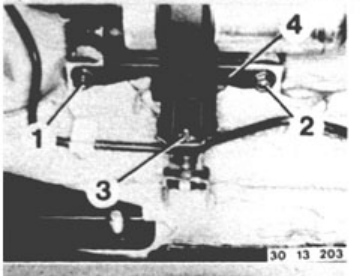


13 31 030 REMOVING AND INSTALLING FUEL PUMP

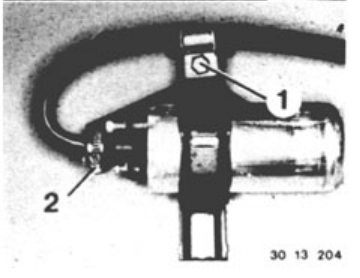
Push back protective caps (1).
Unscrew nuts (2 and 3).
Take off wires.



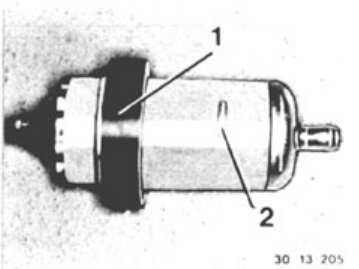
Pinch intake hose (1) and output hose (2) with Special Tool 13 3 010.
Loosen hose clamp (3) and pull off hoses.
Important!
Do not install the output (pressure) hose with squeeze-hose clamps.



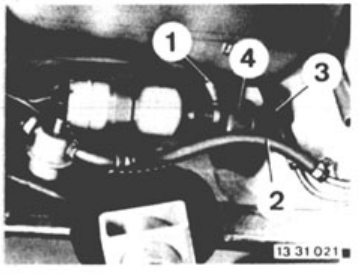
Unscrew nuts (1 ... 3).
Take off holder (4).
Remove fuel pump with bracket.
Installation:
Check rubber mounts, replacing if necessary.



Unscrew bolt (1).
Loosen hose clamp (2) and pull off fuel hose.
Take fuel pump off of bracket.
Important!
Do not install the output (pressure) hose with squeeze-hose clamps.

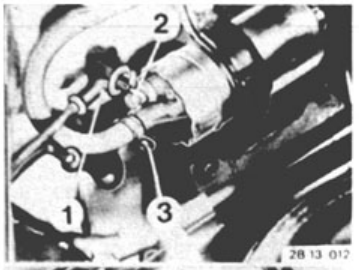


Pull off rubber ring (1).
Installation:
Check code number (2)*.



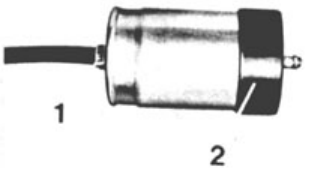
Arrangement of Fuel Pump with Damper Chamber:
1 = Suction line
2 = Pressure line
3 = Return line
4 = Damper chamber

* See Parts Microfiche and Specifications



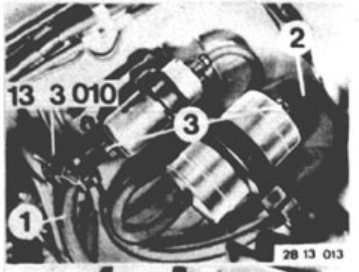
13 31 030 REMOVING AND INSTALLING FUEL PUMP

Push back protective caps (1).
Unscrew nuts (2 and 3).
Take off wires.



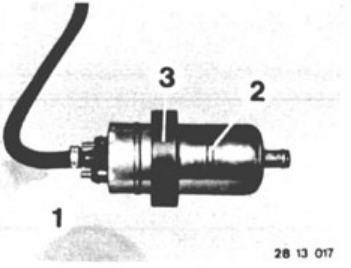
Loosen hose clamp (1) on fuel filter and pull off fuel hose.
Remove rubber ring (2).

Installation:
Check direction of flow.
IN and OUT of filter are marked.
Do not use squeeze-hose clamps.



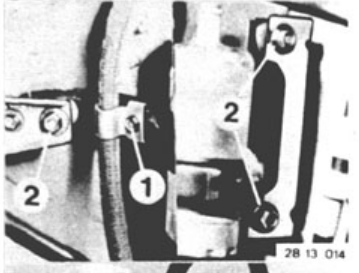
Pinch inlet hose (1) and outlet hose (2) with Special Tool 13 3 010.
Loosen hose clamp (3) and pull off hoses.

Note:
Do not install outlet (pressure) hose with squeeze-hose clamps.

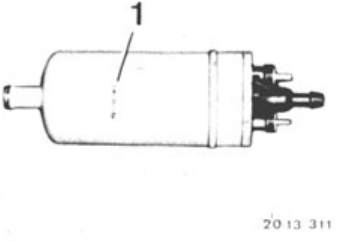


Loosen hose clamp (1) on fuel pump and pull off fuel hose.
Pull off rubber ring (3).

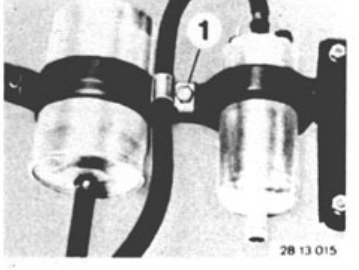
2 = Code number*



Unscrew bolt (1) and nuts (2).
Take off fuel pump with filter.

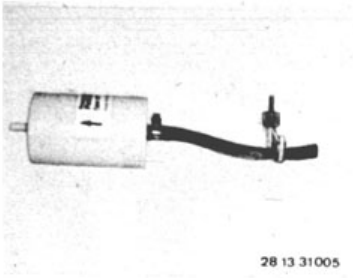


Installation:
Check code number (1)*.



Unscrew bolt (1) and remove clamp.

* See Specifications



28 13 31005

13 32 051 REMOVING AND INSTALLING FUEL FILTER

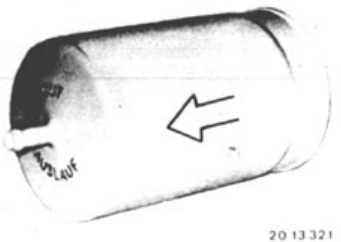
E 30

Note:

Remove fuel filter with fuel feed line and Special Tool 13 3 010.

Installation:

Check direction of flow (arrow).



20 13 321

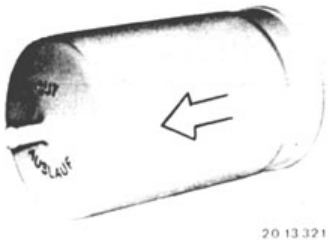
13 32 052 REMOVING AND INSTALLING FUEL FILTER

E 28

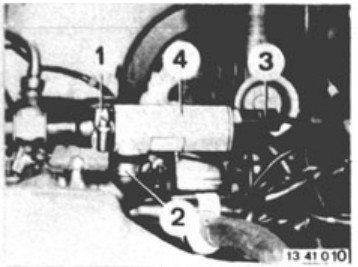
See "Removing and Installing Fuel Pump" – 13 31 030.

Installation:

Check direction of flow (arrow).

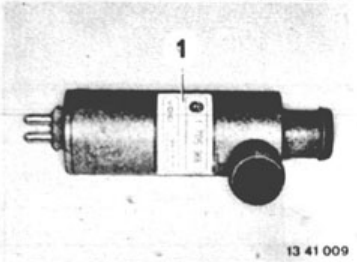


20 13 321



13 41 000 REMOVING AND INSTALLING IDLE CONTROL VALVE

Loosen hose clamps (1 and 2).
Pull off plug (3).
Remove idel control valve (4).

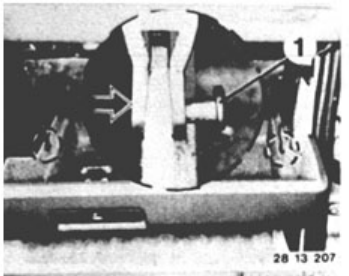


Installation:
Check code number (1)*.
Check idle speed*.

B) With Basic Adjustment Screw
Disconnect strap.
Loosen hose clamps (1 and 2).
Pull off plug (3).
Remove idle control valve.
Installation:
Make basic adjustment.

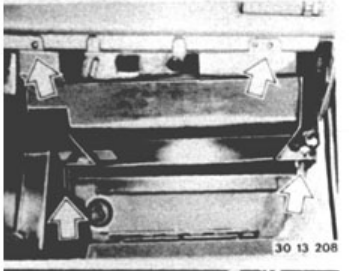
Checking Idle Control Valve:
Supply battery voltage to idle control valve.
Idle control valve must close and be tight.
Idle control valve should be open when without voltage.

* See Specifications + Nom. Value Microfiche



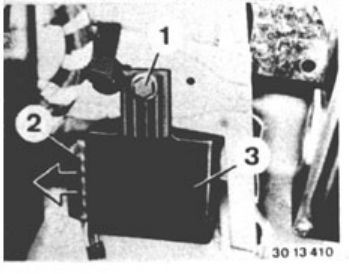
13 41 010 REMOVING AND INSTALLING CONTROL UNIT FOR IDLE SPEED REGULATION

Open glove box.
Pull out pins (1) of both retaining straps.

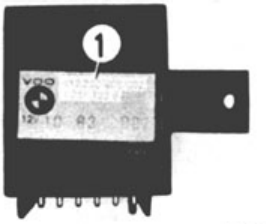


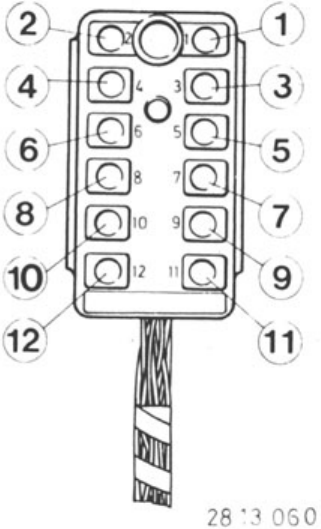
Unscrew screws and take off trim.

Pull off both plugs for glove box light and lay trim aside.



Unscrew screw (1).
Pull off plug (2).
Remove control unit (3).





Installation:
Check code number (1)*.
Check engine idle speed*.

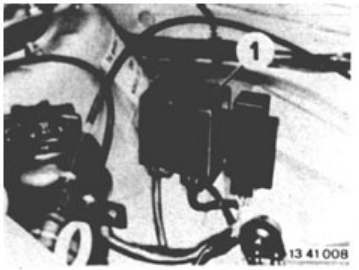
Multiple Pin Plug Connections:

No.	mm	Color	Connection To
1	0.75	BL/RT	Idle valve (A)
2	1.5	GN/GE	Idle valve (A)
3	1	GN	Terminal 1 Ignition coil
4	1.5	BR	Terminal 31
5	0.75	BL/WS	Idle positioner (B)
6	0.5	WS	Temp. switch 45°C/113°F (temp. transmitter)
7	0.5	BL/GE	Conn. automatic transm. N/P
8	–	–	–
9	0.5	BL/WS	Air conditioner switch
10	0.5	BL/GN	Temp. switch 0°C/32°F
11	0.5	BL/WS	Air cond. magn. coupling
12	0.5	BR/BL	L-Jetronic control unit (Pin 2)

Color Codes

BL	blue
BR	brown
GE	yellow
GN	green
RT	red
SW	black
WS	white

* See Specifications and Nominal Value Microfiche



13 41 . . . RUNNING-UP SAFETY RELAY

1 = Running-up safety relay

Function:
This relay switches off the fuel injectors when engine idle speed exceeds 1500 rpm for so long, until the speed drops below 1500 rpm. Coasting shutoff action is stopped when the air conditioner is turned on.

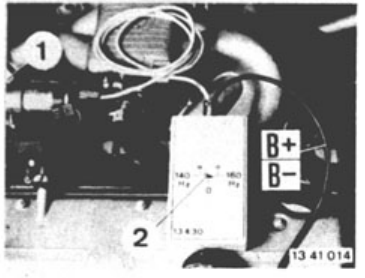
13 41 . . . MAKING BASIC ADJUSTMENT OF VDO IDLE SPEED CONTROL SYSTEM

Requirements:
- Engine at operating temperature, i.e. oil temperature at least + 60° C (140° F).
- Ignition timing and valve clearance correct.
- Air filter cartridge in perfect condition.
- All electric equipment switched off.
- Idle speed CO level correct.

Note:
A basic adjustment does not have to be made at certain intervals.

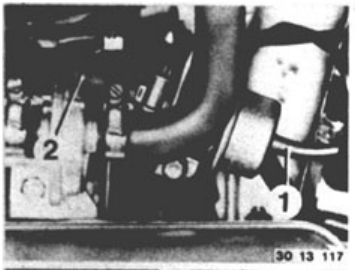
13 41 013

Basic adjustments can only be made with the illustrated metal valve.
This metal valve can be installed retroactively since 9.83.
1 = Basic adjustment screw



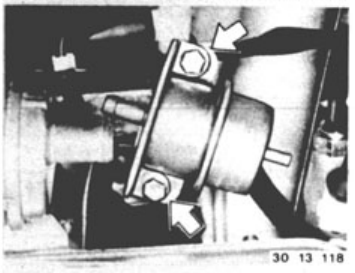
Connect tester 13 4 030 on the car battery and idle control valve.
Set switch (2) to 160 Hz.
Connect speed tester (BMW service tester).
Run engine at idle speed.
Adjust idle speed to 750 + 50 rpm with basic adjustment screw (1).

Remove tester 13 4 030.
Connect plug from engine wire harness on idle control valve again.

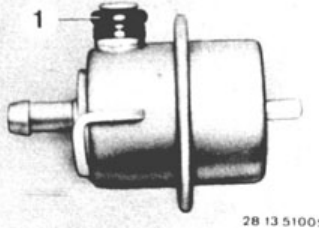


13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

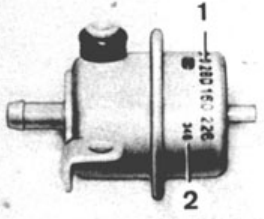
Disconnect air hose (1) and fuel hose (2).



Unscrew bolts (1).
Take off fuel pressure regulator.

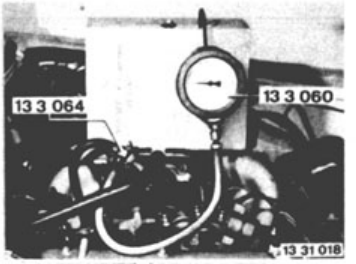


Installation:
Check seal (1), replacing if necessary.

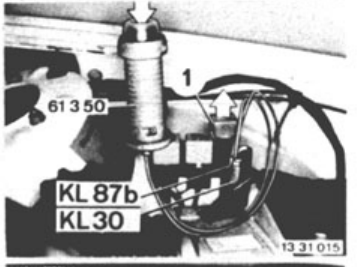


Installation:
Check code number (1)*.
(2) = Manufacturing date

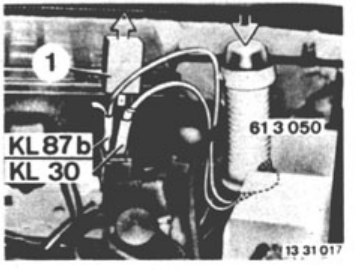
* See Specifications



Checking:
Install pressure tester 13 3 060 with connecting line and t-adapter 13 3 064 in fuel feed line, in front of fuel pressure regulator.

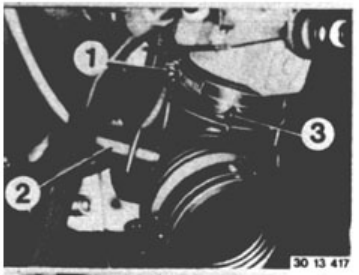


E 30:
Pull off fuel pump relay (1).
Bridge 87b and 30 with Special Tool 61 3 050.
Fuel injection pressure*.



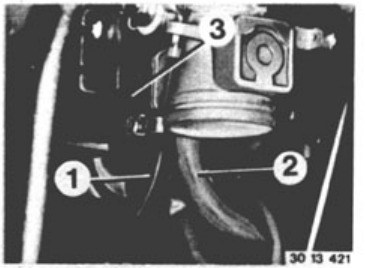
E 28:
Pull off fuel pump relay (1).
Bridge 87b and 30 with Special Tool 61 3 050.
Fuel injection pressure*.

* See Specifications + Nom. Value Microfiche

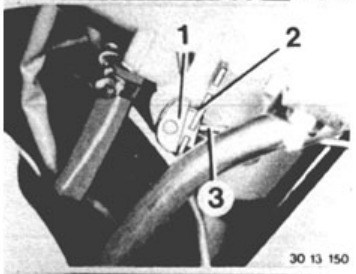


13 54 030 REMOVING AND INSTALLING THROTTLE HOUSING

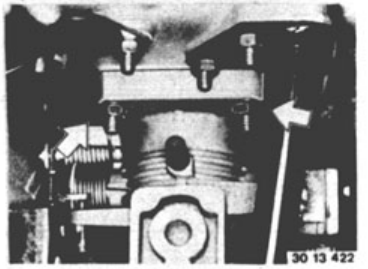
Loosen hose clamp (1).
Pull off hose (2).
Pull off hose (3) on throttle housing.



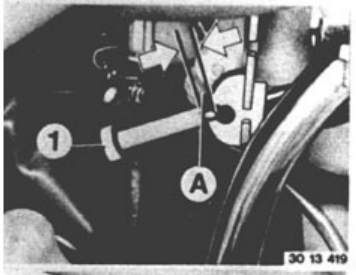
Disconnect water hoses (1 and 2).
Pull off hose (3) for secondary air injection.



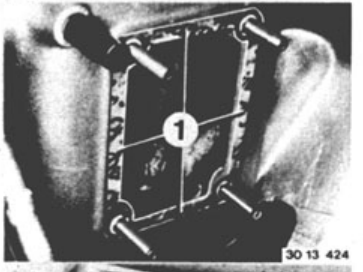
Press adapter (1) out of lever (2).
Disconnect cable (3) on lever (2).
(Disconnect cable for automatic transmission.)



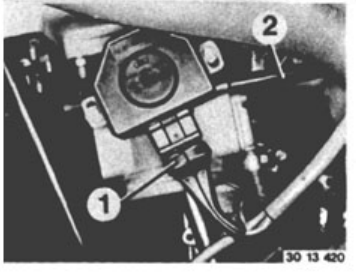
Unscrew four screws.
Take off throttle housing.



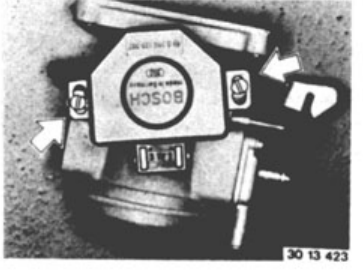
Installation:
Use screw (1) to adjust distance A to 1 ... 2 mm (0.039 to 0.079") with throttle valve closed and accelerator pedal in idle position.



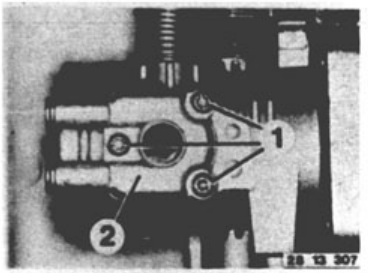
Installation:
Replace gasket (1).



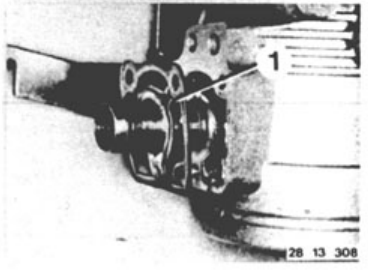
Pull off plug (1) on throttle switch.
Pull off hose (2) for active carbon filter vent.



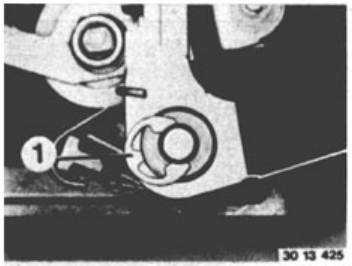
Unscrew screws.
Take off throttle switch.
Installation:
Adjust throttle switch 13 63 544.



Unscrew screws (1).
Take off housing section (2).

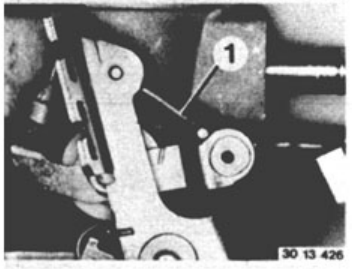


Installation:
Replace gasket (1).

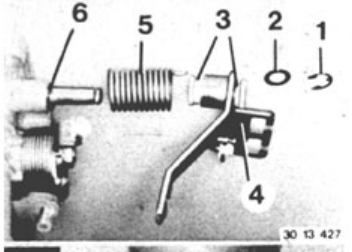


13 54 051 REPLACING RETURN SPRINGS FOR THROTTLE SHAFTS
– Throttle Housing Removed –

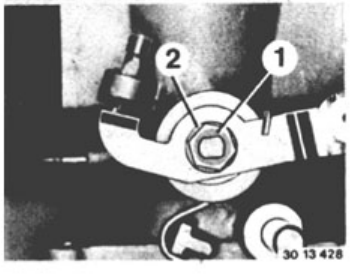
Remove retainer (1).



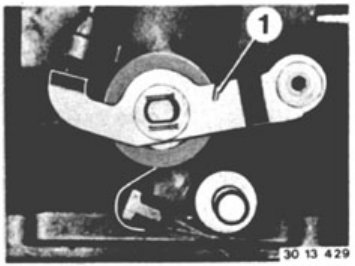
Lift out connecting rod (1).



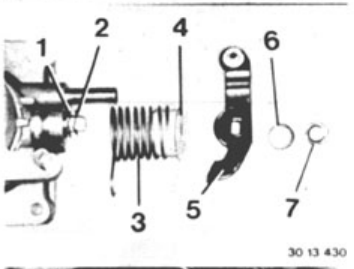
Disconnect spring on operating lever.
Take off parts.
Installation:
Preload spring with about 1/2 turn.
1 = Retainer
2 = Washer
3 = Bearing sleeve
4 = Operating lever
5 = Spring
6 = Lock washer



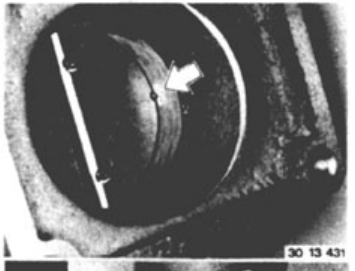
Unscrew nut (1).
Take off lock washer (2).



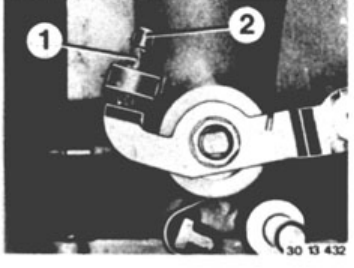
Disconnect return spring (1) on operating lever.
Installation:
Preload return spring with about 1/2 turn.



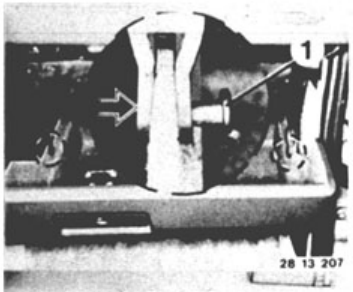
Take off parts.
1 = Washer
2 = Spring washer
3 = Spring
4 = Bearing sleeve
5 = Operating lever
6 = Lock washer
7 = Nut



Installation:
Check or adjust basic setting of throttle valve.
Checking:
When throttle valve is adjusted correctly, there will be slight clearance between housing and throttle valve.
Vacuum bores must not be covered.

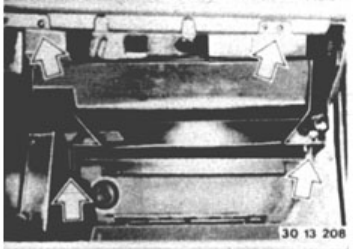


Adjusting (adjustment should not be changed if at all possible):
Turn screw (1) to adjust throttle valve until there is slight clearance between housing and throttle valve.
Lock screw (1) with clear lacquer after finishing adjustment.
Reinstall anti-tamper lock (2).

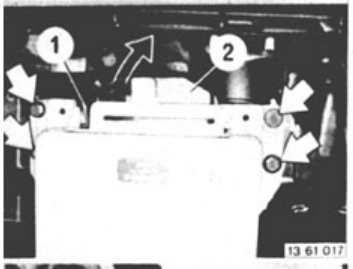


13 61 000 REMOVING AND INSTALLING CONTROL UNIT

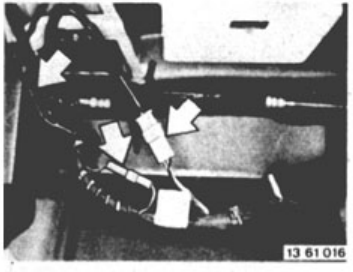
E 30
Open glove box.
Pull off pin (1) of both retaining straps.



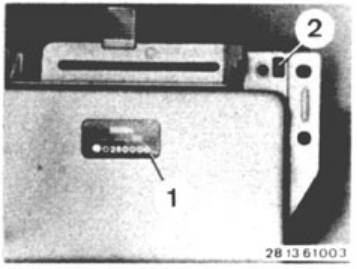
Unscrew trim panel.



Push back lock (1) and pull off plug (2).
Unscrew four mounting screws and take off control unit.

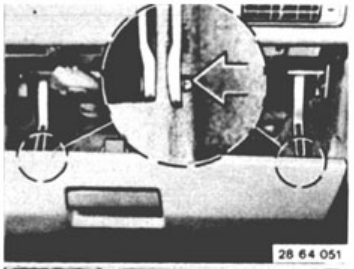


Plug connections – see wiring diagram or Group 12.



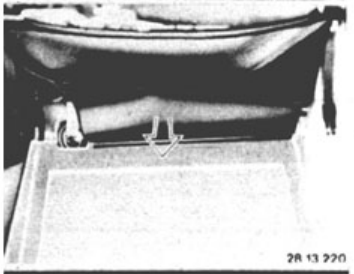
Installation:
Check code number (1)* and manufacturing date (2)*.
Check/adjust engine idle speed* and idle speed CO level*.

* See Specifications and Nominal Values

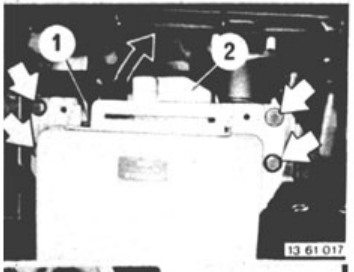


13 61 000 REMOVING AND INSTALLING CONTROL UNIT

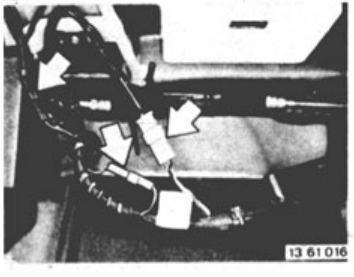
E 28:
Open glove box.
Pull off pins (1) of both retaining straps.



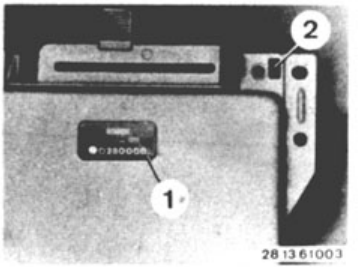
Unscrew trim panel.



Push back lock (1) and pull off plug (2).
Unscrew four mounting bolts and take out control unit.

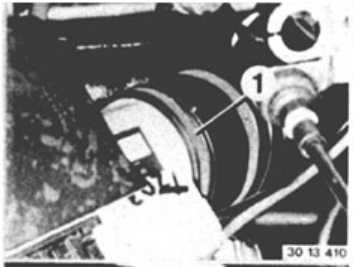


See wiring diagram or Gr. 12 for plug connections.



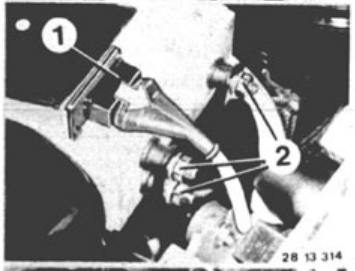
Installation:
Check code number (1)* and manufacturing date (2)*.
Check / adjust engine idle speed* and idle speed CO level*.

* See Specifications + Nom. Value Microfiche



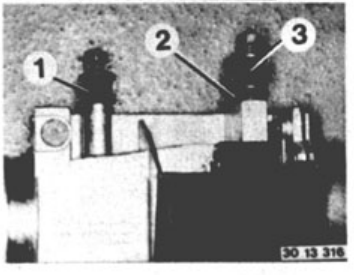
13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR

Loosen hose clamp (1) and pull air hose off of air flow sensor.

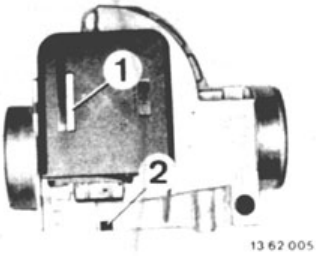


Pull off plug (1).
Loosen nut (2) and take off air flow sensor.

Installation:
Check seal (1), replacing if necessary.

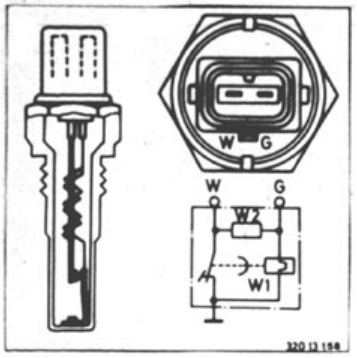


Unscrew mounts (1 ... 3) on air flow sensor.
Check mounts, replacing if necessary.



Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and idle speed CO level*.
Check air flow sensor*.

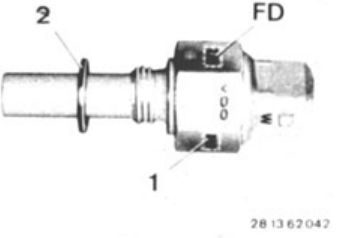
* See Specifications + Nom. Value Microfiche



13 62 050 REMOVING AND INSTALLING/ CHECKING TEMPERATURE TIME SWITCH

The temperature time switch regulates the open time of the cold start valve according to coolant temperature.
The open time (e.g. 8 sec.) and switching off temperature (e.g. + 35° C = 95° F) are stamped in the hexagon.

Removing and Installing:
Pull off plug (1).
Unscrew temperature time switch.
Installation:
Tightening torque*.

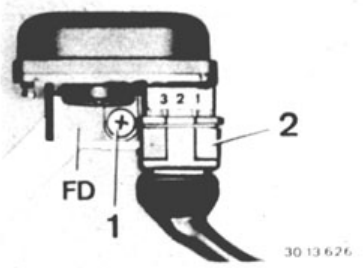


Installation:
Check code number (1)*.
Replace seal (2).
FD = Manufacturing date
Fill and bleed cooling system (Gr. 17).

Checking:
Connect Jetronic test lead 61 1 440.
Check nominal value* with an ohmmeter.
To check the entire temperature range, remove temperature sensor and place it in a water bath heated to testing temperature.
Check resistance* with an ohmmeter.

* See Specifications

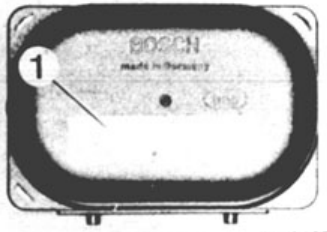
* See Specifications



30 13 626

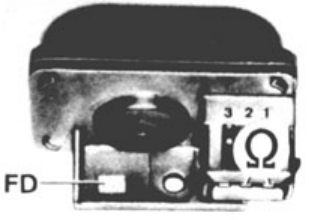
13 62 080 REMOVING AND INSTALLING/ CHECKING PRESSURE SENSOR

Pull off plug (1).
Unscrew screw (2) and remove pressure sensor.
FD = Manufacturing date



30 13 627

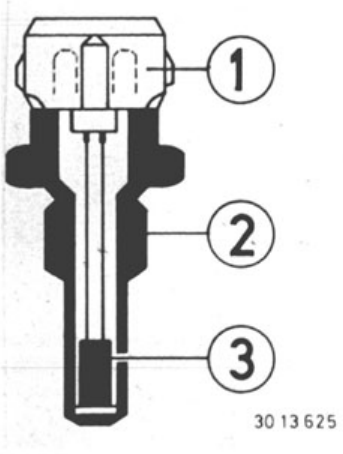
Installation:
Check code number (1)*.



30 13 628

Checking:
There should be approximately 0 ohm between plug connections (1 and 2) with ≤ 880 mbar atmospheric pressure.
There should be approximately ∞ ohms between plug connections (1 and 2) with ≥ 930 mbar atmospheric pressure.

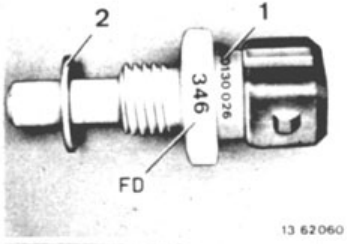
* See Specifications



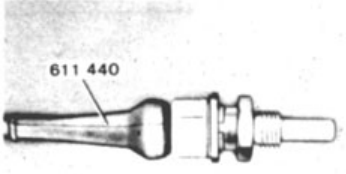
13 62 531 REMOVING AND INSTALLING/ CHECKING COOLANT TEMPERATURE SENSOR

The temperature sensor measures the engine temperature and sends this data as a resistance value to the control unit.
The resistance value drops as temperature rises (NTC).
1 = Plug connection
2 = Housing
3 = NTC resistor

Removing and Installing:
Pull off plug (1).
Unscrew temperature sensor.
Installation:
Tightening torque*.



Installation:
Check code number (1)*.
Replace seal (2).
FD = Manufacturing date
Fill and bleed cooling system (Gr. 17).

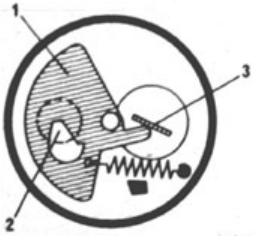


Checking:
Connect Jetronic test lead 61 1 440.
Check nominal value* with an ohmmeter.
To check the entire temperature range, remove temperature sensor and place it in a water bath heated to testing temperature.
Check resistance with ohmmeter*.

* See Specifications

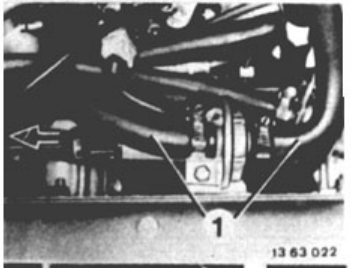
* See Specifications

13 63 060 REPLACING / CHECKING THROTTLE BYPASS VALVE



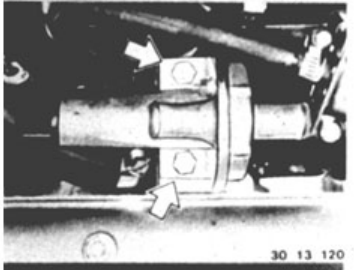
320 13 088

The throttle bypass valve is heated electrically and with heat from the engine.
Electric heating comes from the fuel pump relay simultaneous with switching in the fuel pump.
1 = Shutoff valve
2 = Bypass opening
3 = Bimetal spring



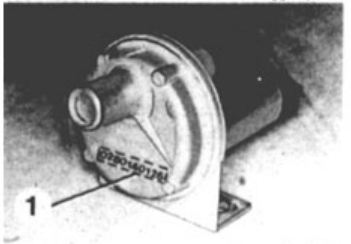
13 63 022

Disconnect both air hoses.
Pull off plug (1).



30 13 120

Unscrew screws and take off throttle bypass valve.

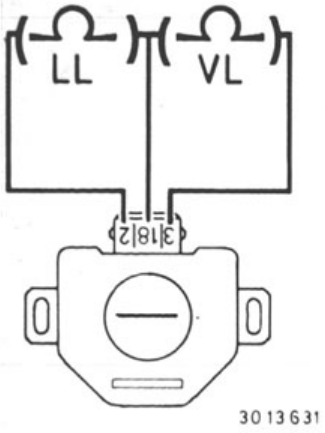


23 13 025

Installation:
Check code number (1)*.

Checking:
There should be no change in engine speed of an engine having operating temperature after pinching shut the air hose between the throttle bypass valve and air intake.
The engine speed of a cold engine must drop when pinching shut the air hose between the bypass valve and air intake.

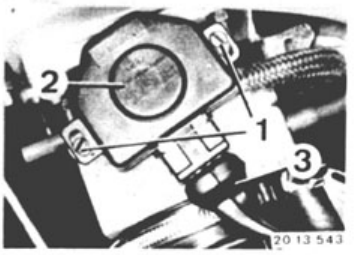
* See Specifications



30 13 631

13 63 544 ADJUSTING THROTTLE SWITCH

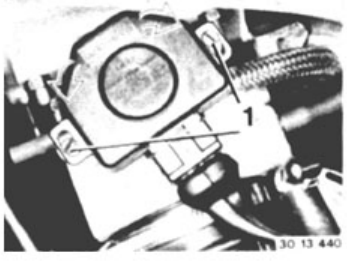
Checking Throttle Switch:
There should be approximately 0 ohm between connections (2 and 18) with throttle valve closed.
There should be approximately 0 ohm between connections (3 and 18) with throttle valve wide open.
LL = Idle
VL = Full load



20 13 543

13 63 551 REMOVING AND INSTALLING THROTTLE SWITCH

Pull off multiple pin plug (3).
Unscrew screws (1).
Remove throttle switch (2).



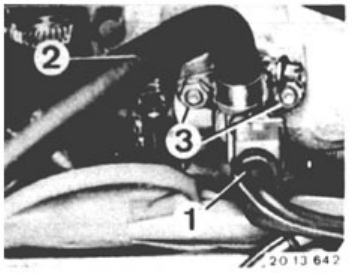
30 13 440

Adjusting:
There should be approximately 0 ohm between connections (2 and 18) with throttle valve closed.
Adjust by loosening screws (1) and turning throttle switch.
Open throttle valve after finishing adjustment – resistance should go immediately to ∞ ohms.
Resistance must drop again to approximately 0 ohm when releasing the throttle valve.

30 13 456

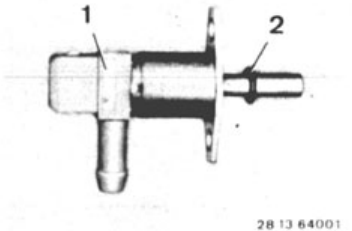
Installation:
Check code number (1)*.
Adjust throttle switch 13 63 544.

* See Specifications



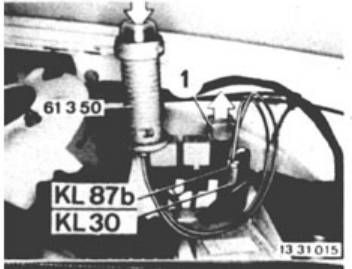
13 64 030 REMOVING AND INSTALLING/ CHECKING COLD START VALVE

Removing and Installing:
Pull off plug (1).
Disconnect fuel line (2).
Unscrew screws (3).
Remove cold start valve.

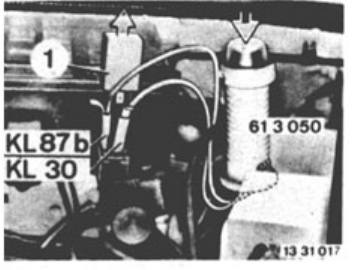


Installation:
Check code number (1)*.
Replace seal (2).

Checking:
Disconnect cold start valve on intake housing.
Fuel line remains connected.

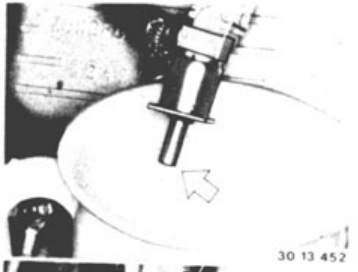


E 30:
Pull off fuel pump relay (1).
Bridge terminals 87b and 30.
Fuel pump runs.

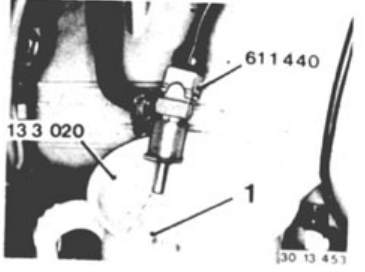


E 28:
Pull off fuel pump relay (1).
Bridge terminals 87b and 30.
Fuel pump runs.

* See Specifications

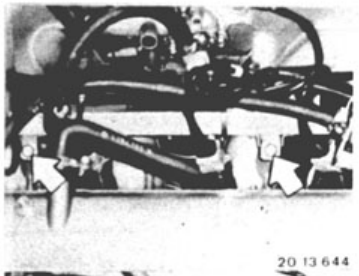


Leak Test:
Check permissible leak rate*.



Checking Fuel Flow Rate and Spray Angle:
Hold cold start valve over measuring glass 13 3 020.
Plug Jetronic test lead 61 1 440 on cold start valve and connect on B + and B –.
Check fuel flow rate* and spray angle (1)*.

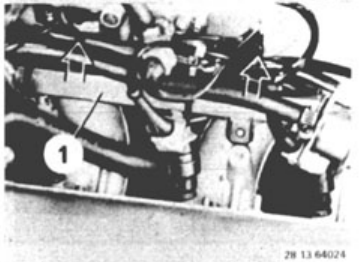
* See Specifications



20 13 644

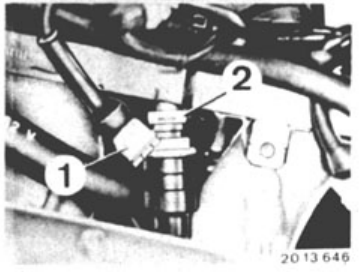
13 64 501 REMOVING AND INSTALLING ONE FUEL INJECTOR

Unscrew screws on injection tube.
Installation:
Mount ground wire with screw.



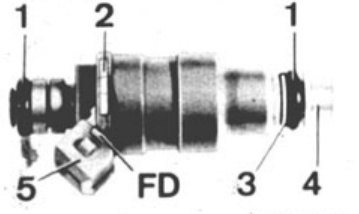
28 13 64024

Push up injection tube (1) until fuel injectors have cleared guide on intake manifold.



20 13 646

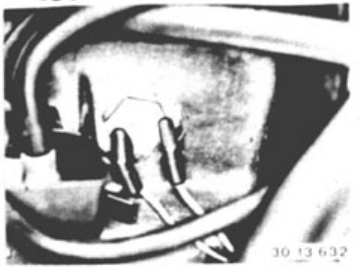
Pull off plug (1).
Lift off retainer (2) and remove fuel injector.



30 13 122

Installation:
Check O-rings (1), replacing if necessary.
Check code number (2)*.
Check location of plastic washer (3).
Check color code* of plug receptacle (5) or spray jet guard (4).
FD = Manufacturing date.
Only coat O-rings with vaseline or SAE 90 gear lube for installation.

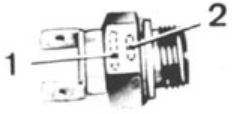
* See Specifications



30 13 632

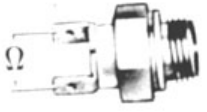
12 63 051 REMOVING AND INSTALLING 0° C (32° F) TEMPERATURE SWITCH

Pull off plug (1).
Unscrew temperature switch.
Installation:
Tightening torque: max. 30 Nm (22 ft. lbs.).



20 13 633

Installation:
Check code number (1)* and switching temperature (2)*.



20 13 634

Checking:
Connect ohmmeter (M 06) on temperature switch.
Ohmmeter should display approx. 0 ohm at temperature < – 8° C (+ 18° F).
Ohmmeter should display approx. ∞ ohms at temperature > + 4° C (+ 39° F).

* See Specifications.

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL

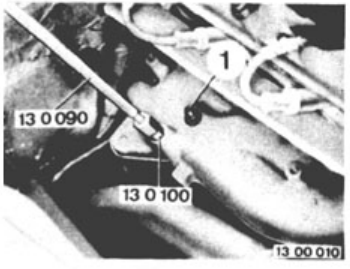
Cars with Catalytic Converter and Provisions for Cat. Conv. Operation

Engines with M 1.1 Motronic:
Identified on inductive sender on vibration damper with 58 teeth and one gap.

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Valve clearance correct.
Engine and ignition in perfect running condition.
Connect BMW Service Tester to operating instructions.
A routine check is not necessary.

Important!
Also valid for cars with provisions for catalytic converter operation.
Adjustments must not be made on the air flow sensor control screw, since this adjustment is the basis for oxygen sensor and idle speed drive control.

13 41 017

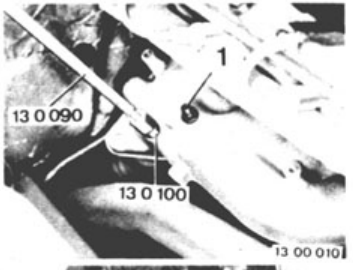


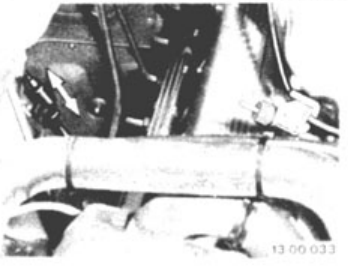
1) Engine Idle Speed
Check engine idle speed**.
See BMW diagnosing system, if the nominal value is not reached.
Check intake system for leaks.

Note:
There is no adjusting screw for idle speed regulation.

2) Emission Test
Disconnect oxygen sensor plug (not in cars with cat. conv. provisions).
Unscrew bolts (1).
Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold.
Check the idle speed CO level**.
Switch off exhaust extraction for time of testing.
CO Level Too High:
Check fuel injectors, fuel pressure and coolant temperature sensor.
CO Level Too Low:
Check hoses and connections for idle speed control and find air leaks.

** See Nominal Value Microfiche





Checking Function of Oxygen Sensor (11 78 010):

Unscrew bolt (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction for the time of testing.
Disconnect oxygen sensor plug.
Clamp vacuum hose leading to fuel pressure regulator (not while engine is running).
Start engine – CO level rises.
Connect oxygen sensor plug – CO level must go back to the nominal value.
Remove clamp.

13 00 060 CHECKING ENGINE IDLE SPEED AND CO LEVEL

Cars with Catalytic Converter and Provisions for Cat. Conv. Operation

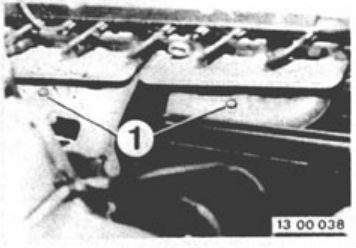
M 20 Engines with M 1.3 Motronic:
Identified on inductive sender on vibration damper with 58 teeth and one gap.

E 34 since beginning of standard production.
E 30 gradually since 3/88.
Control unit identification is possible with the BMW diagnosing system.**

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Valve clearance correct.
Engine and ignition in perfect running condition.
Connect BMW Service Tester to operating instructions.
A routine check is not necessary.

Important!
Also valid for cars with provisions for catalytic converter operation.
Adjustments must not be made on the air flow sensor control screw, since this adjustment is the basis for oxygen sensor and idle speed drive control.

13 41 017

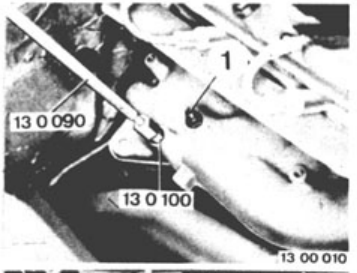


1) Engine Idle Speed
Check engine idle speed.**
See BMW diagnosing system, if the nominal value is not reached.
Check intake system for leaks.

Note:
There is no adjusting screw for idle speed regulation.

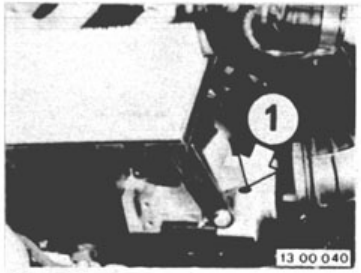
2) Emission Test
Disconnect oxygen sensor plug (not in cars with cat. conv. provisions).
Unscrew bolts (1).
Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold.
Check the idle speed CO level.**
Switch off exhaust extraction for time of testing.
CO Level Too High:
Check fuel injectors, fuel pressure and coolant temperature sensor.
CO Level Too Low:
Check hoses and connections for idle speed control and find air leaks.

**** See Nominal Value Microfiche**



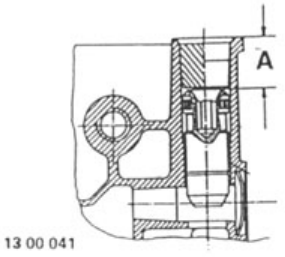
Checking Function of Oxygen Sensor (11 78 010):

Unscrew bolt (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Switch off exhaust extraction for the time of testing.
Disconnect oxygen sensor plug.
Clamp vacuum hose leading to fuel pressure regulator (not while engine is running).
Start engine – CO level rises.
Connect oxygen sensor plug – CO level must go back to the nominal value.
Remove clamp.



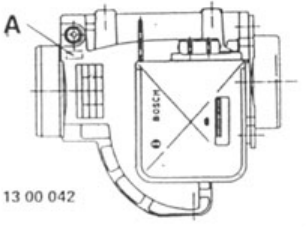
13 00 . . . ENGINE IDLE SPEED / CO LEVEL

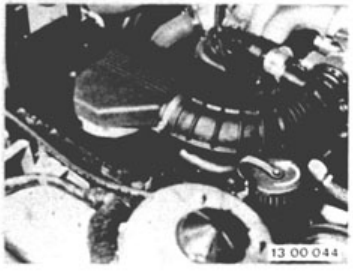
Only for Cars with Provisions for Cat. Converter Operation - M 1.1 Motronic Since 9.87 and M 1.3 Motronic (M 20):
If it is absolutely necessary to adjut the CO level/engine idle speed on air flow sensor control screw (1) or if the control screw was adjusted by mistake, the basic adjustment must be checked or made again when converting to catalytic converter operation or working on the fuel/air mixing system.



13 00 . . . CHECKING BASIC ADJUSTMENT OF AIR FLOW SENSOR CONTROL SCREW

Only for Cars with Provisions for Cat. Converter Operation (Anti-tamper Lock in Cars with Catalytic Converter) - M 1.1 Motronic Since 9.87 and M 1.3 Motronic (M 20):
Measure distance "A" on control screw with a depth gage and compare with value stamped on air flow sensor, adjusting if necessary.



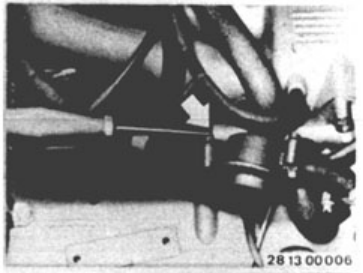


Corrections must never be made, if there is a fault in the fuel/air mixing system.
Read self-diagnosis.
Check for leaks in intake and fuel systems.
Check fuel injectors, temperature sensor and fuel pressure - also refer to 13 00 060.

13 00 054 ADJUSTING ENGINE IDLE SPEED

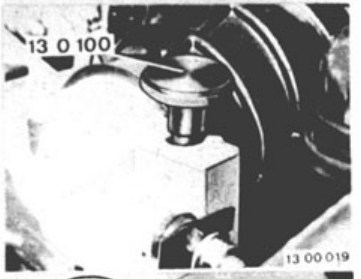
2.0 and 2.3 Ltr. Engines:

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance correct.
Air filter in perfect condition.
All electric consumers switched off.
Connect BMW Service Tester to operating instructions.
Switch off exhaust extraction system for time of emission test.



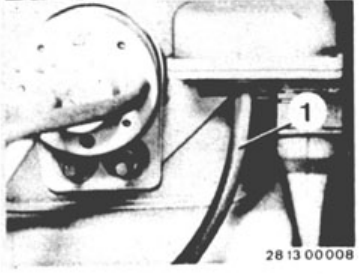
1) Engine Idle Speed

Adjust the engine idle speed* with the bypass screw in the bypass port.



2) Emission Test

First make sure that there are no faults in the engine, ignition or injection systems (see Troubleshooting) prior to correcting the CO level.
Remove cap with Special Tool 13 1 011.
Adjust the CO level* with Special Tool 13 1 100 applied on the bypass screw in the air flow sensor.

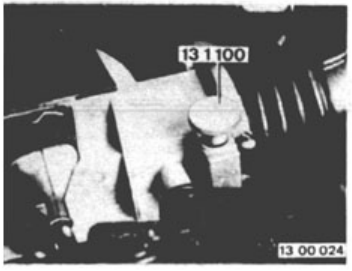


Checking Partial Load Enrichment (until 1984 Plant Shutdown):
Pull off vacuum hose (1) and plug opening – CO level must rise considerably (approx. 2.5 % by volume).

* See Nominal Value Microfiche

13 00 054 ADJUSTING ENGINE IDLE SPEED / EMISSION TEST (M 20 - 2.5 Ltr.)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Engine, ignition and injection in perfect running condition.
Valve clearance correct.
All electric consumers switched off.
Air filter cartridge in perfect condition.
Connect BMW Service Tester to operating instructions.

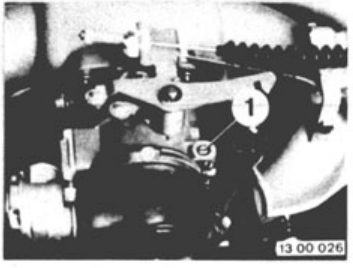


1) Engine Idle Speed
Check engine idle speed*.
Check idle speed control valve, if the nominal value is not reached.
Check or adjust basic setting.
Check intake system for leaks.

Note:
There is no adjusting screw for the engine idle speed.

BASIC ADJUSTMENT FOR IDLE SPEED CONTROL SYSTEM

Run engine at idle speed.
Pull off plug on throttle valve switch.
Apply Special Tool 13 4 010 or 13 4 020 in wire plug.
Idle speed control valve is now tight in basic adjustment position.



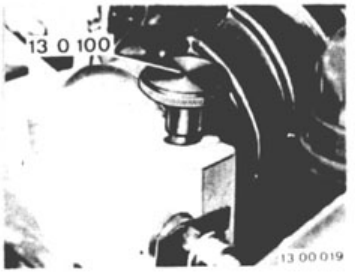
Remove anti-tamper lock.
Adjust engine speed to 760 ± 20 rpm with screw (1).
Install a new anti-tamper lock.

2) Emission Test
Remove anti-tamper lock with Special Tool 13 1 011.
Adjust the CO level* with Special Tool 13 1 100 applied on the bypass screw in the air flow sensor.
Install a new anti-tamper lock.

* See Nominal Value Microfiche

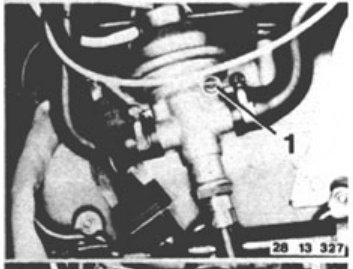
13 00 054 ADJUSTING ENGINE IDLE SPEED AND CO LEVEL (M 20, 2.7 Liter)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least + 60° C (140° F).
Engine in perfect running condition.
Air filter cartridge in perfect condition.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Exhaust extraction system switched off for time of testing.
Outside temperature above 0° C (32° F).



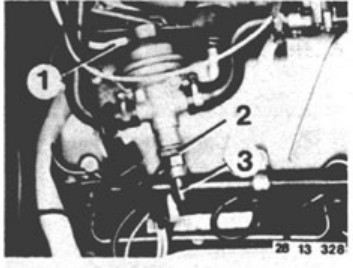
2) CO Level:

Make sure that there are no faults in the engine, ignition or injection systems before correcting the CO level.
Remove anti-tamper lock.
Adjust CO level* with Special Tool 13 1 100 applied on the air control screw in the air flow sensor.



1) Engine Idle Speed:

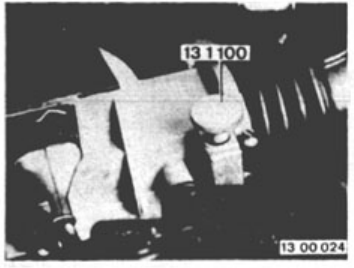
Adjust engine idle speed* with screw (1).



Running Up Speed:
Pull off hose (1) on idle speed control valve and plug openings.
Adjust running up speed* by loosening nut (2) and turning the thermo drive motor (3).
Tighten nut again.

* **See Nominal Value Microfiche and Specifications**

* **See Nominal Value Microfiche and Specifications**



13 00 054 ADJUSTING ENGINE IDLE SPEED / EMISSION TEST (Cars without Cat. Conv. – 525 e Since 1986 Models)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temp. at least 60° C (140° F).
Ignition timing and valve clearance correct.
All electric consumers switched off.
BMW Service Tester connected to operating instructions.

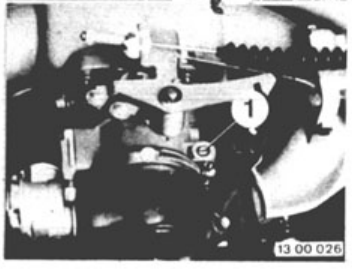
1) Emission Test

First make sure that there are no faults in the engine, ignition or injection before correcting the CO level.
Remove anti-tamper lock.
Adjust CO level* with Special Tool 13 1 100 applied on the bypass screw in the air flow sensor.
Install a new anti-tamper lock.

2) Engine Idle Speed

Check engine idle speed*.
Check the idle control valve, if the nominal value is not reached.
Check / adjust the basic setting.
Check intake system for leaks.

Note:
There is no adjusting screw for the idle speed.



BASIC SETTING FOR IDLE SPEED CONTROL SYSTEM

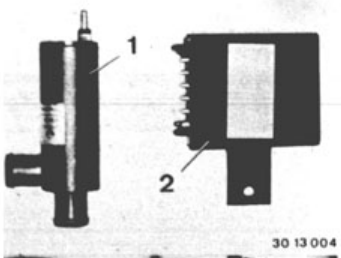
Run engine at idle speed.
Pull off plug on throttle valve switch.
Apply Special Tool 13 4 010 or 13 4 020 in wire plug.
Idle control valve is now tight in basic setting position.

Remove anti-tamper lock.
Adjust speed to 720 ± 20 rpm on screw (1).
Install new anti-tamper lock.
Pull off tool.
Connect plug on throttle valve switch.

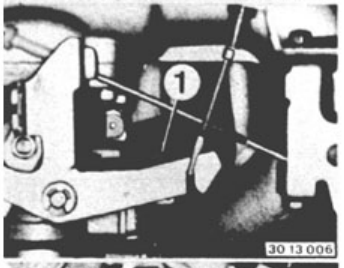
* See Nominal Value Microfiche

13 00 054 ADJUSTING ENGINE IDLE SPEED/EMISSION TEST (Cars with Catalytic Converter)

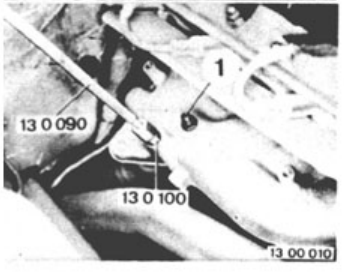
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine and ignition in perfect running condition.
Valve clearance correct.
All electric consumers switched off.
Connect BMW Service Tester to operating instructions.
Outside temperature above 0° C (32° F).



(BMW 325 e / US)
1) Checking Engine Idle Speed:**
If nominal value is not reached, check idle speed control valve (1) and idle speed control unit (2), replacing if necessary (see trouble-shooting idle speed regulation).
Note:
There is no adjusting screw for idle speed regulation.

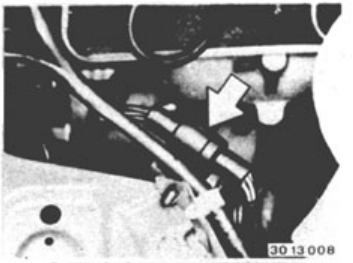


2) Emission Test:
Pull off hose (1) on throttle valve neck.
Plugs are not inserted in open connections.

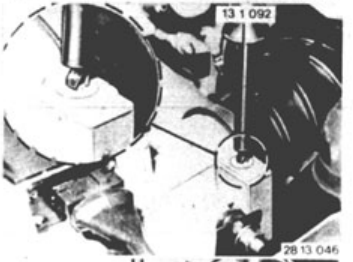


Unscrew screws (1).
Connect Special Tools 13 0 090 and 13 0 100 on exhaust manifold.
Check idle speed CO level.**
Important!
The adjusting screw on the air flow sensor in cars with M 1.1 Motronic (pulse sender on vibration damper) must not be turned.

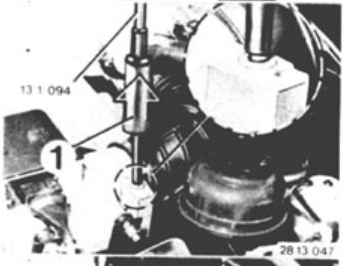
**** See Nominal Value Microfiche**



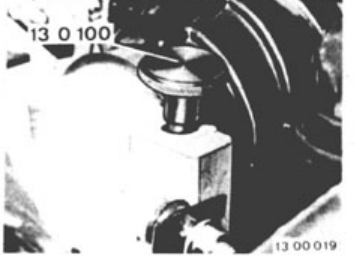
Disconnect oxygen sensor plug.



Drill hole in anti-tamper lock (1) with Special Tool 13 1 092.

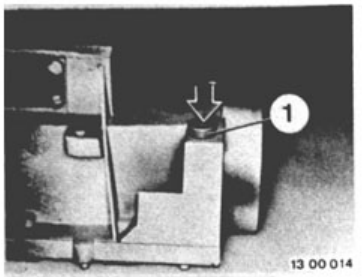


Screw Special Tool 13 1 094 in anti-tamper lock. Drive special tool and anti-tamper lock out of air flow sensor with impact (1).

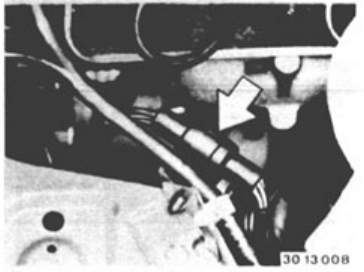


Adjust idle speed CO level* with Special Tool 13 1 100.
Make basic adjustment of idle control system.

*** See Nominal Value Microfiche**



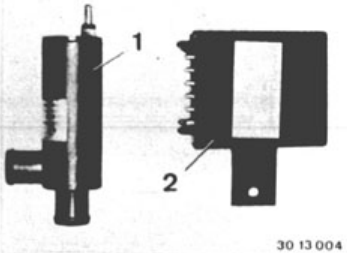
Install new anti-tamper lock (1) in air flow sensor.



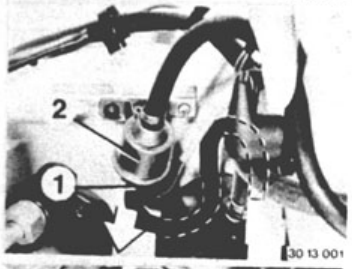
Connect oxygen sensor plug.

13 00 054 ADJUSTING ENGINE IDLE SPEED AND CO LEVEL (BMW 528 e / US)

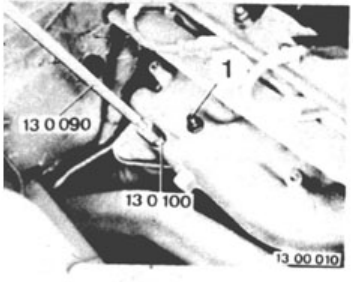
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140 ° F).
Ignition timing and valve clearance okay.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Outside temperature above 0° C (32° F).



1) Engine Idle Speed:
Check engine idle speed*.
If the nominal value is not reached, check idle speed control valve (1) and idle speed control unit (2), replacing if necessary.
Note:
There is no adjusting screw for the engine idle speed.



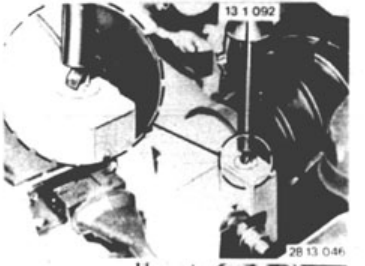
2) CO Level:
Pull off hose (1) on solenoid valve (2).
Connections remain unplugged (open).



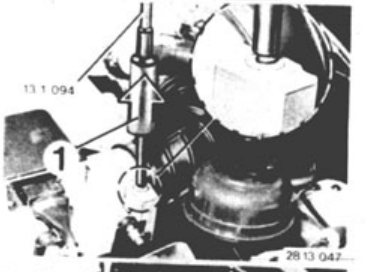
Unscrew screws (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Check idle speed CO level.**

* **See Nominal Value Microfiche**

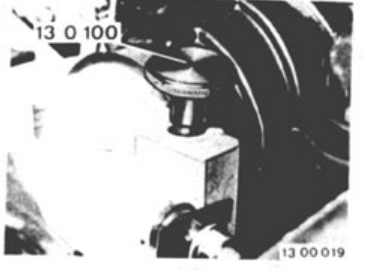
Disconnect oxygen sensor plug.



Drill hole in anti-tamper lock with Special Tool 13 1 092.

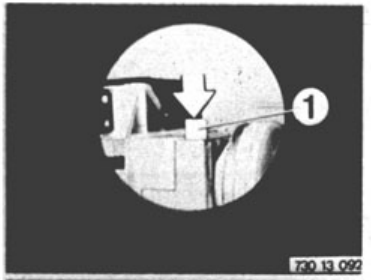


Screw Special Tool 13 1 094 into anti-tamper lock.
Drive special tool and anti-tamper lock out of the air flow sensor with impact (1).



Adjust idle speed CO level* with Special Tool 13 1 100.
Make basic adjustment of idle speed regulating system.

* **See Nominal Value Microfiche**

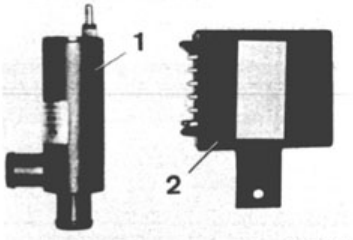


Install new anti-tamper lock (1) in air flow sensor.

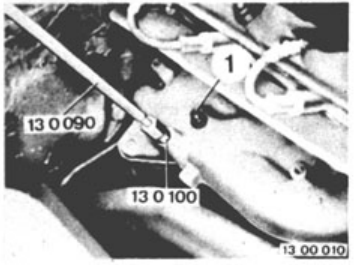
Connect oxygen sensor plug.

13 00 054 **ADJUSTING ENGINE IDLE SPEED AND CO LEVEL (BMW 325 e/ECE with Catalytic Converter)**

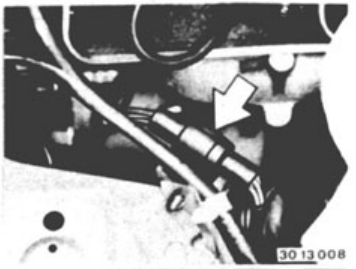
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance okay.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Outside temperature above 0° C (32° F).



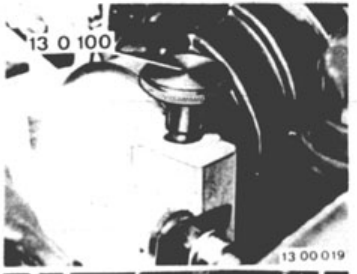
1) Engine Idle Speed:
Check engine idle speed*.
If the nominal value is not reached, check idle speed control valve (1) and idle speed control unit (2), replacing if necessary.
Note:
There is no adjusting screw for the engine idle speed.



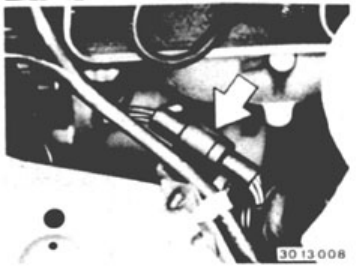
2) CO Level:
Unscrew screws (1).
Connect Special Tools 13 0 090 and 130 100 on the exhaust manifold.
Check idle speed CO level*.



Disconnect oxygen sensor plug.



Adjust CO level* with Special Tool 13 1 100 applied on air control screw in the air flow sensor.
Install a new anti-tamper lock after finishing adjustments.
Make basic adjustment of idle speed regulating system.



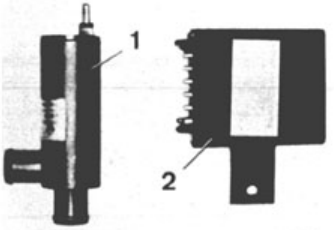
Connect oxygen sensor plug.

* **See Nominal Value Microfiche**

* **See Nominal Value Microfiche**

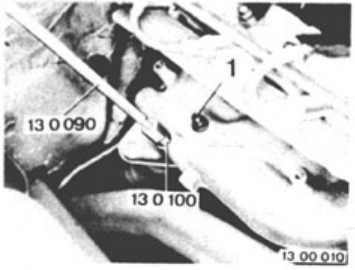
13 00 054 ADJUSTING ENGINE IDLE SPEED AND CO LEVEL (BMW 525 e/ECE with Catalytic Converter)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Ignition timing and valve clearance okay.
All electric equipment switched off.
BMW SERVICE TESTER connected to operating instructions.
Outside temperature above 0° C (32° F).

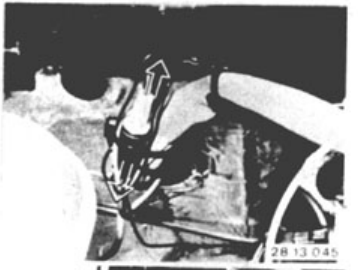


30 13 004

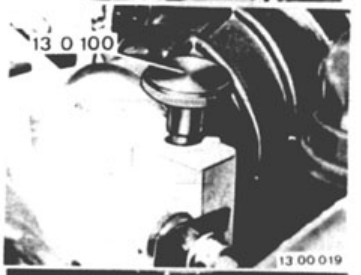
1) Engine Idle Speed:
Check engine idle speed*.
If the nominal value is not reached, check idle speed control valve (1) and idle speed control unit (2), replacing if necessary.
Note:
There is no adjusting screw for the engine idle speed.



2) CO Level:
Unscrew screws (1).
Connect Special Tools 13 0 090 and 13 0 100 on the exhaust manifold.
Check idle speed CO level*.



Disconnect oxygen sensor plug.

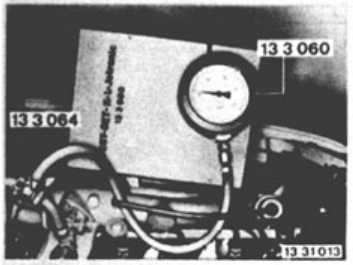


Adjust CO level* with Special Tool 13 1 100 applied on air control screw in the air flow sensor.
Install a new anti-tamper lock after finishing adjustments.
Make basic adjustment of idle speed regulating system.

Connect oxygen sensor plug.

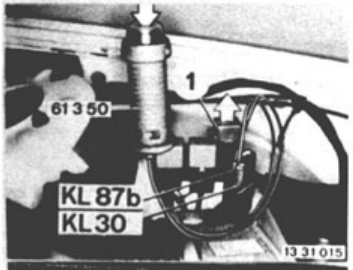
* **See Nominal Value Microfiche**

* **See Nominal Value Microfiche**



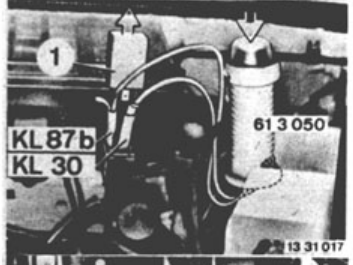
13 31 029 CHECKING FUEL DELIVERY PRESSURE (2.0 and 2.3 Liter)

Install pressure tester 13 3 060 together with connecting hose and Special Tool 13 3 064 in the fuel feed hose, in front of the fuel pressure regulator.
Plug fuel return hose with Special Tool 13 3 010.



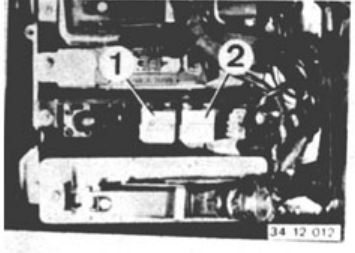
E 30

Pull off fuel pump relay (1).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Check delivery pressure*.



E 28

Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery pressure*.

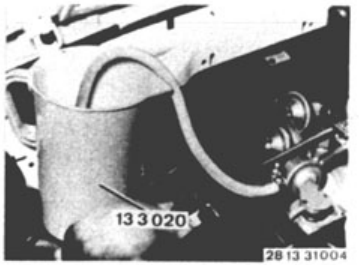


E 34

1 = Master relay
2 = Fuel pump relay

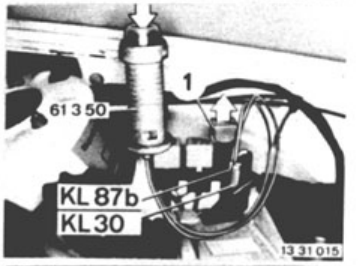
Pull off fuel pump relay (2).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

* See Specifications of Gr. 16



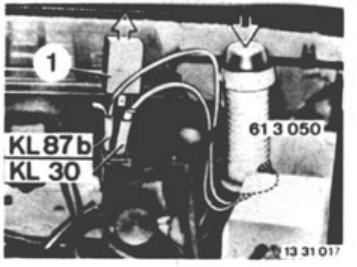
13 31 . . . CHECKING FUEL DELIVERY RATE

Disconnect fuel return hose and hold end of hose in a measuring glass, Special Tool 13 3 020.



E 30

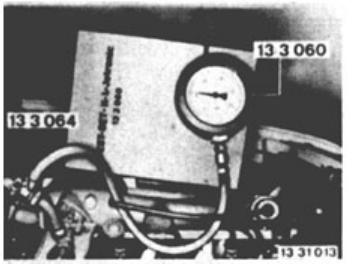
Pull off fuel pump relay (1).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Check delivery rate*.



E 28

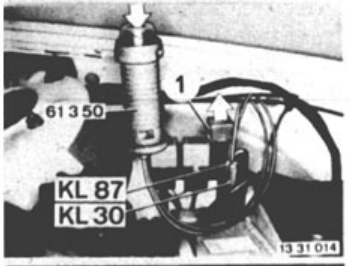
Pull off fuel pump relay (1).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Check delivery rate*.

* See Specifications of Gr. 16



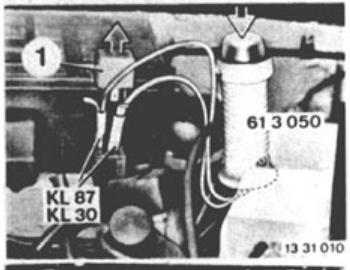
13 31 029 CHECKING FUEL DELIVERY PRESSURE (2.5 and 2.7 Liters)

Install pressure tester 13 3 060 together with a connecting hose and Special Tool 13 3 064 in the fuel feed hose, in front of the fuel pressure regulator.
Plug fuel return hose with Special Tool 13 3 010.



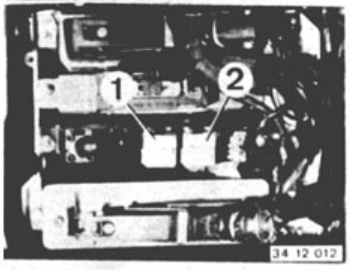
E 30

Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery pressure*.



E 28

Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery pressure*.



E 34

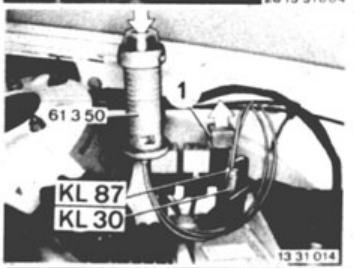
1 = Master relay
2 = Fuel pump relay

Pull off fuel pump relay (2).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

* See Specifications of Gr. 16

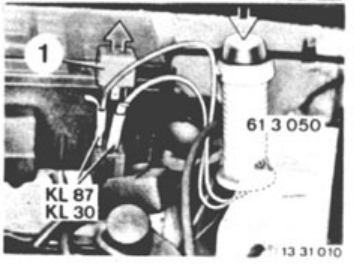
13 31 . . . CHECKING FUEL DELIVERY RATE

Unscrew fuel return hose and hold end of hose in a measuring glass, Special Tool 13 3 020.



E 30

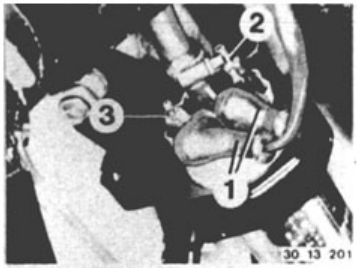
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.



E 28

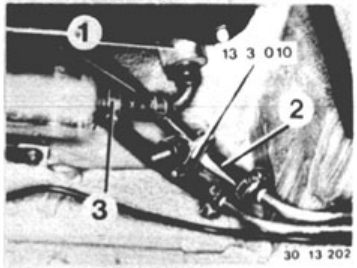
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.

* See Specifications of Gr. 16



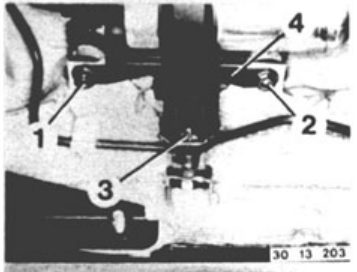
13 31 030 REMOVING AND INSTALLING FUEL PUMP

E 30:
Push back caps (1).
Unscrew nuts (2 and 3) and take off electric leads.



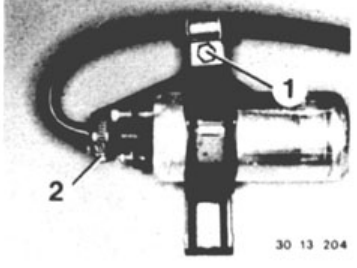
Clamp suction hose (1) and pressure hose (2) with Special Tool 13 3 010.
Loosen hose clamp (3) and pull off hoses.

Note:
Never use squeeze-hose clamps for installation of the pressure hose.

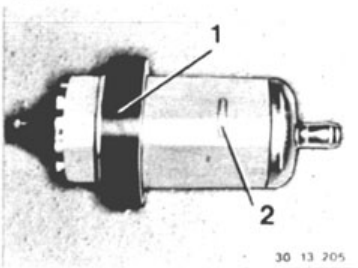


Unscrew nuts (1 ... 3) and take off holder (4).
Take off fuel pump with holder.

Installation:
Check rubber mounts, replacing if necessary.

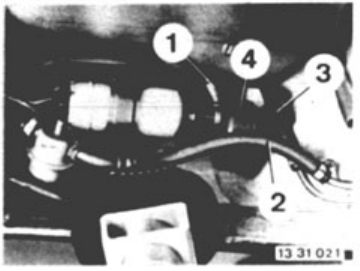


Unscrew bolt (1).
Loosen hose clamp (2) and pull off fuel hose.
Take fuel pump off of the holder.



Pull off rubber ring (1).

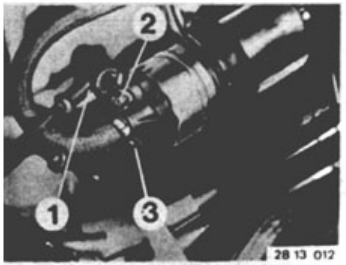
Installation:
Check code number (2)*.



Fuel Pump with Damper Chamber:
1 Suction hose
2 Pressure hose
3 Return hose
4 Damper chamber

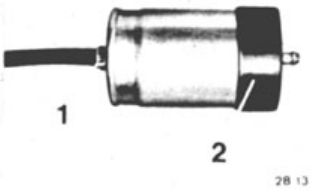
Intank fuel pump since 1988 models – see Group 16 in Model Repair Manual.

*** See Specifications**



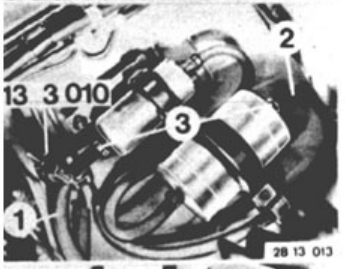
13 31 030 REMOVING AND INSTALLING FUEL PUMP

E 28:
Push back caps (1).
Unscrew nuts (2 and 3) and take off electric leads.



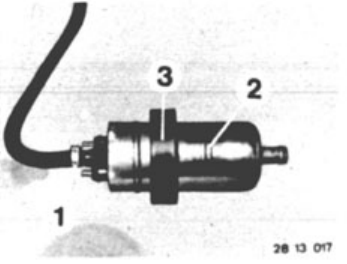
Loosen hose clamp (1) on fuel filter and pull off fuel hose.
Take off rubber ring (2).

Installation:
Inlet and outlet of filter are marked.



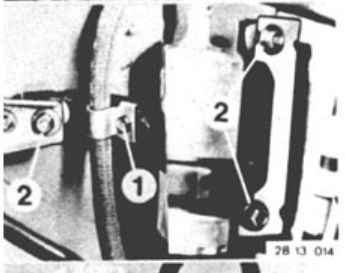
Clamp suction hose (1) and pressure hose (2) with Special Tool 13 3 010.
Loosen hose clamp (3) and pull off hoses.

Note:
Never use squeeze-hose clamps for installation of the pressure hose.

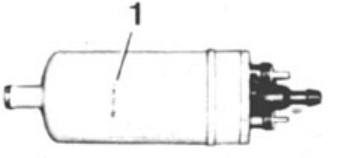


Loosen hose clamp (1) and fuel pump and pull off fuel hose.
Pull off rubber ring (3).

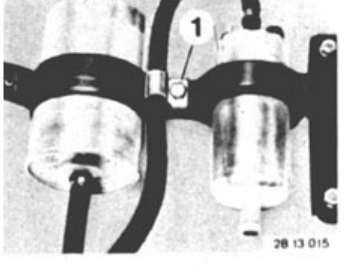
Installation:
Check code number (2)*.



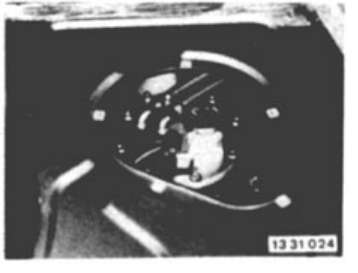
Unscrew bolt (1) and nuts (2).
Take off fuel pump with holder.



Installation:
Check code number (1)*.



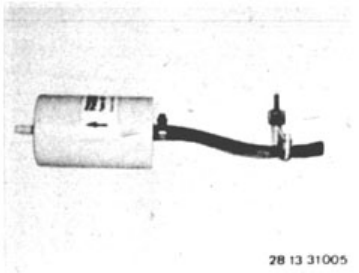
Unscrew bolt (1) and take off clamp.



13 31 . . . REMOVING AND INSTALLING FUEL PUMP

E 34:
Remove intank pump – see 16 12 . . . in the Model Repair Manual.

*** See Specifications**



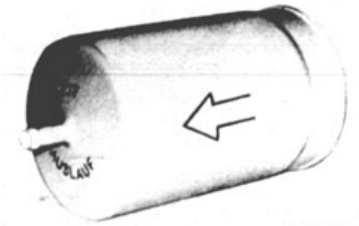
28 13 31005

13 32 051 REMOVING AND INSTALLING FUEL FILTER

E 30

Note:
Remove fuel filter with fuel feed hose and Special Tool 13 3 010.

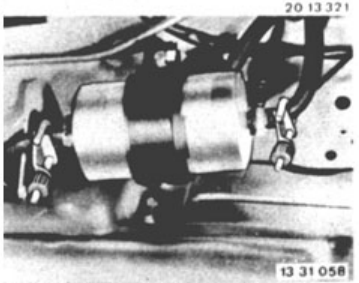
Installation:
Note direction of flow (arrow).



20 13 321

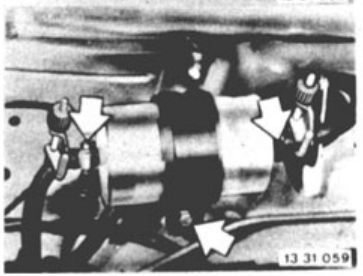
E 34

Unclamp hoses.



13 31 058

Unscrew bolts.
Pull off fuel filter.



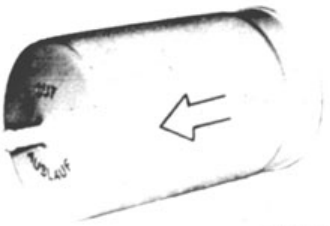
13 31 059

13 32 051 REMOVING AND INSTALLING FUEL FILTER

E 28

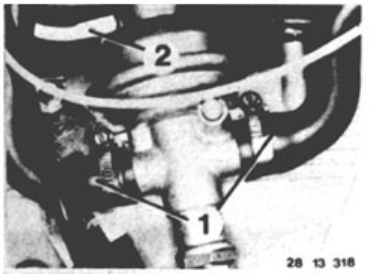
See "Removing and Installing Fuel Pump" 13 31 030.

Installation
Note direction of flow (arrow).

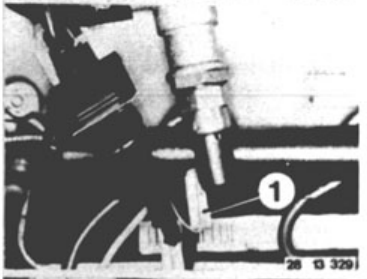


20 13 321

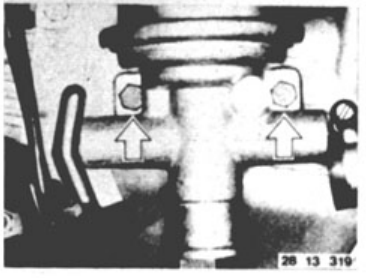
13 41 000 REMOVING AND INSTALLING (REPLACING) IDLE CONTROL VALVE



Disconnect air hoses (1).
Pull off vacuum hose (2).

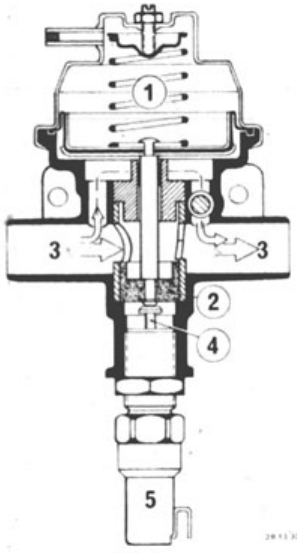


Pull off plug (1).



Unscrew screws and take off idle control valve.
Installation:
Adjust engine idle speed.

The idle speed regulation system consists of idle control valve, 0° C (32° F) air temperature switch, 45° C (113° F) coolant temperature switch and solenoid valve with lines.
The air conditioner switch is also used for activation.

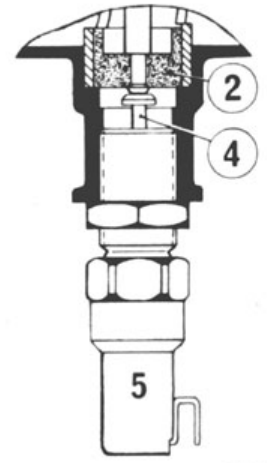


Regulating Unit

Task:
The engine idle speed is regulated by changing the air flow rate in bypass port (3) with valve (2) depending on the intake pressure.
Dropping absolute pressure = rising "vacuum".

Function:
Absolute pressure rises in the intake as engine speed drops.
This means less counterforce on spring (1) and activation of valve (2).
The cross section size of bypass port (3) increases and engine speed picks up.

Or:
Absolute pressure drops in the intake as engine speed rises.
This means greater counterforce on spring (1) and activation of valve (2).
The cross section size of bypass port (3) decreases and engine speed drops.

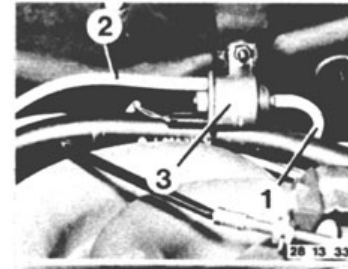


28 13 326

Thermo Operating Motor (5)

Task:
Regulation of engine idle speed with air conditioner switched on and/or coolant temperature below 45° C (113° F) and/or air temperature below 0° C (32° F).
With these operating conditions there is no intake pressure influence on the idle control valve and there is no regulation.

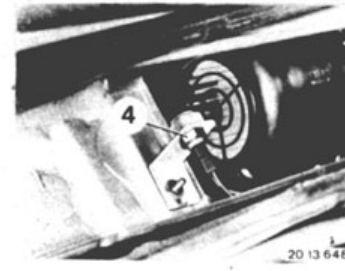
Function:
Depending on temperature of thermo operating motor (5) air valve (2) is lifted by piston (4) and closes part of the bypass port opening.
The remaining bypass port opening determines the air flow rate and consequently the engine speed*.



28 13 330

Solenoid Valve (3)

Task:
Switching supply of intake pressure to idle control valve on and off.
Venting the idle control valve.



20 13 648

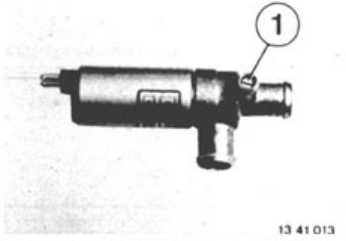
Function:
The solenoid valve receives voltage with the air conditioner switched on and/or coolant temperature below 45° C (113° F) and/or temperature of air below 0° C (32° F).
Pressure line (1) to intake is closed.
Pressure line (2) to idle control valve is vented.
4 = 0° C (32° F) air temperature switch

* See Specifications + Nom. Value Microfiche

13 41 . . . MAKING BASIC ADJUSTMENT OF VDO IDLE CONTROL SYSTEM

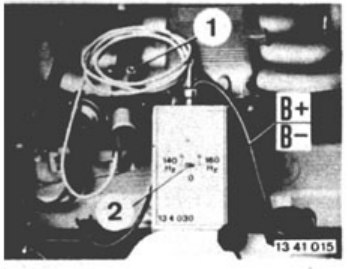
Requirements:
- Engine at operating temperature, i.e. oil temperature at least 60° C (140° F)
- Ignition timing and valve clearance correct.
- Air filter cartridge in perfect condition.
- All electric equipment switched off.
- Idle CO level correct.

Note:
Basic adjustments are not made at certain intervals.



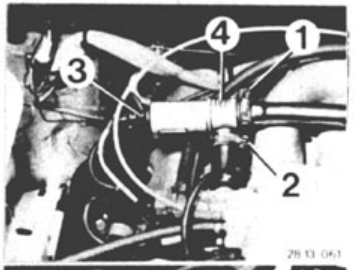
13 41 013

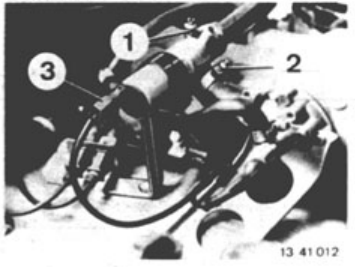
Basic adjustments can only be made with application of the illustrated metal valve. This metal valve can be installed retroactively on a general basis.
1 = Basic adjustment screw



Connect tester 13 4 030 on car battery (B+/B–) and idle control valve.
Set switch (2) to 140 Hz.
Connect speed tester (BMW service tester).
Run engine at idle speed.
Adjust idle speed to 700 ± 50 rpm with basic adjustment screw (1).

Remove tester 13 4 030.
Connect plug from engine wire harness on idle control valve again.





13 41 000 REMOVING AND INSTALLING IDLE CONTROL VALVE

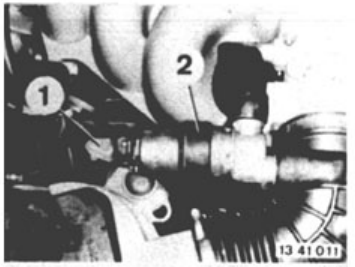
Loosen hose straps (1 and 2).
Pull off plug (3).
Remove idle control valve.
Installation:
Check code number (4)*.
Check idle speed*.

Idle Control Valve with Adjusting Screw:

Disconnect retaining strap.
Loosen hose straps (1 and 2).
Pull off plug (3).
Remove idle control valve.
Installation:
Make basic adjustment.

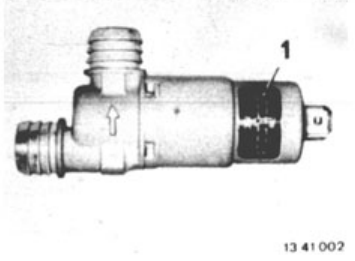
Checking Idle Control Valve:
Apply battery voltage on idle control valve.
Idle control valve must close and be tight.
Idle control valve should be open when without voltage.

* See Specifications and Nominal Values



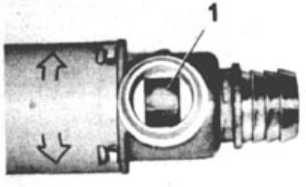
13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE (M 20 B 20 ME-520 i / E 34) (M 20 B 25 ME-325 i/525i / E 34) (M 20 B 27 ME-525 e since 9.85)

Pull of plug (1).
Disconnect retaining strap (2).
Pull idle speed control valve off of hoses and remove.



Installation:
Check code number (1)*.
Check engine idle speed*.

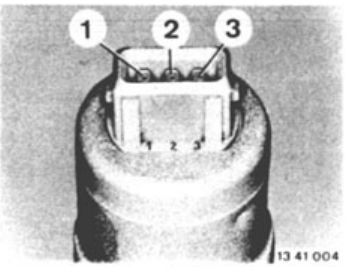
Note:
Check whether idle speed control valve is working by taking hold of it in the hand (the timed power supply will be felt).



<u>Mechanical Test:</u>

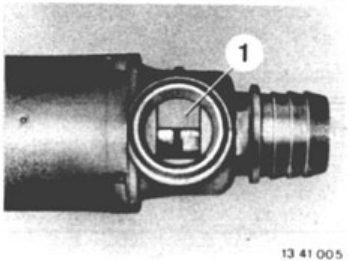
Erratic turning of the idle speed control valve must cause the rotary piston (1) in the idle speed control valve to move.

* See Specifications and Nominal Value Microfiche



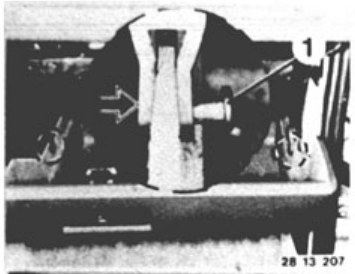
<u>Electric Test:</u>

Measure resistance between terminals (1 and 3).
Nominal value: approx. 40 ohms.
Measure resistance between terminals (2 and 1) or (2 and 3).
Nominal value for each: approx. 20 ohms.



<u>Dynamic Test:</u>

Remove idle speed control valve (plug remains connected).
Open or close rotary piston (1) completely.
Turn on ignition.
Rotary piston must move to and remain in a position of approx. 50 % open.

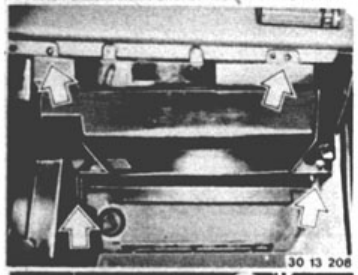


13 41 010 REMOVING AND INSTALLING CONTROL UNIT FOR IDLE CONTROL VALVE

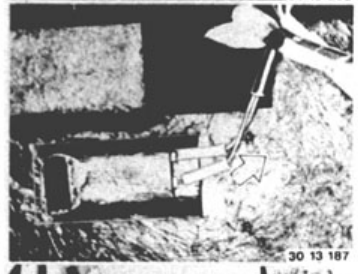
E 30

Open glove box.

Pull out pins (1) of both retaining straps.

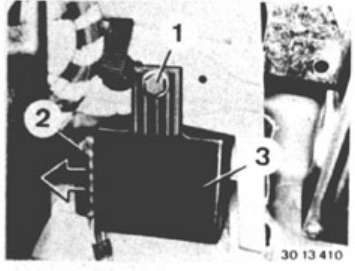


Unscrew screws and take off trim.



Pull off both plugs of glove box light.

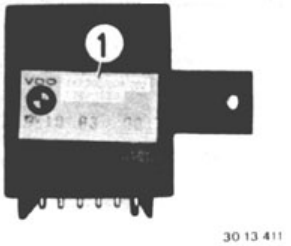
Place trim aside.

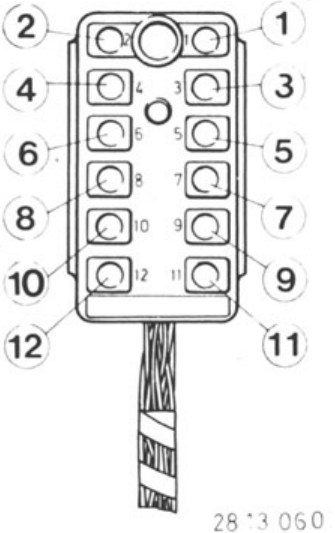


Unscrew screw (1).

Pull off plug (2).

Remove control unit (3).





Installation:

Check code number (1)*.

Check idle speed*.

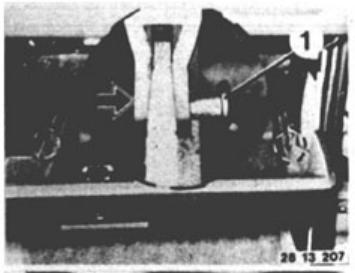
Multiple Pin Plug Connections:

No.	mm²	Color	Connection To
1	0.75	BLRT	Idle control valve A
2	1.5	GNGE	Terminal 15
3	1.0	GN	DME control unit (pin 8)
4	1.5	BR	Terminal 31
5	0.75	BLSW	Idle control valve B
6	0.5	WS	Temp. switch 45°C/113°F
7	0.5	BLBR	Conn. transm. N
8	–	–	–
9	0.5	BLWS	Air conditioner
10	0.5	BLGN	Air temperature switch
11	0.5	BRRT	DME control unit (pin 13)
12	0.5	BRBL	DME control unit (pin 2)

Wire Colors:

BL = blue
BR = brown
GE = yellow
GN = green
RT = red
SW = black
WS = white

* See Specifications + Nom. Value Microfiche

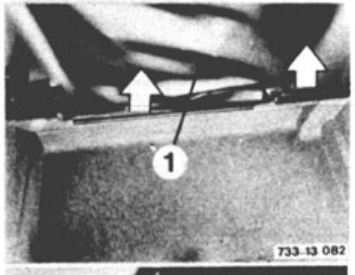


13 41 010 REMOVING AND INSTALLING CONTROL UNIT FOR IDLE CONTROL VALVE

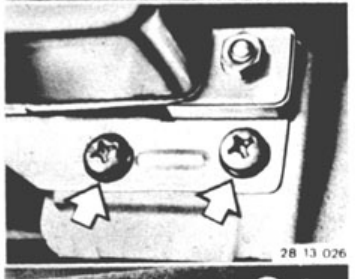
E 28

Open glove box.

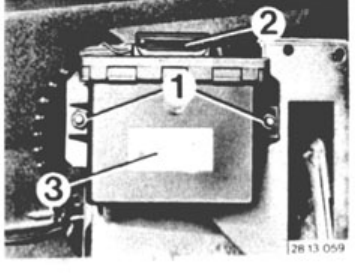
Pull out pins (1) of both retaining straps.



Disconnect cover (1).



Unscrew both screws on left and right sides of control unit.



Unscrew nuts (1).

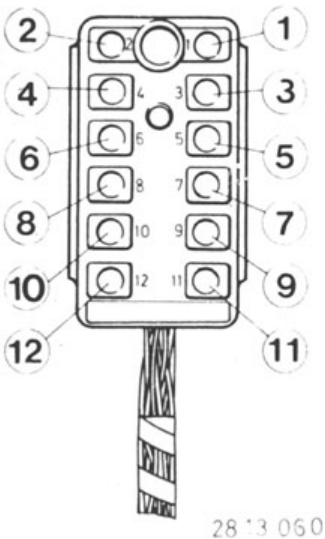
Pull off multiple pin plug (2).

Remove control unit.

Installation:

Check code number (3)*.

Check idle speed*.



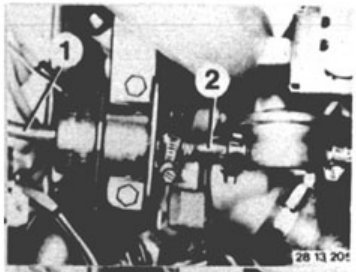
Multiple Pin Plug Connections:

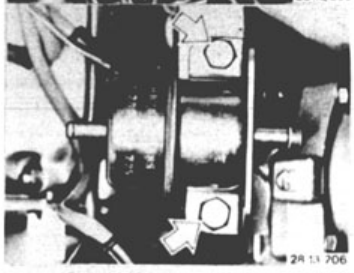
No.	mm²	Color	Connection To
1	0.5	BLRT	Idle control valve A
2	0.5	GNGE	Terminal 15
3	1.0	GN	DME control unit (pin 8)
4	0.5	BR	Terminal 31
5	0.5	BLSW	Idle control valve B
6	0.5	WS	Temp. switch 45°C/113°F
7	0.5	BLBR	Conn. transm. P
8	0.5	BLGE	Conn. transm. N
9	0.5	BLWS	Air conditioner
10	0.5	BLGN	Air temp. switch
11	0.5	BRRT	DME control unit (pin 13)
12	0.5	BRBL	DME control unit (pin 2)

Wire Colors:

BL = blue
BR = brown
GE = yellow
GN = green
RT = red
SW = black
WS = white

* See Specifications + Nom. Value Microfiche

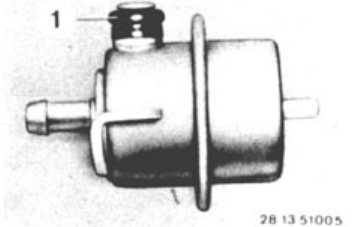




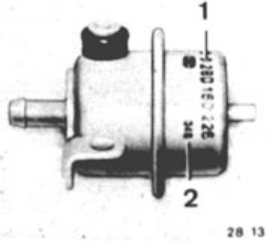
13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

Disconnect air hose (1) and fuel hose (2).

Unscrew screws.
Take off fuel pressure regulator.



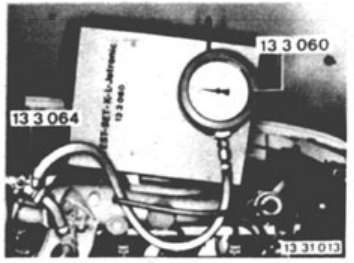
Installation:
Check seal (1), replacing if necessary.



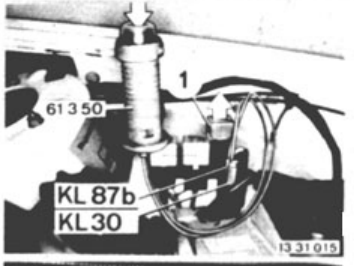
Installation:
Check code number (1)*.

(2) = Manufacturing date

* See Specifications

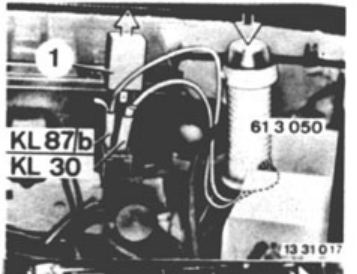


Checking:
Install pressure tester 13 3 060 with a connecting hose and Special Tool 13 3 064 in the fuel feed hose, in front of the pressure regulator.



E 30

Pull off fuel pump relay (1).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Fuel injection pressure*.



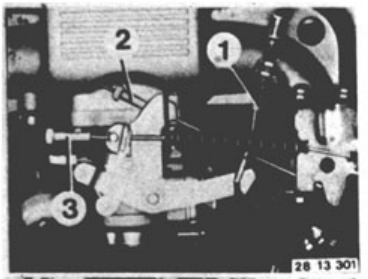
E 28

Pull off fuel pump relay (1).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Fuel injection pressure*.

E 34

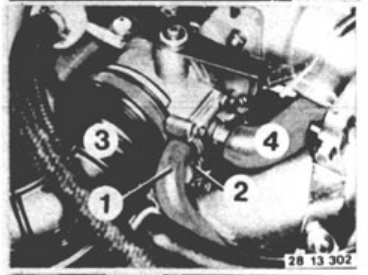
Pull off fuel pump relay (2).
Bridge terminals 87 b and 30 with Special Tool 61 3 050.
Fuel injection pressure*.

*See Specifications or Nominal Value



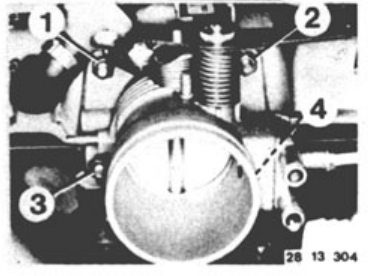
13 54 030 REMOVING AND INSTALLING THROTTLE HOUSING

(2.0 ... 2.7 Liter Engines)
1 = Automatic transmission
2 = Accelerator pedal
3 = Cruise control
Installation:
Adjust cables – see Groups 24/35/65.

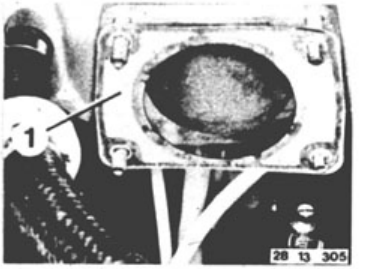


Disconnect water hose (1 and 2).
Disconnect air hoses (3 and 4).
Installation:
Fill and bleed cooling system .

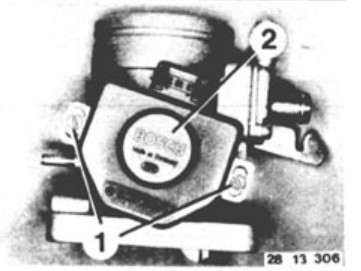
Pull off multiple pin plug (1) on throttle switch.
Pull off vacuum hose (2).



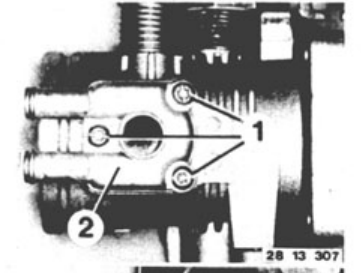
Unscrew nuts (1 ... 4) and remove throttle housing (nut 4 is not shown in picture).



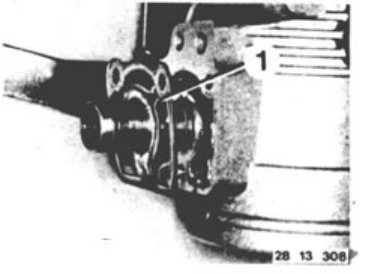
Installation:
Replace gasket (1).



Unscrew screws (1).
Remove throttle switch (2).
Installation:
Adjust throttle switch.

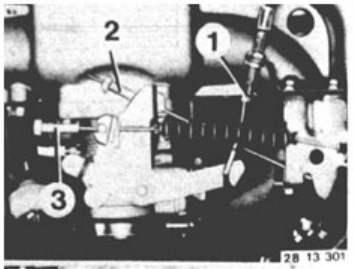


Unscrew screws (1) and take off cover (2).



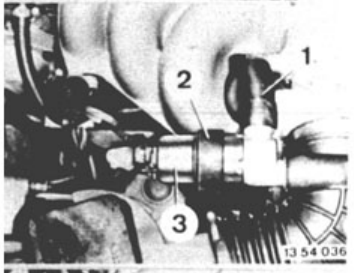
Installation:
Replace gasket (1).
Check engine idle speed* and CO*.

* See Nominal Value Microfiche

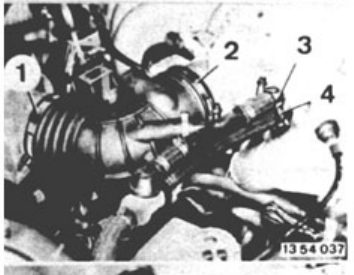


13 54 030 REMOVING AND INSTALLING THROTTLE VALVE NECKS (325 i and 525 e since 9.85/ M 20 - E 34)

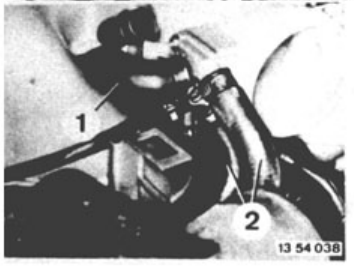
Disconnect cables (1 ... 3).
1 = Automatic transmission
2 = Accelerator pedal
3 = Cruise control
Installation:
Adjust cables - see Groups 24/35/65.



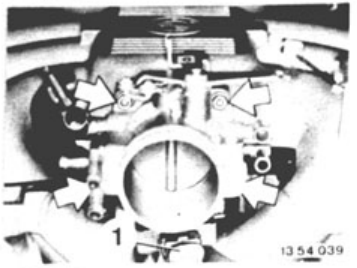
Disconnect retaining strap (2).
Take off and place aside idle speed control valve (3) together with hose (1).



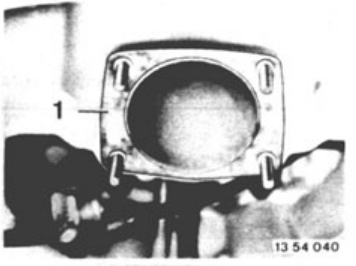
Loosen hose clamps (1 ... 4).
Place intake hose and air hose for brake booster aside.



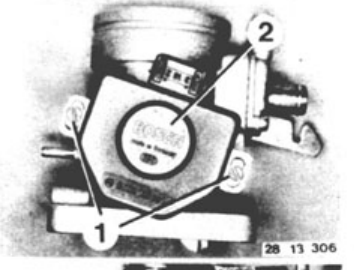
Disconnect air hose (1).
Disconnect and plug coolant hoses (2).
Installation:
Fill and bleed cooling system - see Gr. 17.



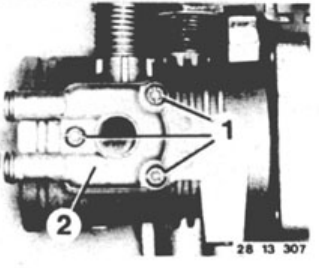
Pull off plug (1) on throttle valve switch.
Unscrew four screws.
Take off throttle valve neck.



Installation:
Replace gasket (1).

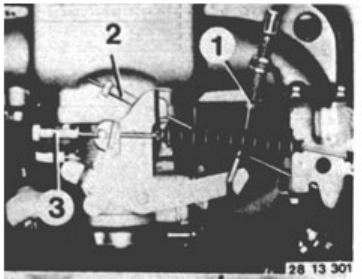


Unscrew screws (1).
Take off throttle valve switch (2).
Installation:
Adjust throttle valve switch.



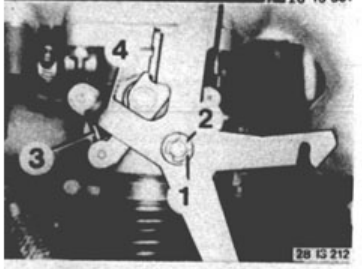
Unscrew screws (1) and take off cover (2).
Installation:
Replace gasket.
Check engine idle speed* and CO level*.

* See Nominal Value Microfiche

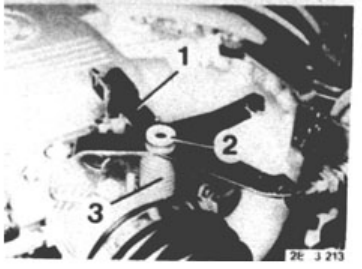


13 54 051 REPLACING THROTTLE SHAFT RETURN SPRING

Disconnect cables (1 ... 3).
1 = Automatic transmission
2 = Accelerator pedal
3 = Cruise control
Installation:
Adjust cables – see Groups 24/35/65.

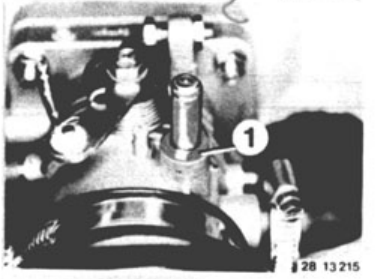


Remove retainer (1).
Take off washer (2).
Disconnect linkage (3) on lever (4).

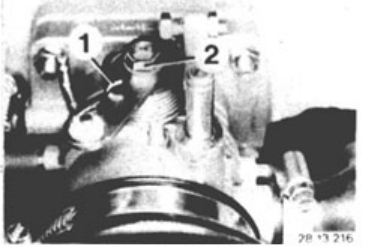


Lift and turn lever (1) to release tension of spring (3).
Take off lever (1).
Installation:
Check bearing sleeves (2), replacing if necessary.
Check spring pre-load.

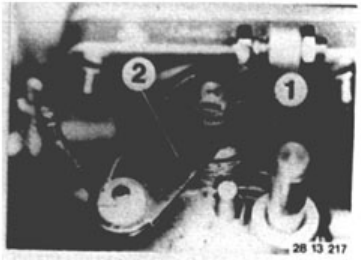
Take off spring (1).



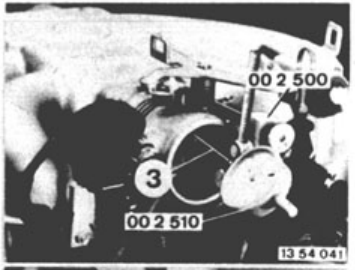
Note:
Check spring washer (1).



Disconnect spring (1).
Unscrew nut (2).
Installation:
Check spring pre-load.

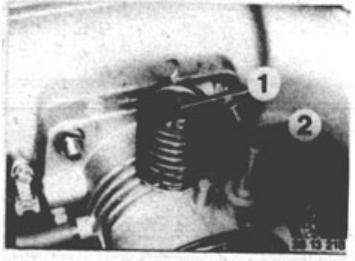


Take off washer (1) and lever (2).

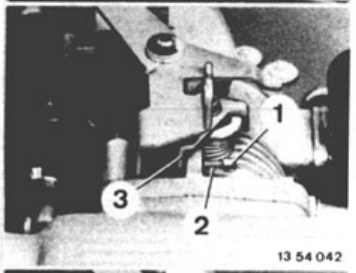


Basic Throttle Valve Adjustment:

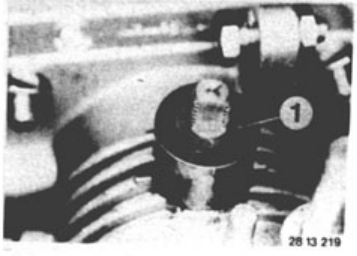
Disconnect air hose on throttle valve neck.
Mount Special Tool 00 2 510 (with extension no. 3) and Special Tool 00 2 500 on the throttle valve neck.
Apply tip of dial gage with preload on edge of throttle valve.



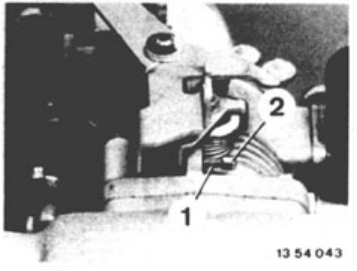
Take off sleeve (1) and spring (2).



Pull off anti-tamper lock (1) and loosen screw (2) until lever (3) no longer bears on screw (2).
Tighten screw (2) again until throttle valve begins to move.



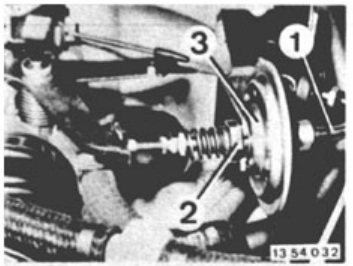
Note corrugated washer (1) and washer (2).

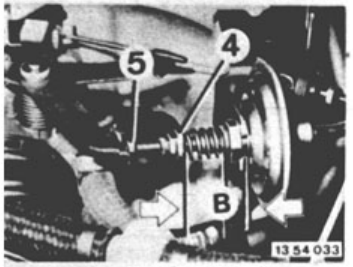


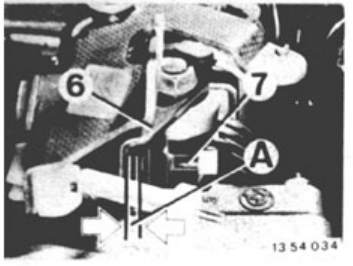
Open throttle valve further by 0.2 - 0.05 mm (0.008 - 0.002") with screw (1).
Lock screw with paint.
Install anti-tamper lock (2).
Open and close throttle valve several times after adjusting to make sure that the throttle valve does not stick.

Check adjustment of throttle valve switch.
Check engine idle speed* and CO level*.

* See Nominal Value Microfiche





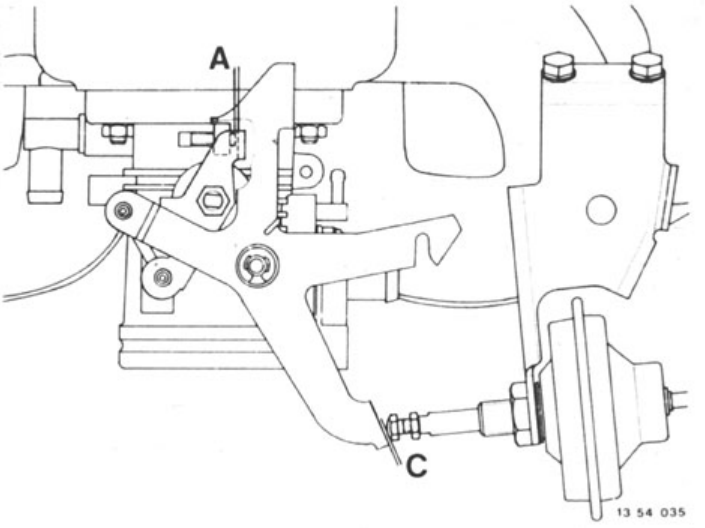


13 54 130 REPLACING / ADJUSTING VACUUM CONTROL FOR THROTTLE VALVE

Pull off hose (1).
Loosen nut (2).
Take off vacuum control (3).

Installation:
Adjust spring distance B = 33 ± 0.3 mm (1.299 ± 0.012") with screw (4).
Adjust distance (A) with screw (5).

A is distance measured between lever (6) and idle stop screw (7) with vacuum control run out.

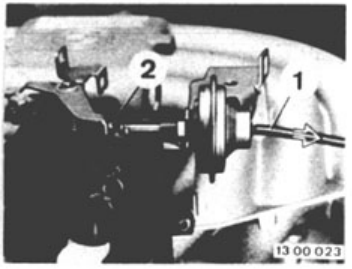


M 20 B 20 and M 20 B 23: A = 3.5 ± 0.1 mm (0.138 ± 0.004")

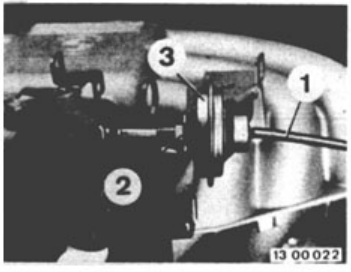
Distance (C) ≙ 1 mm (0.039") is measured with control unit pulled back.

13 54 130 CHECKING/ADJUSTING/REPLACING VACUUM CONTROL FOR THROTTLE VALVE (M 20 B 25 ME 6 – 325 i - 4 All Wheel Drive)

The throttle valve positioner in 325 i-4 (all wheel drive) cars only operates the throttle valve briefly during the control phase of the ABS control unit.
The throttle valve positioner combines with the control phase of ABS – releasing of brakes – locking of wheels through braking torque of engine, by way of operation of the throttle valve.
Depressing the clutch pedal stops operation of the throttle valve positioner (clutch pedal switch).

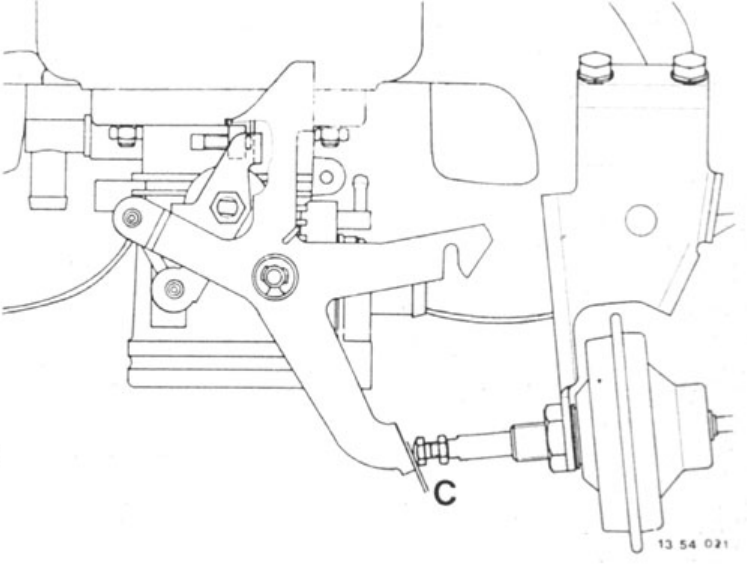


Pull off vacuum hose (1) and plug manifold connection.
Adjust engine speed to 2400 ± 50 rpm with screw (2).
Lock screw (2) again.
After brief acceleration the speed must always remain within tolerances.
Connect vacuum hose again.

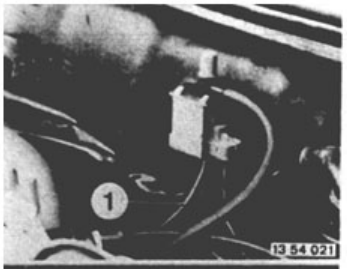


Replacing:
Pull off vacuum hose (1).
Unscrew nut (2).
Take off vacuum control.
Check location of lock washer between vacuum control and bracket.

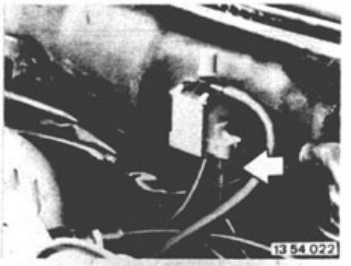
Check distance C.
Distance C is ≥ 1 mm (0.039") when measured with pulled back vacuum control.



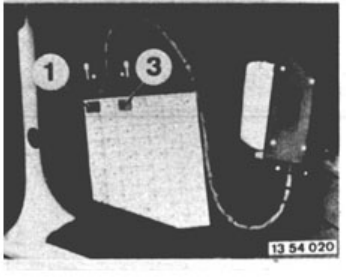
Adjusting:
Requirements:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
All electric equipment switched off.
CO level and idle speed basic adjustment correct.
Tachometer (BMW service tester) connected.



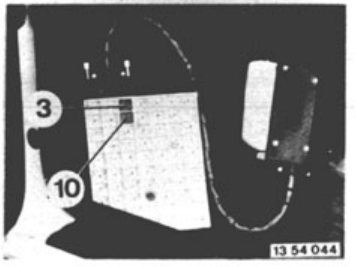
Checking:
Pull off vacuum hose (1).
Connect vacuum pump.
Throttle valve positioner runs in.



Electric Test:
Pull off plug on solenoid valve.
Check resistance (27.5 to 36 ohms) on solenoid valve.



Connect universal adapter on wire harness of ABS control unit.
Bridge terminals 1 and 3.
Turn on ignition.
Throttle valve positioner runs out.



Electric Test (with Wire and Plug Connections):
Connect universal adapter on wire harness of ABS control unit.
Connect ohmmeter between 3 and 10.
Nominal value: 27.5 to 36 ohms.

13 61 . . . PRINTED CIRCUIT SWITCH

With several DME control units a printed circuit switch makes it possible to correct the ignition timing and fuel/air mixture in relatively tight tolerances over the entire engine load range. Adjustments must only be made, if the fuel grade is not correct or the mixture has to be adapted after fully exploiting all other known measures. An unjustified adjustment would lead to unsatisfactory handling and excessive fuel consumption. An increase in power output is not possible with the printed circuit switch.

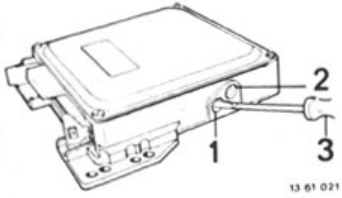
Ignition Timing Correction

If fuel grade is insufficient, the ignition timing can be retarded over the entire performance curve in order to avoid pinging or knocking. This ignition timing change will automatically cause higher fuel consumption.
Consequently the ignition timing should be set back to the basic adjustment as soon as this is permitted by the fuel grade.

Mixture Correction

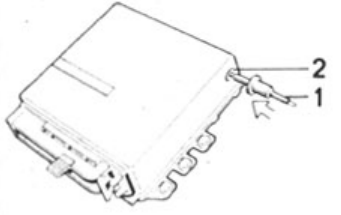
The printed circuit switch permits correction of the mixture over the entire performance curve, in contradiction to the mixture control screw.
A mixture correction is only justified, when there is guarantee that there is no defect in the engine, fuel injection or ignition.

Adjusting Printed Circuit Switch: -- Remove control unit 13 61 000.



13 61 021

Molded Housing:
Remove anti-tamper lock (1) carefully with a screwdriver (3).
Make sure that the printed circuit switch is not subjected to impact.
2 = Diode

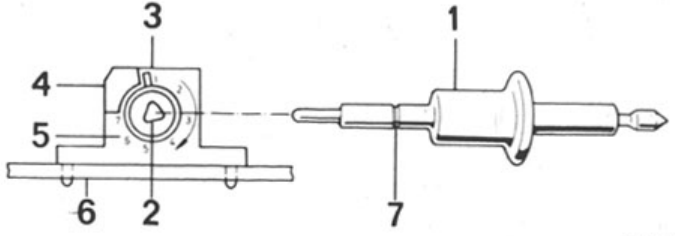


13 61 022

Metal Housing:
Press tool (1) fully into anti-tamper lock (2).
Pull anti-tamper lock (2) out of housing with tool (1).

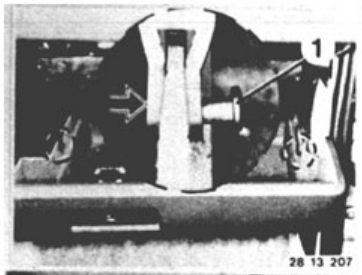
Adjusting:
Only use Special Tool 12 4 010 for adjustments.
Turn printed circuit switch carefully against the left stop.
Count number of catches, if already maladjusted.
See technical data on page 13 - 406a for switch positions and corresponding correction values.
Count switch positions beginning at left stop, making sure that the switch catches and is not in an intermediate position.
Check adjustment with BMW service tester and a test drive.
Install a new (red) cap after finishing adjustments.
Note:
BMW installs blue or black anti-tamper locks (also the manufacturers of control units).

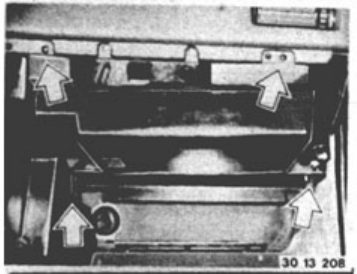
See page 13 - 406a of Technical Data for control values belonging to the switch steps.

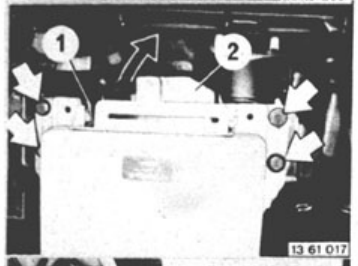


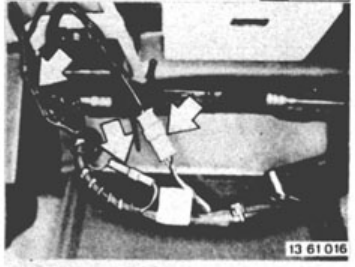
13 61 020

1 = Tool
2 = Bore
3 = Basic setting (left stop)
4 = Stop
5 = Switch positions
6 = Printed circuit board
7 = Nominal break point



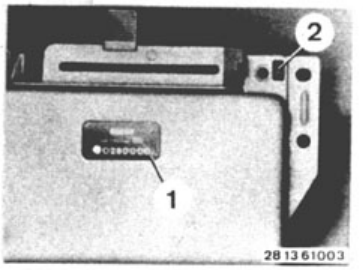




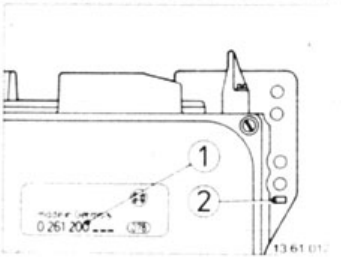


13 61 000 REMOVING AND INSTALLING CONTROL UNIT

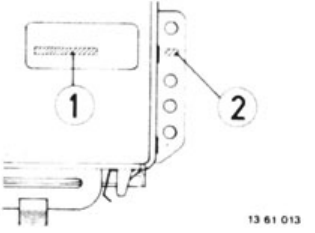
E 30:
Open glove box.
Pull off pins (1) of both retaining straps.



Unscrew trim panel.



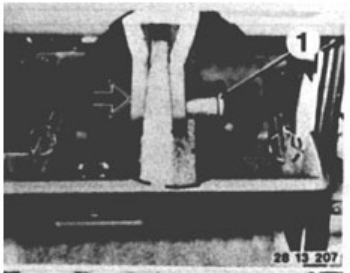
Push back lock (1) and pull off plug (2).
Unscrew four mounting bolts and take out control unit.



See wiring diagram for plug connections.

Installation:
Check code number (1)* and manufacturing date (2)*.
Check / adjust engine idle speed* and idle speed CO level*.

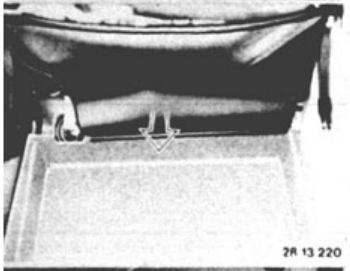
* See Specifications + Nom. Value Microfiche



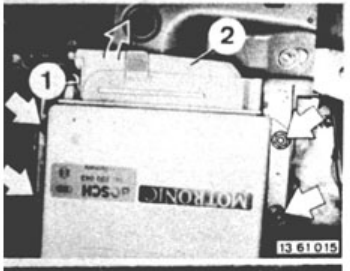
13 61 000 REMOVING AND INSTALLING CONTROL UNIT

E 28

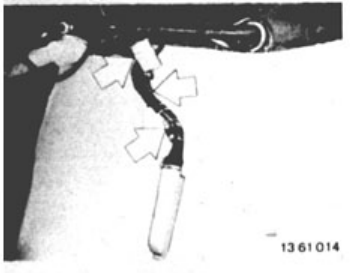
Open glove box.
Pull off shaft (1) of both retaining straps.



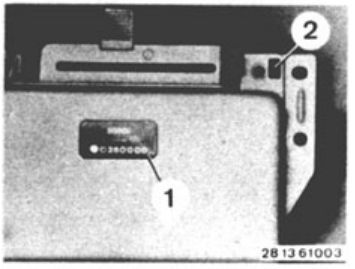
Take out trim panel.

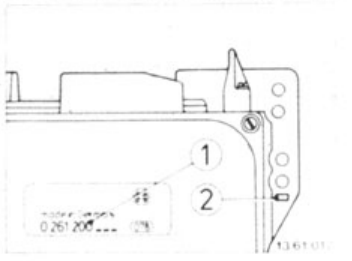


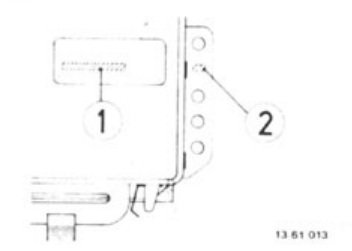
Push back retainer (1) and pull off plug (2).
Unscrew four mounting screws and take off control unit.



Plug connections - see wiring diagram in Group 12.







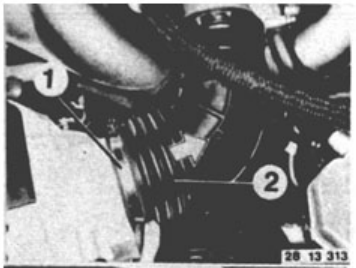
Installation:
Check code number (1)* and manufacturing date (2)*.
Check and adjust idle speed CO level*.

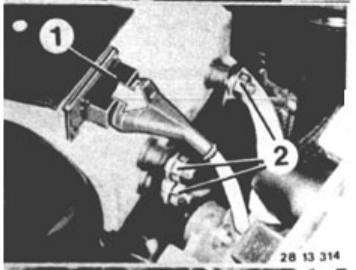
13 61 . . . REMOVING AND INSTALLING CONTROL UNIT

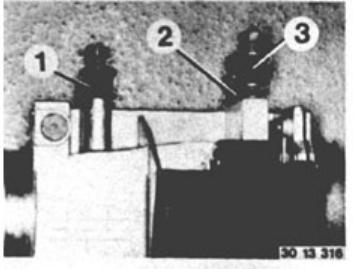
E 34

See M 30.

* See Specifications and Nominal Value Microfiche

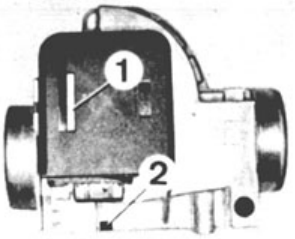






13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR

Loosen hose clamp (1) and pul air hose off of air flow sensor.



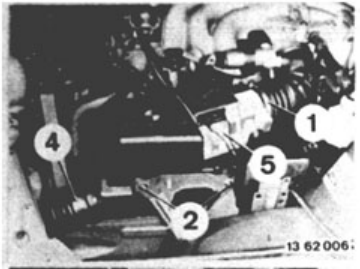
Pull off plug (1).
Unscrew nut (2) and take off air flow sensor.

Installation:
Check seal (1), replacing if necessary.

Unscrew dampers (1 ... 3) on air flow sensor.
Check dampers, replacing if necessary.

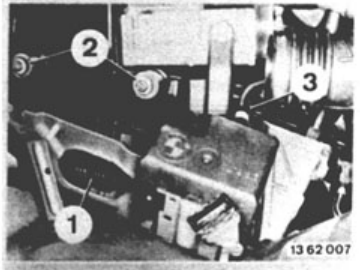
Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and idle speed CO level*.
Check air flow sensor*.

* **See Specifications and Nominal Value Microfiche**

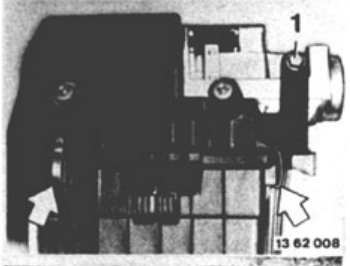


13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR
(M 20 B 20 ME-520 i / E 34)
(M 20 B 25 ME-325 i/525 i/E 34)
(M 20 B 27 ME-325 e/525 e since 9.85)

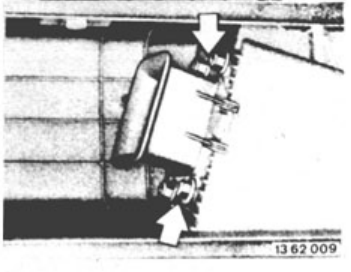
Loosen hose clamp (1)-
Loosen nuts (2).
Pull off hose (4).
Pull off plug (5).



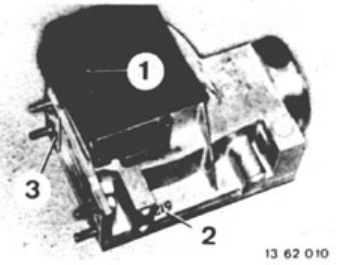
Cut off strap (3).
Take off complete air cleaner.
Installation:
Check rubber mount (1) and dampers (2) and also for correct seating.



Open fasteners (four).
Unscrew screw (1).
Separate housing sections.

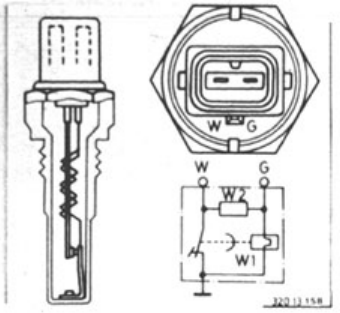


Unscrew nuts.



Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and idle speed CO level*.
Check gasket (3).
Check air flow sensor*.

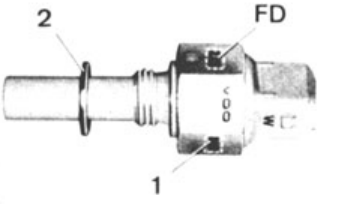
* **See Specifications and Nominal Value Microfiche**



13 62 050 REMOVING AND INSTALLING/ CHECKING TEMPERATURE TIME SWITCH

The temperature time switch regulates the open time of the cold start valve according to coolant temperature.
The open time (e.g. 8 sec.) and switching off temperature (e.g. + 35° C = 95° F) are stamped in the hexagon.

Removing and Installing:
Pull off plug (1).
Unscrew temperature time switch.
Installation:
Tightening torque*.



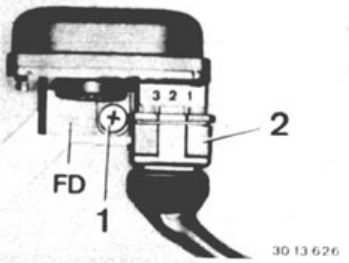
Installation:
Check code number (1)*.
Replace seal (2).
FD = Manufacturing date
Fill and bleed cooling system (Gr. 17).

Checking:
Connect Jetronic test lead 61 1 440.
Check nominal value* with an ohmmeter.
To check the entire temperature range, remove temperature sensor and place it in a water bath heated to testing temperature.
Check resistance* with an ohmmeter.

* See Specifications

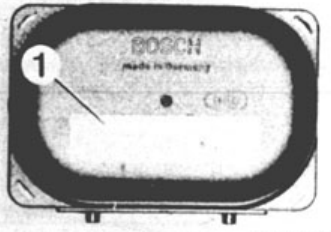
* See Specifications

13 62 080 REMOVING AND INSTALLING/ CHECKING PRESSURE SENSOR



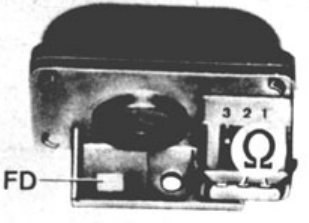
30 13 626

Pull off plug (1).
Unscrew screw (2) and remove pressure sensor.
FD = Manufacturing date



30 13 627

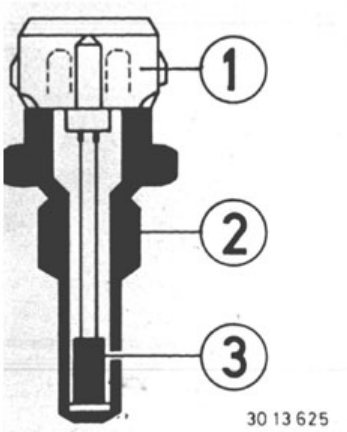
Installation:
Check code number (1)*.



30 13 628

Checking:
There should be approximately 0 ohm between plug connections (1 and 2) with ≤ 880 mbar atmospheric pressure.
There should be approximately ∞ ohms between plug connections (1 and 2) with ≥ 930 mbar atmospheric pressure.

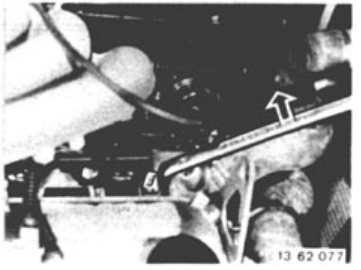
* See Specifications



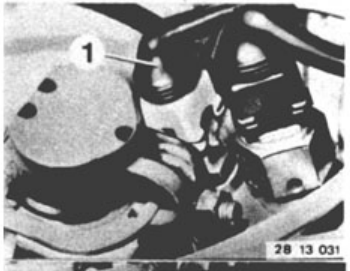
13 62 531 REMOVING AND INSTALLING/ CHECKING COOLANT TEMPERATURE SENSOR

The temperature sensor measures the engine temperature and sends this information in the form of a resistance value to the control unit.
The resistance value drops with rising temperature (NTC).

1 = Plug connection
2 = Housing
3 = NTC resistor

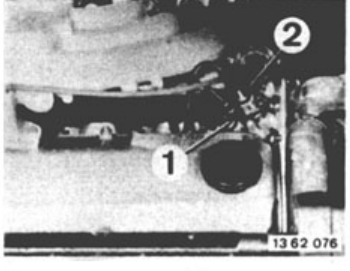


Unscrew temperature sender (2).
Unscrew temperature sensor (1).



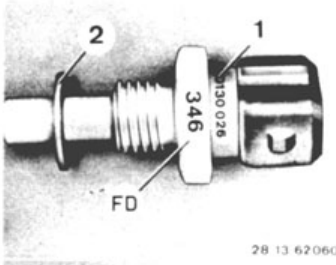
Removing and Installing:

Pull off plug (1).
Unscrew temperature sensor.
Installation:
Tightening torque*.

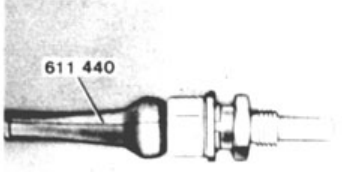


E 34 - M 20

Pull off plugs (1 and 2).
Lift fuel injector plug rail slightly.



Installation:
Check code number (1)*.
Replace seal (2).
FD = Manufacturing date.
Fill and bleed cooling system - see Gr. 17.

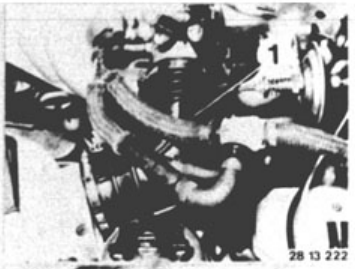


Checking:
Connect Jetronic test leads 61 1 440.
Check nominal value* with an ohmmeter.
If the entire temperature range has to be checked, remove temperature sensor, place it in a water bath heated to testing temperature and check resistance* with an ohmmeter.

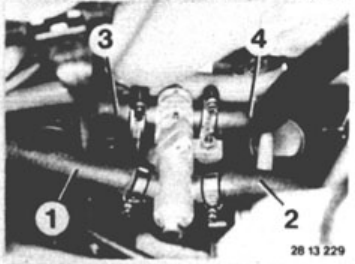
* See Specifications

* See Specifications

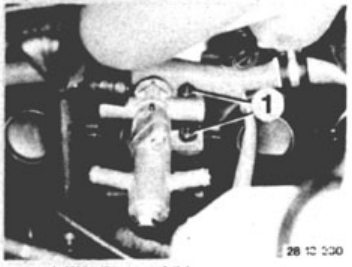
13 63 060 REMOVING AND INSTALLING THROTTLE BYPASS VALVE



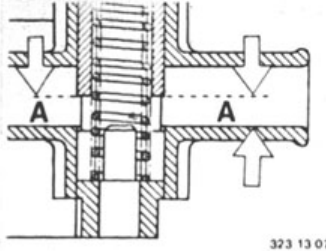
Remove intake cowl (1).



Disconnect water hoses (1 and 2).
Disconnect air hoses (3 and 4).
Installation:
Check coolant level, correcting if necessary.
Bleed cooling system.



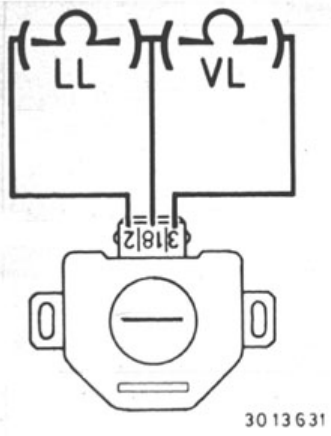
Unscrew nuts (1).
Take throttle bypass valve off of holder.



Checking:
Check distance (A)* on removed valve.

Testing:
There should be no noticeable change in speed of an engine having operating temperature after pinching the air hose between the throttle bypass valve and air intake.
There should be a drop in speed of a cold engine when pinching the air hose between the throttle bypass valve and air intake.

* See Specifications

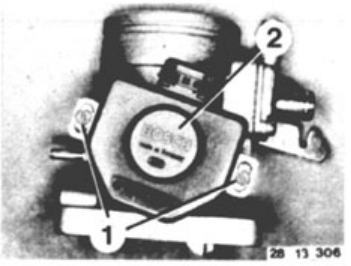


30 13 631

13 63 544 ADJUSTING THROTTLE VALVE SWITCH

Checking Throttle Valve Switch:
There should be approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
There should be approximately infinite ohms between connections 3 and 18 with the throttle valve wide open.

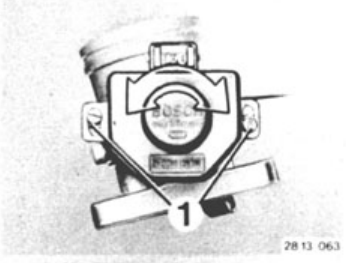
LL = Idle speed
VL = Full load



28 13 306

13 63 551 REMOVING AND INSTALLING THROTTLE VALVE SWITCH

Remove throttle valve neck - see 13 54 030.
Unscrew screws (1).
Take off throttle valve switch (2).

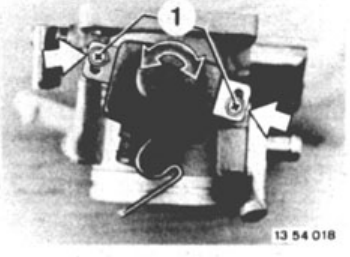


28 13 063

Adjusting (Throttle Valve Neck Removed):
There must be approximately 0 ohm between connections 2 and 18 with the throttle valve closed.
Adjust by loosening screws (1) and turning the throttle valve switch.
Open throttle valve after adjusting - resistance should rise immediately to infinite ohms.
Resistance must drop back to approximately 0 ohm when releasing the throttle valve.

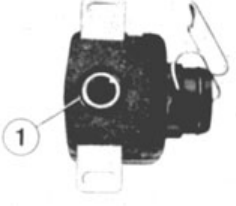
30 13 456

Installation
Check code number (1)*.
Adjust throttle valve switch - see 13 63 544.



13 54 018

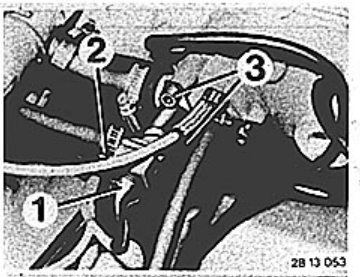
Cars with Independent Electronic Transmission Control:
Adjust as described above.
Check points between plug sockets 4 and 6.



13 54 019

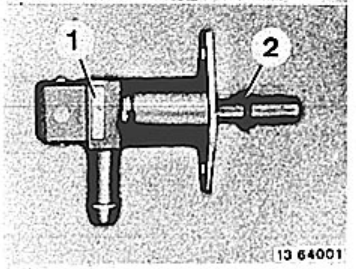
Cars with Independent Electronic Transmission Control:
Check O-ring (1), replacing if necessary.

* **See Specifications**



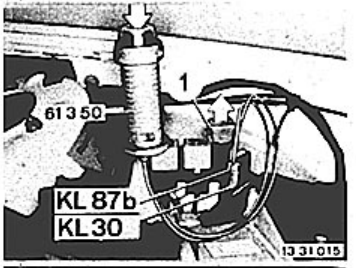
13 64 030 REMOVING AND INSTALLING/ CHECKING COLD START VALVE

Removing and Installing:
Pull off plug (1).
Disconnect fuel line (2).
Unscrew screws (3).
Remove cold start valve.



Installation:
Check code number (1)*.
Replace seal (2).

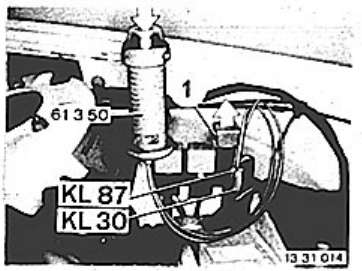
Checking:
Unscrew cold start valve on intake housing.
Fuel line remains connected.



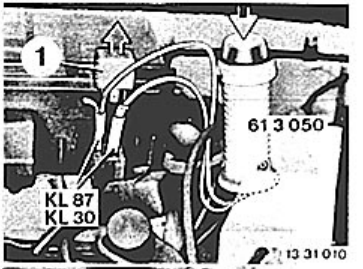
Checking:
L-Jetronic / E 30:
Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

L-Jetronic / E 28:
Pull off fuel pump relay (1).
Bridge terminals 87b and 30 with Special Tool 61 3 050.
Check delivery pressure*.

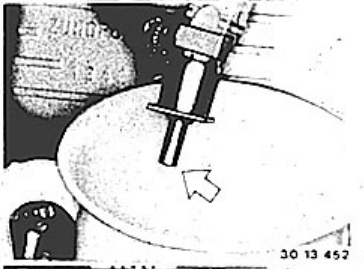
* See Specifications



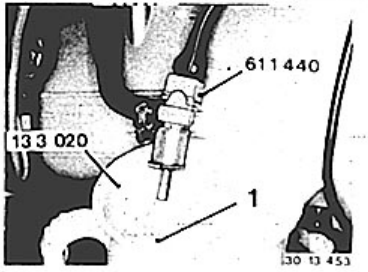
Digital Motor Electronics / E 30:
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.



Digital Motor Electronics / E 28:
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Check delivery rate*.

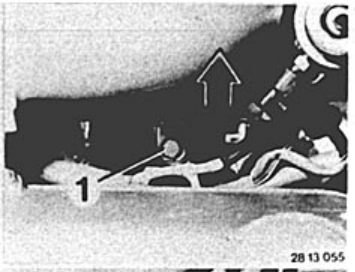


Leak Test:
Check permissible leak rate*.



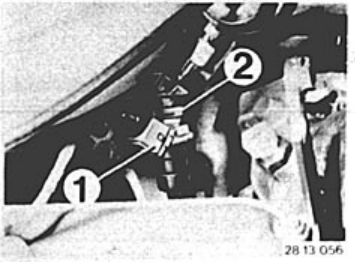
Checking Fuel Flow Rate and Spray Angle:
Hold cold start valve over measuring glass 13 3 020.
Plug Jetronic test lead 61 1 440 on cold start valve and connect with B + and B –.
Check fuel flow rate* and spray angle (1)*.

* See Specifications

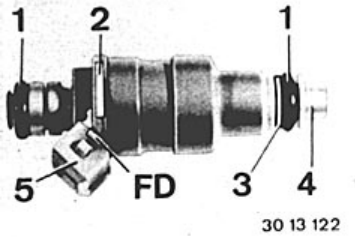


13 64 501 REPLACING FUEL INJECTOR

Unscrew four mounting bolts (1) for injection pipe.
Push up injection pipe until fuel injectors are out of the guide on the intake manifold.

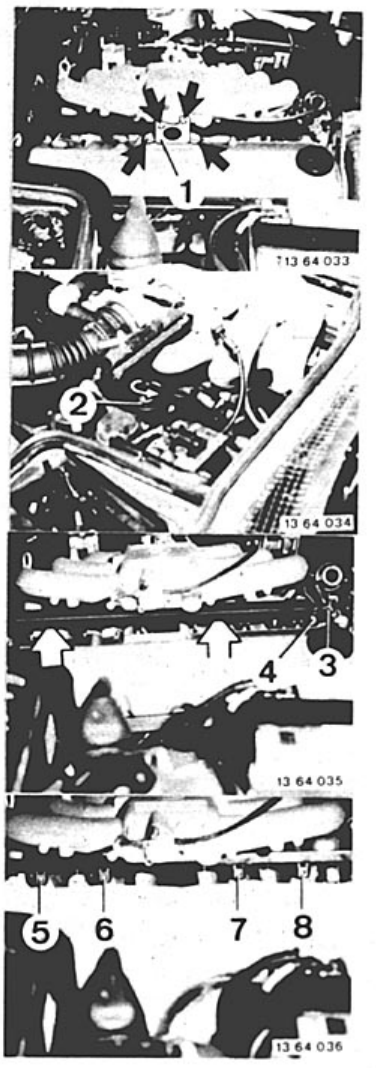


Pull plug (1) off of fuel injector.
Lift out retainer (2) and pull fuel injector out of injection pipe.



Installation:
Check O-rings (1), replacing if necessary.
Check code number (2)*.
Check position of plastic washer (3).
Check color* of plug receptacle (5) or fuel injector guard (4).
FD = Manufacturing date
Coat O-rings lightly with Vaseline only for installation.

* See Specifications



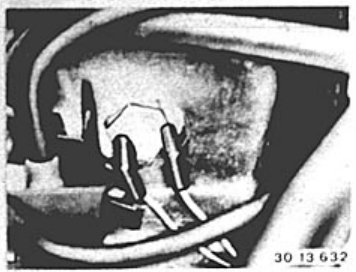
13 64 501 REPLACING FUEL INJECTORS (New Plug Rail)

Unscrew eclamp (1).

Disconnect plug (2).

Disconnect coolant temperature sensor plug (3) and DME temperature sensor plug (4).
Pull up and remove plug rail.

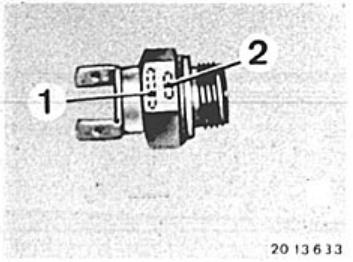
Unscrew mounting screws (5 ... 8).
Push up injection pipe until fuel injectors are out of guide on the intake manifold.
Remove fuel injectors separately.
Installation:
Check O-rings, replacing if necessary.
Coat O-rings lightly with Vaseline only for installation.



30 13 632

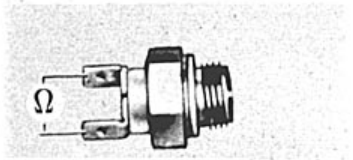
12 63 051 REMOVING AND INSTALLING 0° C (32° F) TEMPERATURE SWITCH

E 30
Pull off plug (1).
Unscrew temperature switch.
Installation:
Torque: max. 30 Nm (22 ft. lbs.).



20 13 633

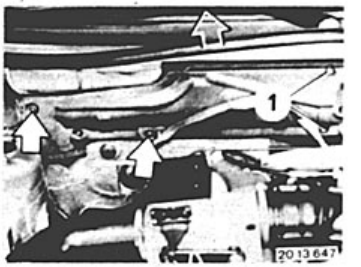
Installation:
Check code number (1)* and switching point (2)*.



20 13 634

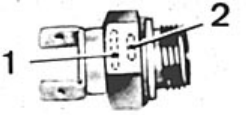
Checking:
Connect ohmmeter (M 06) on temperature switch.
Ohmmeter should display about 0 ohm with temperature < – 8° C (+ 18° F).
Ohmmeter should display about ∞ ohms with temperature > 4° C (39° F).

* See Specifications

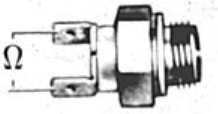


20 13 647

20 13 648



20 13 633



20 13 634

12 63 051 REMOVING AND INSTALLING 0° C (32° F) TEMPERATURE SWITCH

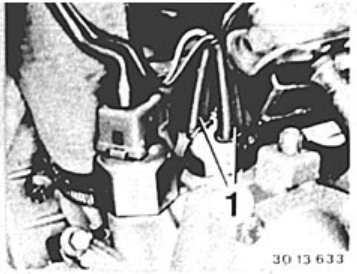
E 28
Unscrew screws (1).
Unscrew screws (2) on left and right sides.
Pull off rubber guard.
Fold cover forward.

Pull off plug (1).
Unscrew temperature switch.
Installation:
Torque: max. 30 Nm (22 ft. lbs.).

Installation:
Check code number (1)* and switching point (2)*.

Checking:
Connect ohmmeter (M 06) on temperature switch.
Ohmmeter should display about 0 ohm with temperature < – 8° C (+ 18° F).
Ohmmeter should display about ∞ ohms with temperature > 4° C (39° F).

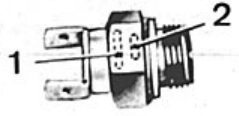
* See Specifications



30 13 633

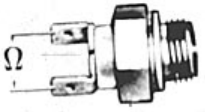
12 63 060 REMOVING AND INSTALLING TEMPERATURE SWITCH 45° C (113° F)

Pull off plug (1).
Remove temperature switch.
Installation:
Tightening torque: max. 30 Nm (22 ft. lbs.).
Fill and bleed cooling system (Group 17).



20 13 633

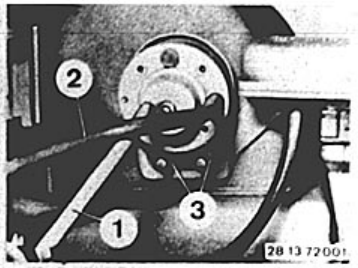
Installation:
Check code number (1)* and switching temperature (2)*.

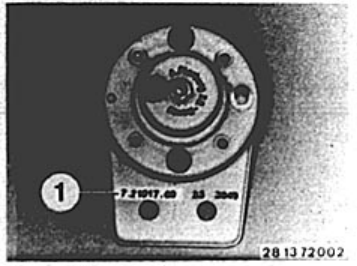


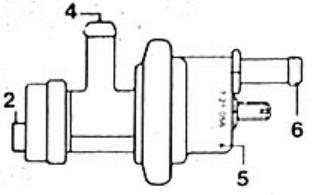
20 13 634

Checking:
Connect ohmmeter (M 06) on temperature switch.
Ohmmeter should display approx. 0 ohm for temperature of $< 30^{\circ}$ C (86° F).
Ohmmeter should display approx. ∞ ohms for temperature of $> 48^{\circ}$ C (118° F).

* See Specifications







13 72 003

13 72 020 REMOVING AND INSTALLING/ CHECKING 3/2 WAY VALVE (Until 1984 Plant Shutdown)

Removing and Installing:
Pull off vacuum hoses (1 = for throttle housing and 2 = for distributor vacuum box).
Unscrew nut (3).
Remove valve.

Installation:
Check code number (1)*.
2.0 Ltr. = 7.21017.00 20 / yellow
2.3 Ltr. = 7.21017.00 23 / blue

Since 9.84:
Check code number (5)*.
2.0 Ltr. = 7.21056.20 / yellow
2.3 Ltr. = 7.21056.23 / blue
6 = To throttle housing
4 = To distributor vacuum box
2 = Venting

Checking and Adjusting:
(in case of engine idling surge or hard re-engagement jolt of coasting shutoff)

A) Troubleshooting

Stop function of coasting shutoff by pulling off plug on throttle switch.
If car still shakes – check drive line!
If car does not shake anymore – check/adjust the 3/2 way valve.

B) Checking/Adjusting 3/2 Way Valve

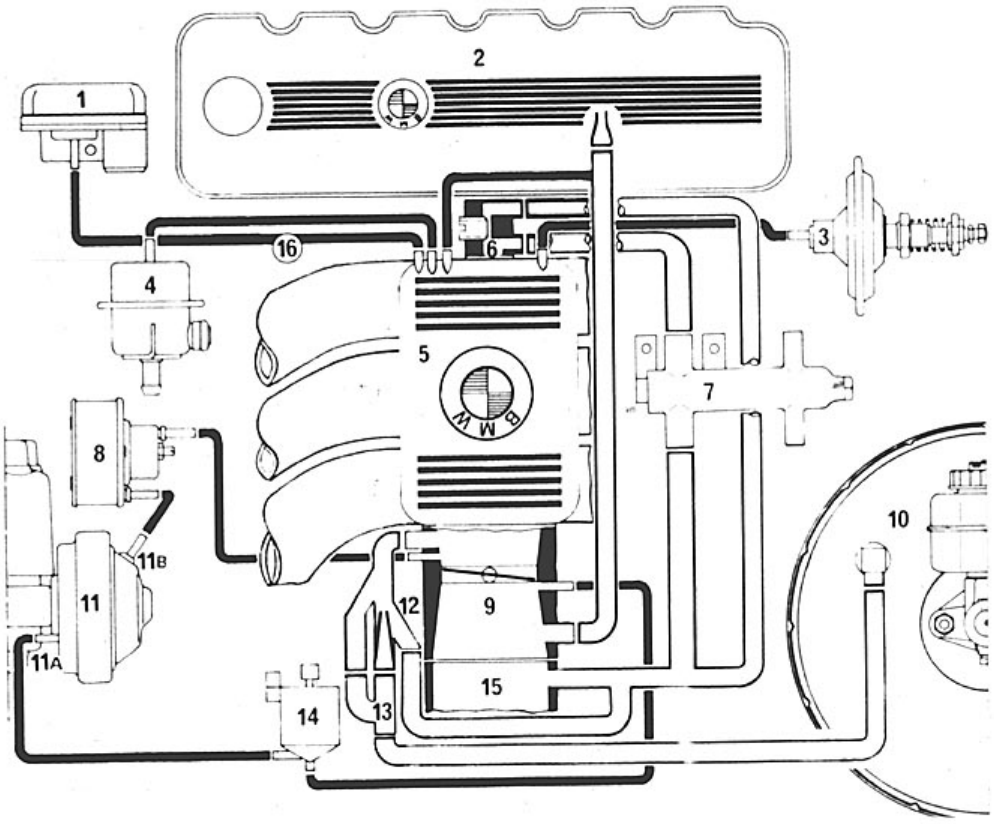
Checking:
Install T-adapter in pressure line between 3/2 way valve and distributor and connect on vacuum tester (in passenger compartment).
Operate car in coasting condition.
Throttle open = 0 mbar display; throttle closed = approx. 600 mbar display.

Adjusting:
Vacuum tester "installed" (in passenger compartment).
Observe fuel consumption indicator and tester in the coasting phase.
When valve adjustment is optimal, the vacuum will collapse as fuel injection cuts in again. (The adjustment should indicate slightly earlier fuel injection since vacuum drop will be displayed in the instrument with delay because of the additional vacuum in the test line which has to be removed).

Adjustments with the adjusting screw (pressure converter - middle) should be made in steps of approx. 1/2 turns.

* See Specifications

HOSE ROUTING PLAN – 2.0 and 2.3 Liter Engines



1 Partial load switch
2 Cylinder head cover
3 Vacuum restriction regulator
4 Fuel pressure regulator
5 Collector

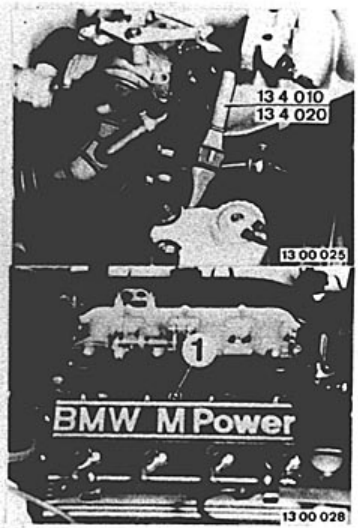
13 00 054 ADJUSTING ENGINE IDLE SPEED / EMISSION TEST (Cars without Cat. Converter)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine, ignition and fuel injection in good working condition.
Valve clearance correct.
Air filter cartridge in good condition.
All electric consumers switched off.
Connect BMW Service Tester to operating instructions (altitude correction box must be connected).
Mount CO tester in exhaust.
Switch off exhaust extraction for the time of testing.

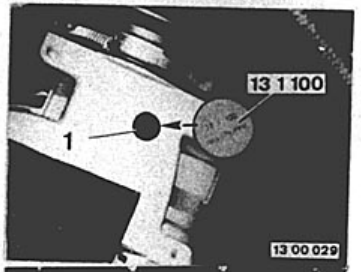


Pull off plug on throttle valve switch and insert Special Tool 13 4 010 in the wire plug.

1) Checking Engine Idle Speed*

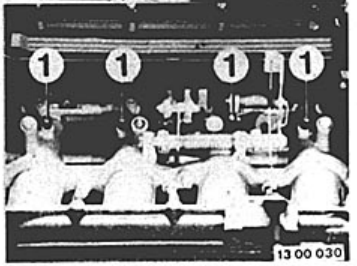
Adjust idle speed with screw (1).

* See Specifications and Nominal Value Microfiche



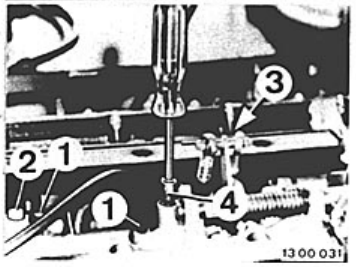
2) Emission Test

Remove cap (1) with Special Tool 13 1 011.
Adjust CO level* with Special Tool 13 1 100 applied on the air control screw in the air flow sensor.



Synchronization:

Requirement – thrust rod adjustment correct (see "Removing and Installing Throttle Valve Necks" in 13 54 030).
Pull off caps (1).
Measure and note intake vacuum on all four throttle valve necks.
Leave caps (1) connected on throttle valve necks not being measured.

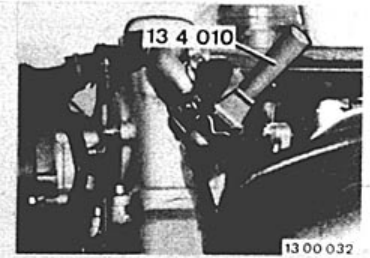


Pull off caps (1).
Connect the vacuum tester (BMW Service Tester M 21).
Adjust each throttle valve neck to the same intake vacuum at idle speed* (screw/3) with screw (4/7 mm wrench socket).
Max. vacuum difference: ± 5 mbar.
Install new anti-tamper locks (2) after finishing adjustments.
Then recheck engine idle speed* and CO level*, correcting if necessary.

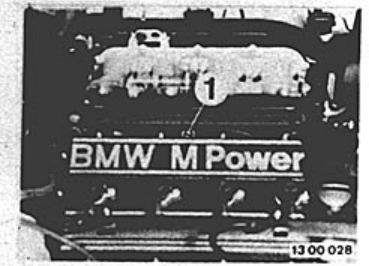
* See Specifications and Nominal Value Microfiche

13 00 054 CHECKING / ADJUSTING ENGINE IDLE SPEED AND CO LEVEL

Car with catalytic converter.
Car with exhaust manifold lacking testing connections.
Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Valve clearance correct.
Engine and ignition in good working condition.
Connect BMW Service Tester to operating instructions (altitude correction box must be connected.
Mount emission tester in exhaust tailpipe.
Switch off extraction system for exhaust gas during time of testing.

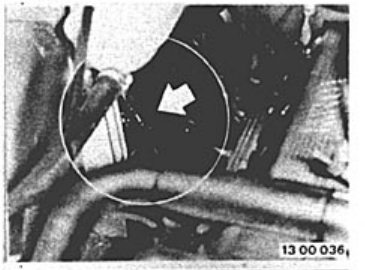


Pull off plug on throttle valve switch and insert Special Tool 13 4 010 in wire plug.



1) Engine Idle Speed

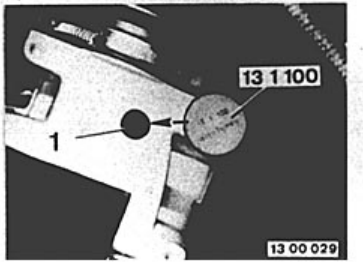
Check engine idle speed.
Adjust engine idle speed with screw (1).



2) Emission Test

Disconnect oxygen sensor plug.
Idle speed CO level cannot be measured in the tailpipe = 0 (zero).
CO Level Displayed:
Remove cap with Special Tool 13 1 011.
Adjust CO-level back to 0 (zero) with Special Tool 13 1 100 applied on the control screw in the air flow sensor.

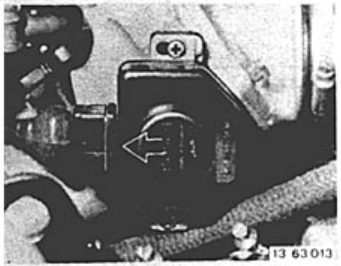
Synchronization: see next page.



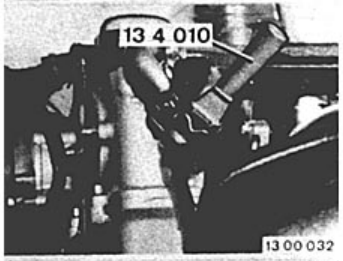
Checking Function of Oxygen Sensor (11 78 010):
Disconnect oxygen sensor plug and adjust CO level to 0.5 ... 1.0 % by volume with Special Tool 13 1 100 applied on the control screw in the air flow sensor (turned clockwise).
Connect oxygen sensor plug – CO level must go back to 0 (zero).
Disconnect oxygen sensor plug again.
Adjust CO level back to 0 (zero) with the control screw (back to original position as well as possible).
Connect oxygen sensor.

13 00 054 ADJUSTING ENGINE IDLE SPEED / EMISSION TEST (Car with Catalytic Converter)

Requirements for All Adjustments:
Engine at operating temperature, i.e. oil temperature at least 60° C (140° F).
Engine, ignition and fuel injection in good working condition.
Valve clearance correct.
Air filter cartridge in good condition.
All electric consumers switched off.
Connect BMW Service Tester to operating instructions (altitude correction box must be connected).
Connect emission tester on testing connections of the manifold.
Switch off exhaust extraction for the time of testing.

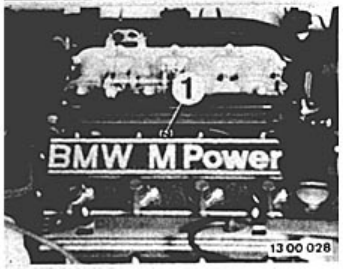


Pull off plug on throttle valve switch and insert Special Tool 13 4 010 in the wire plug.

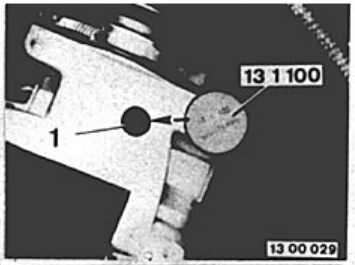


1) Engine Idle Speed*

Check engine idle speed.
Adjust engine idle speed with screw (1).

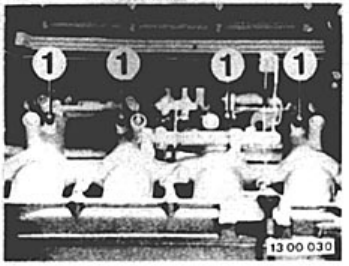


* See Specifications and Nominal Value Microfiche



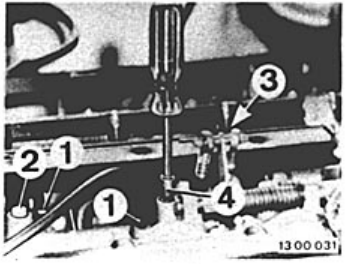
2) Emission Test

Measure CO level with oxygen sensor connected.
Note CO level value.
Disconnect oxygen sensor plug.
Deviation from Nominal Value:
Remove cap (1) with Special Tool 13 1 011.
Adjust CO level to value measured with oxygen sensor connected with Special Tool 13 1 100 applied on control screw in the air flow sensor.



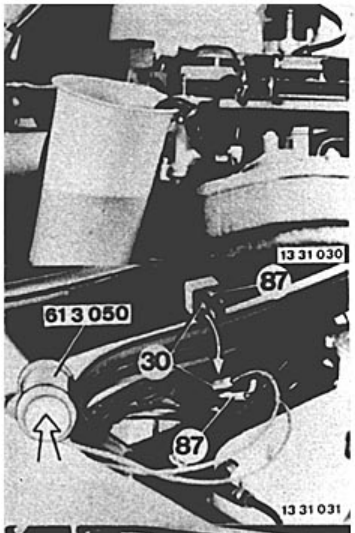
Synchronization:

Requirement – thrust rod adjustment correct (see Removing and Installing Throttle Valve Necks in 13 54 030).
Pull off caps (1).
Measure and note intake vacuum on all four throttle valve necks.
Leave caps (1) connected on throttle valve necks not being measured.



Pull off caps (1).
Connect vacuum tester (BMW Service Tester M 21).
Adjust each throttle valve neck to the same intake vacuum at idle speed* (screw/3) with screw (4/7 mm wrench socket).
Install new anti-tamper locks (2) after finishing adjustments.
Then recheck engine idle speed* and CO level*, correcting if necessary.

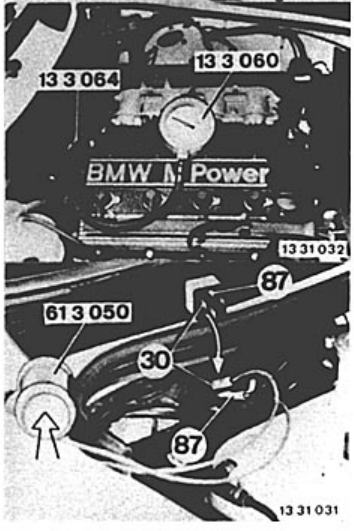
* See Specifications and Nominal Value Microfiche



13 31 029 CHECKING FUEL DELIVERY PRESSURE AND RATE

Checking Fuel Pump Delivery Rate:
Disconnect return line and hold end in Special Tool 13 3 020.

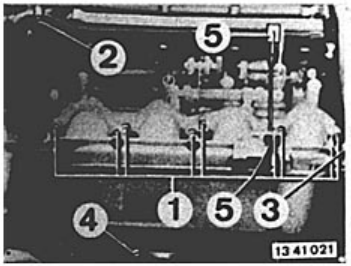
Remove trim on right engine compartment wall.
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Press the button.
Fuel pump runs.
Check delivery rate*.



Checking Fuel Pump Delivery Pressure:
Install Special Tools 13 3 060 and 13 3 064 between return line and hose.
Shut fuel return hose with Special Tool 13 3 010.

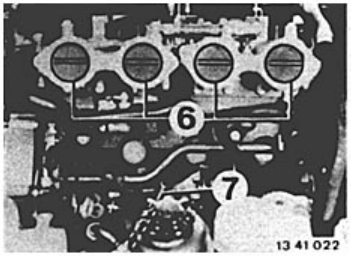
Remove trim on right engine compartment wall.
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Press the button.
Fuel pump runs.
Check delivery pressure*.

* See Specifications of Gr. 16

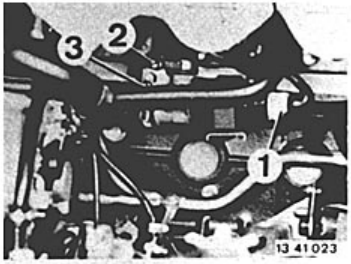


13 41 000 REMOVING AND INSTALLING IDLE SPEED CONTROL VALVE

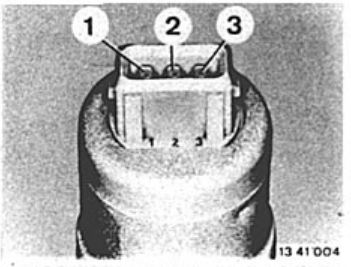
Unscrew capped nuts (1) on all four throttle valve housings.
Unscrew mounting nut.
Loosen hose straps (2 ... 4).
Disconnect throttle cable (5).
Take off air intake manifold, while cutting off the hose between the manifold and crankcase (cannot be pulled off).



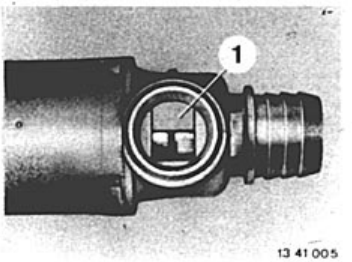
Installation:
Check O-rings (6), replacing if necessary.
Replace hose (7) between manifold and crankcase.



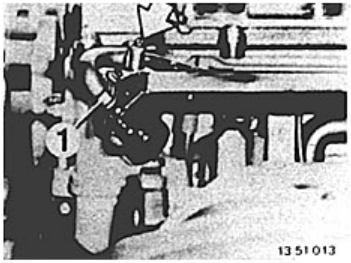
Pull off plug (1).
Disconnect hoses (2 and 3).
Disconnect retaining strap.



Electric Test:
Measure resistance between terminals (1) and (3)
Nominal value: approx. 40 ohms.
Measure resistance between terminals (2) and (1) or (2) and (3).
Nominal value: approx. 20 ohms each.

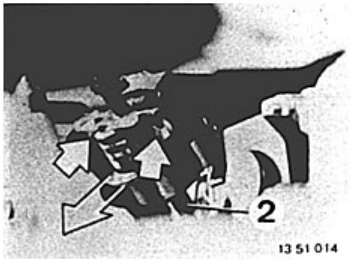


Dynamic Test:
Remove idle speed control valve (plug remains connected).
Open or close rotary piston (1) completely.
Turn on ignition.
Rotary piston should move into and remain in a position of approx. 50 % the cross section opening.

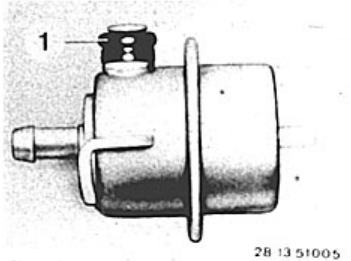


13 51 200 REMOVING AND INSTALLING FUEL PRESSURE REGULATOR

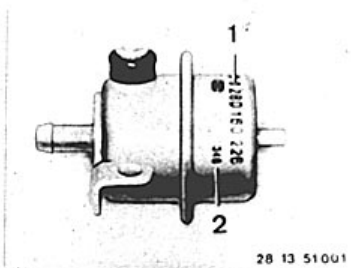
Disconnect fuel hose (1).



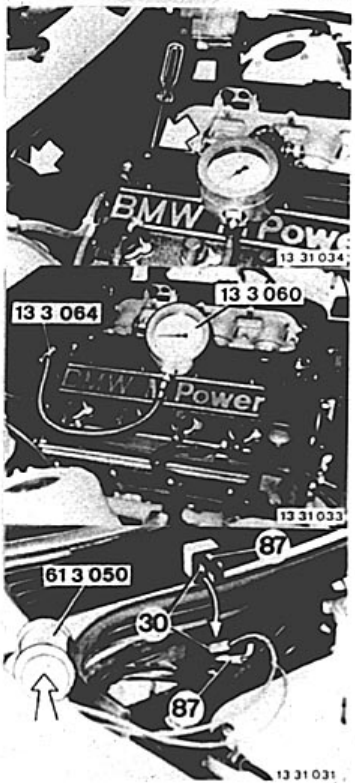
Unscrew bolts.
Pull fuel pressure regulator out of injection pipe.
Pull off vacuum hose (2).



Installation:
Check seal (1), replacing if necessary.



Installation:
Check code number (1)*.
(2) = Manufacturing date

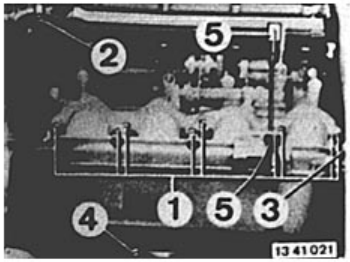


Checking:
Install Special Tools 13 3 060 and 13 3 064 between feed pipe and hose.

Remove trim on engine compartment wall.

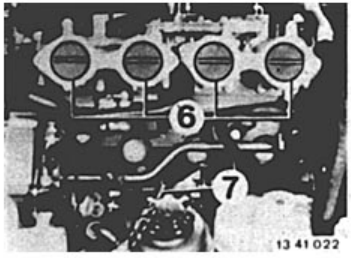
Pull off fuel pump relay (1).
Bridge terminals 87 and 30 with Special Tool 61 3 050.
Press the button.
Fuel pump runs.
Check fuel injection pressure*

* See Specifications/Nominal Value Microfiche

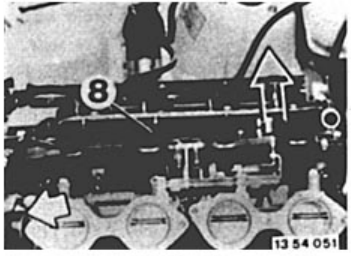


13 54 030 REMOVING AND INSTALLING THROTTLE VALVE HOUSING

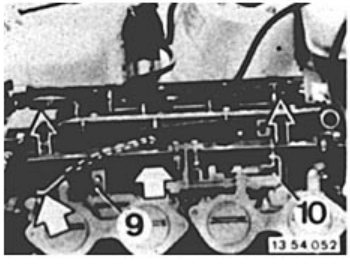
Unscrew capped nuts (1) on all four throttle valve housings.
Loosen hose straps (2 ... 4).
Disconnect throttle cable (5).
Take off air intake manifold and cut off hose between manifold and crankcase (cannot be pulled off).



Installation:
Check O-rings (6), replacing if necessary.
Replace hose (7) between manifold and crankcase.

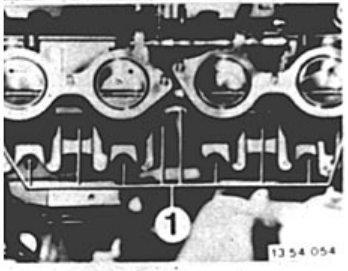


Pull off plug on throttle valve switch.
Pull off plug plate (8) on fuel injectors.

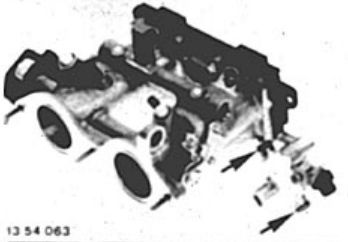


Pull off vacuum hose for fuel pressure regulator.
Unscrew bolts (9 and 10).
Lift off injection pipe with fuel injectors.

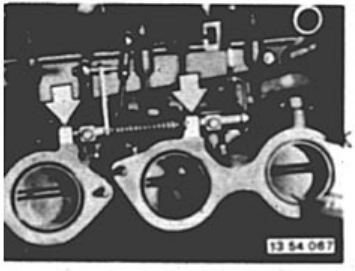
Unscrew nut on joint.
Installation:
Replace self-locking nut.

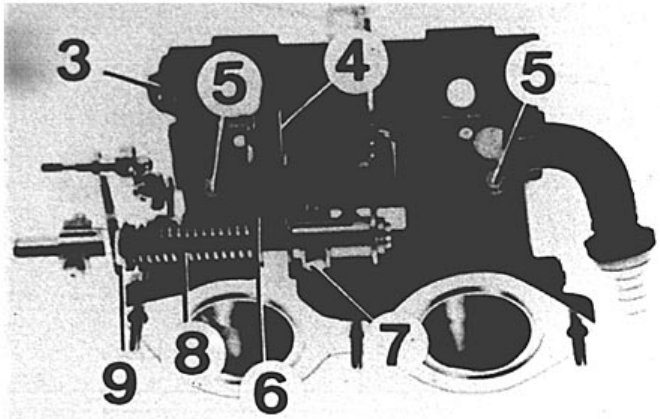


Unscrew torx nuts (1) on all throttle valve housings.
Take off throttle valve housing assembly.



Separate throttle valve housings.
Check O-ring of connecting pipe, replacing if necessary.
Note:
Shaft runs on needle bearings.
Keep dirt off of bearings and don't damage the shaft.



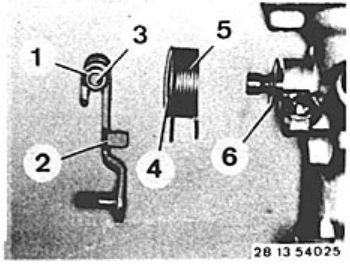


13 54 055

(throttle valve housing of cylinders 3 and 4). Replace gasket (3). Lift out retainer (4). Unscrew throttle screws. Check O-rings (5), replacing if necessary. Take off lever bearing (7), sleeves (6), spring (8) and washer (9).

Installation:

Screw in throttle screws carefully until they fit tight and then loosen 1 and 1/2 turns again. Preload spring (8) by about 1/2 turn.



28 13 54025

Throttle valve adjustment is optimized and secured with paint in the plant.

Note:

Throttle valve housing basic adjustments are only necessary after replacing parts, in case of a loose clamping screw or erroneous adjustment.

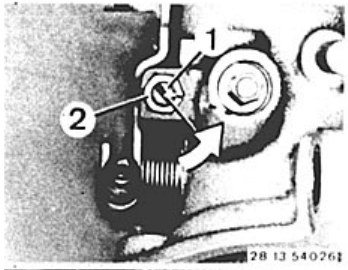
Unscrew nut (1).
Take off throttle lever (2) and screw (3).
Take off sleeve (4) and spring (5).
Check washer (6).

Installation:

Preload spring (5) with about 1/2 a turn.

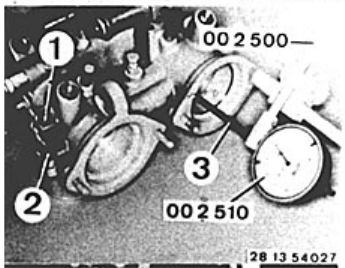
Adjusting Conditions:

Component temperature: approx. 20° C (68° C).



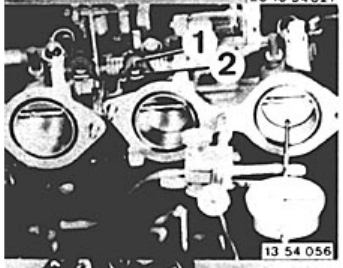
28 13 54026

Loosen nut (2).
Turn idle stop screw (1) about 1/10th of a turn in direction of arrow.
Tighten nut (2) again.



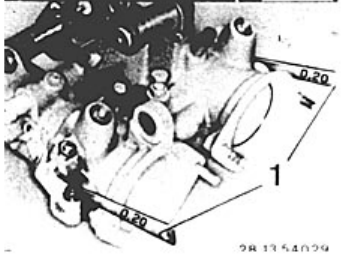
28 13 54027

Close throttle valves.
Press throttle lever against idle stop screw (1) and tighten nut (2).
Mount dial gage 00 2 510 (with extension 3) and Special Tool 00 2 500 on the throttle valve housing.
Dial gage tip bears with preload on throttle valve in the lowest possible position.



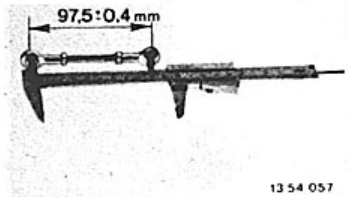
13 54 056

Loosen nut (2).
Adjust the throttle valve lower edge to 0.1 + 0.05 mm (0.004 + 0.002") with idle stop screw (1) (approx. 1/10th of a turn).
Lock idle stop screw (1) and secure with paint.



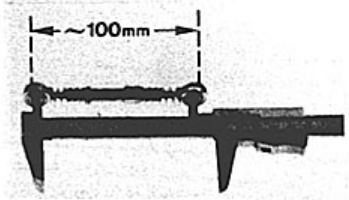
28 13 54029

Checking Axial Clearance:
A 0.2 mm (0.008") feeler gage blade (1) must fit easily on both left and right sides between the circlip or throttle lever and housing with a closed throttle valve and at room temperature of about 20° C (68° F).
Check whether throttle valve moves easily at temperature.



13 54 057

Basic Throttle Valve Linkage Adjustment:
Adjust push rod of throttle valve assemblies for 3rd and 4th cylinders to 97.5 ± 0.4 mm (3.838 ± 0.016").

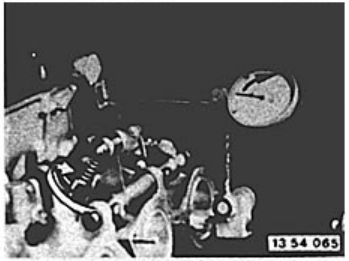


13 54 058

Adjust push rod of throttle valve assemblies for 1st and 2nd cylinders to approx. 100 mm (3.937").

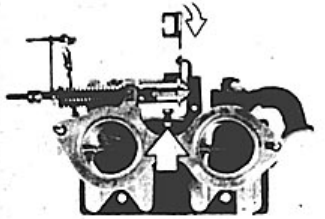
13 54 064

Mount dial gage with holder.
Apply dial gage with preload on the operating lever for 3rd and 4th cylinders.



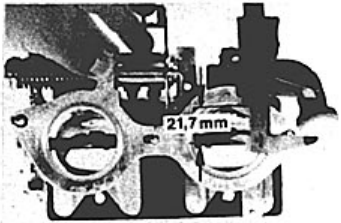
13 54 065

Shorten the push rod for 1st and 2nd cylinders until the dial gage needle begins to move.
Both throttle levers must bear uniformly on the idle speed stop.



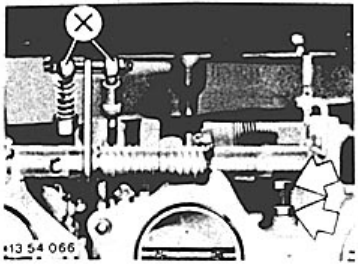
13 54 061

Adjusting Full Load Stop:
Open throttle valves until valves are parallel to the direction of flow.
Turn the full load stop screw until it bears on the stop of the operating lever.



13 54 062

Adjust the distance from the throttle valve upper edge to the throttle valve neck opening to 21.7 ± 1 mm (0.854 ± 0.039") with the full load stop screw.

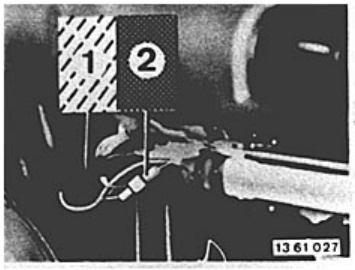


13 54 066

Important!
Do not change the position of push rods in this adjustment.
Adjust the stop screw in such a manner that any possible slight deviation is distributed equally to both necks.

If the 21.7 ± 1 mm (0.854 ± 0.039") distance can not be reached on all throttle valves by adjusting the full load stop screw, the pertinent components must be replaced.

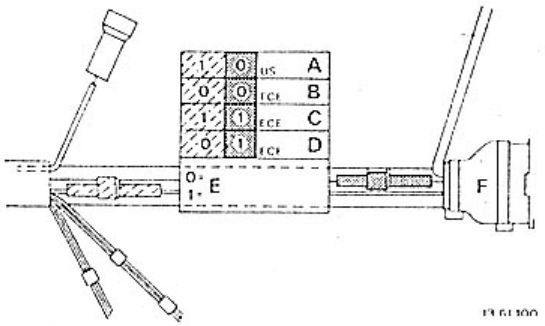
Continued in next column!



13 61 . . . CONTROL UNIT PLUG CONNECTIONS

Plugs (1) and (2) must be disconnected on the control unit plug, or connected, for operation with unleaded gasoline.

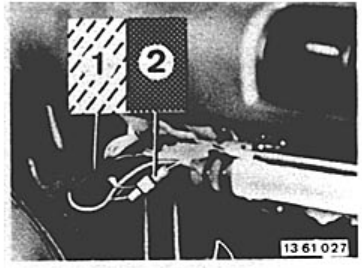
(1) = black
(2) = blue



Plug Connections:
A) 1 + 0 = unleaded premium US
B) 0 + 0 = unleaded regular ECE
C) 1 + 1 = leaded premium ECE
D) 0 + 1 = unleaded premium ECE
E) Plug connection status:
0 = open 1 = closed
F) To control unit

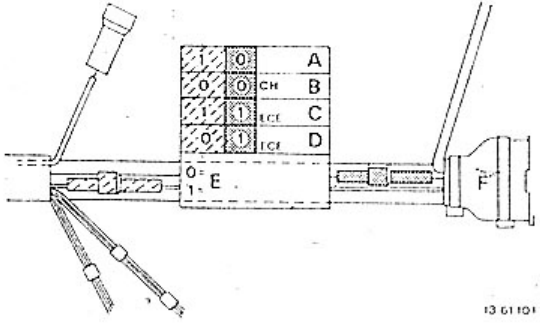
Important!
Plug Connections for 1990 Model Up-dating (also Special Series in 1989):

(1) = black
(2) = blue

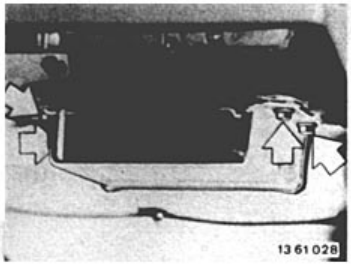


Control Unit No. 1315 263

Wire Harness No. 1315 593

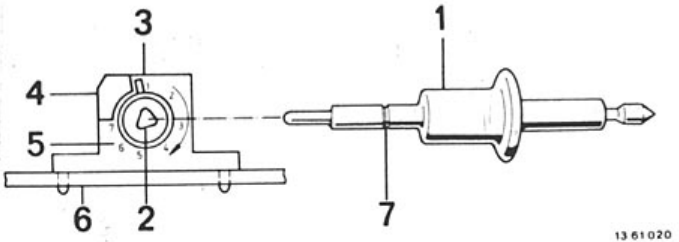


Plug Connections:
A) 1 + 0 =
B) 0 + 0 = unleaded premium 95 RON / Switzerland
C) 1 + 1 = unleaded premium 95 RON / without catalytic converter
D) 0 + 1 = unleaded premium 95 RON / with catalytic converter
E) Plug connection status:
0 = open 1 = closed
F) To control unit

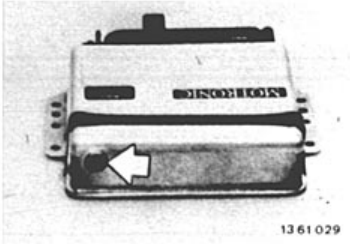


13 61 028

Adjust printed circuit board switch (no longer installed or sealed).



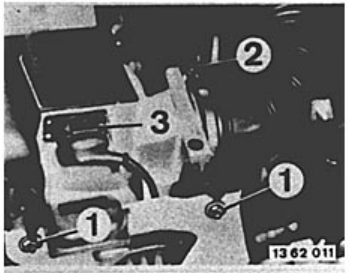
13 61 020



13 61 029

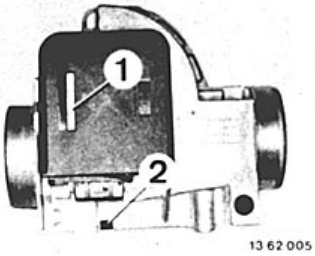
Adjusting Printed Circuit Boards:
Printed circuit board switch should be adjusted to zero (0).
If applicable, check switch adjustment.

1 = Special Tool 12 4 010
2 = Hole
3 = Basic setting (left stop)
4 = Stop
5 = Switch positions
6 = Printed circuit board
7 = Predetermined breaking point

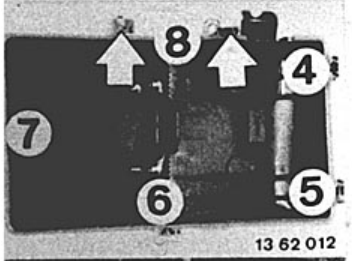


13 62 000 REMOVING AND INSTALLING AIR FLOW SENSOR

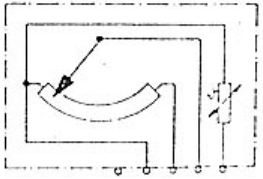
Unscrew nuts (1).
Loosen hose straps (2).
Pull off plug (3).
Open fasteners (4 ... 8).



Checking:
Installation:
Check code number (1)* and manufacturing date (2)*.
Check engine idle speed* and CO level*.
Check air flow sensor*.



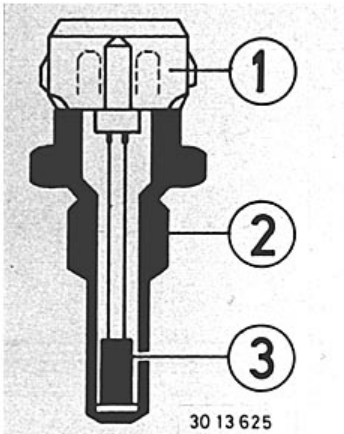
Take off upper air cleaner section with air flow sensor.
Check rubber mounts, replacing if necessary.



4 3 2 1

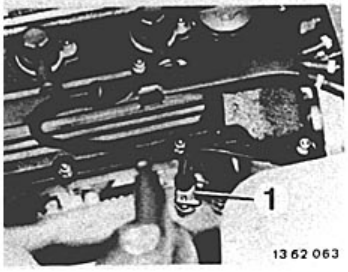
Installation:
Check installed position of air filter cartridge (arrows face in direction of flow).

Unscrew screws (9) and take off air flow sensor.
Check gasket between air cleaner and air flow sensor, replacing if necessary.
Installation:
Install screws with liquid bolt cement, HWB No. 81 22 9 400 086.

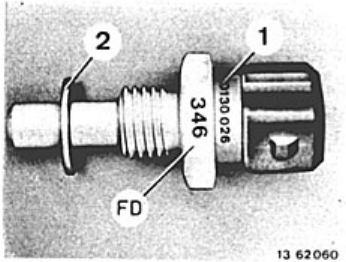


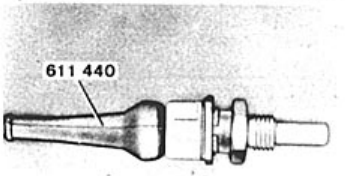
13 62 531 REMOVING AND INSTALLING/ CHECKING COOLANT TEMPERATURE SENSOR

The temperature sensor measures the engine temperature and sends this information to the control unit as a resistance value.
The resistance value drops with rising temperature (NTC).
1 = Plug connection
2 = Housing
3 = NTC resistor



Removing and Installing:
Pull off plug (1).
Unscrew temperature sensor.
Installation:
Tightening torque*.



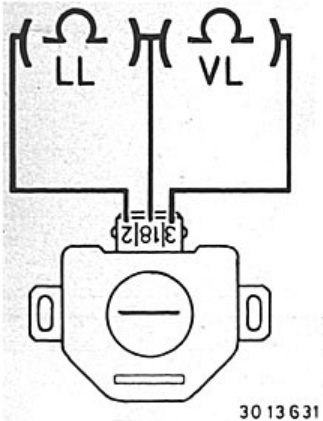


Installation:
Check code number (1)*.
Replace seal (2).
FD = Manufacturing date.
Fill and bleed cooling system (Group 17).

Checking:
Connect Jetronic test leads 61 1 440.
Check nominal value* with an ohmmeter.
To check the entire temperature range, remove and place temperature sensor in a water bath, heat bath to testing temperature and check resistance* with an ohmmeter.

* See Specifications

* See Specifications



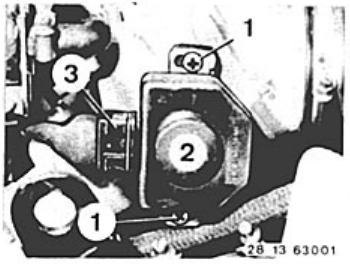
30 13 631

13 63 544 ADJUSTING THROTTLE VALVE SWITCH

Check throttle valve switch.
There should be approximately 0 ohm between connections 6 and 4 with a closed throttle valve.
There should be approximately 0 ohm between connections 5 and 4 with a wide open throttle valve.
LL = Idle
VL = Full load

WIRING DIAGRAM

drawn in idle position of throttle valve.



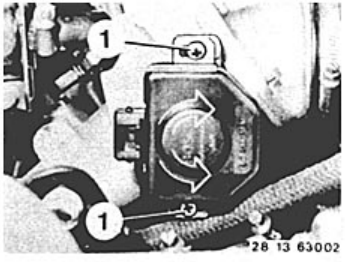
28 13 63001

13 63 551 REMOVING AND INSTALLING THROTTLE VALVE SWITCH

Pull off multiple-pin plug (3).
Unscrew screws (1).
Take off throttle valve switch (2).

30 13 456

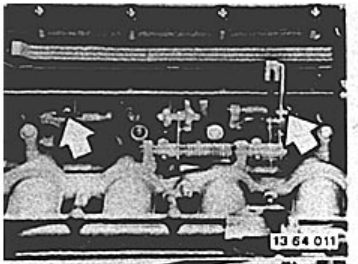
Installation:
Check code number (1)*.
Adjust throttle valve switch – see 13 63 544.



28 13 63002

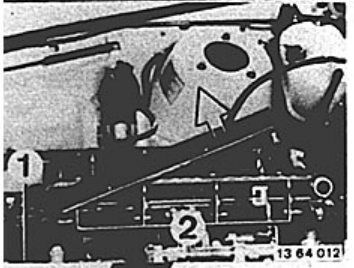
Adjusting:
There must be approx. 0 ohm between connections 6 and 4 with a closed throttle valve.
Adjust by loosening screws (1) and turning the throttle valve switch.
Open throttle valve after adjusting – the resistance should rise immediately to ∞ ohms.
Resistance must drop again to approximately 0 ohm when releasing the throttle valve.

* See Specifications

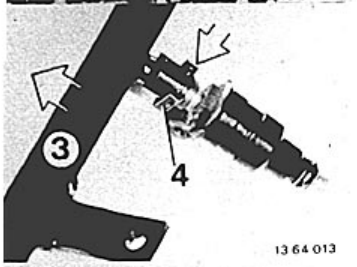


13 64 501 REMOVING AND INSTALLING ONE FUEL INJECTOR

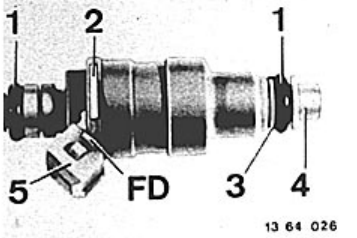
Unscrew screws on injection pipe.



Pull off plug on throttle valve switch (1).
Pull off plug plate (2) on fuel injectors.



Push up injection pipe (3) until fuel injectors are lifted out of guides on throttle valve housings.
Lift out retainer (4) and take off fuel injector.



Installation:
Check O-rings (1), replacing if necessary.
Check code number (2)*.
FD = Manufacturing date
Check position of plastic washer (3).
Check color* of plug receptacle (5) or fuel injector guard (4).
Only coat O-rings with vaseline or SAE 90 gear lube for installation.

* See Specifications

TESTING INSTRUCTIONS FOR ELECTRONIC IDLE REGULATION (VDO) WITH L-JETRONIC

Testing Requirements:
Battery charged – battery voltage at least 11.5 volts.
Components must have room temperature = 23 ± 5° C (73 ± 9° F).
Stated multimeter functions (e.g. M 01) refer to the BMW SERVICE TEST.
Measuring is performed on the disconnected control unit plug for electronic idle regulation.
The following tests do not cover defects which are outside of the electronic idle regulation system.

Idle control valve in perfect working condition.
Piston not seized.
Correct resistance of idle control valve (9 to 10 ohms).
Basic adjustment completed.

1.) Checking Power Supply and Ground of Idle Control Unit

Connect voltmeter (M 01) between term. 2 and car ground.
Turn on ignition.
Voltmeter displaying at least 9 volts?

no → Check green/yellow wire for breaks according to wiring diagram with ohmmeter (M 06). Eliminate breaks.

yes ↓

Connect voltmeter (M 01) between term. 2 and term. 4.
Turn on ignition.
Voltmeter displaying at least 9 volts?

no → Check brown wire for breaks according to wiring diagram with ohmmeter (M 06). Eliminate breaks.

yes ↓

Power supply and ground of idle control unit are okay!

2.) Checking Speed Signal and Idle Signal for Idle Control Unit

a) Speed Signal

Connect voltmeter (M 01) between term. 3 and term. 4.
Turn on ignition.
Voltmeter displaying at least 9 volts?

no → Connect ohmmeter (M 06) between term. 3 and pin 13 of diagnosis socket.
Ohmmeter displaying approx. 0 ohm?

no → Eliminate breaks of green wire.

yes ↓

Speed signal for idle control unit okay!

b) Idle Signal

Connect voltmeter (M 01) between term. 4 and term. 12.
Turn on ignition.
Voltmeter displaying at least 9 volts briefly?
Turn off ignition.

no → Pull off multiple pin plug on throttle switch.
Connect voltmeter (M 01) between center plug contact of plug receptacle and ground
Turn on ignition.
Voltmeter displaying at least 9 volts briefly?

no → Make power supply connections according to wiring diagram.

yes ↓

yes ↓

Press down accelerator pedal several centimeters.
Turn on ignition.
Voltmeter displaying approx. "0" volt?

no → Adjust or replace throttle switch.
Adjust cable.

3.) Checking Idle Control Valve

Pull off plug on idle control valve.
Connect ohmmeter (M 06) on idle control valve.
Ohmmeter displaying 9 to 10 ohms with a component temperature of 23 ± 5° C (73 ± 9° F)?

no → Replace idle control valve.
Check code number* and color code*.

yes

Connect ammeter (M 03) between idle control valve and wire plug.
Run engine having operating temperature** at idle speed.
Ammeter displaying 400 to 500 mA?

no → Check both wires (from control unit to idle control valve) for breaks according to wiring diagram with ohmmeter (M 06).
Eliminate any breaks.
Replace control unit if there are not any breaks.
Check code number* and color code*.

yes

Run engine having operating temperature** at idle speed.
Pull off wire plug on idle control valve.
Engine speed should now rise to approx. 2,000 rpm.
Engine speed okay?

no → Replace idle control valve.
Check code number* and color code*.

yes

Connect wire plug on idle control valve.
Does speed drop to nominal speed?

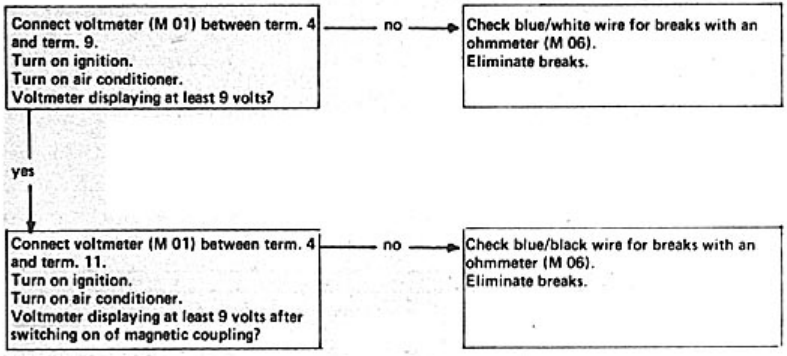
no → Replace idle control valve.
Check code number* and color code*.

yes

Idle control valve okay!

* See Specifications
** Engine oil temperature at least 60° C (140° F)

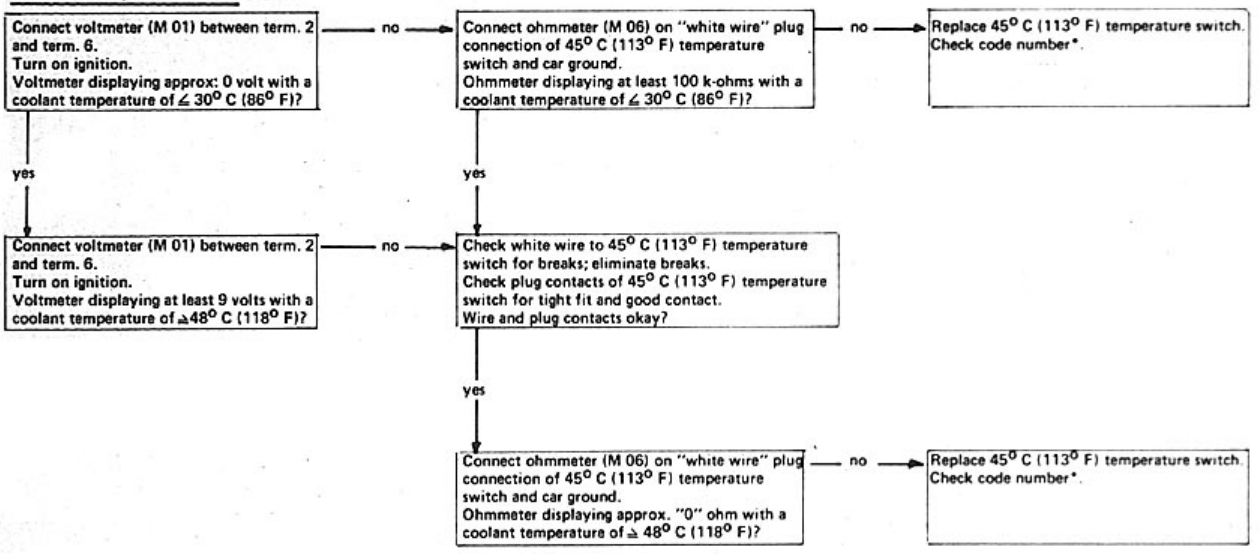
4.) Checking Periphery for Air Conditioner Speed



Important! After engaging a driving range (cars with automatic transmission) always only the nominal idle speed (750 ± 50 rpm) will be regulated (preferred circuit).

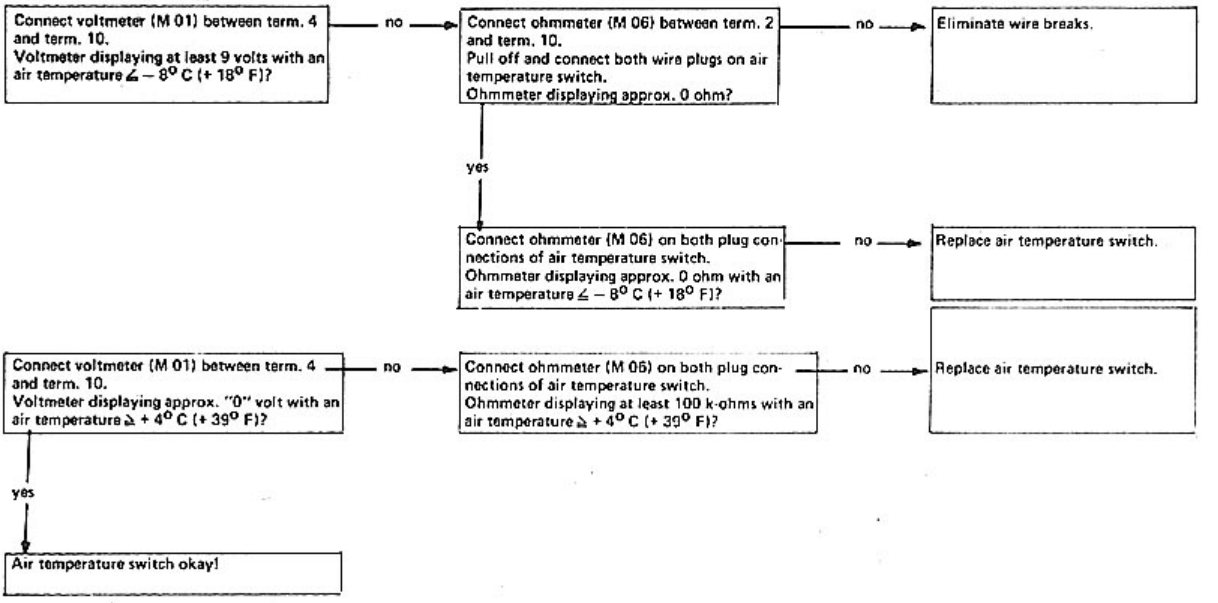
5.) Checking Periphery for Warm-up Speed

a) Coolant Temperature Switch



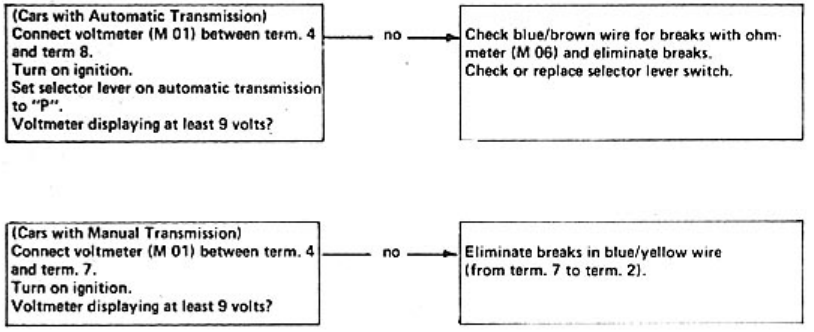
* See Specifications

b) Air Temperature Switch



6.) Preferred Circuit

Important! The nominal idle speed (700 ± 50 rpm) is always regulated when engaging a driving range (cars with automatic transmission).



TESTING INSTRUCTIONS FOR ELECTRONIC IDLE SPEED REGULATION (VDO) WITH DIGITAL MOTOR ELECTRONICS

Testing Requirements:

Battery charged - battery voltage at least 11.5 volts.
Components must have room temperature = 23 ± 5° C (73 ± 9° F).
Stated multimeter functions (e.g. M 01) refer to the BMW SERVICE TEST.
Measuring is performed on the disconnected control unit plug for electronic idle speed regulation.
The following tests do not cover defects which are outside of the electronic idle speed regulation system

Idle control valve in perfect working condition.
Piston not seized.
Correct resistance (9 to 10 ohms) of idle control valve.
Basic adjustment completed.

1.) Power Supply Voltage and Ground of Idle Control Unit

Connect voltmeter (M 01) between term. 2 and car ground.
Turn on ignition.
Voltmeter displaying at least 9 volts?

— no → Check green/yellow wire for breaks according to wiring diagram with ohmmeter (M 06).
Eliminate breaks.

↓ yes

Connect voltmeter (M 01) between term. 2 and term. 4.
Turn on ignition.
Voltmeter displaying at least 9 volts?

— no → Check brown wire for breaks according to wiring diagram with ohmmeter (M 06).
Eliminate breaks.

↓ yes

Power supply voltage and ground of idle control unit okay!

2. Checking Speed Signal and Idle Signal for Idle Control Unit

a) Speed Signal

Terminal 3 must have "terminal 1 signal" with the engine running.

b) Idle Signal

Connect ohmmeter (M 06) between terminal 4 and terminal 12.
Nominal value: 0 ohm.

no → Adjust or replace throttle switch. Adjust cable.

yes

Press down accelerator pedal several centimeters.
Nominal value: ∞ ohms.

no → Adjust or replace throttle switch. Adjust cable.

yes

Idle signal for idle control unit okay!

3.) Checking Idle Control Valve

Pull off plug on idle control valve.
Connect ohmmeter (M 06) on idle control valve.
Ohmmeter displaying 9 to 10 ohms with a component temperature of 23 ± 5° C (73 ± 9° F)?

no → Replace idle control valve.
Check code number* and color code*.

yes ↓

Connect ammeter (M 03) between idle control valve and wire plug.
Run engine having operating temperature** at idle speed.
Ammeter displaying 400 to 500 mA?

no → Check both wires (from control unit to idle control valve) for breaks according to wiring diagram with ohmmeter (M 06).
Eliminate any breaks.
Replace control unit, if there are not any breaks.
Check code number* and color code*.

yes ↓

Run engine having operating temperature** at idle speed.
Pull off wire plug on idle control valve.
Engine speed must rise to approx. 2,000 rpm.
Engine speed okay?

no → Replace idle control valve.
Check code number* and color code*.

yes ↓

Connect wire plug on idle control valve again.
Speed drops to nominal speed?

no → Replace idle control valve.
Check code number* and color code*.

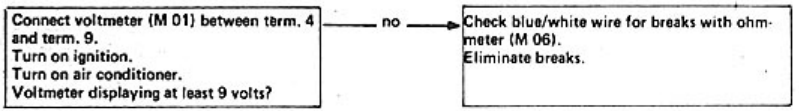
yes ↓

Idle control valve okay!

* See Specifications
** Engine oil temperature at least 60° C (140° F)

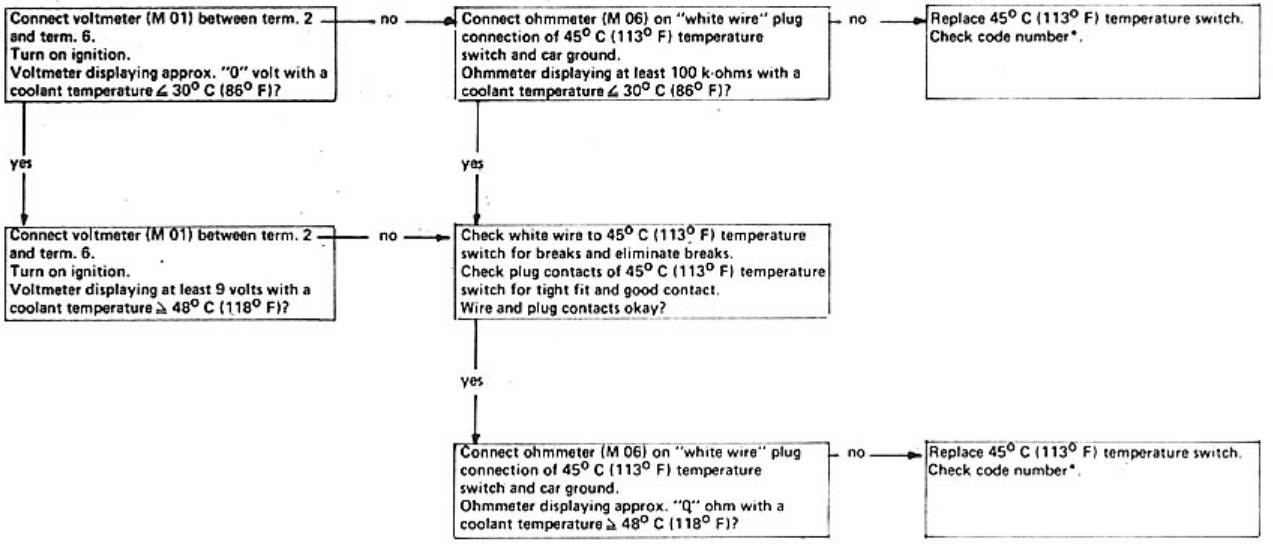
4.) Checking Periphery for Air Conditioner Speed

Important! Always only the nominal idle speed (700 ± 50 rpm) is regulated (preferred circuit) after engaging a driving range (cars with automatic transmission).



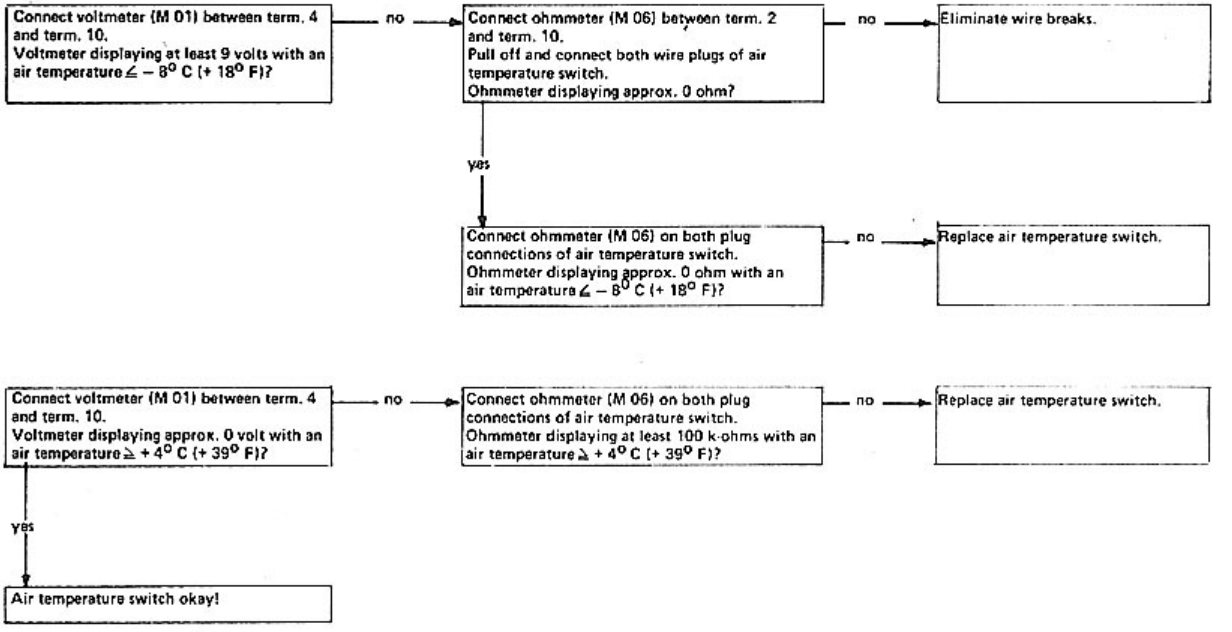
5.) Checking Periphery for Warm-up Speed

a) Coolant Temperature Switch



* See Specifications

b) Air Temperature Switch



6.) Preferred Circuit

Important! Nominal idle speed (700 ± 50 rpm) is always regulated when engaging a driving range (cars with automatic transmission).

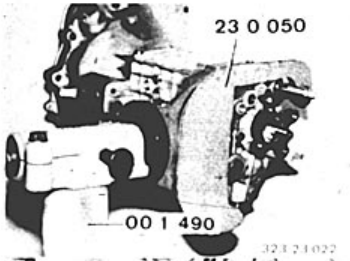
323 23 021

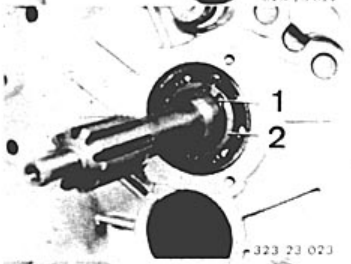
23 11 000 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE FRONT SECTION

Remove transmission – see 23 00 022 in pertinent model repair manual microfiche beginning with 1985 models.
Unscrew bracket and rubber mounts.



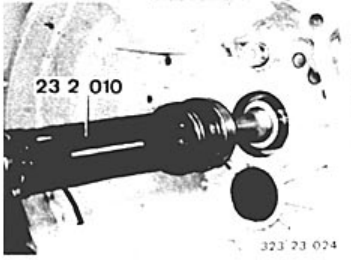
323 23 022

Mount transmission on Special Tools 23 0 050 and 00 1 490.
Drain oil.



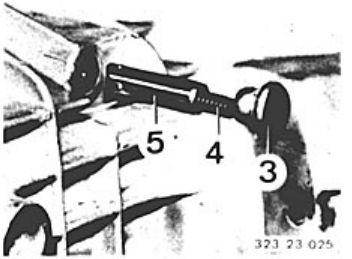
323 23 023

Remove guide sleeve – see 23 11 621.
Remove circlip (1).
Remove support (2).



323 23 024

Pull out grooved ball bearing with Special Tool 23 2 010.
Important!
Shim.

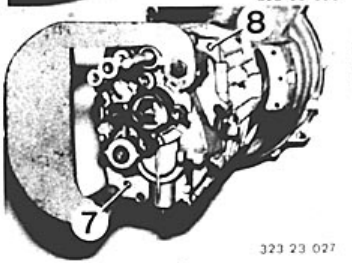


323 23 025

Remove cover (3).
Remove spring (4) and lockpin (5).
Check installed position.

323 23 026

Unscrew bolt (6).
Installation:
Install bolt with bolt cement**.
Tightening torque*.



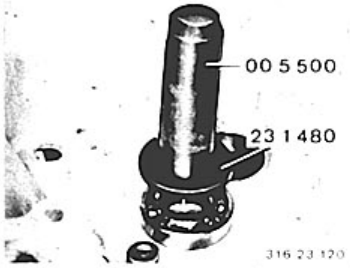
323 23 027

Unscrew transmission case cover mounting bolts.
Drive dowel pins (7 and 8) out of transmission case.

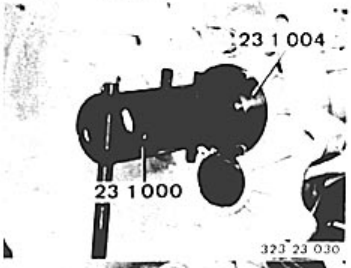
323 23 028

Pull off transmission case.
Installation:
Replace gasket.
Important!
Shims on input shaft and layshaft.

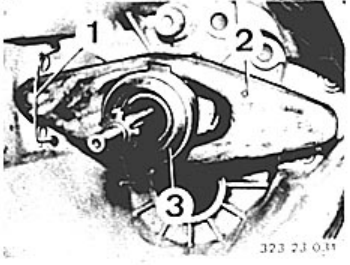
* See Specifications
** Source: HWB



Install a 1 mm (0.039") thick shim.
Drive in grooved ball bearing with Special Tools 23 1 480 and 00 5 500.
Slide case over gear wheel set.

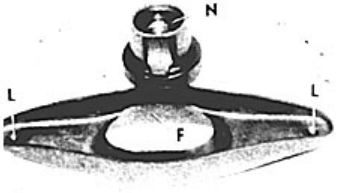


Pull input shaft into grooved ball bearing with Special Tools 23 1 004 and 23 1 000, or push case on to case cover.
Bolt transmission case.
Tightening torque*.
Install lockpins, shims and circlip.



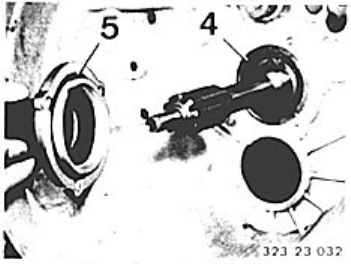
23 11 621 SEALING OR REPLACING COVER FOR CLUTCH RELEASE GUIDE TUBE
– Transmission Removed –

Lift out spring (1) and remove release lever (2) with thrust bearing (3).

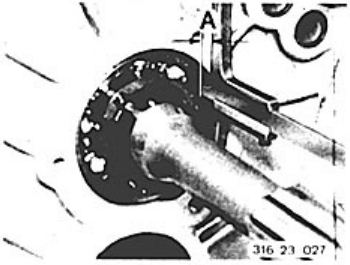


Installation:
Pack lubricating groove (N) with Molykote Longterm 2**.
Coat guides (F) and bearings (L) with Molykote Longterm 2**.
Non-conformance could cause release bearing to seize on guide sleeve.

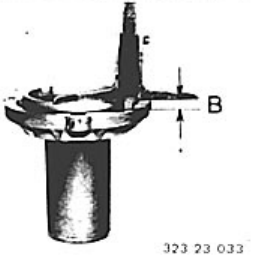
* See Specifications
** Source: HWB



Unscrew guide sleeve.
Important!
Shim (4).
Installation:
Replace O-ring (5).
Tightening torque*.



Measure distance (A) from case to grooved ball bearing.



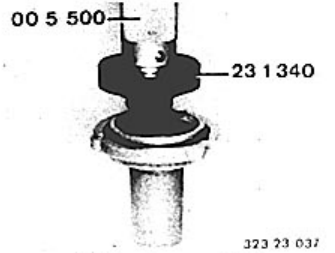
Measure collar height (B) of guide sleeve.
Take up any play with shims to 0 ... 0.09 mm (0 ... 0.0035").
Example:

A	5.2 mm (0.205")
– B	4.8 mm (0.189")
	0.4 mm (0.016") shim thickness

* See Specifications

23 12 501 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT
– Transmission Removed –

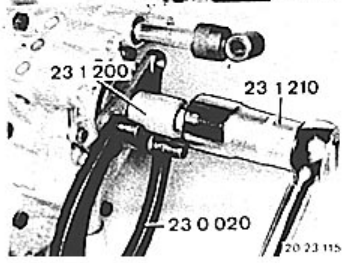
Remove guide sleeve – see 23 11 621.
Lift out radial oil seal.



Drive in radial oil seal with Special Tools 23 1 340 and 00 5 500.
Open end faces transmission case.
Lubricate sealing lip with oil.

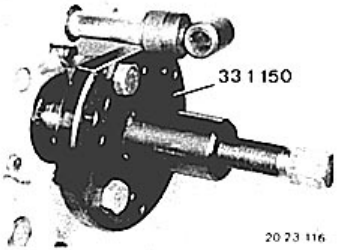
23 12 531 REPLACING RADIAL OIL SEAL FOR OUTPUT FLANGE
– Transmission Removed –

Remove lockplate (1).
Installation:
Replace lockplate.



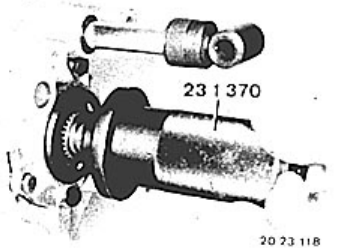
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Install collar nut with bolt cement**.
Tightening torque*.

* See Specifications
** Source: HWB

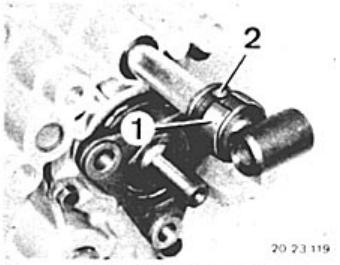


Pull off output flange with Special Tool 33 1 150.

Pull out radial oil seal with Special Tool 00 5 010.

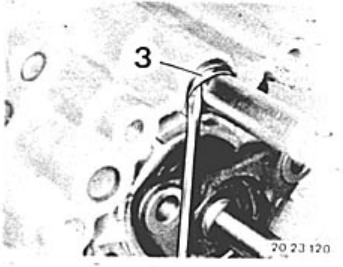


Installation:
Lubricate sealing lip with oil.
Drive in radial oil seal with Special Tool 23 1 370.

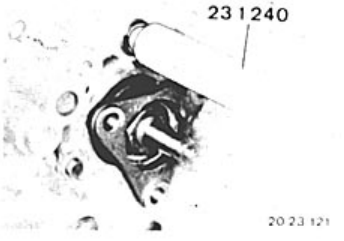


23 12 561 REPLACING RADIAL OIL SEAL FOR SELECTOR SHAFT
– Transmission Removed –

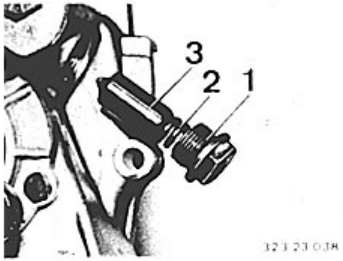
Remove locking sleeve (1).
Drive out pin (2) upwards.
Take off selector rod joint.
Installation:
Install selector rod joint that offset end of bearing sleeve faces toward the right when looking forward in car.



Lift out radial oil seal (3).



Lubricate sealing lip of radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

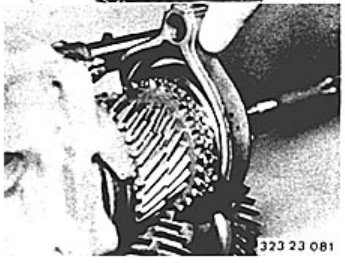


23 21 500 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFTS – TRANSMISSION CASE FRONT SECTION REMOVED –

Unscrew plug (1).
Remove spring (2) and lockpin (3).
Installation:
Seal bearing surface of plug (1) with sealing compound**.

Enagage 3rd gear.
Turn input shaft until opening in 3rd gear wheel is aligned with pin.
Knock out pin (4) downward in this position, until selector rod (5) can be pulled out.
Loose balls!
Important!
Knock pin between tooth flanks and operating sleeve.
Installation:
Replace pin.

Remove key (H).
Knock out pin (B).
Unscrew bolt (6) enough that selector shaft can be turned.
Selector arm must face up.
Engage 4th gear.
Press selector fork in operating sleeve firmly and pull out selector shaft forward.
Important!
Rollers.



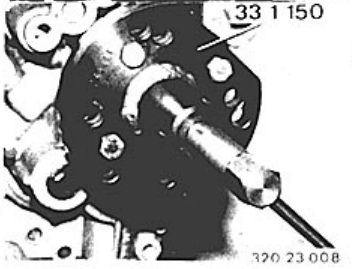
Remove selector fork.
Installation:
Check wear* of selector fork 23 31 501.

* See Specifications
** Source: HWB

Unscrew bolt (7) enough that selector arm (S) for reverse gear can be removed.
Pull out selector rod (8).
Loose balls!

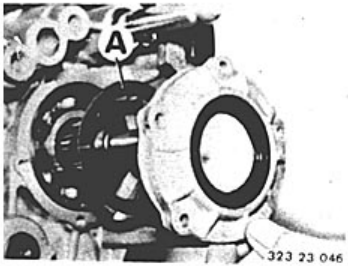
Remove lockplate.
Installation:
Replace lockplate.

Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Tightening torque*.
Install collar nut with a bolt locking agent**.

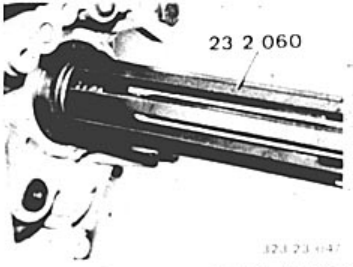


Pull off output flange with Special Tool 33 1 150.

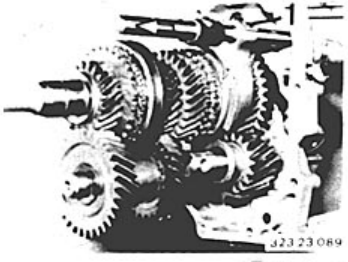
* See Specifications
** Source HWB



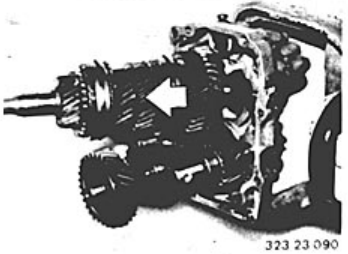
Detach support ring.
Important!
Shim (A).
Installation:
Replace gasket.
Remove old gasket with an adhesive remover*.



Pull grooved ball bearing off of output shaft and out of transmission case cover with Special Tool 23 2 060.

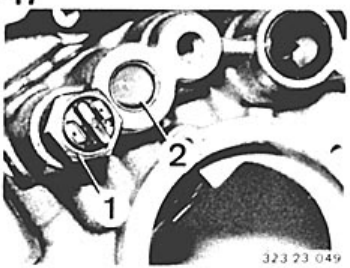


Drive out pin (1).
Pull out 1st/2nd gear selector rod.
Loose balls!
Remove selector fork.
Installation:
Replace pin.

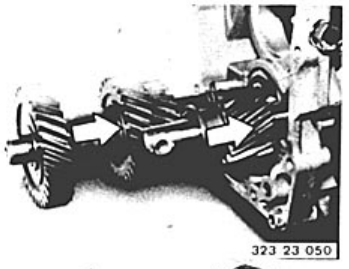


Remove input shaft and output shaft.
Remove layshaft.
Installation:
Check condition of all bearings, replacing if necessary (see 23 21 701).

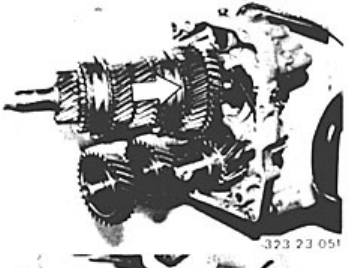
* Source: HWB



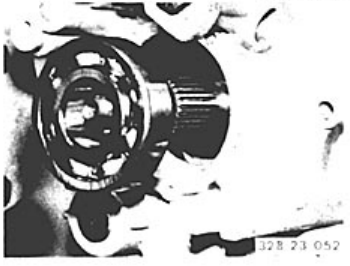
Remove backup light switch (1) and end cover (2).
Installation:
Push down detent balls with a screwdriver applied through open bores.
Replace end cover (2).



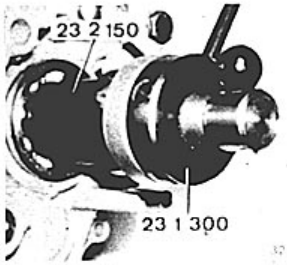
Install layshaft and reverse gear with collar facing forward.
Version with Grooved Ball Bearing:
Heat case rear section in area of ball bearing to about 80° C (176° F) with a hot air blower.



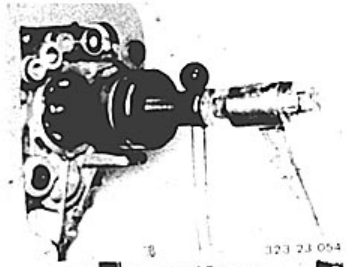
Insert input shaft and output shaft assembly in case rear section.



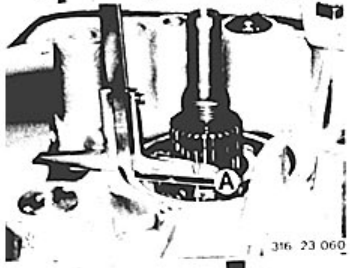
Insert grooved ball bearing in case rear section lightly.



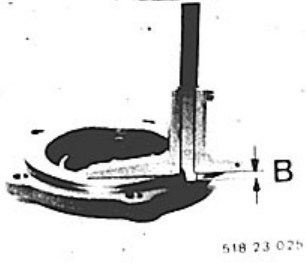
Press grooved ball bearing on output shaft and into case rear section with Special Tools 23 2 150 and 23 1 300.



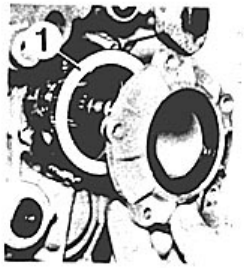
Drive in grooved ball bearing to fit tight by applying light knocks.



Measure distance (A) from case rear section to grooved ball bearing.



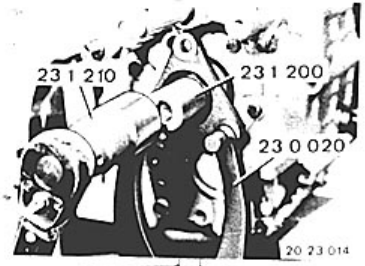
Measure collar height (B) without gasket.
Important!
Use 0.2 mm (0.008") for gasket thickness in calculations.



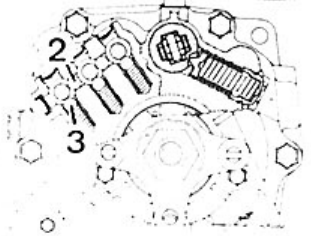
There should not be any play between grooved ball bearing and sealing cover.
All play must be taken up with shims (1).
Example:

A	3.0 mm (0.118")
– B	2.8 mm (0.110")
	0.2 mm (0.008")
+	0.2 mm (0.008") gasket thickness
	0.4 mm (0.016") shim thickness

Tighten sealing cover*.



Mount output flange.
Install collar nut with bolt cement**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 2 210.
Tightening torque*.
Install lockplate.

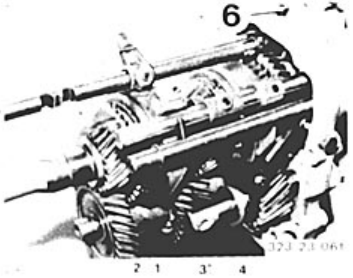


Layout of Detent and Locking Balls:
2 Locking ball
3 Detent ball

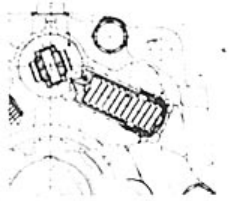
Insert detent balls.
Install selector rod for reverse gear.

* See Specifications for tightening torque
** Source: HWB

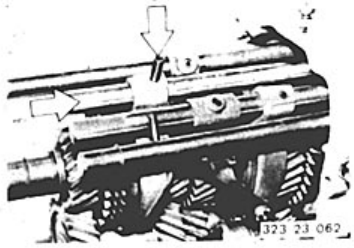
Place 1st/2nd gear selector fork in operating sleeve.
Insert locking and detent balls.
Install selector rod.
Mount selector fork with 6 x 24 mm pin.



Insert 3rd/4th gear selector fork in operating sleeve.
Engage 4th gear.
Install selector shaft; selector arm swung down.
Tighten bolt (6).
Tightening torque*.
Take out 4th gear again.



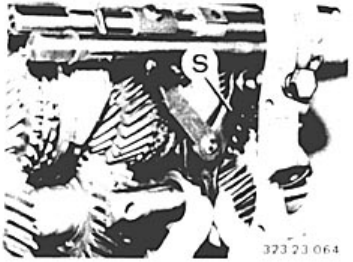
Install lockpin.
Installation:
Check position of lockpin (1) in bush (2).
Insert spring (3).
Install plug (4) with sealing compound**.
Tightening torque*.



Insert locking and detent balls.
Install 3rd/4th gear selector rod.
Mount selector fork with 6 x 24 mm pin.

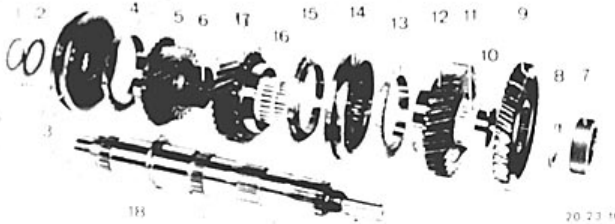
* See Specifications
** Source: HWB

Install backup light switch (1) and end cover (2).

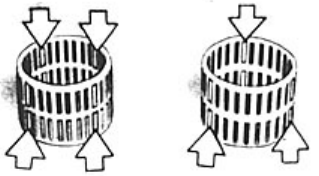


Install selector arm (S) for reverse gear with collar facing case.
Important!
Install selector arm without stress.
Clearance is required between selector arm and groove of reverse gear wheel.
Tightening torque*.

* See Specifications

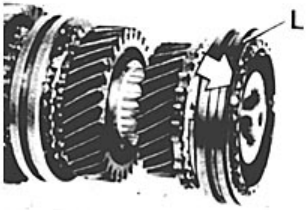


20 23 105



320 23 114

Important!
Split needle bearings.
Slots without needles are provided in 90° and 120° steps to guarantee uniform support of the needles.



320 23 086

23 21 551 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

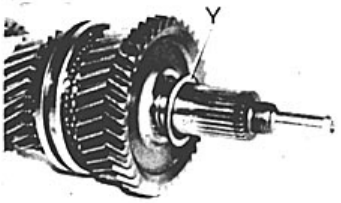
Remove circlip (1).
Installation:
Always replace circlip.
Pull support ring (2), synchronizer with sliding sleeve (3), synchromesh ring (4), 3rd gear (5) and needle cage (6) off of output shaft.
Important! – Installation:
Shouldered end of sliding sleeve faces 4th gear.
Press spacer (7), washer (8), reverse gear (9), spacer (10), needle cage (11), 1st gear (12), synchromesh ring (13), synchronizer with sliding sleeve (14), synchromesh ring (15), needle cage (16) and 2nd gear (17) off of output shaft (18).

Installation:
Adjust play between circlip and guide sleeve to 0 ... 0.09 mm (0 ... 0.0035") with shims.

323 23 079

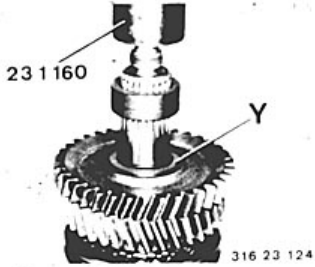
20 23 106

Installation:
Sliding sleeves for 1st/2nd and 3rd/4th gears are different (splines).
Don't mix up sliding sleeves.
1 Sliding sleeve for 1st/2nd gear
2 Sliding sleeve for 3rd/4th gear
Important!
Install sliding sleeve (2) that shouldered end faces 4th gear.



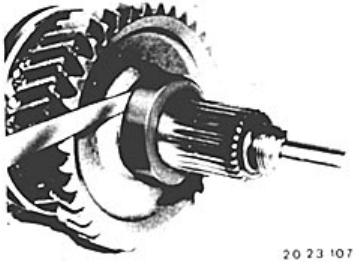
323 23 066

Assemble output shaft.
Important!
Adjust axial play to 0 ... 0.09 mm (0 ... 0.0035") with shim Y.



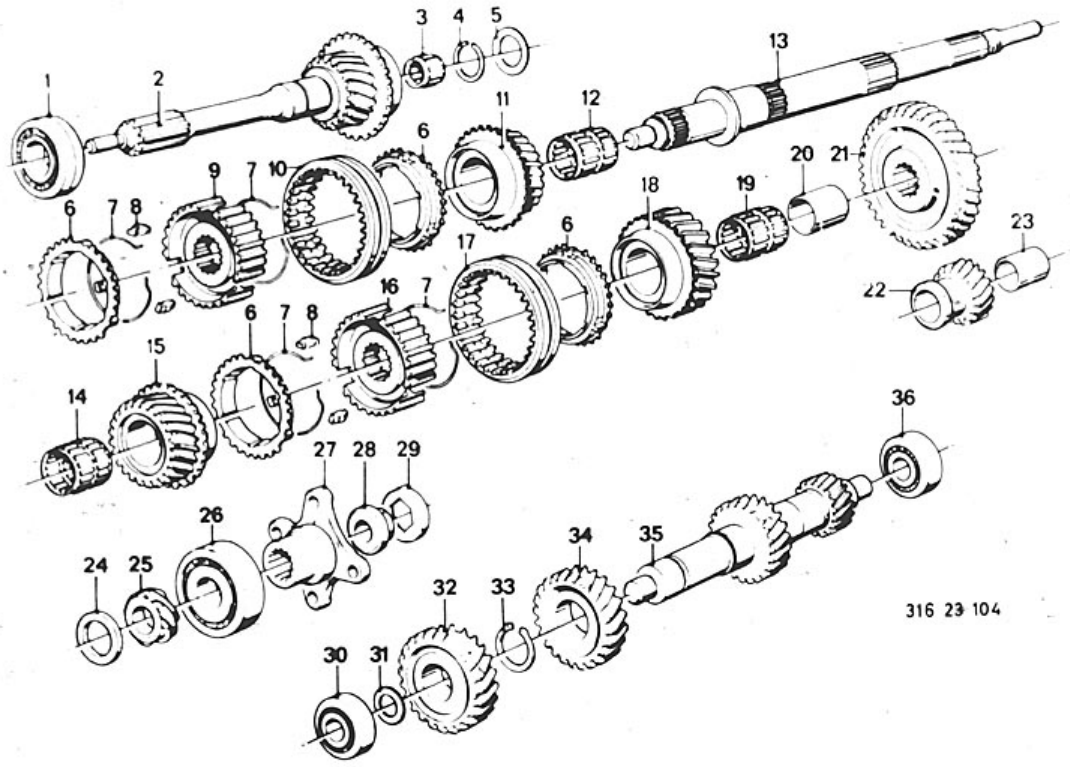
316 23 124

Install shim Y between reverse gear and spacer.
Press spacer against collar of output shaft with Special Tool 23 1 160.



20 23 107

Check axial play.
To correct, remove reverse gear wheel again and replace shim Y with a different one.



Drawing of Gear Set and Bearings:

35 Layshaft
36 Roller bearing

23 21 701 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Transmission Removed –

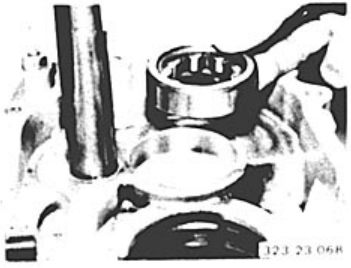
323 21 055

Remove and install input and output shafts – see 23 21 500.

A) Layshaft:

Pull off bearing inner race or grooved ball bearing on layshaft.

Press new bearing inner race and grooved ball bearing on layshaft, without shim.



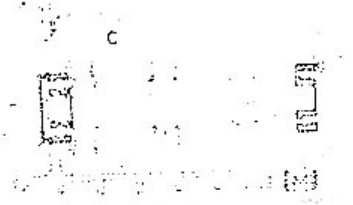
323 23 068

Heat case rear section in area of bearing to about 80° C (176° F) with hot air blower.

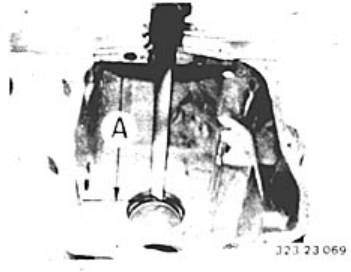
Pull out cylindrical roller bearing.

Installation:

Large diameter end of roller cage faces case rear section.



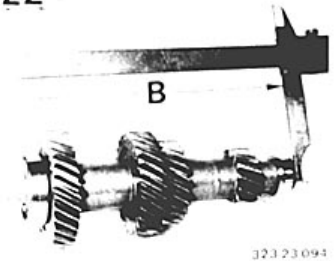
Determine thickness of shim C.



323 23 069

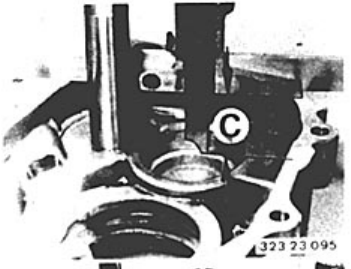
Remove grooved ball bearing in case front section after heating case front section in area of bearing to about 80° C (176° F) with a hot air blower.

Measure distance (A) from case sealing surface to circlip.



323 23 094

Measure distance (B) from bearing inner race to ball bearing inner race.



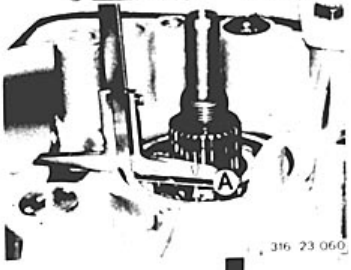
323 23 095

Measure distance C from case sealing surface to bearing outer race on cover without gasket.

Use 0.2 mm (0.008") for gasket thickness in calculations.

Example:

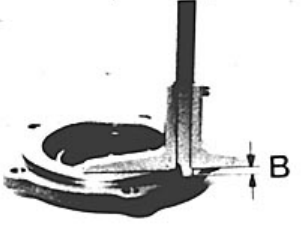
A	170.0 mm (6.693")
+ C	38.7 mm (1.523")
+	0.2 mm (0.008") gasket thickness
	208.9 mm (8.224")
– B	208.5 mm (8.208")
	0.4 mm (0.016")
–	0.1 ...0.2 mm (0.004,..0.008") axial play
	0.2 ...0.3 mm (0.008...0.012") shim th.



316 23 060

B) Output Shaft:

Measure distance A from case cover to grooved ball bearing.

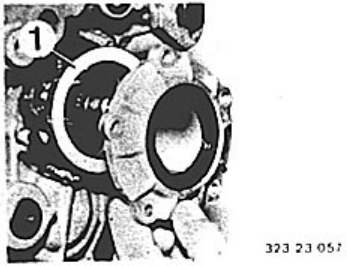


518 23 025

Measure collar height B without gasket.

Important!

Use 0.2 mm (0.008") for gasket thickness in calculations.



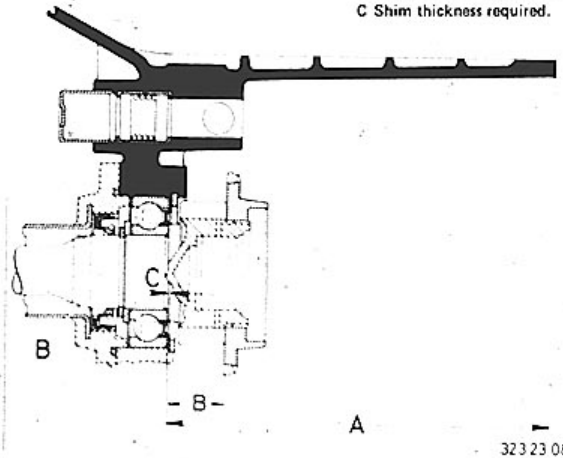
There should not be play between grooved ball bearing and sealing cover.
Take up all play with shims (1).
Example:

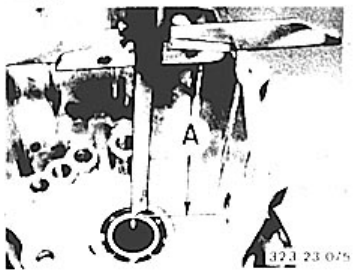
A	3.0 mm (0.118")
– B	2.8 mm (0.110")
	0.2 mm (0.008")
+	0.2 mm (0.008") gasket thickness
	0.4 mm (0.016") shim thickness

Tighten sealing cover.
Mount and lock output flange.

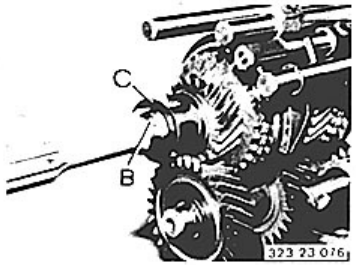
C) Input Shaft:
Install a 1 mm (0.039") shim and drive in grooved ball bearing with Special Tools 23 1 480 and 00 5 500.

A Distance from case sealing surface to grooved ball bearing.
B Actual distance inscribed in input shaft.
C Shim thickness required.





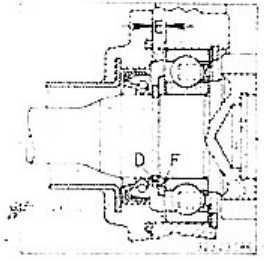
Measure distance A from case sealing surface to grooved ball bearing.



After having actual distances A and B the thickness of shim C can be read in the "C" column.

A mm	B mm	Inscribed Lines	C mm
159.9	24	3 or 4	0.5
	23.9	1 or 2	0.6
159.8	24	3 or 4	0.4
	23.9	1 or 2	0.5
159.7	24	3 or 4	0.3
	23.9	1 or 2	0.4
159.6	24	3 or 4	0.3
	23.9	1 or 2	0.3

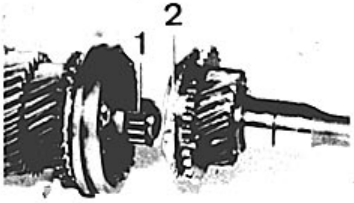
Install shim C on input shaft.



Measure circlip thickness D.
Insert circlip in groove of input shaft.
Measure distance E from circlip to grooved ball bearing.
Determine support ring thickness F.
Example:

E	4.1 mm (0.161")
– D	1.8 mm (0.071")
F	2.3 mm (0.090")

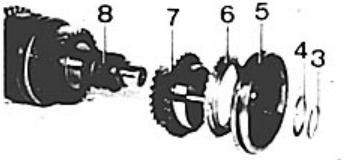
Install support ring F.



323 23 077

23 22 551 REPLACING 3RD AND 4TH GEAR WHEEL SET
– Output Shaft Removed –

Pull input shaft with needle cage (1) and synchromesh ring (2) off of output shaft.



Remove circlip (3).
Pull off support ring (4), guide sleeve (5), synchromesh ring (6) and 3rd gear (7) with needle cage (8).

Installation:
Replace circlip.

Important!
Shouldered end of sliding sleeve (5) faces 4th gear.

323 23 078

Installation:
Adjust play between circlip and guide sleeve to 0 ... 0.09 mm (0 ... 0.0035") with shims.

386 23 091

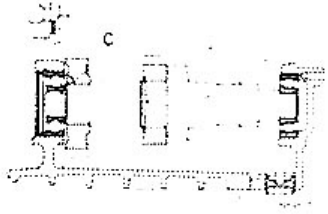
Press 4th gear and grooved ball bearing off of layshaft.

Important!
Shims.

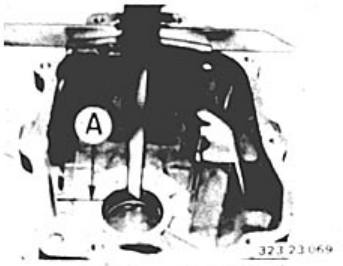
Remove circlip and press off 3rd gear.
Pressing off force: approx. 10 tons.
Pressing on force: approx. 7 tons.

Installation:
Heat gears to 120 ... 150° C (250 ... 300° F) with a hot air blower.

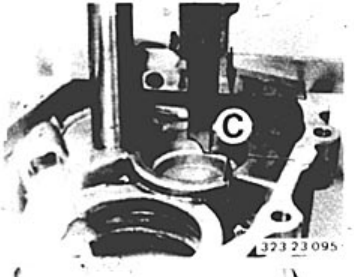
Important!
High collar at bore of 3rd and 4th gears faces toward 2nd gear.



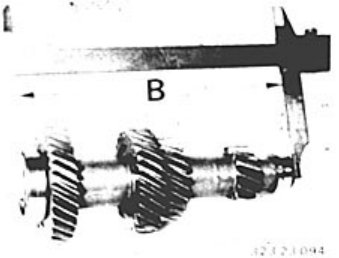
Determine thickness of shim C.



Measure distance A from case sealing surface to circlip.

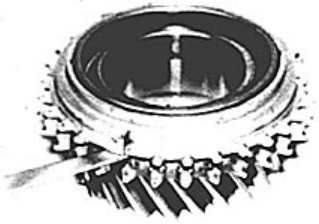


Measure distance C from case sealing surface to bearing outer race on cover without gasket.
Use 0.2 mm (0.008") for gasket thickness in calculations.



Measure distance B from bearing inner race to ball bearing inner race.
Example:

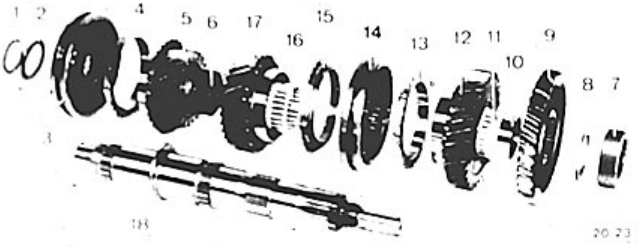
	A	170.0 mm (6.693")
+	C	38.7 mm (1.523")
+		0.2 mm (0.008") gasket thickness
		208.9 mm (8.224")
–	B	208.5 mm (8.208")
		0.4 mm (0.016")
–	0.1...	0.2 mm (0.004...0.008") axial play
	0.2 ...	0.3 mm (0.008...0.012") shim thickness



316 23 095

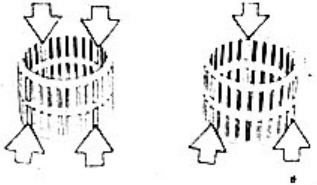
23 23 503 DISASSEMBLING/ASSEMBLING COMPLETE SYNCHRONIZATION
– Transmission Removed –

Remove output shaft – see 23 21 500.
Visually inspect synchromesh rings for wear.
Synchromesh rings must be replaced when distance between synchromesh ring and clutch unit is less than 1.0 mm (0.039").
Important!
Measure in area of stops.
Synchromesh rings should have uniform contact all around.



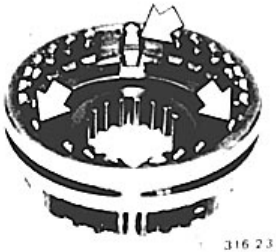
20 23 105

Remove circlip (1).
Installation:
Always replace circlip.
Pull support ring (2), synchronizer with sliding sleeve (3), synchromesh ring (4), 3rd gear (5) and needle cage (6) off of output shaft.
Press spacer (7), washer (8), reverse gear (9), spacer (10), needle cage (11), 1st gear (12), synchromesh ring (13), synchronizer with sliding sleeve (14), synchromesh ring (15), needle cage (16) and 2nd gear (17) off of output shaft (18).



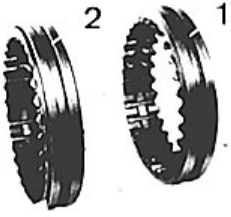
320 23 114

Important!
Split needle bearings:
Slots are provided without needles in steps of 90° or 120° to guarantee uniform support of the needles.



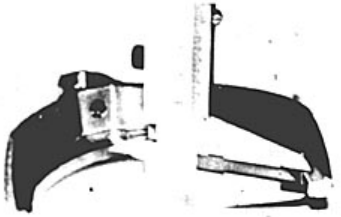
316 23 125

Press sliding sleeve off of synchronizer.
Installation:
Push flat teeth of sliding sleeve over thrust pieces.



Installation:
Sliding sleeves for 1st/2nd gear and 3rd/4th gear are different (splines).
Don't mix up sliding sleeves.
1 Sliding sleeve for 1st/2nd gear
2 Sliding sleeve for 3rd/4th gear
Important!
Install sliding sleeve(2) that shouldered end faces 4th gear.

Offset hooks of synchromeshing springs in an axial groove to each other.
Connect thrust pieces in synchromeshing springs.



316 23 096

23 31 501 REPLACING 1ST/2ND AND 3RD/ 4TH GEAR SELECTOR FORKS

Remove input and output shafts 23 21 500.
Check wear* of selector forks.

* See Specifications

Construction group 23 Manual transmission

Getrag 240 Manual transmission (overdrive)

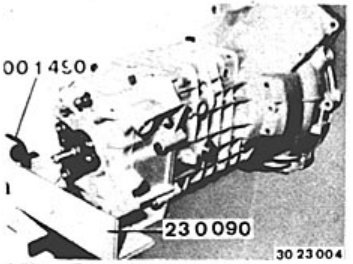
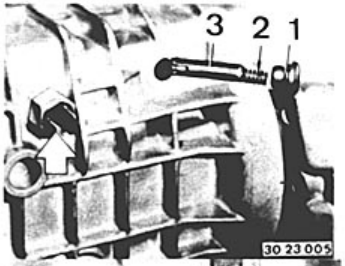
12 Operating lever

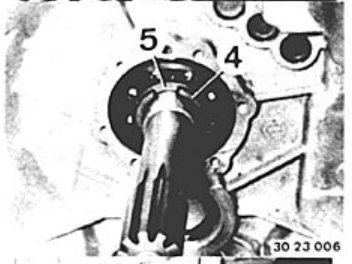


23 11 013 REMOVING AND INSTALLING/ SEALING FRONT TRANSMISSION CASE SECTION

Remove transmission – see pertinent model repair manual microfiche since 1985 models – 23 00 022.
Mount Special Tool 23 0 090 on Special Tool 00 1 490.
Mount transmission on special tool.
Drain oil.



Remove guide sleeve 23 11 623.
Unscrew backup light switch.
Remove cap (1).
Pull out spring (2) and lockpin (3).
Check installed position!

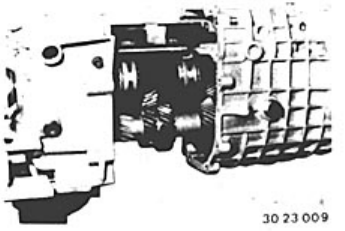


Remove snap ring (4).
Remove washer (5).
Installation:
Always replace circlip.

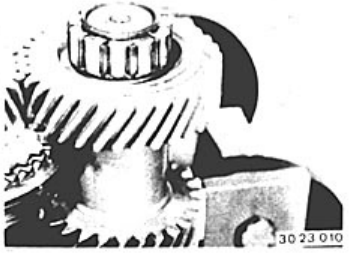
Unscrew bolt (6).
Installation:
Install bolt with a bolt cement**.
Tightening torque*.

* See Specifications
** Source: HWB

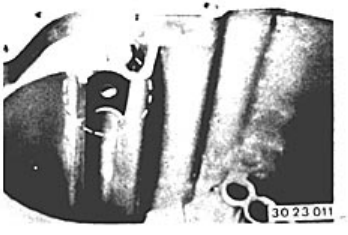
Drive out dowel pins.
Unscrew bolts.
Installation:
Check length of bolts.
Bolt (1) = 8 x 60 mm.



Pull off case front section.
Installation:
Coat sealing surface with sealing compound**.
Sealing surface must be thoroughly clean and dried of oil.

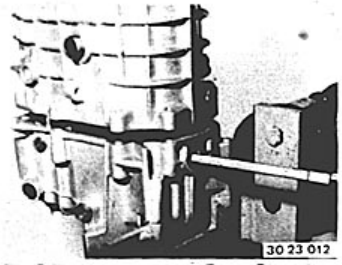


Install roller bearing on layshaft that small diameter end faces up.

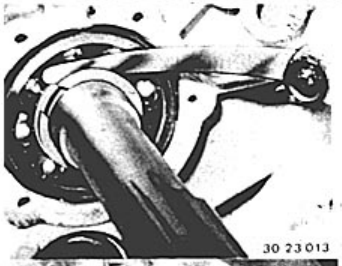


Coat case front section in area of reverse gear shaft with sealing compound**.
Surface must be thoroughly clean and dried of oil.

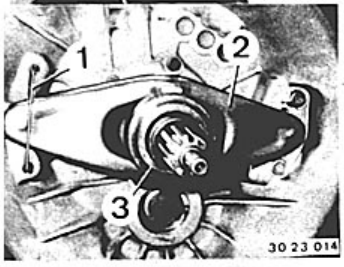
** Source: HWB



Unscrew oil drain plug.
Mount case front section.
Align layshaft through bore for oil drain plug that roller bearing of layshaft slides into bearing shell.
Mount case front section.
Tightening torque*.
Install lockpin.

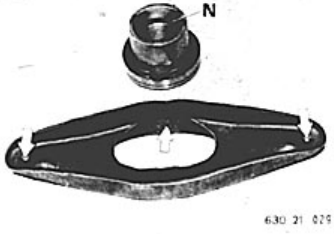


Install spacer and circlip.
Adjust play between bearing race and circlip to 0 ... 0.09 mm (0 ... 0.0035").

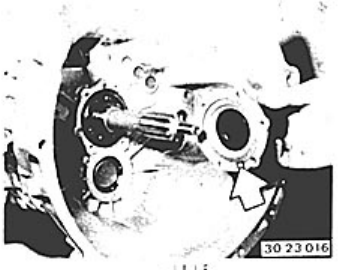


23 11 623 REMOVING AND INSTALLING GUIDE SLEEVE FOR CLUTCH RELEASE
– Transmission Removed –

Lift out spring (1) and remove release lever (2) with thrust bearing (3).

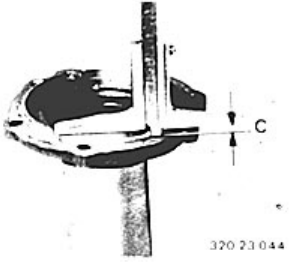


Installation:
Pack lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) with Molykote Longterm 2.
Non-conformance could cause release bearing to seize on guide sleeve.



Detach guide sleeve.
Important!
Spacer.
Installation:
Install guide sleeve with sealing compound**.
Sealing surface must be thoroughly clean and dried of oil.

Installation:
Adjust play to 0 ... 0.09 mm (0 ... 0.0035").
Determine thickness of spacer.
Measure distance (B) from guide sleeve protrusion to inside surface.

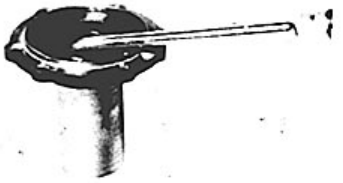


Measure distance (C) from guide sleeve protrusion to outside surface.
Example:

B	4.0 mm (0.157")
– C	2.6 mm (0.102")
	1.4 mm (0.055") spacer thickness

* See Specifications

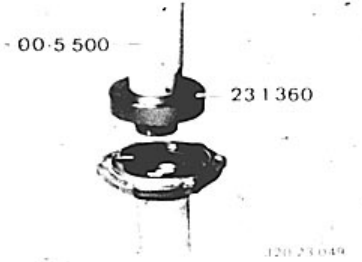
** Source: HWB



320 23 048

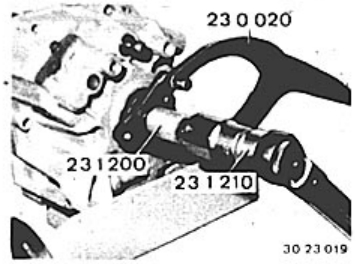
23 12 503 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT - Transmission Removed -

Remove guide sleeve - see 23 11 622.
Lift-out radial oil seal.



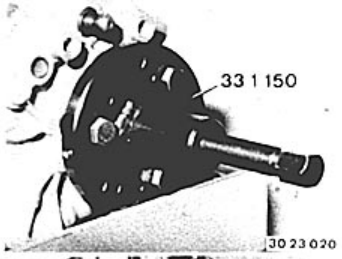
320 23 049

Drive in radial oil seal with Special Tools 23 1 360 and 00 5 500.
Open end faces up.
Lubricate sealing lip with oil.

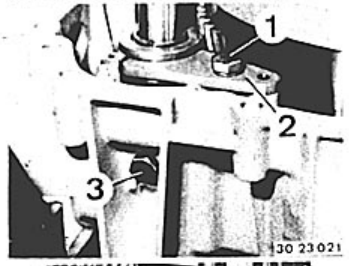


23 21 503 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY
–TRANSMISSION REMOVED–

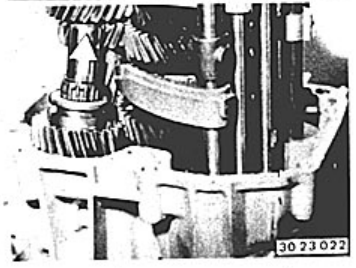
Remove transmission case front section 23 11 013.
Remove lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.



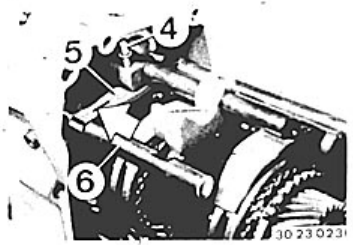
Pull off output flange with Special Tool 33 1 150.



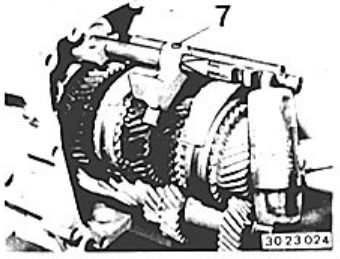
Unscrew bolt (1).
Remove holder (2).
Unscrew bolt (3).



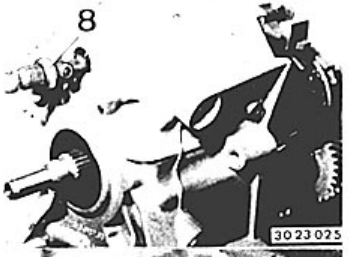
Remove shaft with reverse gear and needle bearing.



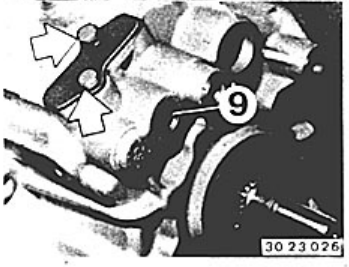
Pull out pin (4) for operating lever (5).
Pull out selector rail (6).
Remove operating lever (5).
Installation:
Install operating lever that notch faces up and in direction of selector rail.



Engage 4th gear.
Drive in pin (7), while counterholding.
Important!
Only drive in pin (7) far enough that selector shaft can be pulled back and out.



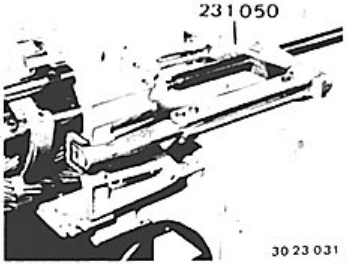
Radial oil seal (8) will also be pulled out.
Important!
Rollers on selector shaft.
Installation:
Replace radial oil seal.
Remove selector arm.



Detach end plate.
Installation:
Install end plate with sealing compound**.
Sealing surface must be thoroughly clean and dried of oil.
Remove end plate (9).
Installation:
Replace end plate.

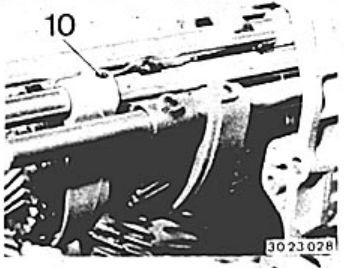
** Source: HWB

Remove three springs.



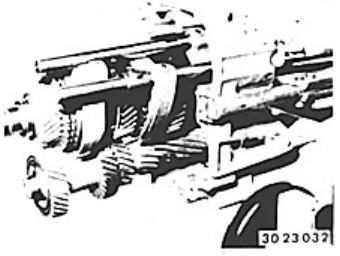
Press input shaft, output shaft and layshaft out of the rear case section with Special Tool 23 1 050.

Important!
Use a piece of wood, aluminum or something similar between the claws of the special tool and sealing surface, to avoid damaging the sealing surface.



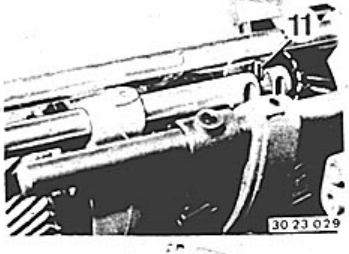
Drive pin (10) out of the 3rd/4th gear shift fork.

Installation:
Install a new pin.



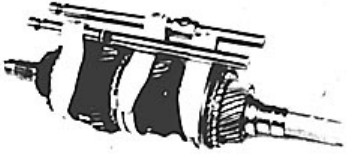
Important!
Make sure that shift rods and the layshaft do not clamp while pressing out. The layshaft must not fall down in this step.

Installation:
Check condition of all bearings, replacing if necessary.

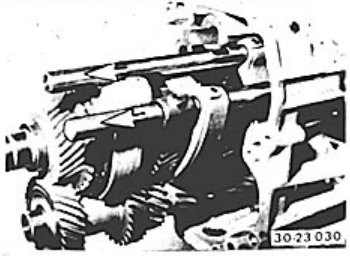


Knock out 3rd/4th gear shift rod forward.

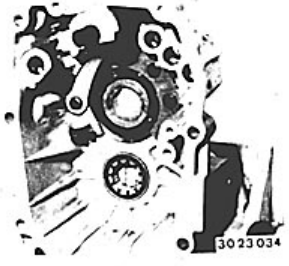
Important!
Lockpin (11) in shift rod.



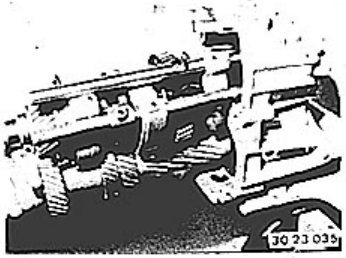
Installation:
Install 3rd/4th gear shift fork and shift rods with shift forks for 1st/2nd and 5th/reverse gears.



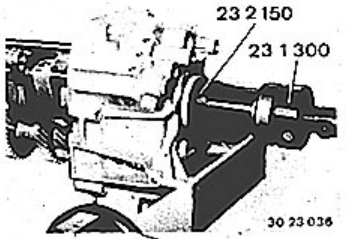
Engage 2nd and reverse gears by moving 1st/2nd and 5th/reverse gear shift rods forward.



Remove all locking and detent balls in rear case section.
Install the roller bearing with the large diameter end facing out.
Lubricate lockpins and locking arms with oil.

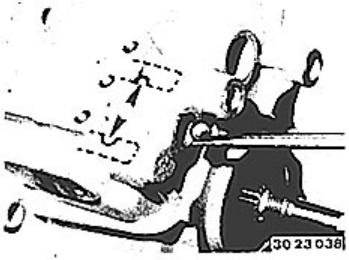


Heat grooved ball bearing inner race in case rear section to approx. 80° C (175° F) with a hot air blower.
Second and reverse gears are engaged.
Insert input shaft, output shaft and layshaft in case rear section.
Align selector rods.

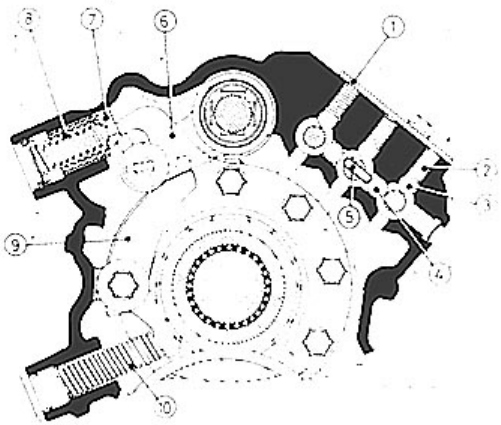


Pull input shaft, output shaft and layshaft into case rear section with Special Tools 23 1 300 and 23 2 150.
Important!
Make sure selector rods and layshaft are not clamped while pulling in parts.

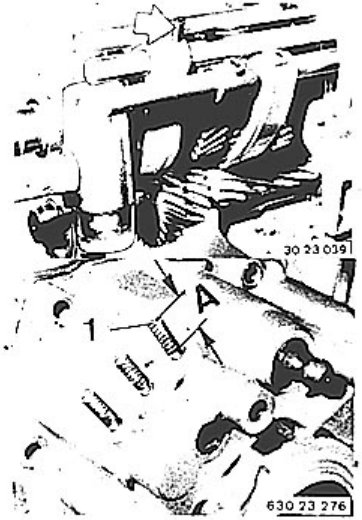
Move selector rods to neutral position.
Slide 3rd/4th gear selector rod through selector forks.
Install lockpin (1) in selector rod with grease.
Push in selector rod up to bore.
Opening in selector rod faces up.



Install two detent balls with grease.
Push in 3rd/4th gear selector rod against lock.

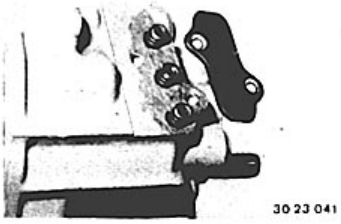


Arrest Assembly:
1 End cover
2 Spring
3 Locking ball
4 Detent ball
5 Lockpin
6 Selector arm
7 Lockpin
8 Spring
9 Locking screw
10 Spring

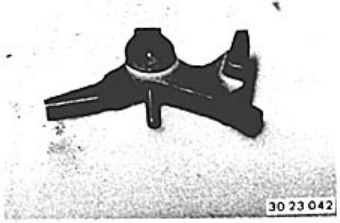


Drive 6 x 24 mm pin into 3rd/4th gear selector fork (counterhold).

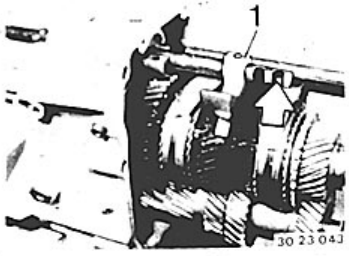
Install 3 locking balls and 3 springs.
Important!
Version with Different Length Springs:
Install the short spring (1) with relaxed length (A) = 15.9 mm (0.626") for 5th/reverse gear selector rod.



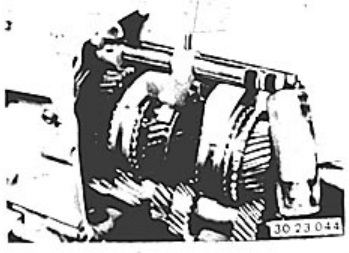
Install end cover after coating with sealing compound**.
Install end cover with sealing compound**.



Drive pin out of selector arm.

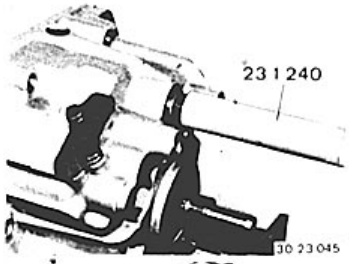


Hold 4 rollers in position with grease.
Slide in selector shaft and install selector arm (1) at same time.
Important!
Opening in selector shaft faces out.



Drive in 6 x 26 mm pin (counterhold).

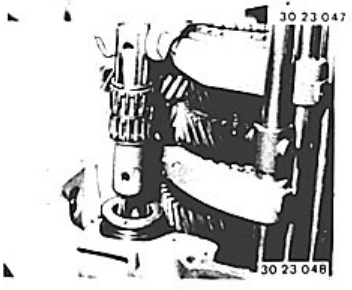
** Source: HWB



Lubricate sealing lips of radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

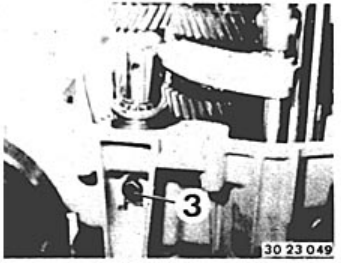
Install selector rail.
Groove (1) in selector rail faces up.
Install operating lever (5) with notch facing up and toward selector rail.
Install pin (4).

Coat case rear section in area of reverse gear shaft with sealing compound**.
Surface must be thoroughly clean and dried of oil.



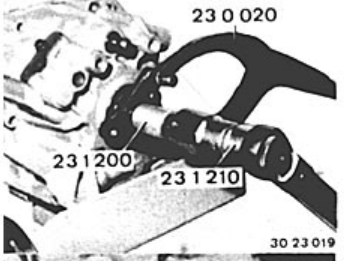
Install shaft with needle bearing and reverse gear.

** Source: HWB



Mount shaft with bolt (3).
Install bolt with a locking compound**.

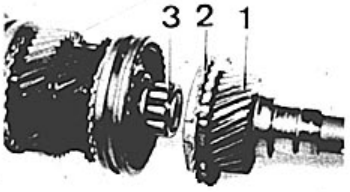
Insert holder (2), press out and secure in this position.



Install output flange.
Install collar nut with a locking compound**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten* collar nut with Special Tool 23 1 210.

Install lockplate.

* See Specifications for tightening torque
** Source: HWB

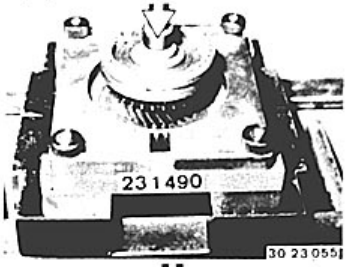


30 23 051

23 21 554 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

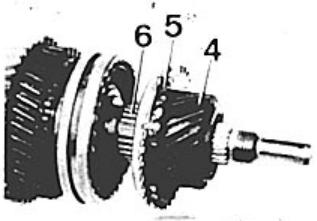
Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).

Note:
To avoid mixing up the synchromesh rings while disassembling the output shaft, it is recommended to mark the synchromesh rings for a pertinent gear wheel.



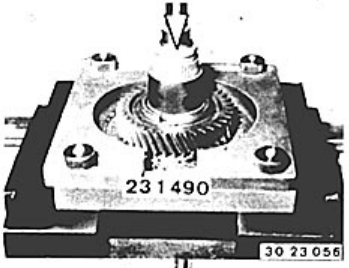
30 23 055

Press off 3rd gear wheel, guide and operating sleeves with Special Tool 23 1 490.
Take off needle bearing.
Pressing-off force*.



30 23 052

Pull off 5th gear wheel (4), synchromesh ring (5) and needle bearing (6).



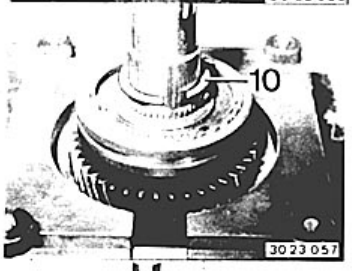
30 23 056

Press off bearing sleeve and 2nd gear wheel with Special Tool 23 1 490.
Remove needle bearing and synchromesh ring.

30 23 053

Lift out circlip (7).
Take off spacer (8).

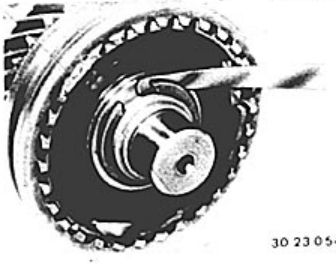
Installation:
Always replace the circlip.



30 23 057

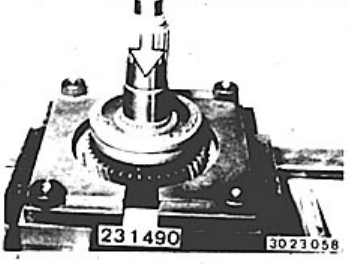
Important!
Circlip (10) must be removed before pressing off the 1st gear wheel.

Installation:
Always replace the circlip.



30 23 054

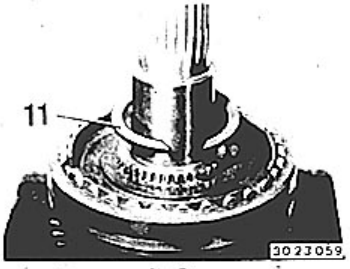
Installation:
Adjust play between the circlip and guide sleeve to 0 ... 0.09 mm (0 to 0.0035").



30 23 058

Press off 1st gear wheel, guide and operating sleeves with Special Tool 23 1 490.
Take off needle bearing.
Pressing-off force*.

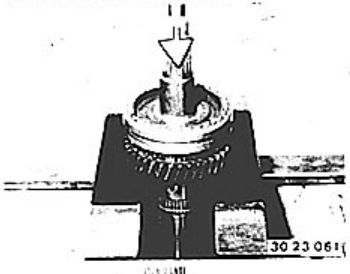
* See Specifications



Important!
Circlip (11) must be removed prior to pressing off the reverse gear wheel.

Installation:
Always replace the circlip.

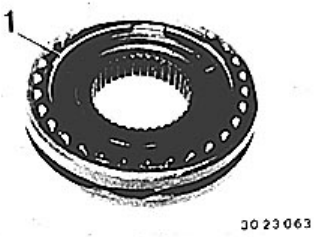
Place output shaft next to the collar.



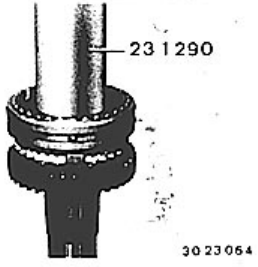
Press guide and operating sleeves as well as reverse gear wheel off of the output shaft.
Take off needle bearing.
Pressing-off force*.

Assembling:
Note:
Check wear of synchromesh rings prior to assembling (see 23 23 505).
Install needle bearing, reverse gear wheel and synchromesh ring (only for version with synchronized reverse gear).
Insert guide and operating sleeves on splines of the output shaft.
Important!
Version with 3 Identification Grooves:
Grooves must face the 5th gear wheel.

* See Specifications

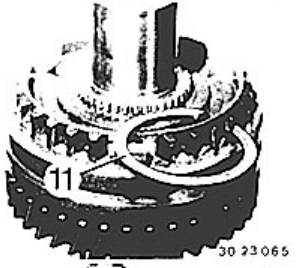


Important!
Version without Synchronized Reverse Gear:
Retainer (1) in the guide sleeve faces the reverse gear wheel.



Press on guide sleeve to fit tight with Special Tool 23 1 290.
Pressing-on force*.

Important!
Make sure that tabs on the synchromesh ring are aligned with openings in the guide sleeve while pressing on.



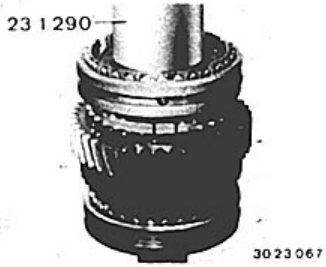
Shift operating sleeve in direction of the reverse gear wheel.
Adjust guide sleeve to be without play with circlip (11).
Circlips are available from Parts in different thicknesses from 1.7 to 2.0 mm (0.067 to 0.079").
Install circlip (11).

Install needle bearing, 1st gear wheel and synchromesh ring.
Slide guide and operating sleeves on splines of the output shaft.

Shouldered Operating Sleeve Version:
Shouldered end faces 2nd gear wheel.

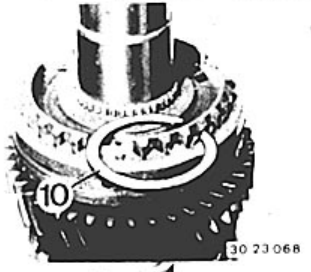
Version with Identification Groove:
Groove faces 1st gear wheel.

* See Specifications



Press on guide sleeve to fit tight with Special Tool 23 1 290.
Pressing-on force*.

Important!
Make sure that tabs on the synchromesh ring are aligned with openings in the guide sleeve while pressing on.



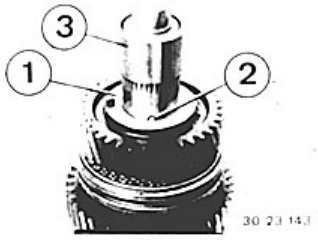
Shift operating sleeve in direction of the 1st gear wheel.
Adjust guide sleeve to be without play.
Circlips are available from Parts in different thicknesses from 1.7 to 2.0 mm (0.067 to 0.079").
Install circlip (10).

Install needle bearing, synchromesh ring and 2nd gear wheel.

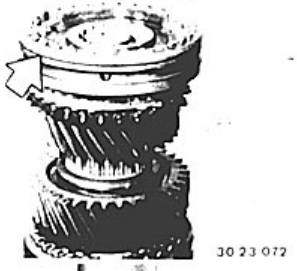
Important!
Collar for the bearing sleeve on the output shaft must protrude slightly.
If necessary, check circlip (10) for correct seating.

Heat bearing sleeve to about 80° C (175° F) with a hot air blower and install on the output shaft.

* See Specifications

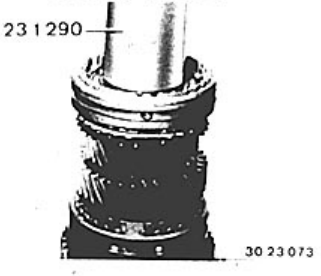


Version with Thrust Washer:
Install thrust washer (1) and ball (2).
Heat bearing sleeve (3) without collar to about 80° C (175° F) with a hot air blower and install on the output shaft.



Install needle bearing, 3rd gear wheel and synchromesh ring.
Install guide and operating sleeves on the splines with the groove facing the 4th gear wheel.

Version with 2 Identification Grooves:
Grooves face the 3rd gear wheel.



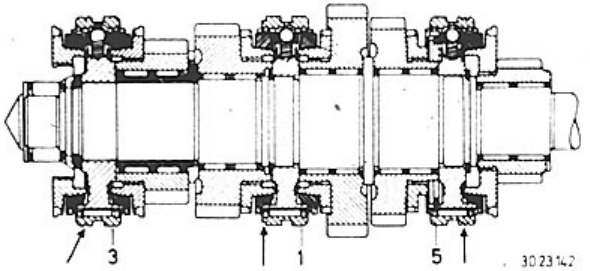
Press on guide sleeve to fit tight with Special Tool 23 1 290.

Important!
Make sure that tabs on synchromesh ring are aligned with openings in the guide sleeve while pressing on.

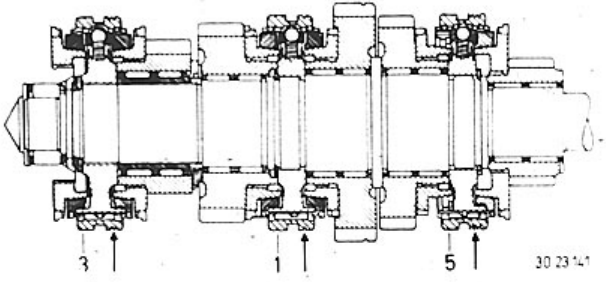
Install spacer and circlip.

Pressing-on force*.

* See Specifications

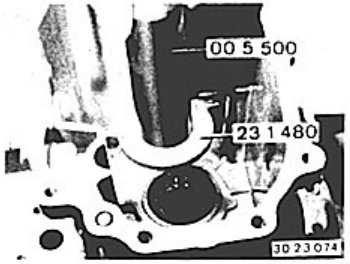


Identification and Installed Location of Operating Sleeves:
Date of introduction: 8.85
Operating sleeve (1) for 1st/2nd gears.
Operating sleeve installed with shouldered end facing 2nd gear wheel.
Operating sleeve (3) for 3rd/4th gears with one identification groove.
Operating sleeve installed with groove facing 4th gear wheel.
Operating sleeve (5) for 5th/reverse gears with two identification grooves.
Operating sleeve installed with grooves facing 5th gear wheel.



Important!
Modified synchronization since 11.87 with new gear wheels, synchromesh rings, guide and operating sleeves, guides, ball and springs.
Identification and Installed Location of Operating Sleeves:
Operating sleeve (1) for 1st/2nd gears with one identification groove.
Operating sleeve installed with groove facing 1st gear wheel.
Operating sleeve (3) for 3rd/4th gears with two identification grooves.
Operating sleeve installed with grooves facing 3rd gear wheel.
Operating sleeve (5) for 5th/reverse gears with three identification grooves.
Operating sleeve installed with grooves facing 5th gear wheel.

Important!
Modified shift components may not be installed in older transmissions (shifting problems).



23 21 703 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Transmission Removed –

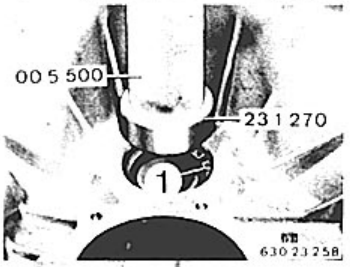
Remove input/output shaft assembly – see 23 21 503.

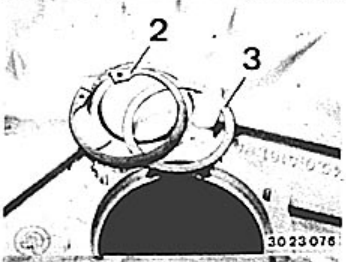
A) Input Shaft, Layshaft in Case Front Section

Input Shaft:
Drive out grooved ball bearing with Special Tools 23 1 480 and 00 5 500.

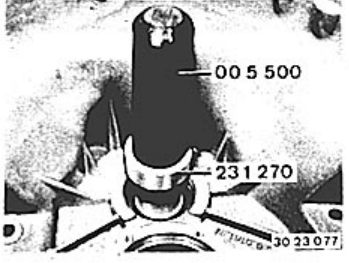
Important!
Collar is on clutch end.

Layshaft:
Loosen circlip (1) with a single knock from Special Tool 23 1 270 used in conjunction with Special Tool 00 5 500.

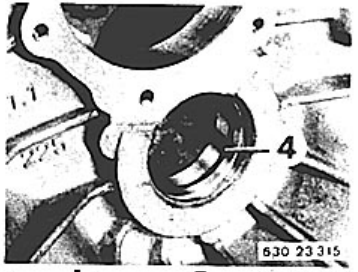




Lift out circlip (2).
Remove spacer (3).



Drive out bearing shell toward the inside with Special Tools 23 1 270 and 00 5 500.



Version with O-ring:
Lift out O-ring (4) with a feeler gage blade.

Installation:
Replace and insert new O-ring coated with engine oil in groove prior to installation of the bearing shell.

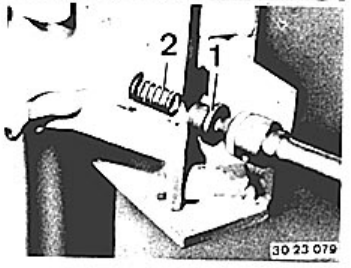
B) Output Shaft, Layshaft in Case Rear Section

Output Shaft:
Unscrew bolt (1).

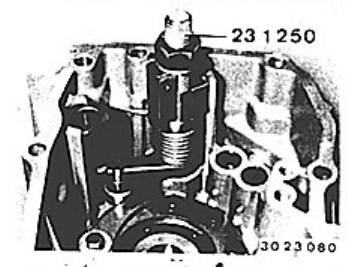
Caution!
Spring pressure.

Remove spring (2).

Installation:
Install bolt with a bolt cement**.

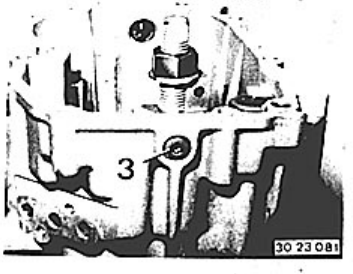


Install Special Tool 23 1 250 for removal of the selector arm.



Remove socket head screw (3).

Installation:
Install screw with a bolt cement**.
Tightening torque*.



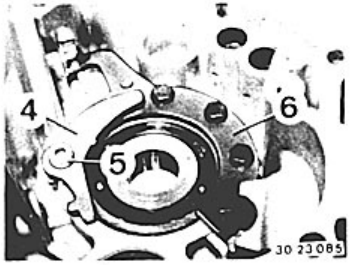
* See Specifications
** Source of Supply: HWB

Remove selector arm from above.

Important!
Roller.

Installation:
Install spring (2).
Insert selector arm with Special Tool 23 1 250.
Swing out selector arm with the roller over locking lever (4).

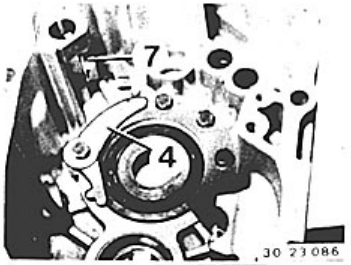
Move end of spring (3) over the raised point into installed position.
Press down on the selector arm in this position (do not knock down).
Install the socket head screw with a bolt cement** and tighten with correct torque* before removing the special tool.



Unscrew bolt.
Take off locking lever (4) and spacer (5).
Remove bearing holder (6).

Installation:
Install bolt with a large washer.

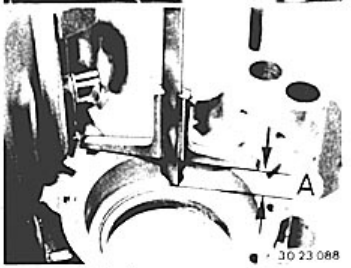
* See Specifications
** Source of Supply: HWB



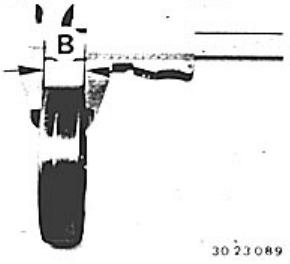
Installation:
Check the installed position of locking lever (4) and thrust pin (7).

Lift out radial oil seal.
Drive out grooved ball bearing with Special Tools 23 1 120 and 00 5 500.

Important!
Shim X.



Determine thickness of shim X.
Measure distance (A).

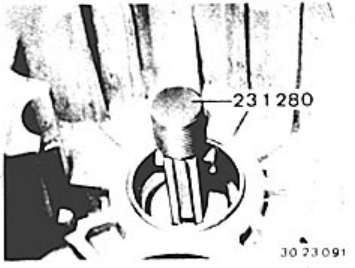


Measure distance (B).

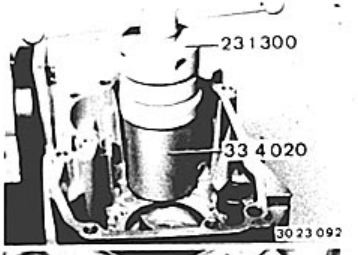
Example:

	A =	17.5 mm (0.689")
–	B =	17.0 mm (0.669")
	X =	0.5 mm (0.020") thick shim

Heat rear case section in area of the grooved ball bearing to about 80° C (175° F).
Install shim X.
Install grooved ball bearing.
Closed cage faces in.
If necessary, drive in against the stop with Special Tool 24 1 060.

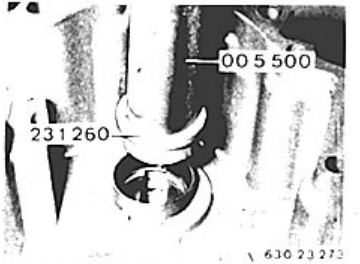


Layshaft:
Apply the stronger end of Special Tool 23 1 280 in the bearing shell.
If applicable, remove the turning lock on the side of the drain plug.

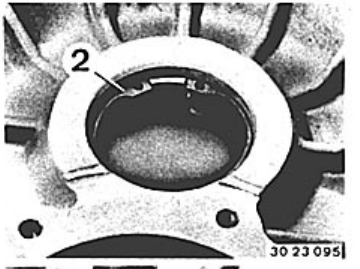


Apply Special Tool 33 4 020.
Screw on Special Tool 23 1 300.
Pull out bearing shell.

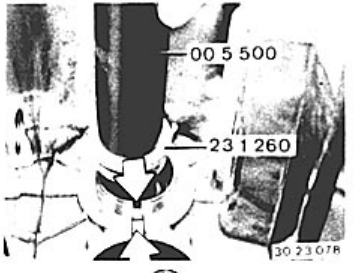
Installation:
Install bearing shell that the slot in the bearing shell is aligned with the bead (turning lock) in the case.



Drive in bearing shell with Special Tools 23 1 260 and 00 5 500.

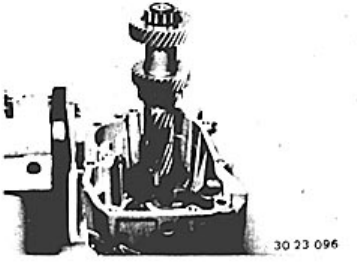


Determining Axial Play of Layshaft:
Install circlip (2).



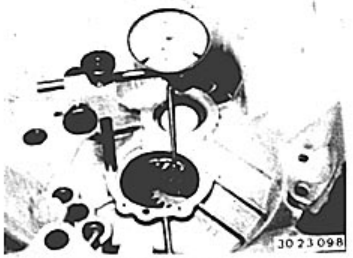
Install old shims.
Drive in bearing shell to fit tight in the front case section with Special Tools 23 1 260 and 00 5 500.

Important!
The oil groove must be aligned with the groove in the case.

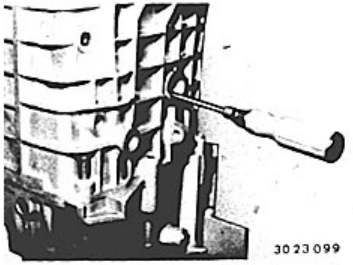


Place layshaft with roller bearings in the rear case section.

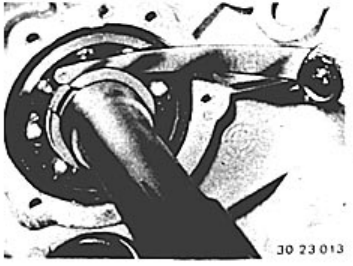
Mount front case section and secure with two bolts opposite each other.
Center front case section slightly with dowel pins.
Unscrew oil filler plug (1).



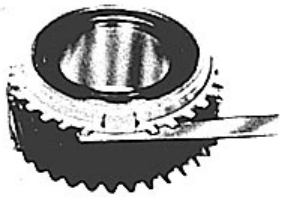
Mount holder with dial gage.
Dial gage must bear on tooth of the layshaft.



Check axial play of the layshaft through the bore for the oil filler plug.
Axial play: 0.13 to 0.23 mm (0.005 to 0.009").
Correct when necessary by removing the bearing shell and replacing the shim with a thicker one.



Install gear wheel set.
Determine thickness of shim for the input shaft.
Install old shim and circlip.
Reduce play to 0 ... 0.09 mm (0 to 0.0035").
Determine thickness of shim for the guide sleeve – see 23 11 623.



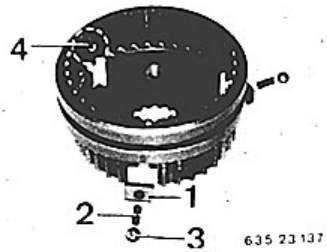
30 23 101

23 23 505 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION
- Output Shaft Removed -

Disassemble output shaft - see 23 21 554.

Note:
Only use molybdenum coated synchromesh rings for repairs.
Check distance* between synchromesh ring and clutch body.
Measure in area of stops.

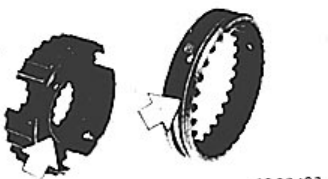
Note:
Twist and press down on synchromesh ring while measuring.
Synchromesh rings should bear on the entire surface uniformly.



635 23 137

Disassemble synchronizer.
Thrust piece (1), spring (2) and ball (3).

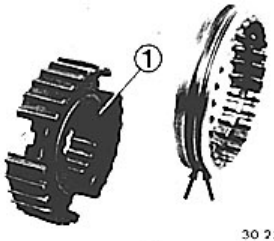
Installation:
Bores (4) or flattened teeth on the operating sleeve must be aligned with ball (3).



30 23 103

Important!
Only for 3rd/4th Gear Synchronization:

Version with One Groove:
Groove of operating sleeve must be on end with the narrow collar.



30 23 144

Version with Two Grooves:
Grooves of operating sleeve must be on end with the wide collar (1).

30 23 104

Install all springs, thrust pieces and balls.

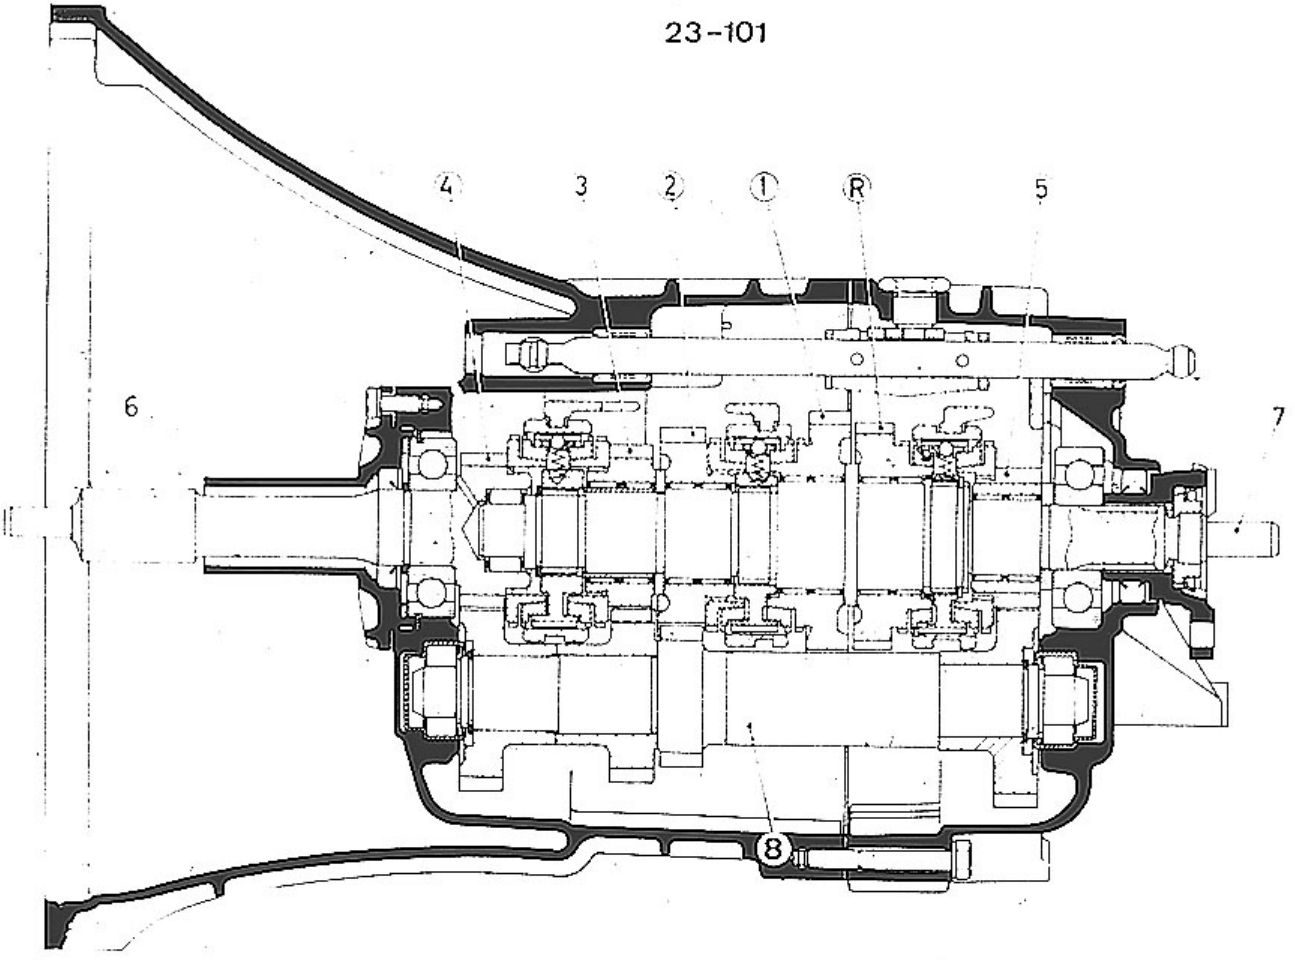
Important!
Shouldered end of thrust pieces faces the operating sleeve.
Insert guide sleeve in operating sleeve to half its length.
Press in balls far enough, until the guide sleeve can be pressed into the operating sleeve.

* See Specifications

Construction group 23 Manual transmission

ZF – S5 – 16 Manual transmission (overdrive)

	Drawing – transmission	23- 101
	Drawing – shift components	23- 102
23 11 014	Transmission case front section – remove and install/seal	23- 103
624	Guide sleeve for clutch release – remove and install	23- 106
23 12 504	Radial oil seal for input shaft – replace	23- 108
23 21 504	Input and output shaft assembly – remove and install	23- 109
555	Output shaft – replace	23- 113
704	Bearings of all transmission shafts – replace	23- 118
23 23 506	Synchronization – disassemble and assemble	23- 120



ASSEMBLY DRAWING OF ZF – S5 – 16 FIVE SPEED OVERDRIVE MANUAL TRANSMISSION

1 First gear
2 Second gear
3 Third gear

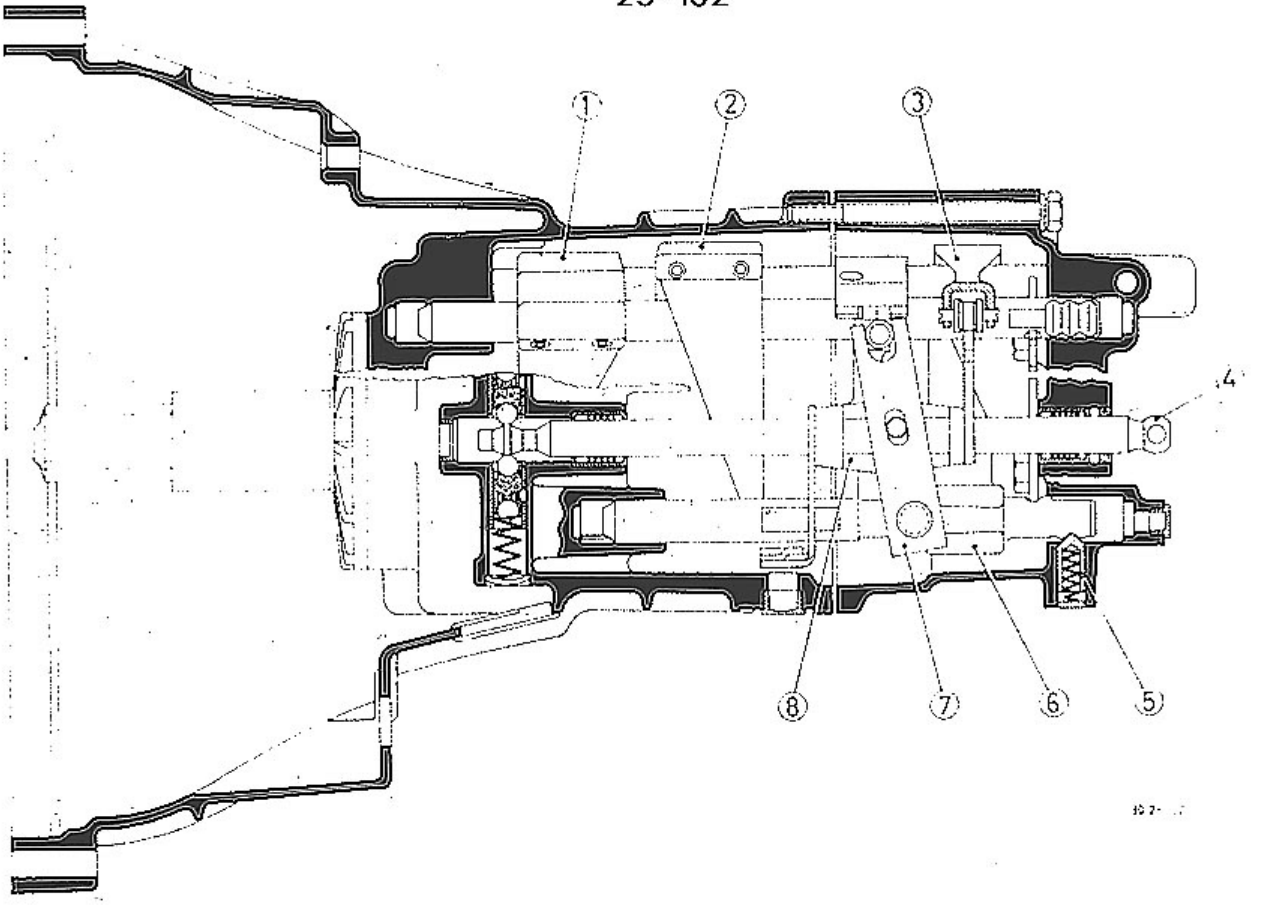
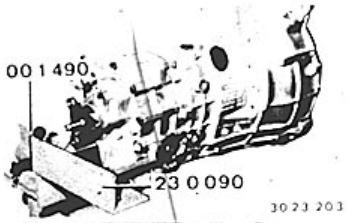
5 Fifth gear
R Reverse gear
6 Input shaft
7 Output shaft
8 Layshaft



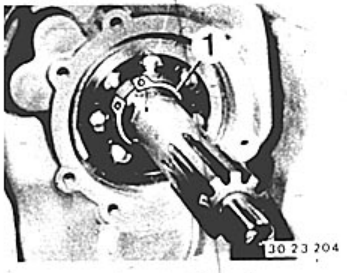
ASSEMBLY DRAWING OF SHIFT PARTS FOR ZF – S5 – 16 FIVE SPEED OVERDRIVE MANUAL TRANSMISSION

1 Selector fork – 3rd/4th gear
2 Selector fork – 1st/2nd gear
3 Leaf spring
4 Selector shaft
5 Stop pin
6 Selector fork – reverse/5th gear
7 Operating lever
8 Selector arm

23 11 014 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE FRONT SECTION

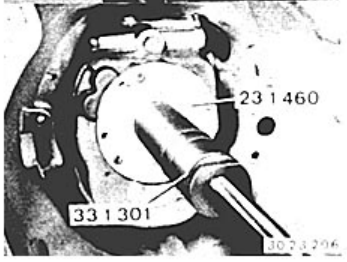


Remove transmission – see pertinent model repair manual microfiche since 1985 models – 23 00 022.
Mount Special Tool 23 0 090 on Special Tool 00 1 490.
Mount transmission on special tool assembly.
Drain oil.

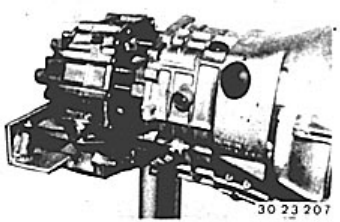


Remove guide sleeve 23 11 624.
Lift out circlip (1).

Unscrew backup light switch.
Drive back cylindrical pins.
Unscrew bolts.



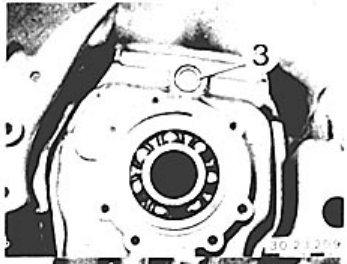
Pull off case front section with Special Tools 23 1 460 and 33 1 301.



Pull off case front section.

Installation
Replace gasket.
Remove old gasket with adhesive remover**

Important!
Installation
Magnet (2) in case rear section.
Clean magnet.

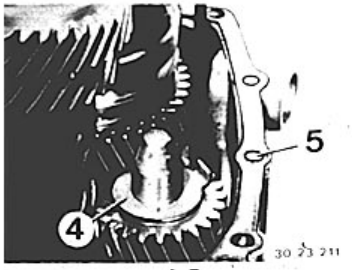


Drive out end cap (3).

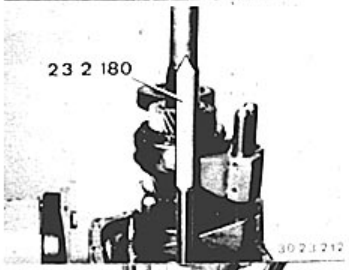
Installation
Replace end cap and insert with sealing compound**.

Drive out grooved ball bearing in direction of clutch housing.

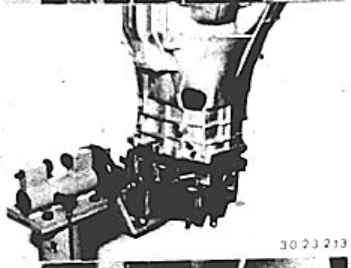
** Source: HWB



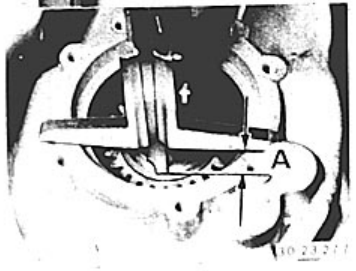
Hold thrust washer (4) on the reverse gear shaft with grease that the angle faces bore (5) in the rear case section.
New version without angle.
Install gasket with grease.



Apply Special Tool 23 2 180 on the shift shaft.

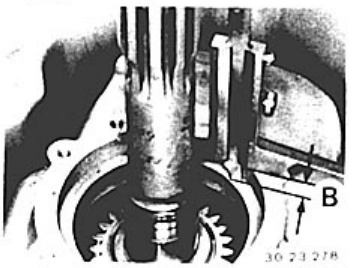


Mount front case section and bolt on rear case section.
Tightening torque*.
Remove Special Tool 23 2 180.
Install end cover for shift shaft.



The axial play of the input shaft has to be adjusted after replacing the case or bearings.
Input shaft must bear on the synchro-mesh ring.
Measure distance (A) from sealing surface of the guide sleeve to the input shaft.

* See Specifications



Measure distance (B) from sealing surface of the guide sleeve to bearing surface of the snap ring.

Important!
If a shim is found between the snap ring and case while removing the bearing, it must be installed again for measuring.

Measure distance (C) from bearing outer race to the snap ring.

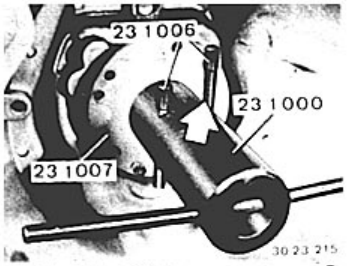
Note:
Snap ring must be pressed firmly in the groove for measuring.

Example:

A	25.5 mm (1.004")
– B	10.3 mm (0.406")
	15.2 mm (0.598")
– C	14.0 mm (0.551")
	01.2 mm (0.047")

Axial play required: 1.1 to 1.3 mm (0.043 to 0.051").
Snap rings are available from Parts in different thicknesses for corrections.

Heat grooved ball bearing inner race and front case section in area of bearing to about 80° C (175° F) with a hot air blower and slide grooved ball bearing on the input shaft as far as possible.

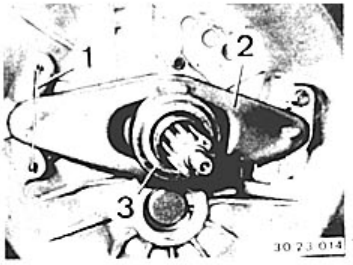


Press grooved ball bearing on to drive shaft or into front case section with Special Tool 23 1 007 used together with Special Tools 23 1 000 and 23 1 006.

Important!
Apply Special Tools 23 1 006 in such a manner that the flat side faces the drive shaft.

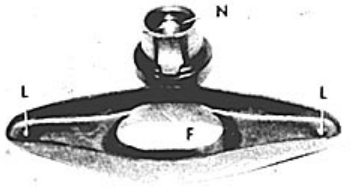
Drive on grooved ball bearing further and further simultaneously with light knocks from a hammer.
Install circlip and reverse gear switch.

Note:
Coat operating pin of the reverse gear switch with oil.

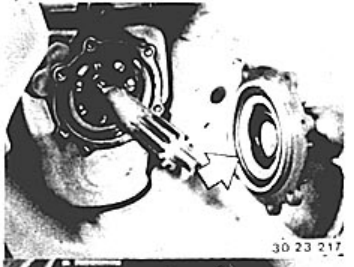


23 11 624 REMOVING AND INSTALLING GUIDE SLEEVE FOR CLUTCH RELEASE
–TRANSMISSION REMOVED–

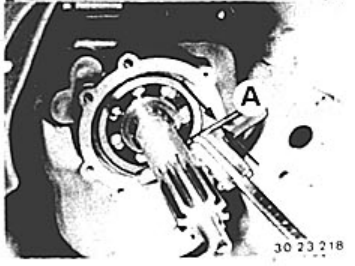
Lift out spring (1) and remove release lever (2) with thrust bearing (3).



Installation:
Pack lubricating groove N with Molykote Longterm 2.
Coat guides F and bearings L with Molykote Longterm 2.
Non-conformance could cause release bearing to seize on guide sleeve.

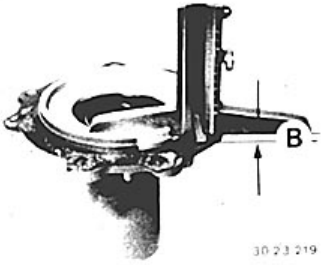


Detach guide sleeve.
Important!
Spacer.
Installation:
Replace gasket.
Remove old gasket with adhesive remover**.



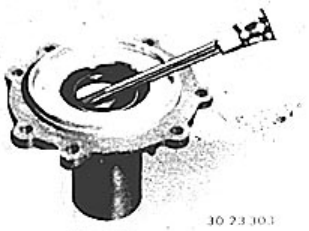
Installation:
Adjust play to 0 ... 0.09 mm (0 ... 0.0035").
Determine thickness of spacer.
Measure distance (A) from sealing surface to bearing outer race.

** Source: HWB



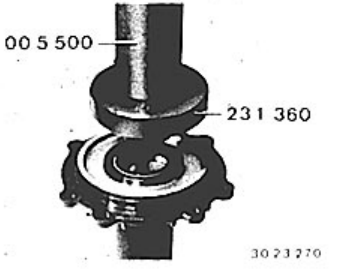
Measure distance (B) from inside surface to sealing surface through opening in guide sleeve, with gasket installed.
Example:

A	5.2 mm (0.205")
– B	3.2 mm (0.126")
	2.0 mm (0.079") spaoer thickness

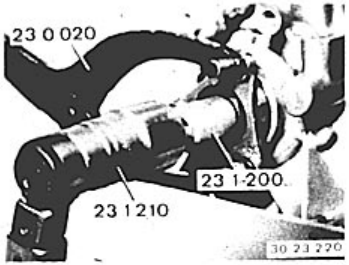


23 12 504 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT
- Transmission Removed -

Remove guide sleeve - see 23 11 624.
Lift out radial oil seal.



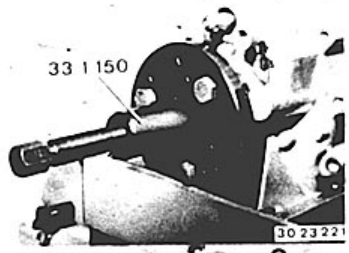
Drive in new radial oil seal with Special Tools 23 1 360 and 00 5 500.
Lubricate sealing lip with oil.



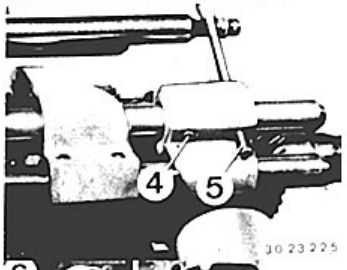
23 21 504 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY
- Transmission Removed -

Remove front case section - see 23 11 014.
Lift out lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.

Pull out three catch pins with a circlip pliers as far as possible.
Catch pins can only be pulled out completely after removal of the lock.



Pull off output flange with Special Tool 33 1 150.



Drive pins (4 and 5) out of the 3rd/4th gear shift fork while counterholding.
New Version:
* pin.

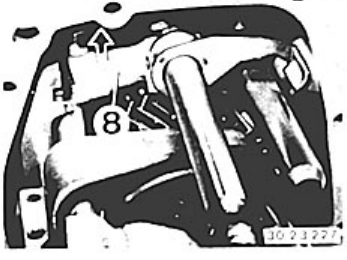
Remove end plugs (1 ... 3).

Caution!
Spring force.

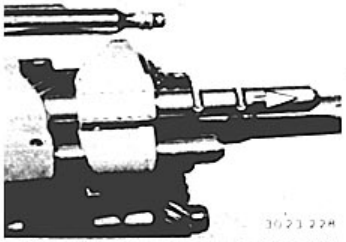
Installation:
Replace end plugs.

Push back leaf spring (6) for reverse gear with Special Tool 23 2 170 far enough, until shift finger (7) is accessible.
It must be possible to turn the shift shaft back and forth easily.

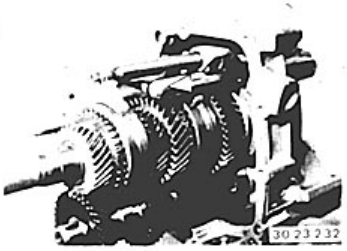
Remove three springs.



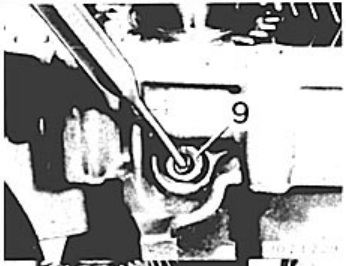
Swing shift finger (8) out of groove in the shift rod.



Pull out 3rd/4th gear shift rod.

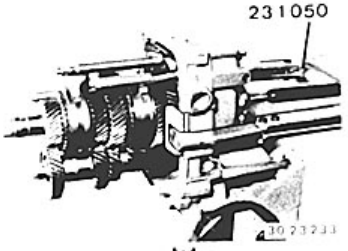


Important!
Engage reverse gear by sliding the operating sleeve forward before pressing out the gear wheel set.

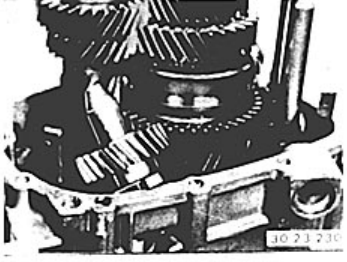


If applicable, remove lock in hexagon socket of bolt.
Unscrew bolt (9).

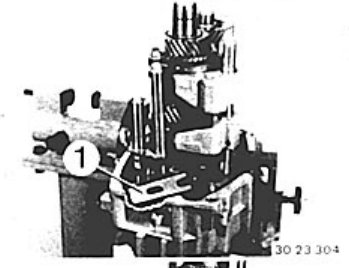
Important!
Seal between case and bolt.



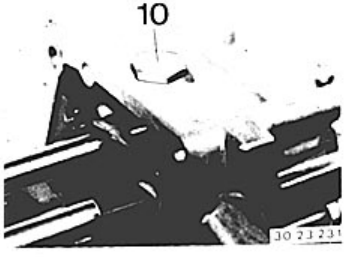
Press input shaft, output shaft and layshaft out of rear case section with Special Tool 23 1 050.
Important!
Use a piece of wood, aluminum or something similar between claws and sealing surface to avoid damaging the sealing surface.
Important!
Make sure that shift rods and layshaft do not clamp while pressing out. Layshaft must not fall down in this step.
Installation:
Check condition of all bearings, replacing if necessary.



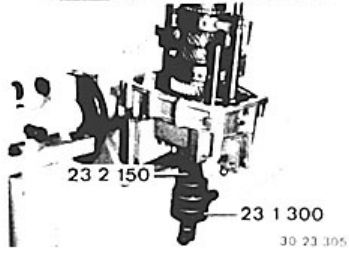
Remove reverse gear shaft, reverse gear wheel with needle bearing and thrust washer.



<u>Installing:</u>
Reverse gear is engaged.
Install input and output shafts with shift rod for 1st/2nd gears, 3rd/4th gear shift fork, shift rod for 5th/reverse gears, shift shaft and layshaft in rear case section.
Important!
Check installed position of operating lever (1).

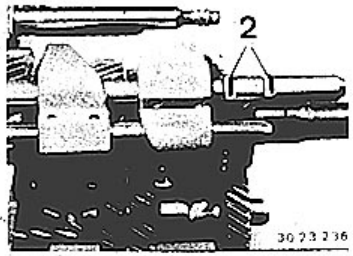


Remove bolt (10) for operating lever.

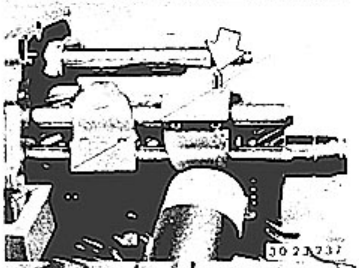


Pull input shaft, output shaft and layshaft into rear case section with Special Tools 23 1 300 and 23 2 150.

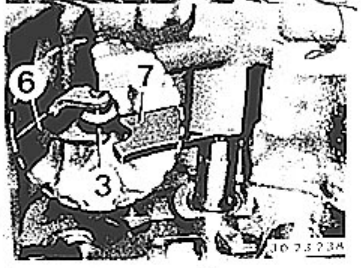
Important!
Make sure that shift rods, shift shaft and layshaft do not clamp while pulling in.



Take out reverse gear.
Slide in 3rd/4th gear shift rod with openings (2) facing up.
New version: one opening.

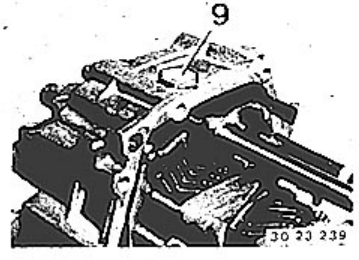


Drive in pins for 3rd/4th gear shift fork while counterholding.
New version: 1 pin.



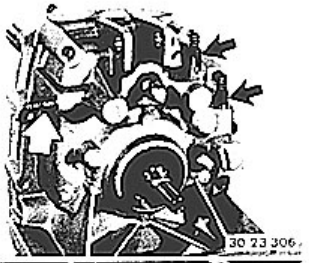
Remove Special Tool 23 2 170 for the leaf spring.

Important!
Roller (3) on leaf spring (6) must engage in the shift finger (7).

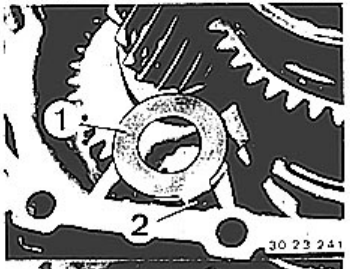


Install bolt (9) for operating lever.
Tip of bolt must engage in bore in operating lever.
Tightening torque*.

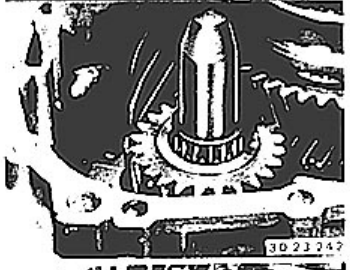
* See Specifications



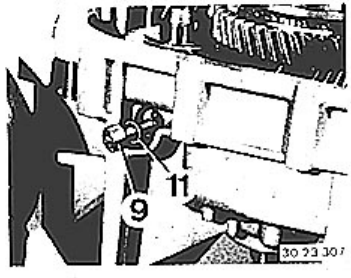
Insert three catch pins with springs in case.
Install new end plugs approx. 0.5 mm (0.020") below the case edge and punch lock slightly.



Install thrust washer (1) with angle (2) in upper opening on the case.
New version: without angle.

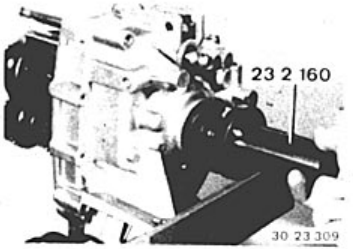


Install reverse gear wheel with long collar facing case, two needle bearings and shaft.

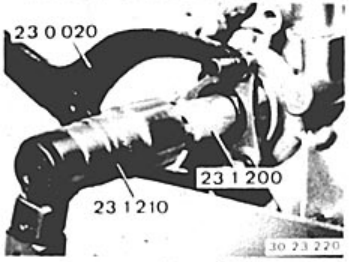


Install seal (11) on bolt.
Tighten bolt (9) to correct torque* and install new locking cap.

* See Specifications



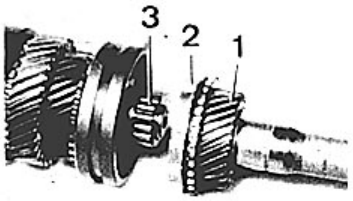
Drive in radial oil seal flush with Special Tool 23 2 160.
Lubricate sealing lip with oil.



Insert or knock on output flange.
Install collar nut with a bolt cement**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.

Install and lock lockplate in the groove.

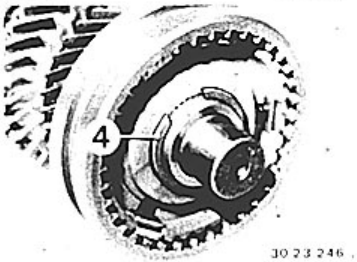
* See Specifications
** Source of Supply: HWB



23 21 555 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

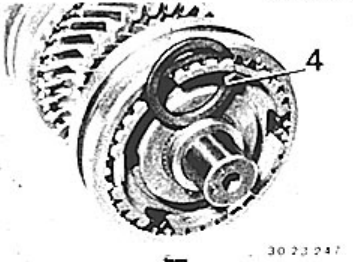
Pull off input shaft (1), brass synchromesh ring (2) and needle bearing (3).

Note:
To avoid mixing up synchromesh rings while disassembling the output shaft, it is recommended to mark synchromesh rings for pertinent gear wheels.

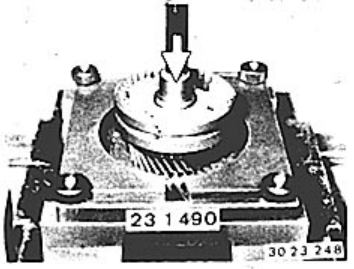


Lift out circlip (4).

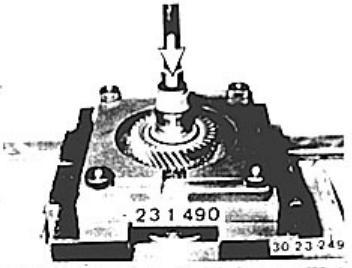
Installation:
Always replace the circlip.



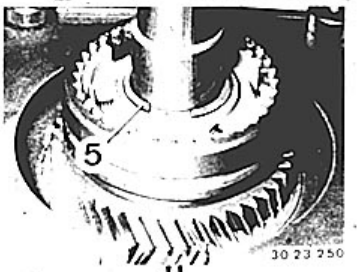
Installation:
Remove guide sleeve play with circlip (4).
Circlips are available in different thicknesses from Parts.



Press 3rd gear wheel, guide and operating sleeves off of the output shaft with Special Tool 23 1 490.
Take off needle bearing.

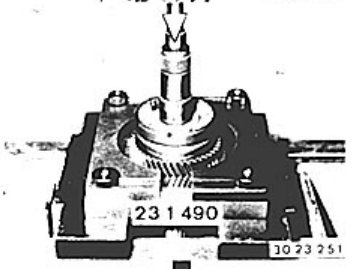


Press bearing sleeve, thrust washer and 2nd gear wheel off of the output shaft with Special Tool 23 1 490.
Take off needle bearing and sintered metal synchromesh ring.

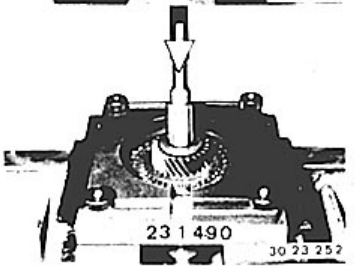


Important!
Circlip (5) must be removed before pressing off the 1st gear wheel.

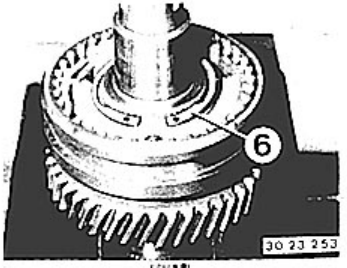
Installation:
Always replace the circlip.



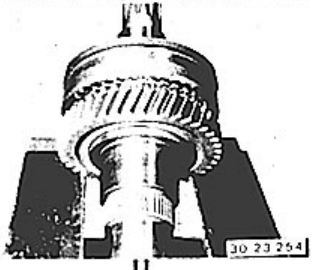
Press 1st gear wheel, guide and operating sleeves off of the output shaft with Special Tool 23 1 490.
Take off needle bearing.



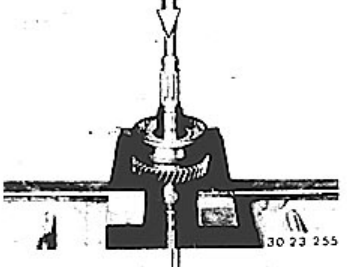
Press thrust washer and 5th gear wheel off of the output shaft with Special Tool 23 1 490.
Take off brass synchromesh ring and needle bearing.



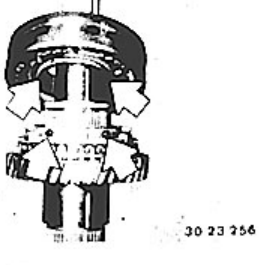
Important!
Circlip (6) must be removed before pressing off reverse gear.
Installation
Always replace circlip.



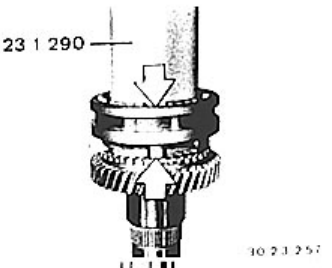
Install output shaft next to collar.



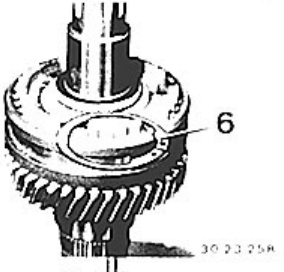
Press guide sleeve with sliding sleeve and reverse gear off of output shaft.
Remove needle bearing.
Only for version with reverse gear synchronization:
Brass synchromesh ring with 6 balls.



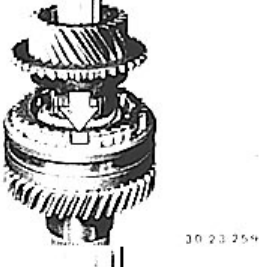
Assembling:
Install needle bearing, reverse gear and brass synchromesh ring with 6 grease held balls (only for version with reverse gear synchronization).
Install guide and sliding sleeve with narrow collar facing reverse gear.



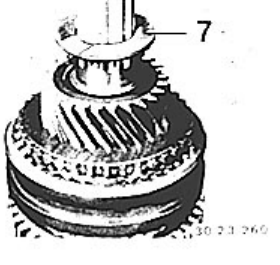
Press on guide sleeve to fit tight with Special Tool 23 1 290.
Important!
Make sure that short tabs of synchromesh ring are aligned with groove in pressure pieces when pressing on guide sleeve.



Move sliding sleeve in reverse gear direction.
Adjust guide sleeve with circlip (6) to take up all play.
Circlips are available from Parts in different thicknesses.
Install circlip (6).



Install brass synchromesh ring with short tabs of synchromesh ring in groove of pressure pieces.
Install needle bearing and 5th gear.

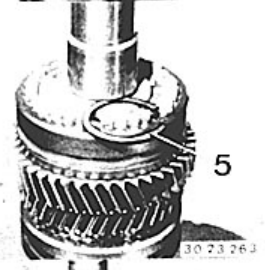


Heat thrust washer (7) to approx. 80° C (175°F) with a hot air blower and install on output shaft.

Install needle bearing, 1st gear wheel and sintered metal synchromesh ring.
Install guide and operating sleeves with the narrow collar facing the 1st gear wheel.

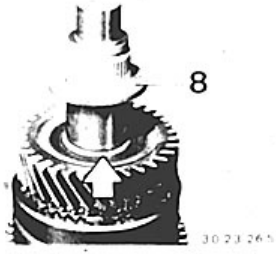
Press on guide sleeve to fit tight with Special Tool 23 1 290.

Important!
Make sure that short tabs of synchromesh ring are aligned with groove in thrust pieces while pressing on.



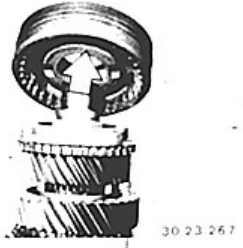
Shift operating sleeve in direction of the 1st gear wheel.
Adjust guide sleeve to be without play.
Circlips are available from Parts in different thicknesses.
Install circlip (5).

Install sintered metal synchromesh ring with its short tabs in the groove of thrust pieces.
Install needle bearing and 2nd gear wheel.



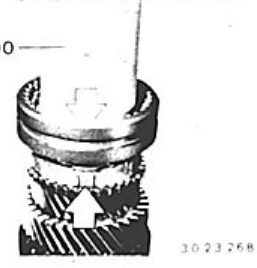
Important!
Collar for the thrust washer on the output shaft must protrude slightly.
If necessary, check circlip (5) for correct seating.
Heat thrust washer (8) to about 80° C (175° F) with a how air blower and install on the output shaft.

Heat bearing sleeve (9) to about 80° C (175° F) with a hot air blower and install on the output shaft.



Install needle bearing, 3rd gear wheel and brass synchromesh ring.
Install guide and operating sleeves with the long collar facing the 3rd gear wheel.

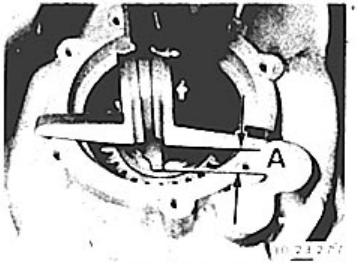
Note:
Version with Identification Groove:
Groove faces the 3rd gear wheel.



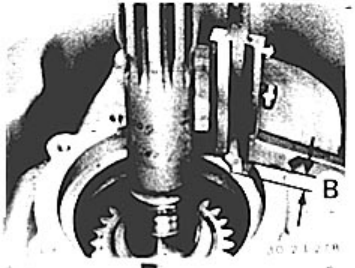
Press on guide sleeve to fit tight with Special Tool 23 1 290.

Important!
Make sure that short tabs on synchromesh ring are aligned with groove in thrust pieces while pressing on.

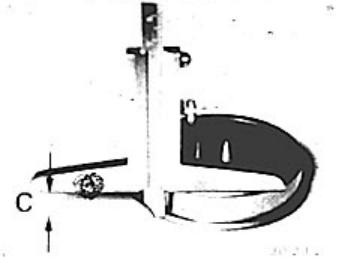
Install circlip.



Adjust axial play of input shaft.
Output shaft and case front section installed.
Input shaft must rest on synchromesh ring.
Measure distance (A) from guide sleeve sealing surface to input shaft.



Measure distance (B) from guide sleeve sealing surface to circlip bearing surface.
Important!
If a spacer had been found between the circlip and case while removing the bearing, it must be installed again for measuring.



Measure distance (C) from bearing outer race to circlip.
Note
Circlip must be pressed tight in groove for measuring.
Example:

A	25.5 mm (1.003")
– B	10.3 mm (0.405")
	15.2 mm (0.598")
– C	14.0 mm (0.551")
	1.2 mm (0.047")

Axial play required: 1.1 to 1.3 mm (0.043 to 0.051").
Circlips are available from Parts in different thicknesses for making corrections.
Install grooved ball bearing – see 23 11 014.

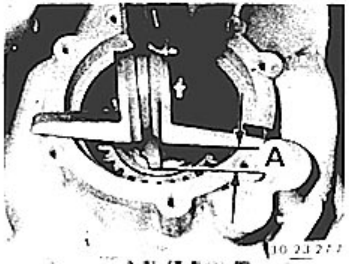
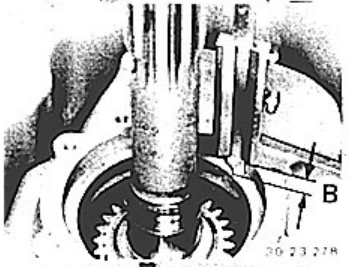
23 21 704 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS –TRANSMISSION REMOVED–

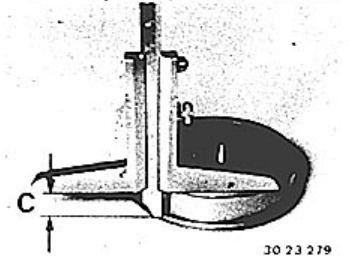
Remove transmission case front section 23 11 014.
A) Input Shaft, Layshaft in Case Front Section:
Input Shaft:
Drive out grooved ball bearing in direction of clutch housing.



Adjust axial play of input shaft.
Case front section attached.
Input shaft must be on synchromesh ring.
Measure distance (A) from guide sleeve sealing surface to input shaft.



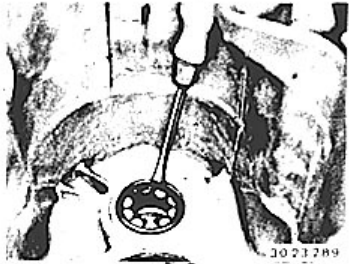
Measure distance (B) from guide sleeve sealing surface to circlip bearing surface.



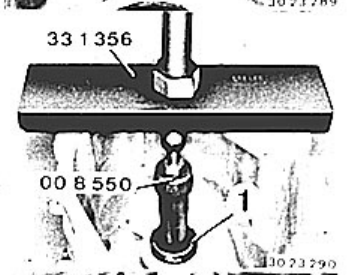
Measure distance (C) from bearing outer race to circlip.
Note:
Circlip must be pressed tight in groove for measuring.
Example:

	A	25.3 mm (0.996")
–	B	10.1 mm (0.398")
		15.2 mm (0.598")
–	C	14.0 mm (0.551")
		1.2 mm (0.047")

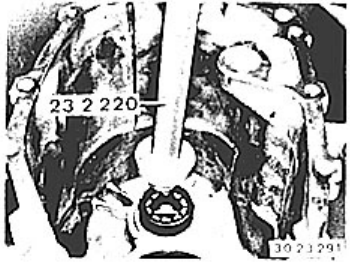
Axial play required: 1.1 to 1.3 mm (0.043 to 0.051").
Different size circlips are available from Parts.



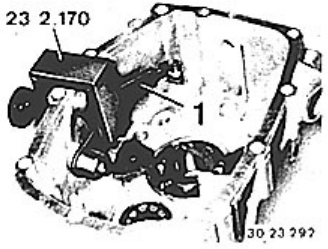
Layshaft:
Destroy roller cage of bearing.
Remove cage with rollers.



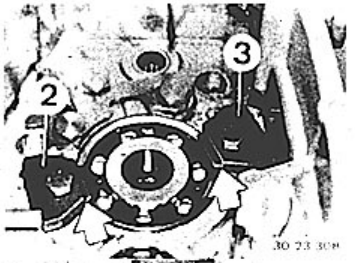
Pull out bearing outer race (1) with Special Tools 00 8 550 (without supports) and 33 1 356.



Heat case front section in area of roller bearing to about 80° C (175° F) with a hot air blower.
Drive in roller bearing with Special Tool 23 2 220.

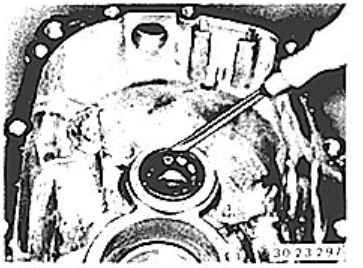


B) Output Shaft, Layshaft in Case Rear Section:
Remove input and output shaft assembly 23 21 504.
Output Shaft:
Remove Special Tool 23 2 170.
Pull off leaf spring (1).

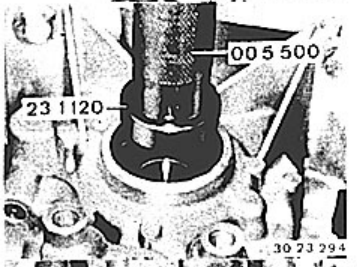


Unscrew bolts.
Take off clamps (2 and 3).

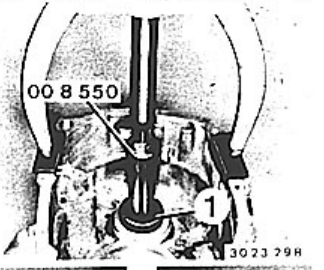
Installation:
Install clamps with curved surface facing the bearing outer race.
Tightening torque*.



Layshaft:
Destroy roller cage of the bearing.
Remove cage with rollers.

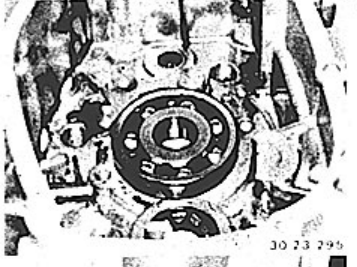


Lift out radial oil seal.
Drive out grooved ball bearing with Special Tools 23 1 120 and 00 5 500.

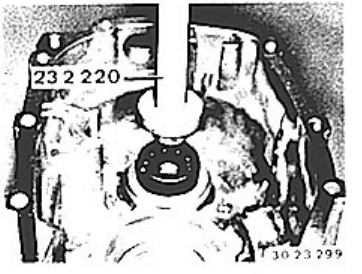


Pull out bearing outer race (1) with Special Tools 00 8 550 and a support.

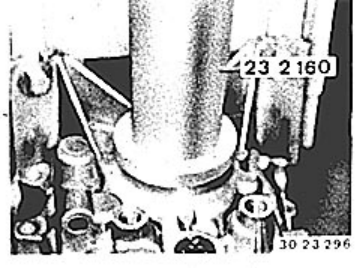
Important!
Use a piece of flat iron or something similar between the support and sealing surface, to avoid damaging the sealing surface.



Heat rear case section in area of the grooved ball bearing to about 80° C (175° F) with a hot air blower.
Install grooved ball bearing.
If applicable, drive in bearing to fit tight with Special Tool 24 1 100.

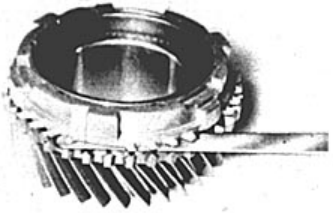


Heat rear case section in area of the roller bearing to about 80° C (175° F) with a hot air blower.
Drive in roller bearing with Special Tool 23 2 220.



Drive in radial oil seal with Special Tool 23 2 160.
Lubricate sealing lip with oil.

* See Specifications

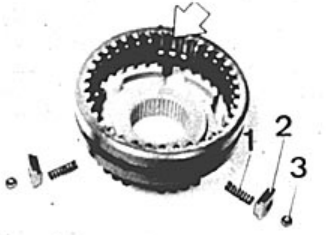


30 23 271

23 23 506 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION
- Output Shaft Removed -

Disassemble output shaft - see 23 21 555.
Check distance* between synchromesh ring and clutch body.
Measure in area of stop.

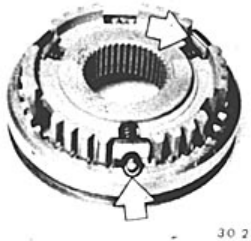
Note:
Twist and press down synchromesh ring for measuring.
Synchromesh rings should bear uniformly on the entire surface.



30 23 272

Disassembling Synchronization:
Press operating sleeve off of guide sleev.
Spring (1), thrust piece (2) and ball (3).

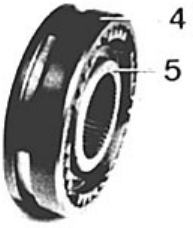
Installation:
Flat teeth of operating sleeve must align with the thrust pieces.



30 23 273

Install all springs, thrust pieces and balls.

Important!
Shouldered end of thrust pieces faces the collar.
Press ball into the operating sleeve one after the other.



30 23 274

1st/2nd Gear Synchronization:
Check installed position of operating sleeve.
Wide surface end (4) of operating sleeve faces thicker collar (5).

30 23 2

5th/Reverse Gear Synchronization:
Check installed position of operating sleeve.
Wide surface end (6) of operating sleeve faces narrow collar (7).

* See Specifications

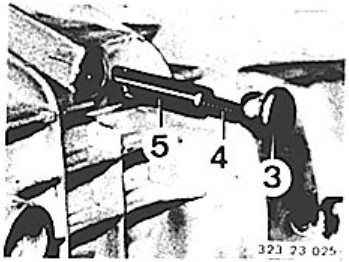
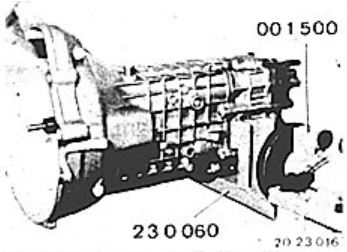
23 11 005 · REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE FRONT SECTION

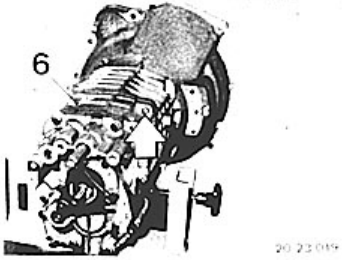
Remove transmission – see pertinent model repair manual microfiche since 1985 models – 23 00 022.
Unscrew brackets for exhaust assembly and rubber mounts.



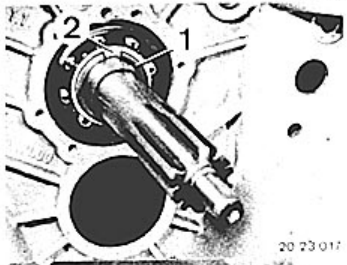
Lift out cover (3).
Remove spring (4) and lockpin (5).
Check installed position.



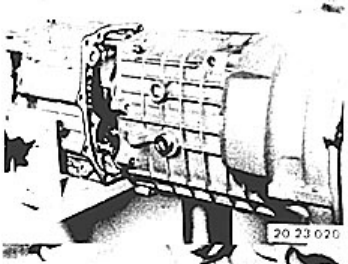
Mount Special Tool 23 0 060 on assembly stand 00 1 490.
Mount transmission on special tool.
Drain oil.



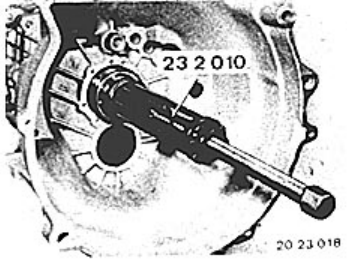
Drive out dowel pins.
Unscrew bolts on cover.
Loosen screw (6).



Remove guide sleeve 23 11 622.
Lift out circlip (1).
Remove spacer (2).
Installation:
Always replace circlip.



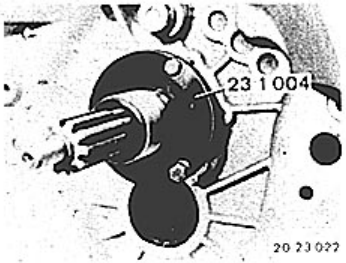
Pull off transmission case.
Installation:
Mount transmission case with a surface sealant**.
Sealing surface must be thoroughly cleaned and dried of oil.



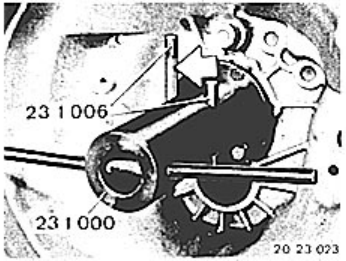
Pull out grooved ball bearing with Special Tool 23 2 020.

Install and bolt transmission case front section.
Tightening torque*.
Heat grooved ball bearing inner race to about 80° C (175° F) with a hot air blower and slide on to input shaft as far as possible.

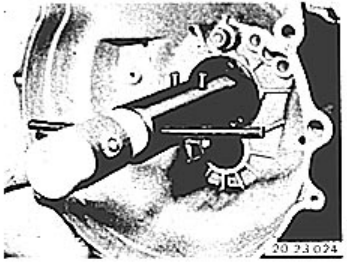
* See Specifications
** Source: HWB



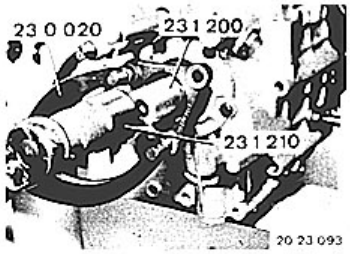
Mount Special Tool 23 1 004 on case with three 6 x 35 mm bolts, but not too tight.



Pull grooved ball bearing into case and on to input shaft with Special Tool 23 1 000 used in conjunction with Special Tools 23 1 006, which are machined flat on one side.
Important!
Insert Special Tools 23 1 006 that flat sides face the input shaft.

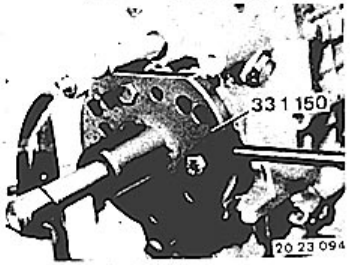


Drive in grooved ball bearing to fit tight by applying light knocks.
Install spacers and circlip.
Install lockpin.

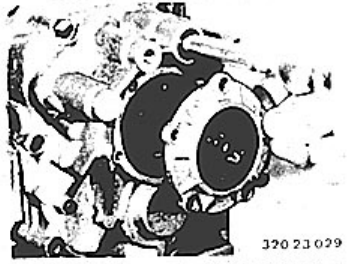


23 11 040 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE REAR SECTION

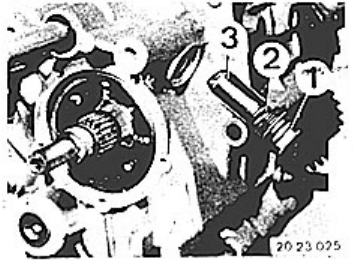
Remove transmission case front section 23 11 005.
Lift off lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew nut with Special Tool 23 1 210.
Installation:
Tightening torque*.
Install collar nut with bolt cement**.



Pull off output flange with Special Tool 33 1 150.

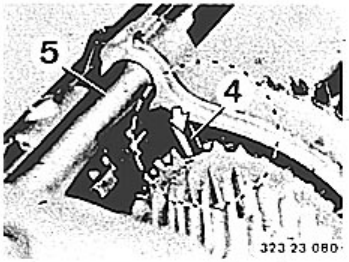


Take off cover.
Important!
Shims.
Installation:
Replace gasket.



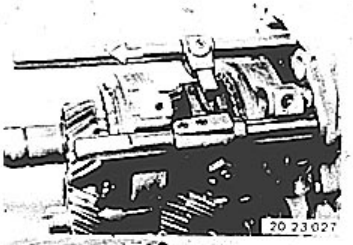
Unscrew plug (1)*.
Pull out spring (2) and lockpin (3).
Installation:
Coat bearing surface of plug (1) with a surface sealant**.

* See Specifications
** Source: HWB

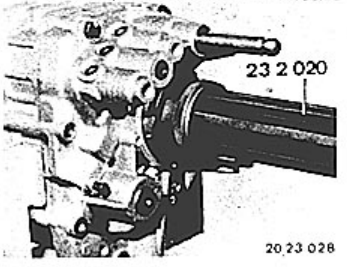


Engage 4th gear.
Turn input shaft until opening in 4th gear aligns with pin.
Drive out pin (4) downward in this position, until selector rod (5) can be pulled out (loose balls).
Important!
Drive pin between tooth flanks of operating sleeve.
Installation:
Replace pin.

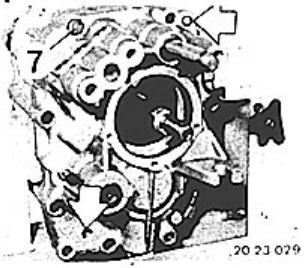
Remove lockwire.
Unscrew bolt (6).
Installation:
Lock bolt with wire.
Pull out 2nd/3rd gear selector rod.



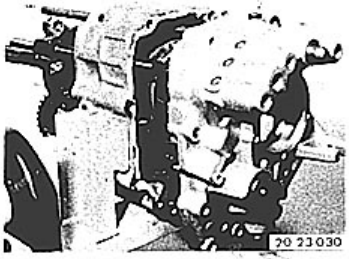
Pull out selector shaft forward as far as possible.



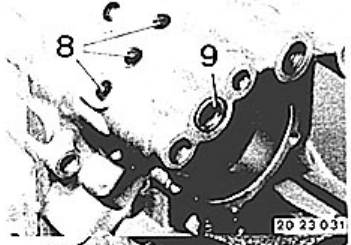
Pull out grooved ball bearing with Special Tool 23 2 020 and the long spindle of Special Tool 23 2 060.



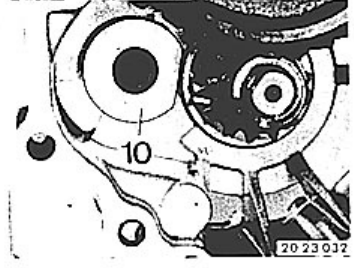
Drive out dowel pins.
Unscrew bolt (7).



Pull off case rear section.
Important!
Spacer between double gear wheel and intermediate case.

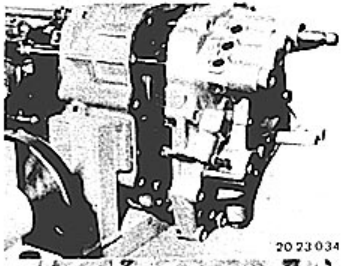


Unscrew backup light switch.
Remove plugs (8 and 9).
Installation:
Replace plugs.



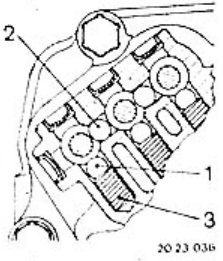
Hold spacer (10) in position with grease.
Check installed position.

Install needle bearing (1), spacer (2), needle bearing (3) and double gear wheel (4) on shaft.



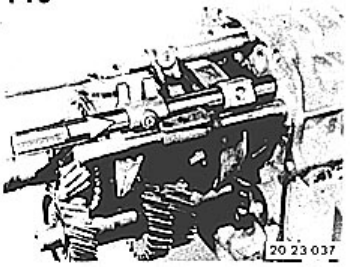
Coat sealing surface with surface sealant*.
Sealing surface must be cleaned thoroughly and dried of oil.
Slide on rear case section up to spring of locking balls.

Insert locking balls and press down.
Slide on and bolt rear case section in this position.



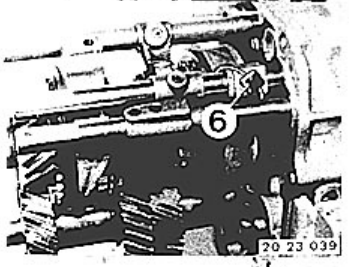
Arrangement of Detent and Locking Balls:
1 Locking ball
2 Detent ball
3 Spring

* Source: HWB

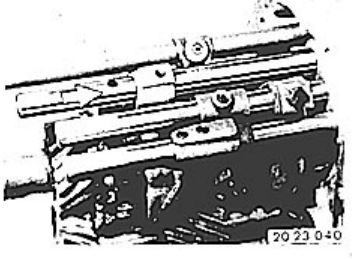


Slide 2nd/3rd gear selector rod into rear case section up to spring.

Insert locking balls.
Insert detent balls and press down.
In this position push selector rod through up to lock.

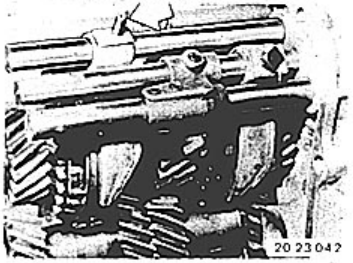


Mount 2nd/3rd gear selector fork with bolt (6) and lock bolt with wire.

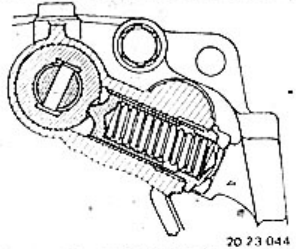


Slide in 4th/5th gear selector rod up to spring on rear case section.

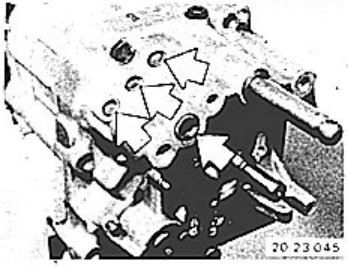
Insert detent balls.
Insert locking balls and press down.
Push 4th/5th gear selector rod through up to lock in this position.



Mount 4th/5th gear selector fork with a 6 x 24 mm pin.

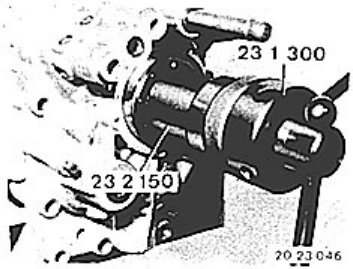


Install lockpin.
Check installed position.
Coat bearing surface of plug with a surface sealant**.
Tightening torque*.

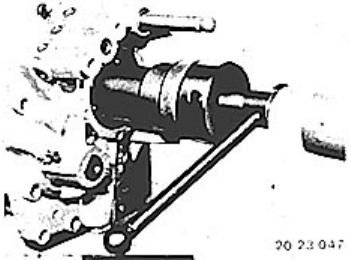


Install all plugs and backup light switch.

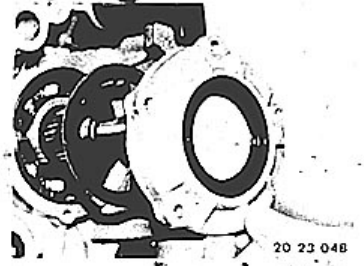
* See Specifications
** Source: HWB



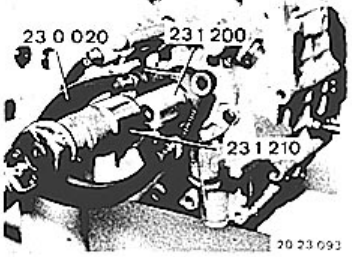
Install and pull grooved ball bearing into rear case section with Special Tools 23 1 300 and 23 2 150.



Drive in grooved ball bearing to fit tight by applying light knocks.

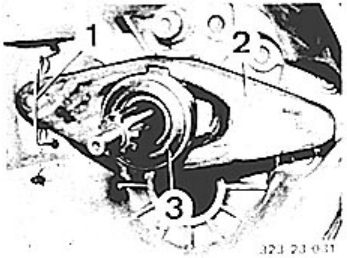


Install gasket.
Insert spacer and mount cover.
Tightening torque*.



Mount output flange.
Install collar nut with bolt cement**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.
Install lockplate.

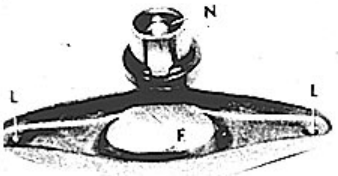
* See Specifications
** Source: HWB



320 23 031

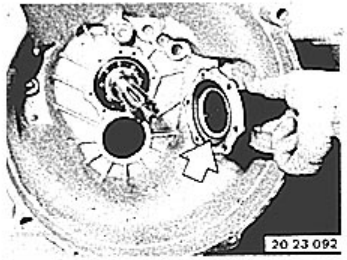
23 11 622 REMOVING AND INSTALLING/ REPLACING CLUTCH RELEASE GUIDE SLEEVE –TRANSMISSION REMOVED–

Lift out spring (1) and remove release lever (2) with thrust bearing (3).



320 23 025

Installation:
Pack lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) with Molykote Longterm 2.
Non-conformance could cause release bearing to seize on guide sleeve.



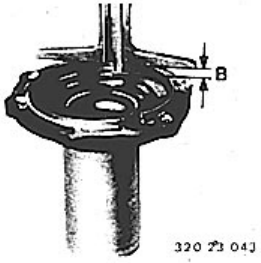
320 23 092

Detach guide sleeve.
Important!
Spacer.
Installation:
Install guide sleeve with surface sealant**.
Sealing surface must be cleaned thoroughly and dried of oil.
Tightening torque*.

320 23 042

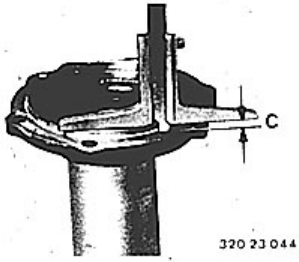
Installation:
If applicable, correct play to 0 ... 0.09 mm (0 ... 0.0035") with a shim.
Determine thickness of shim (spacer).
Measure distance (A) from bearing outer race to case sealing surface.

* See Specifications
** Source: HWB



320 23 043

Measure distance (B) from guide sleeve protrusion to inside surface.



320 23 044

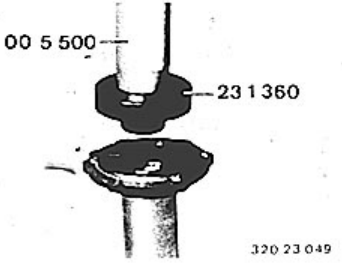
Measure distance (C) from guide sleeve protrusion to outside surface.
Example:

	B	4.0 mm (0.157")
+	A	0.3 mm (0.012")
		4.3 mm (0.169")
–	C	2.8 mm (0.110")
		1.5 mm (0.059") spacer thickness

320 23 048

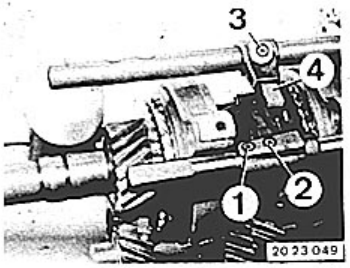
23 12 502 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT –TRANSMISSION REMOVED–

Remove guide sleeve 23 11 622.
Lift out radial oil seal.



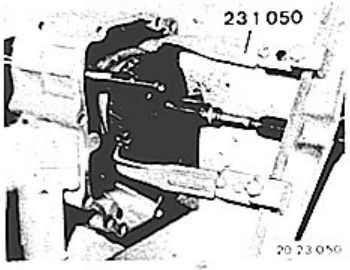
320 23 049

Drive in radial oil seal with Special Tools 23 1 360 and 00 5 500.
Open end faces transmission case.
Lubricate sealing lip with oil.

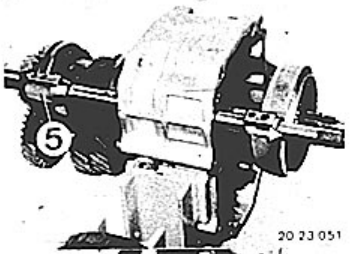


23 21 501 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY – FRONT AND REAR CASE SECTIONS REMOVED

Drive out pins (1 ... 3) while counterholding.
Installation:
Replace pins.
Pull out selector shaft toward rear.
Remove selector arm (4).
Two rollers on selector shaft.

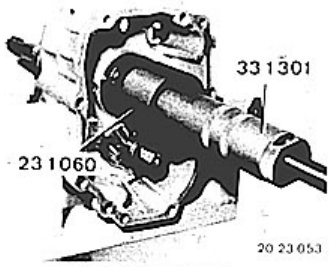


Pull spacer, reverse gear and bearing sleeve off of output shaft with Special Tool 23 1 050.



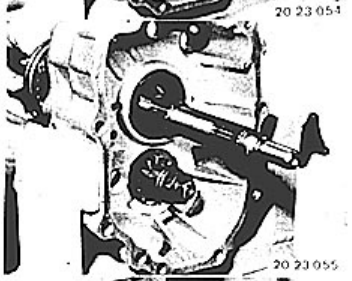
Take off dog (5).
Pull out selector rod with selector fork and guide sleeve toward rear.

Remove synchromesh ring and 1st gear with needle bearing.

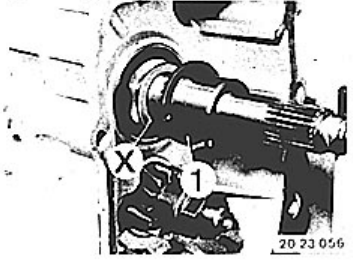


Pull bearing sleeve off of output shaft with Special Tools 23 1 060 and 33 1 301.
Important!
Shim (X).

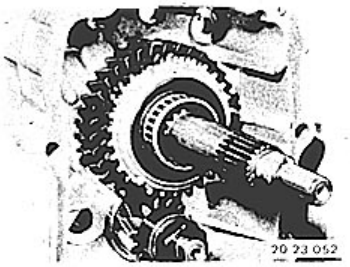
Heat intermediate case in area of layshaft bearing to approx. 80° C (175° F) with a hot air blower.
Pull input shaft/output shaft and layshaft out of intermediate case.
Installation:
Check condition of all bearings, replacing if necessary (see 23 21 703).



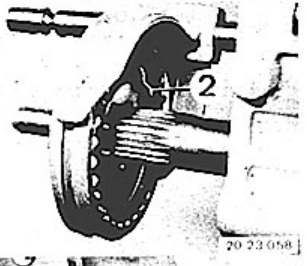
Installation:
Heat intermediate case in area of layshaft bearing to approx. 80° C (175° F) with a hot air blower.
Install input shaft/output shaft and layshaft.



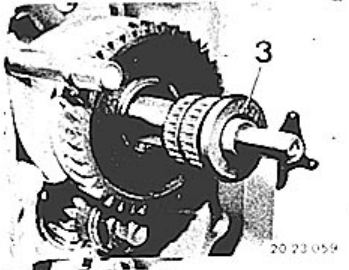
Install shim (X) on output shaft.
Heat bearing sleeve (1) to approx. 80° C (175° F) with a hot air blower and install on output shaft.



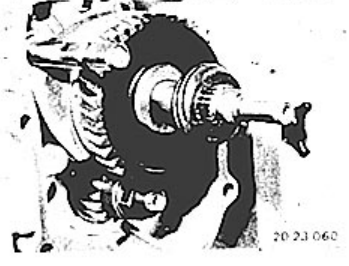
Install needle bearing, 1st gear and synchromesh ring on output shaft.



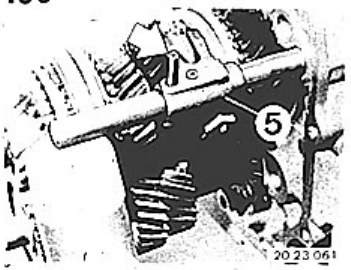
Insert 1st/reverse gear selector rod with selector fork in intermediate case.
Run guide sleeve into selector fork that synchromesh spring (2) faces 1st gear.



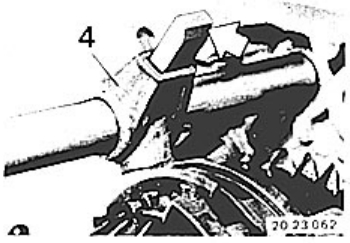
Slide guide sleeve on to spline of output shaft.
Important!
Guide tabs on 1st gear synchromesh ring into guide sleeve.
Install reverse gear and split needle bearing.
Heat bearing sleeve (3) to approx. 80° C (175° F) with a hot air blower and slide on to output shaft.



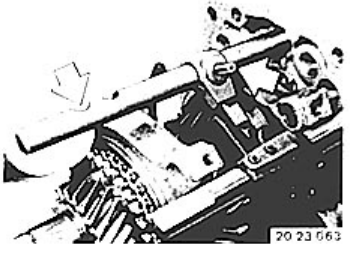
Install spacer.



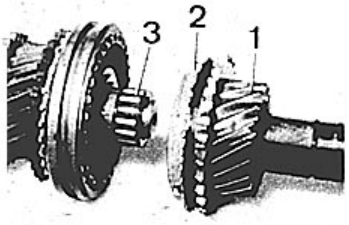
Slide on dog (5) and secure with 6 x 26 mm pins (counterhold).
Install 2nd/3rd and 4th/5th gear selector forks.



Push in selector shaft.
Slide selector arm (4) on to selector shaft in such a manner that bevel on arm faces dog.



Mount selector arm with a 6 x 28 mm pin (counterhold).
Openings in selector shaft must face out.
Install two rollers on selector shaft with grease.

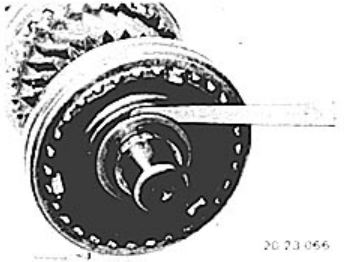


23 21 552 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

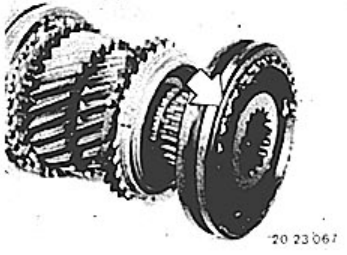
Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).

Note:
To avoid mixing up synchromesh rings while disassembling the output shaft, it is recommended to mark synchromesh rings for pertinent gear wheels.

Lift out snap ring (4).
Take off shim (5).

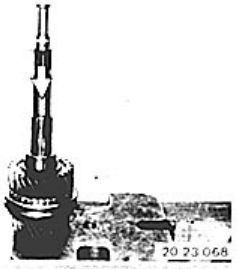


Installation:
Eliminate all play between the snap ring and guide sleeve.
Replace snap ring (4).

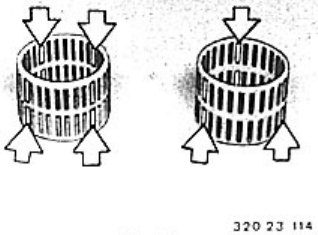


Take off guide sleeve, synchromesh ring, 4th gear wheel and split needle bearing.

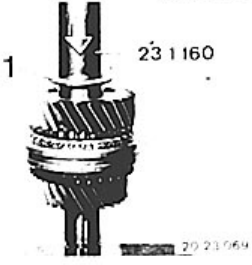
Important! – Installation:
The stepped end of the operating sleeve faces the 5th gear wheel.



Press bearing inner race, bearing sleeve, 2nd gear wheel, synchromesh ring, needle bearing, guide sleeve, synchromesh ring, 3rd gear wheel and needle bearing off of the output shaft.

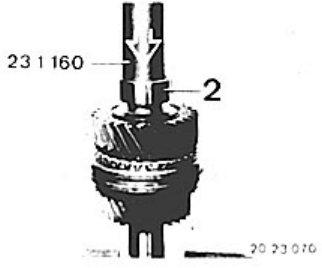


Important!
Split needle bearing:
Slots without needles are provided at angles of 90° and 120° to guarantee uniform bearing of the needles.



Place needle bearing, 3rd gear wheel, synchromesh ring, guide sleeve, synchromesh ring, needle bearing and 2nd gear wheel on the output shaft. Press on bearing sleeve (1) with Special Tool 23 1 160.

Important!
Guide the needle bearing into the bearing sleeve.



Press on bearing inner race (2) with Special Tool 23 1 160.

20 23 071

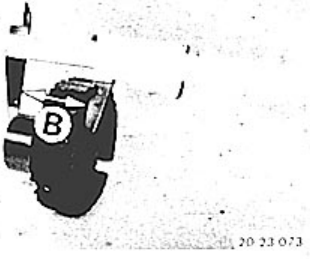
Determine thickness of shim X.
Measure distance (A) from collar of output shaft to bearing inner race.

20 23 072

Pull operating sleeve off of 1st/reverse gear guide sleeve.

Installation

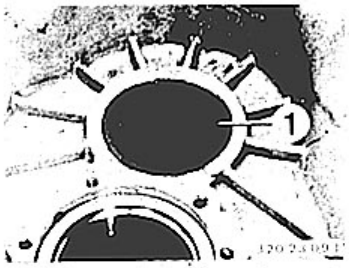
Install operating sleeve that its flat teeth slide over the pressure pieces.



20 23 073

Insert reverse gear bearing sleeve in guide sleeve.
Measure distance (B) from guide sleeve collar to bearing sleeve.
Example:

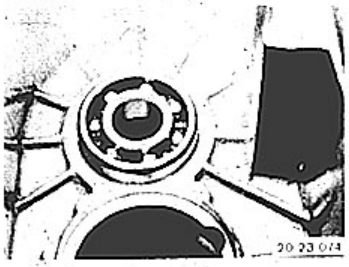
	A	46.8 mm (1.842")
–	B	46,3 mm (1.822")
	X	0.5 mm (0.020")



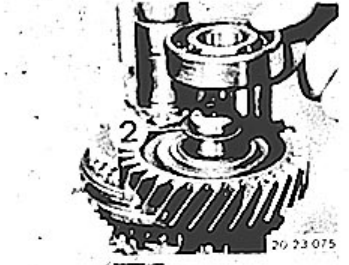
23 21 703 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Transmission Removed –

A) Input Shaft, Layshaft in Front Case Section:

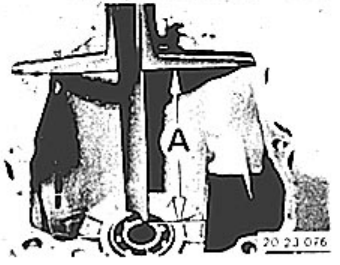
Remove transmission case – see 23 11 005.
Remove end plug (1).
Installation:
Replace end plug and install with sealing compound**.
Remove grooved ball bearing.



Heat transmission case in area of bearing to about 80° C (175° F) with a hot air blower.
Install grooved ball bearing.

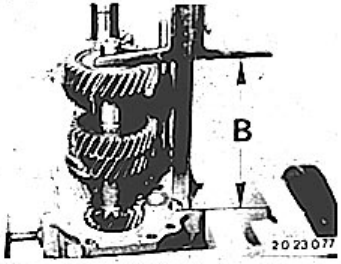


Adjust axial play of layshaft.
Determine thickness of spacer (2) between bearing and layshaft.



Measure distance (A) from case sealing surface to grooved ball bearing.

** Source: HWB

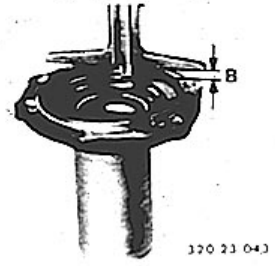


Measure distance (B) from layshaft to sealing surface.
Example:

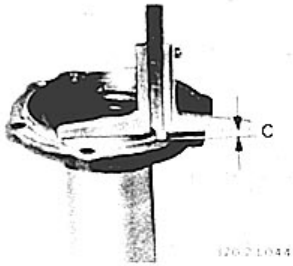
A	155.8 mm (6.134")
– B	155.3 mm (6.114")
	0.5 mm (0.020")
–	0.1 ... 0.2 mm (0.004...0.008") axial pl.
	0.3 ... 0.4 mm (0.012...0.016") spacer

Install front case section.
Adjust play between circlip and bearing inner race to 0 ... 0.09 mm (0 ... 0.0035") with shims.

Adjust play between guide sleeve and bearing outer race to 0 ... 0.09 mm (0 to 0.0035") with shims.
Measure distance (A) from case sealing surface to bearing outer race.



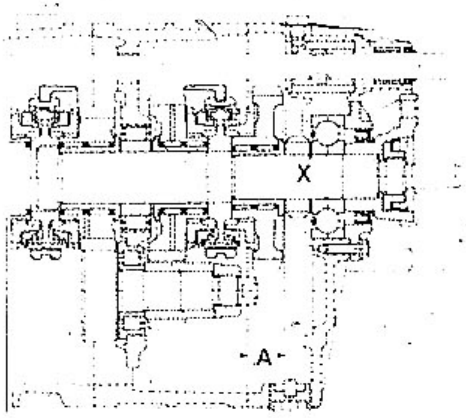
Measure distance (B) from guide sleeve protrusion to inside surface.

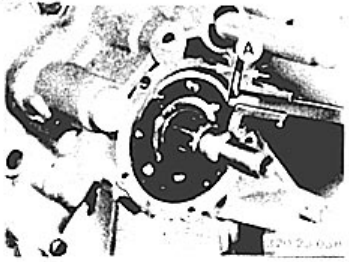


Measure distance (C) from guide sleeve protrusion to outside surface.
Example:

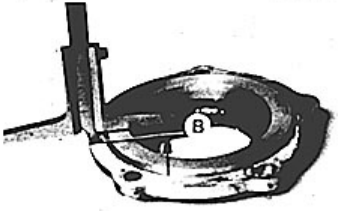
B	4.0 mm (0.157")
+ A	0.3 mm (0.012")
	4.3 mm (0.169")
− C	2.8 mm (0.110")
	1.5 mm (0.059") spacer

B) Output Shaft in Rear Case Section:
Remove rear case section 23 11 040.
Press in grooved ball bearing to fit tight in rear case section. Check distance (A), adjusting with shim X betw. bearing and spacer if necessary.





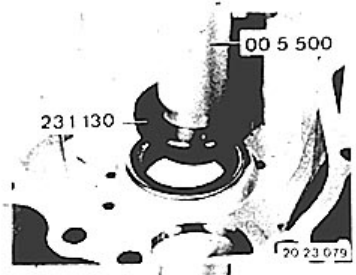
Eliminate play between grooved ball bearing and cover.
Measure distance (A) from case cover to grooved ball bearing.



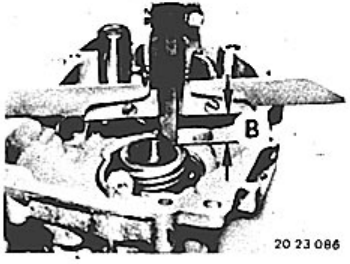
Measure collar height (B), without gasket.
Important!
Use 0.2 mm (0.008") for gasket thickness in calculations.
Example:

A	3.0 mm (0.118")
− B	2.9 mm (0.114")
	0.1 mm (0.004")
+	0.2 mm (0.008") gasket thickness
	0.3 mm (0.012") shim thickness

320 23 039

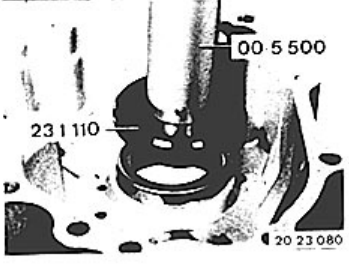


C) Output Shaft, Layshaft in Intermediate Case:
Remove input/output shaft assembly – see 23 21 501.
Drive out roller bearing for output shaft with Special Tools 23 1 130 and 00 5 500.



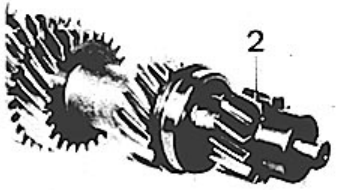
Install spacer on grooved ball bearing.
Measure distance (B) from sealing surface to spacer.
Example:

A	22.0 ± 0.1 mm (0.866 ± 0.004") nominal
− B	21.6 mm (0.850")
	0.4 mm (0.016") spacer

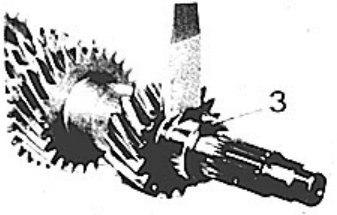


Drive in roller bearing with Special Tools 23 1 110 and 00 5 500.

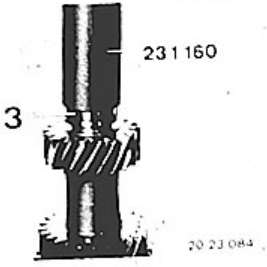
Unscrew collar nut (1).
Installation:
Install collar nut with bolt cement**.
Tightening torque*.



Pull off gear (2).



Take off roller bearing.
Press bearing inner race (3) off of layshaft with, if necessary, Special Tool 00 7 500.

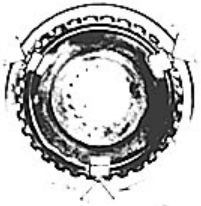


Install bearing inner race (3) with collar facing gear and press on with Special Tool 23 1 160.

* See Specifications
** Source: HWB

23 23 004 DISASSEMBLING/ASSEMBLING COMPLETE SYNCHRONIZATION
– Transmission Removed –

Remove input and output shaft assembly 23 21 501.
Disassemble output shaft 23 21 552.
All synchromesh rings are identical and coated with molybdenum on inside.
Check distance* between synchromesh ring and clutch.
Measure in area of stops.
Synchromesh rings should support uniformly on entire surface.



Press operating sleeve off of synchronizer.
Installation:
Install operating sleeve that its flat teeth slide over pressure pieces.

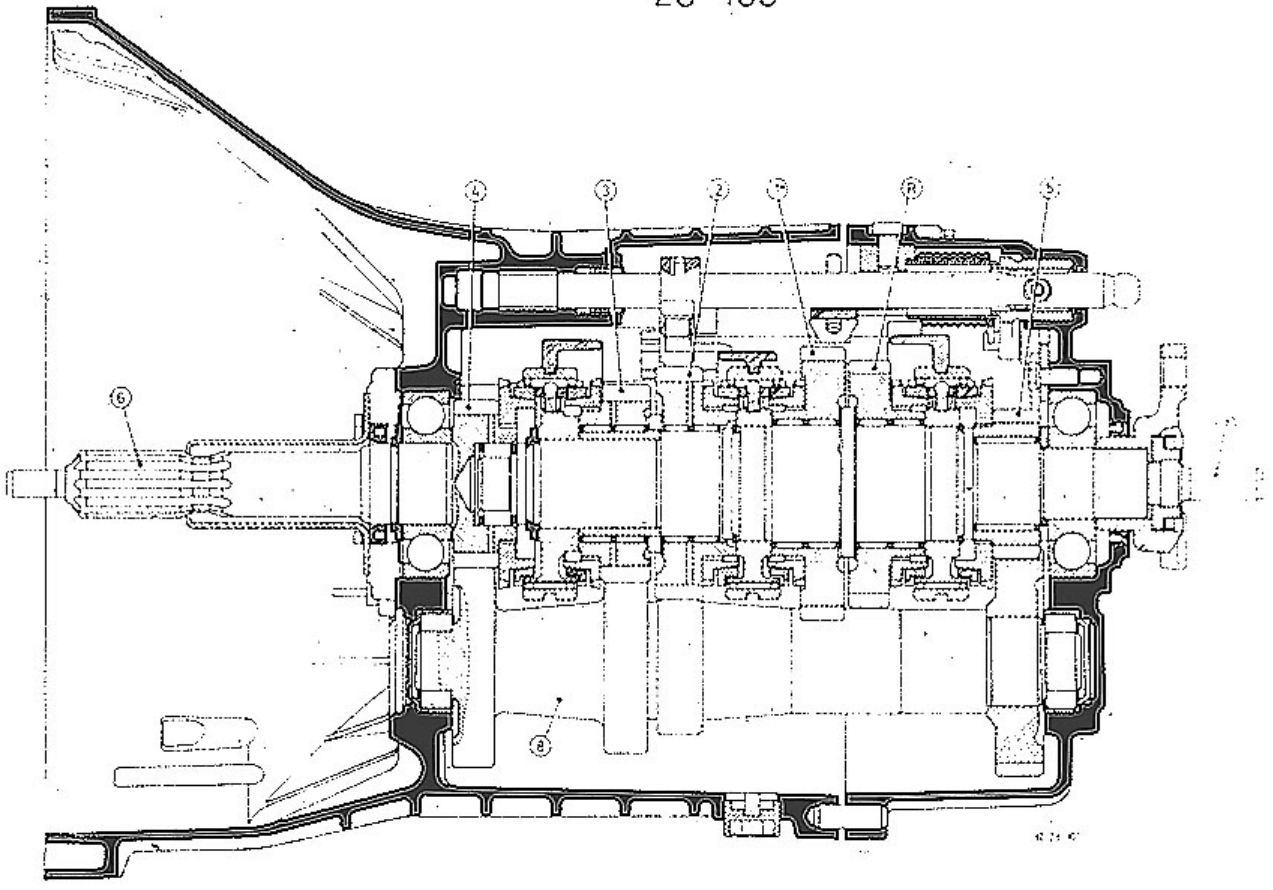
Offset hooks of synchromesh springs in an axial groove to each other.
Engage pressure pieces in synchromesh springs.

* See Specifications

Construction group 23 Manual transmission

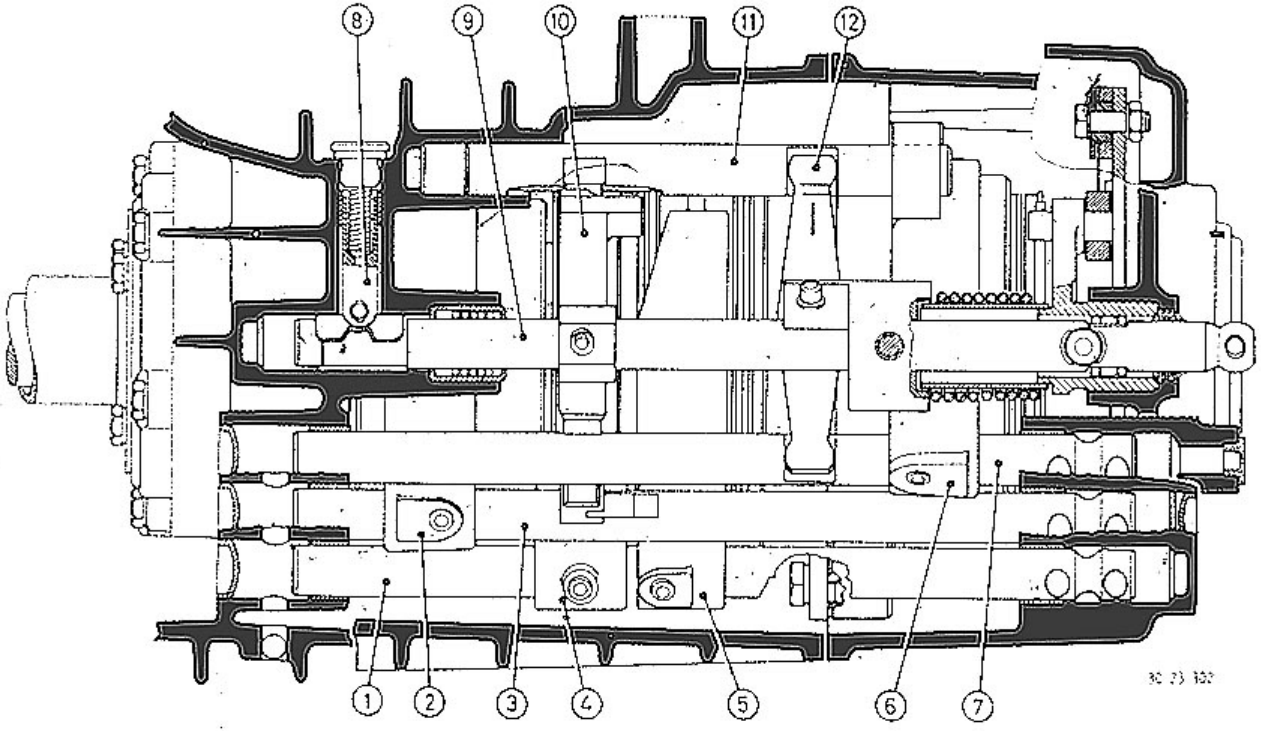
Getrag 260 Five speed overdrive transmission

	Assembly drawing – transmission	23-	165
	Assembly drawing – shift components	23-	166
23 11 013	Transmission case front section – remove and install / seal	23-	169
623	Guide sleeve for clutch release – remove and install	23-	171
23 12 503	Radial oil seal for input shaft – replace	23-	173
23 21 503	Input and output shaft assembly – remove and install	23-	174
554	Output shaft – replace	23-	179
703	Bearings for all transmission shafts – replace	23-	185
23 23 505	Synchronisation – disassemble and assemble	23-	189



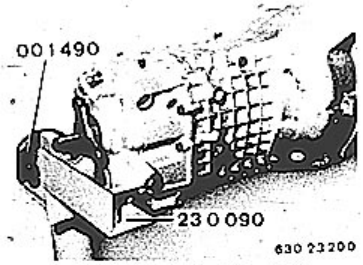
ASSEMBLY DRAWING OF GETRAG 260 FIVE SPEED OVERDRIVE MANUAL TRANSMISSION

1 First gear
2 Second gear
3 Third gear
4 Fourth gear
5 Fifth gear
6 Reverse gear
6 Input shaft
7 Output shaft
8 Layshaft



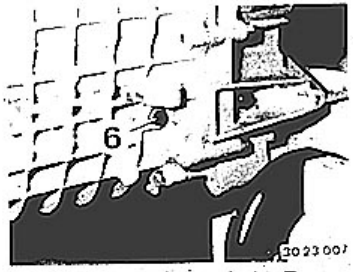
ASSEMBLY DRAWING OF SHIFT MECHANISM FOR GETRAG 260 FIVE SPEED OVERDRIVE MANUAL TRANSMISSION

1 Selector rod — 1st/2nd gear
2 Selector fork — 3rd/4th gear
3 Selector rod — 3rd/4th gear
4 Dog
5 Selector fork — 1st/2nd gear
6 Selector fork — reverse/5th gear
7 Selector rod — reverse/5th gear
8 Lockpin
9 Selector shaft
10 Selector arm
11 Selector rail
12 Operating lever



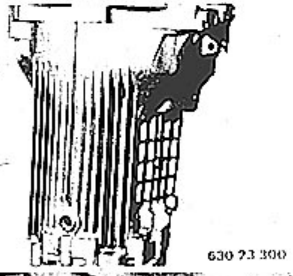
23 11 013 REMOVING AND INSTALLING OR SEALING FRONT CASE SECTION

Remove transmission - see 23 00 022 in model repair manual beginning with 1985 models.
Mount Special Tool 23 0 090 on Special Tool 00 1 490.
Mount transmission on special tool.
Drain oil.



Unscrew bolt (6).

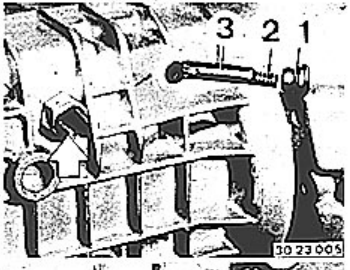
Installation:
Install bolt with a bolt cement**.
Tightening torque*.



General information:
A stronger 5-speed overdrive transmission type 260/6 is installed in cars with M 30 engine, 3.2 or 3.4 liter, since 9.85.
Identification: additional cooling ribs on lower case section.
The 260/6 overdrive transmission is included in the following description for the former 260/5 transmission.
Transmission Type 260/6 is mentioned when procedures deviate.

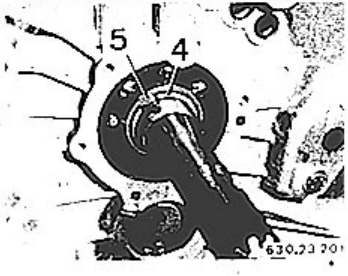
Drive out cylindrical pin.
Unscrew bolts.

Installation:
Check length of bolts.
Bolt (1) = 8 x 60 mm.



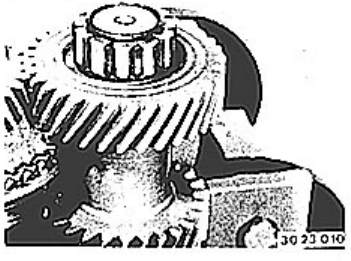
Remove guide sleeve - see 23 11 623.
Unscrew backup light switch.
Lift out cover (1).
Pull out spring (2) and lockpin (3).
Check installed position!

Pull off front case section with Special Tools 23 1 460 and 33 1 301.



Lift out snap ring (4).
Take off washer (5).

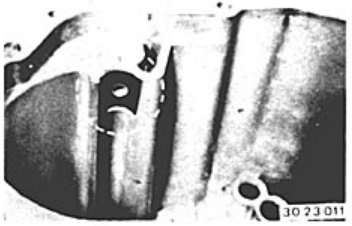
Installation:
Always replace the snap ring.



Place roller bearing on the layshaft in such a manner that the small diameter faces up.

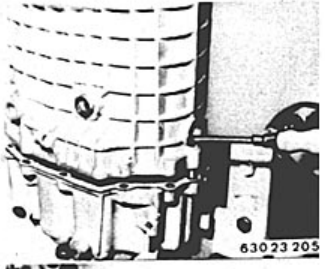
Note:
To avoid seizure of the rollers while mounting the front case section, coat rollers with grease and press in.

* See Specifications
** Source of Supply: HWB

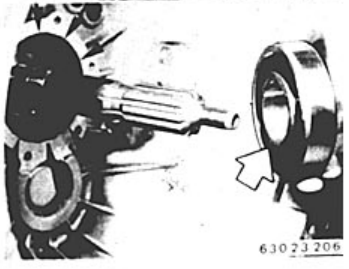


Coat front case section in area of the reverse gear shaft with a surface sealing compound**.
Surface must be cleaned thoroughly and dried of oil.

Remove grooved ball bearing for input shaft.
Important! - Installation:
Inner race of the grooved ball bearing protrudes.
Install with protrusion face the gear set.

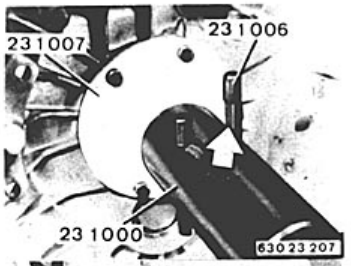


Unscrew oil drain plug.
Coat sealing surface with surface sealing compound**.
Sealing surface must be cleaned thoroughly and dried of oil.
Mount front case section.
Align intermediate shaft through bore for oil drain plug in such a manner, that roller bearing of intermediate shaft slides into the bearing shell.
Tighten front case section bolts.
Tightening torque*.
Install lockpin and reverse gear switch.

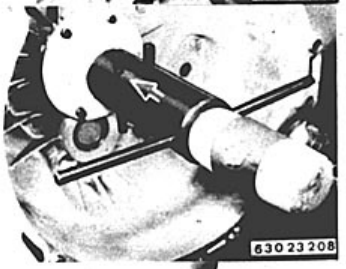


Heat* bearing inner race and front case section in area of grooved ball bearing with a hot air blower.
Push on grooved ball bearing as far as possible.
Protrusion of inner race faces the gear set.

* See Specifications
** Source of Supply: HWB



Press grooved ball bearing on input shaft or into front case section with Special Tools 23 1 007, 23 1 000 and 23 1 006.
Important!
Apply Special Tools 23 1 006 in such a manner, that flat ends face the input shaft.

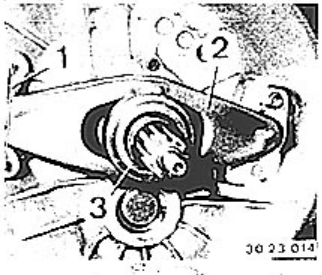


Drive on grooved ball bearing further continuously and simultaneously apply light knocks from a hammer.

Transmission 260 / 6 or 260 Sport:
The front case section cannot be pressed on due to the uniform thickness of the input shaft.
Double bearing is installed in the front case section.
Heat bearing inner race to about 80° C (175° F) with a hot air blower.
Caution!
Protect plastic cage against heat.
Mount front case section, whereby the input shaft must be pulled out.
Tighten front case section bolts.
Tightening torque*.

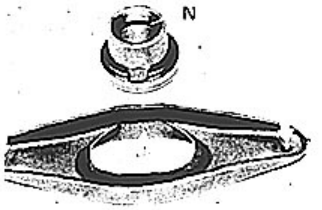
Install shim and circlip.
Reduce any possible play between the bearing inner race and circlip to 0 ... 0.09 mm (0 to 0.0035").

* See Specifications



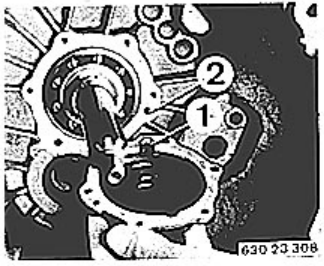
23 11 623 REMOVING AND INSTALLING GUIDE SLEEVE FOR CLUTCH RELEASE (Transmission Removed)

Lift out spring (1) and remove release lever (2) with bearing (3).



Installation:
Fill lubricating groove N with Molykote Longterm 2.
Coat guides F and bearings L with Molykote Longterm 2.
Non-conformance could cause the release bearing to seize on the guide sleeve.

Important!
Use Microlube 261** for version with a double-mass flywheel.

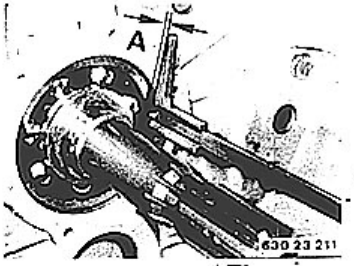


Unscrew guide sleeve.

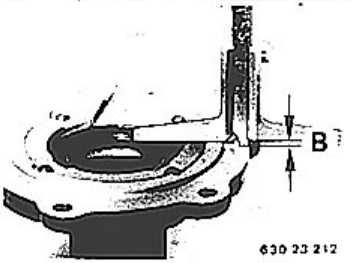
Important!
Spacer.

Installation:
Mount guide sleeve that oil groove (1) is aligned with oil bore (2) in transmission case, or "up/down" marks on guide sleeve are aligned and arrow on face points to middle of layshaft.
Install guide sleeve and bolts with a sealant**.
Sealing surface and bolts must be cleaned thoroughly and dried of oil.
Tightening torque*.

* See Specifications
** Source of Supply: HWB



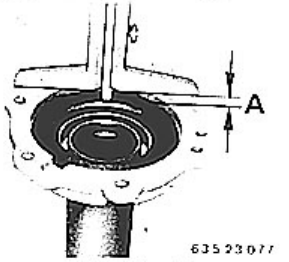
Installation:
Adjust any play to 0 ... 0.09 mm (0 to 0.0035").
Determine thickness of spacer.
Measure distance (A).



Measure distance (B).

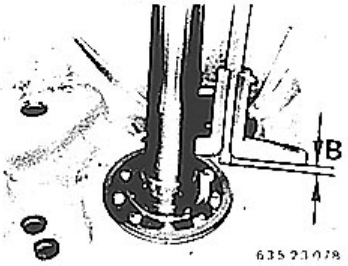
Example:

A	3.0 mm (0.118")
– B	2.6 mm (0.102")
Spacer	0.4 mm (0.016")



260/6 or 260 Sport Transmission:

Installation:
Adjust any play to 0 ... 0.09 mm (0 to 0.0035").
Determine thickness of spacer.
Measure distance (A).



Measure distance (B).

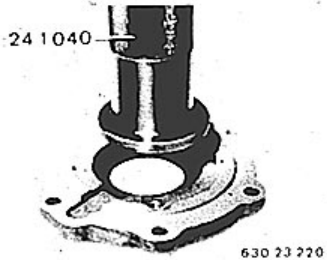
Example:

A	3.0 mm (0.118")
– B	2.6 mm (0.102")
Spacer	0.4 mm (0.016")

630 23 219

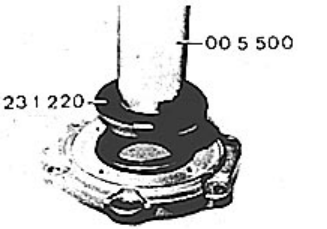
23 12 503 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT
- Transmission Removed -

Remove guide sleeve - see 23 11 622.
Unscrew guide pipe.
Installation:
Install guide pipe and bolts with a surface sealing compound.**
Sealing surface and bolts must be cleaned thoroughly and dried of oil.
Tightening torque*.



630 23 220

Important!
Collar on inside surface of flange.
Drive out radial oil seal in direction of the guide pipe with Special Tool 24 1 040.

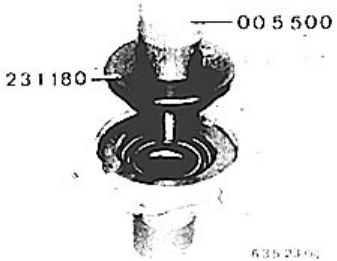


630 23 221

Drive in radial oil seal with Special Tools 23 1 220 and 00 5 500.
Lubricate sealing lip of radial oil seal with oil.

635 23 027

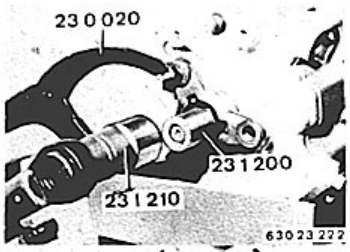
Transmission 260 / 6 or 260 Sport:
Lift out radial oil seal.



635 23 0[illegible]

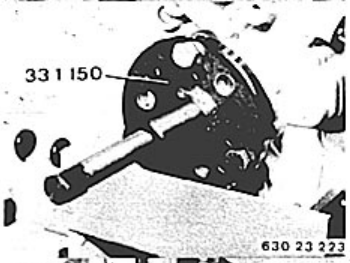
Drive in radial oil seal with Special Tools 23 1 180 and 00 5 500.
Open end faces up.
Lubricate sealing lip with oil.

* See Specifications
** Source of Supply: HWB

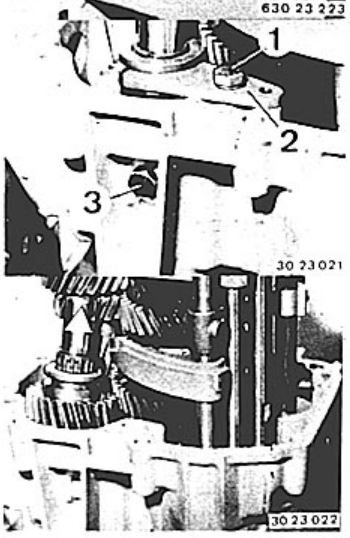


23 21 503 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY
– Transmission Removed –

Remove transmission case front section – 23 11 013.
Remove lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Version with Integrated Vibration Damper:
Hold output flange with Special Tool 23 1 320.

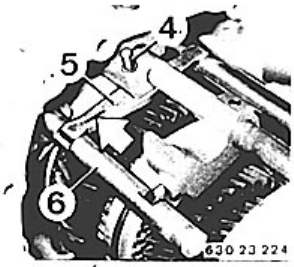


Pull off output flange with Special Tool 33 1 150.

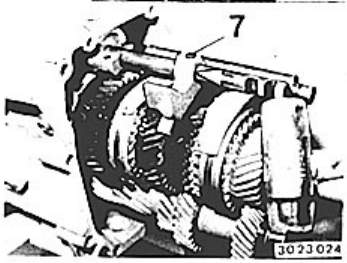


Unscrew bolt (1).
Remove holder (2).
Unscrew bolt (3).

Remove shaft with reverse gear and needle bearing.



Pull out pin (4) for operating lever (5).
Pull out selector rail (6).
Remove operating lever (5).
Installation:
Install operating lever that notch faces up and in direction of selector rail.



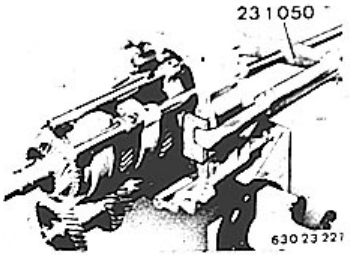
Engage 4th gear.
Drive in pin (7), while counterholding.
Important!
Only drive in pin (7) far enough that selector shaft can be pulled back and out.

Radial oil seal (8) will also be pulled out.
Important!
Rollers on selector shaft.
Installation:
Replace radial oil seal.
Remove selector arm.

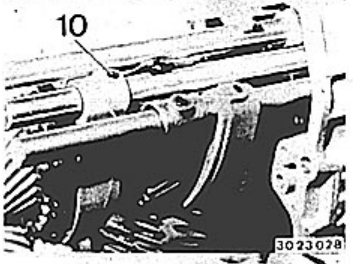
Detach end plate.
Installation:
Install end plate with sealing compound**.
Sealing surface must be cleaned thoroughly and dried of oil.
Remove end plate (9).
Installation:
Replace end plate.

** Source: HWB

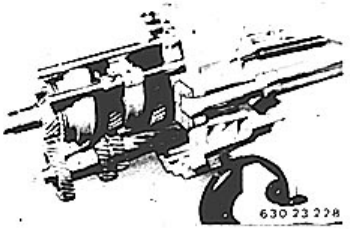
Remove 3 springs and 3 balls.
Note:
Springs differ in length (see installation).



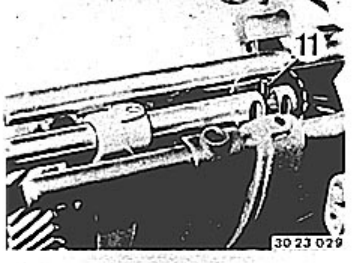
Press input shaft, putput shaft and layshaft out of case rear section with Special Tool 23 1 050.
Important!
To avoid damage on sealing surface, use a piece of wood, aluminum or similar material between claws and sealing surface.



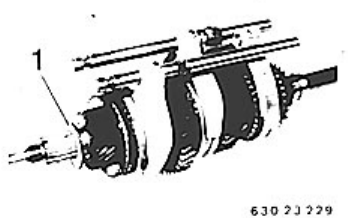
Drive out pin (10) in 3rd/4th gear selector fork.
Installation:
Replace pin.



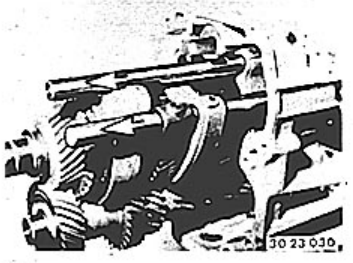
Important!
Be careful not to clamp selector rods and layshaft while pressing out parts.
Layshaft must not tilt off in this step.
Installation:
Check condition of all bearings, replacing if necessary.



Knock out 3rd/4th gear selector fork forward.
Important!
Lockpin (11) in selector fork.

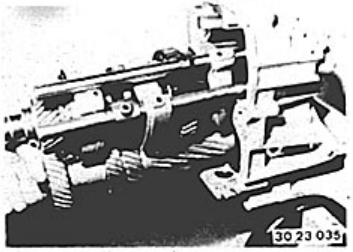


Installing:
Install 3rd/4th gear selector fork and 1st/2nd as well as 5th/reverse gear selector rods with selector forks.
Check thrust washer (1) (only for 260/5).

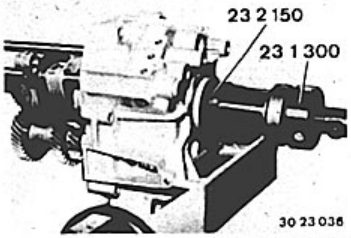


Engage 2nd and reverse gears by pushing 1st/2nd and 5th/reverse gear selector rods forward.

Remove all detent and locking balls from case rear section.
Install roller bearing with large diameter facing out.
Lubricate lockpins and locking levers with oil.
Transmission 260/6:
The radial oil seal for the output flange and the ball bearing inner race must be removed prior to installation of the input and output shafts.

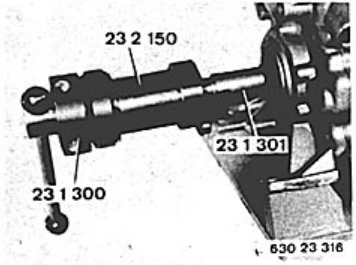


Heat grooved ball bearing inner race in rear case section to about 80° C (175° F) with a hot air blower.
2nd and reverse gears are engaged.
Install input shaft, output shaft and layshaft in rear case section.
Align shift rods.

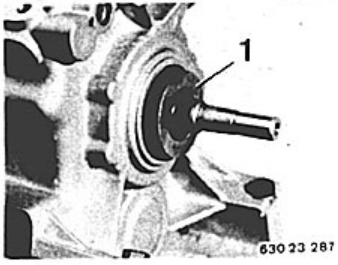


Pull input shaft, output shaft and layshaft into rear case section with Special Tools 23 1 300 and 23 2 150.

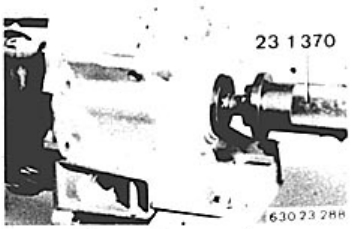
Important!
Make sure shift rods and layshaft are not clamped while pulling in.



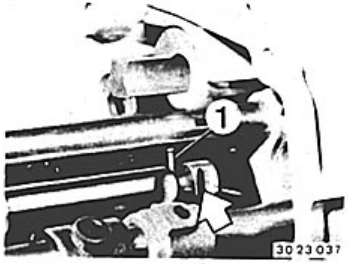
Note:
Screw Special Tool 23 1 301 between both above mentioned special tools for the version with a longer output journal.



260/6 Transmission:
Install input shaft and output shaft with 3rd/4th gear shift forks and 1st/2nd and 5th/reverse gear shift rods or layshaft in the rear case section.
Heat bearing inner race (1) to about 80° C (175° F) with a hot air blower and slide it on the output shaft, pressing on with Special Tool 23 1 160 if necessary.

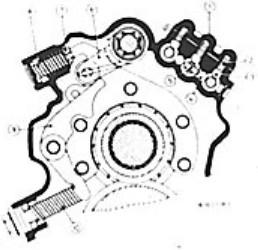


Drive in radial oil seal flush with Special Tool 23 1 370.
Lubricate sealing lip with oil.

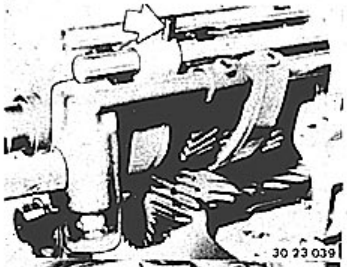


Move shift rods into neutral position.
Push 3rd/4th gear shift rod through the shift forks.
Place lockpin (1) in the shift rod with grease.
Push in shift rod up to the bore.
Opening on shift rod faces up.

Insert two locking balls with grease.
Push in 3rd/4th gear shift rod up to the arrest.



Arrest Assembly:
1 Cap
2 Spring
3 Dentent ball
4 Locking ball
5 Lockpin
6 Selector arm
7 Lockpin
8 Spring
9 Locking lever
10 Spring



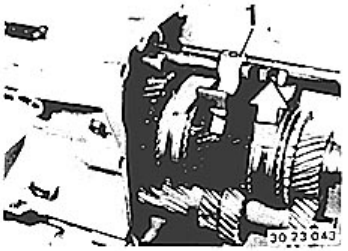
Drive 6 x 26 mm pin into 3rd / 4th gear selector fork (counterhold).

Install 3 locking balls and 3 springs.
Important!
Version with Different Length Springs:
Install short spring (1) with relaxed length (A) = 15.9 mm (0.626") for 5th/reverse gear selector rod.

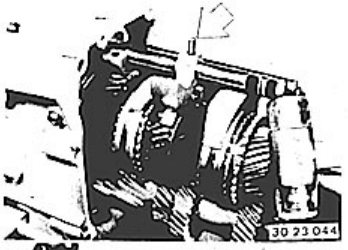
Install end cap after coating with sealing compound**.
Install end cover with sealing compound**.

Drive pin out of selector arm.

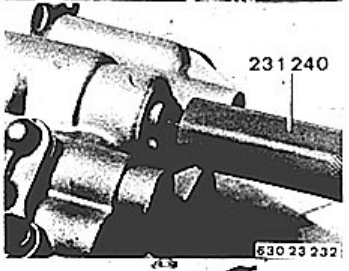
** Source: HWB



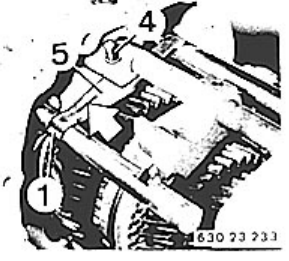
Hold 4 rollers in position with grease.
Slide in selector shaft and install selector arm (1) at same time.
Important!
Opening in selector shaft faces out.



Drive in 6 x 26 mm pin (counterhold).

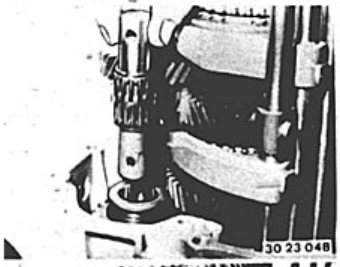


Lubricate sealing lip of radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.



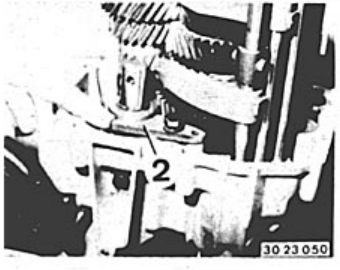
Install selector rail.
Groove (1) in selector rail faces up.
Install operating lever (5) with notch facing up and toward selector rail.
Install pin (4).

Coat case rear section in area of reverse gear shaft with sealing compound**.
Surface must be cleaned thoroughly and dried of oil.



Install shaft with needle bearing and reverse gear.

Mount shaft with bolt (3).
Install bolt with a bolt cement**.



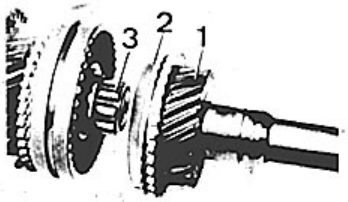
Insert holder (2), press out and secure in this position.

** Source: HWB

Install output flange.
Install collar nut with a bolt cement**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.
Version with Integrated Vibration Damper:
Hold output flange with Special Tool 23 1 320.

Install lockplate.

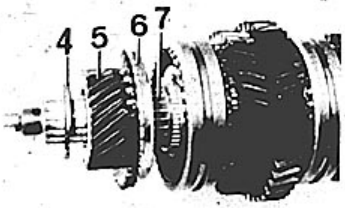
* See Specifications
** Source: HWB



630 23 236

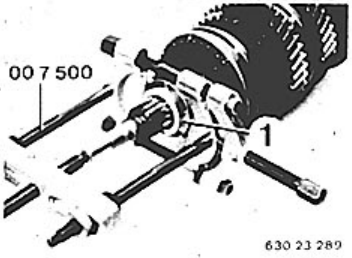
23 21 554 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).
Note:
Synchronization:
To avoid mixing up synchromesh rings, it is recommended to mark sychromesh rings and corresponding gear wheels when disassembling the output shaft.



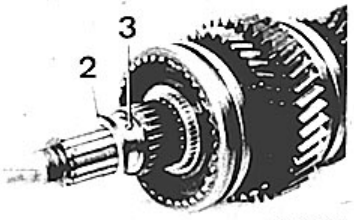
630 23 237

Pull off thrust washer (4), 5th gear (5), synchromesh ring (6) and needle bearing (7).



630 23 289

Transmission 260/6:
Pull ball bearing inner race (1) off of the output shaft with Special Tool 00 7 500.



630 23 290

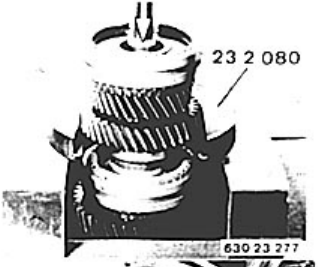
Transmission 260/6:
Pull off 5th gear wheel and synchromesh ring.
Take off thrust washer (2) and ball (3).
Pull off needle bearing.

630 23 238

Lift out circlip (8).
Remove spacer (9).
Installation:
Always replace circlip.

630 23 239

Installation:
Adjust play between circlip and guide sleeve to 0... 0.09 mm (0 to 0.0035").



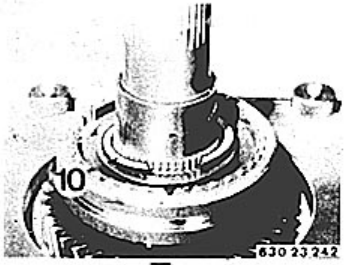
630 23 277

Press 2nd gear, bearing sleeve, 3rd gear, synchromesh ring and guiding sleeve with sliding sleeve off of output shaft with Special Tool 23 2 080.
Pressing off force*.

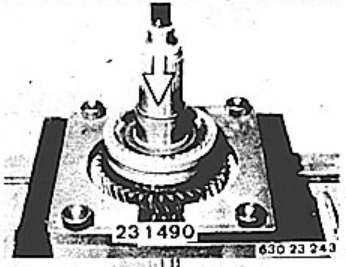
630 23 291

Transmissions 260/6 and 260/5**:
Note thrust washer (2) and ball (3) between 2nd and 3rd gear wheels.

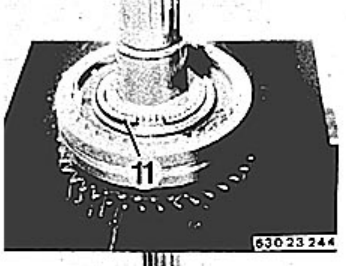
* See Specifications
** Since 7.85



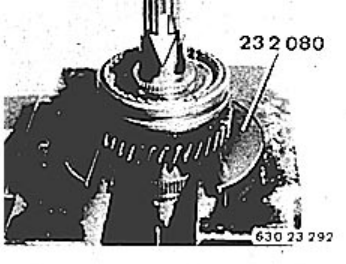
Important!
Circlip (10) must be removed before pressing off the first gear wheel.
Installation:
Always replace circlip.



Press off 1st gear wheel and guide as well as operating sleeve with Special Tool 23 1 490.
Take off needle bearing.
Pressing-off force*.

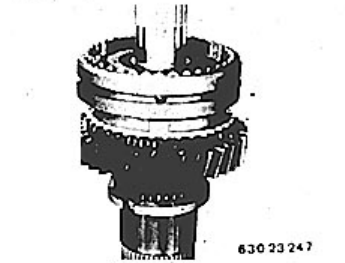


Important!
Circlip (11) must be removed before pressing off the reverse gear wheel.
Installation:
Always replace circlip.s

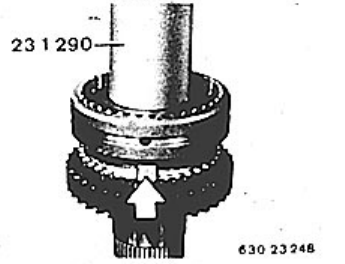


Press off guide as well as operating sleeve and reverse gear wheel with Special Tool 23 2 080, with the bottom end facing the gear wheel.
Take off needle bearing.
Pressing-off force*.

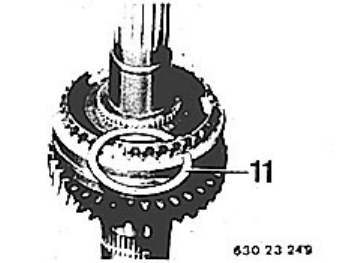
* See Specifications



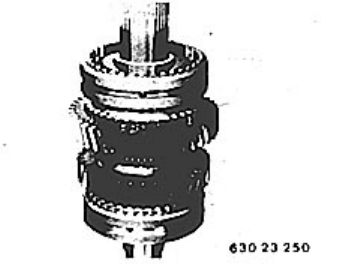
Assembling:
Note:
Check wear of synchromesh rings before assembling (see 23 23 505).
Install needle bearing, reverse gear wheel and synchromesh ring.
Slide guide and operating sleeve on splines of the output shaft.
Transmission 260/6 and 260/5** or 260 Sport:
Shouldered end of operating sleeve faces reverse gear wheel or, for version with 1 groove, 5th gear wheel.



Press on guide sleeve to fit tight with Special Tool 23 1 290.
Pressing-on force*.
Important!
Make sure tabs on synchromesh ring are aligned with openings in the guide sleeve while pressing on.

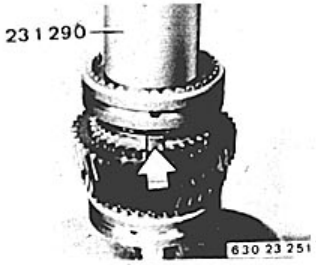


Move operating sleeve in direction of reverse gear wheel.
Adjust guide sleeve to be without play with circlip (11).
Circlips are available from Parts in different thicknesses between 1.7 and 2.0 mm (0.067 and 0.079").
Install circlip (11).



Install needle bearing, 1st gear wheel and synchromesh ring.
Slide guide and operating sleeves on the splines of the output shaft.
Transmission 260/6 and 260/5** or 260 Sport:
Shouldered end of operating sleeve faces the 1st gear wheel or, for version with 2 grooves, 2nd gear wheel.

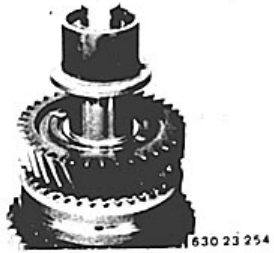
* See Specifications
** Since 5.85



Press on guide sleeve to fit tight with Special Tool 23 1 290.
Pressing-on force*.
Important!
Make sure tabs on synchromesh ring are aligned with openings in the guide sleeve while pressing on.

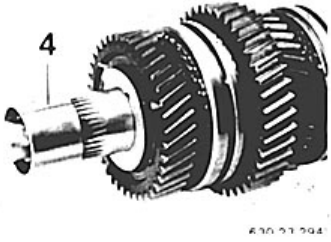
Move operating sleeve in direction of the 1st gear wheel.
Adjust guide sleeve to remove all play.
Circlips are available from Parts in different thicknesses between 1.7 and 2.0 mm (0.067 and 0.079").
Install circlip (10).

Install needle bearing, synchromesh ring and 2nd gear wheel.
Important!
Collar for bearing sleeve on the output shaft must protrude slightly.
If necessary, check whether circlip (10) seats correctly.



Heat bearing sleeve to about 80° C (175° F) with a hot air blower and install on the output shaft.

Transmission 260/6 and 260/5** or 260 Sport:
Install ball (3) and thrust washer (2) with the opening facing ball (3).

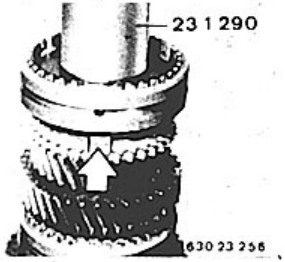


Transmission 260/6 and 260 Sport:
Heat bearing sleeve (4) without collar to about 80° C (175° F) with a hot air blower and install on the output shaft.

** Since 7.85

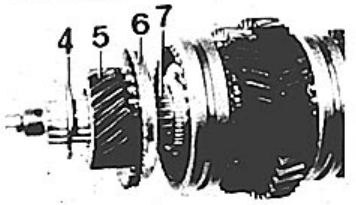
630 23 255

Install needle bearing, 3rd gear wheel and synchromesh ring.
Install guide and operating sleeve on splines with the long collar facing the 3rd gear wheel.
260/5 since 6.85 or 260 Sport:
Shouldered end of operating sleeves faces the 3rd gear wheel or, for version with 3 gr,ooves, the 4th gear wheel.
260/6:
Groove for shift fork is off-center.
Wide flat spot on operating sleeve faces the 3rd gear wheel.



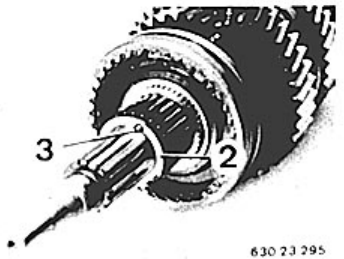
630 23 256

Press on guide sleeve to fit tight with Special Tool 23 1 290.
Important!
Make sure that tabs on synchromesh ring are aligned with openings in the guide sleeve while pressing on.
Install shim and circlip.
Pressing-on force*.



630 23 237

Pull off thrust washer (4), 5th gear wheel (5), synchromesh ring (6) and needle bearing (7).



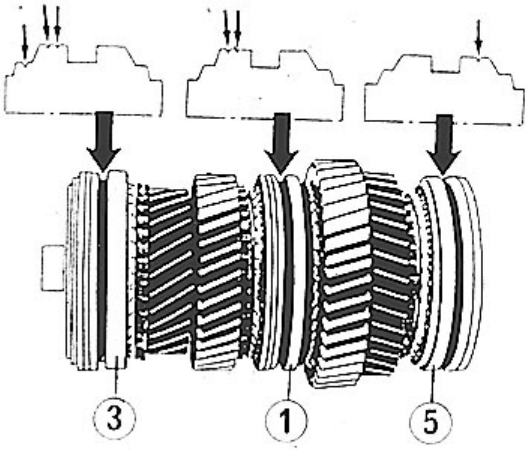
630 23 295

Transmission 260/6:
Slide needle bearing on output shaft.
Insert ball (3).
Install thrust washer (2) with opening facing the ball.
Install synchromesh ring and 5th gear wheel.

* See Specifications

630 23 296

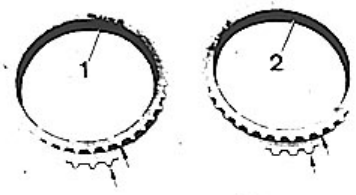
Transmission 260/6:
Heat ball bearing inner race to about 80° C (175° F) with a hot air blower and install on the output shaft.
Important!
The opening in the bearing inner race must engage with the ball (turning lock).



630 23 312

Transmission 260/5:

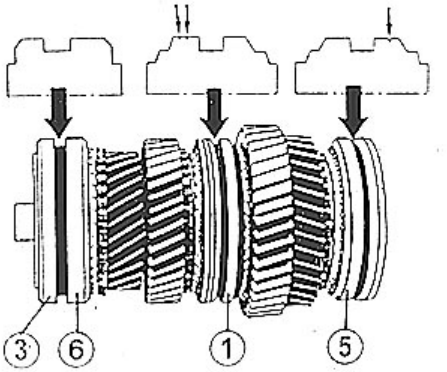
Note:
Modified synchronization since 5.85 with new gear wheels, synchromesh rings, guide and operating sleeves, guides, balls and springs.
Identification: grooves in operating sleeves (check installed position).
Operating sleeves are machined asymmetrically.
Operating sleeve (1), marked with 2 grooves, is installed with shouldered end facing 1st gear wheel or grooves facing 2nd gear wheel.
Operating sleeve (3), marked with 3 grooves, is installed with shouldered end facing 3rd gear wheel or grooves facing 4th gear wheel.
Operating sleeve (5), marked with 1 groove, is installed with shouldered end facing reverse gear wheel or grooves facing 5th gear wheel.



630 23 305

Identification of Synchromesh Rings:
To avoid mixing up synchromesh rings among each other, it is important to note the drawing number and tooth width.
Synchromesh ring (1) for 1st/reverse gears has stamped drawing no. 011.8.0241.00 and narrow teeth.
Synchromesh ring (2) for 2nd ... 5th gears has stamped drawing no. 011.8.0161.00 and wide teeth.

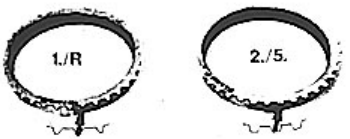
Important!
Modified shift components cannot be used in transmissions manufactured before 5.85 (shifting problems).



630 23 313

Transmission 260/6:

Note:
Operating sleeves are machined asymmetrically (check installed position).
Install operating sleeve (1) for 1st/2nd gears, marked with 2 grooves, that grooves face the 2nd gear wheel.
Operating sleeve (3) for 3rd/4th gears, without grooves, groove for shift fork is offcenter.
Install operating sleeve that wide land (6) faces the 3rd gear wheel.
Install operating sleeve (5) for 5th/reverse gears with one groove that groove faces the 5th gear wheel.



630 23 288

Identification of Synchromesh Rings:
To avoid mixing up synchromesh rings among each other, it is important to note the drawing number and tooth width.
Synchromesh rings for 1st/reverse gears have engraved drawing no. 011.8.0241.10 and narrow teeth.
Synchromesh ring for 2nd gear has engraved drawing no. 011.8.0161.2.
Synchromesh ring for 5th gear has engraved drawing no. 011.8.0161.00.
Synchromesh rings for 2nd ... 5th gears have wide teeth.

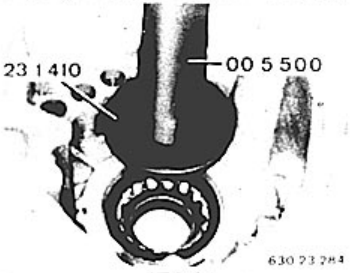
23 21 703 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Transmission Removed –

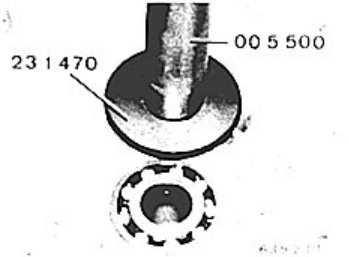
Remove input/output shaft assembly – see 23 21 503.

A) Input Shaft, Layshaft in Front Case Section

Input Shaft:
Drive out grooved ball bearing with Special Tools 23 1 480 and 00 5 500 – see 23 11 013.

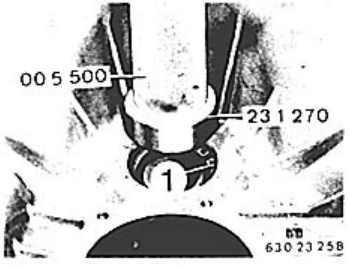


Transmission 260/6:
Drive out double bearing with Special Tools 23 1 410 and 00 5 500.

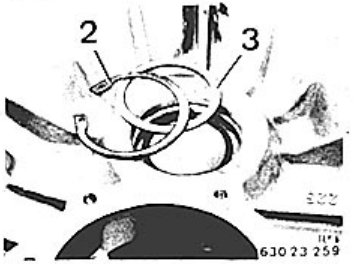


Transmission 260/6:
Heat front case section in area of the bearing to about 80° C (175° F) with a hot air blower.

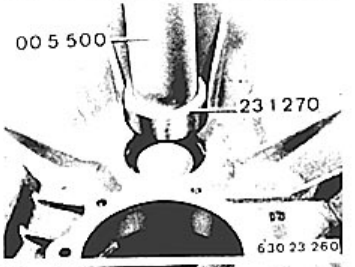
Important!
Install bearings with rollers for gear wheel set, driving in to fit tight with Special Tools 23 1 470 and 00 5 500.



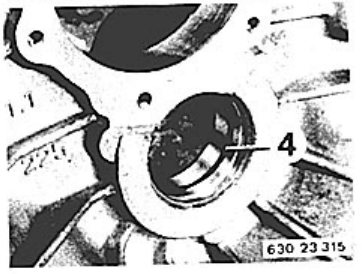
Layshaft:
Loosen circlip (1) with a single knock from Special Tool 23 1 270 used in conjunction with Special Tool 00 5 500.



Lift out circlip (2).
Remove shim (3).

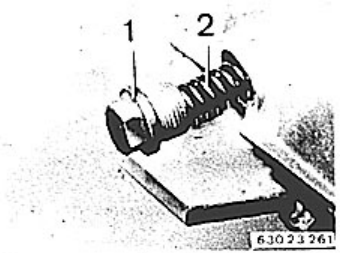


Drive out bearing shell toward inside with Special Tools 23 1 270 and 00 5 500.



Version with O-ring:
Lift out O-ring (4) with a feeler gage blade.

Installation:
Replace O-ring.
Install O-ring in groove and coat it with engine oil prior to installation of the bearing shell.



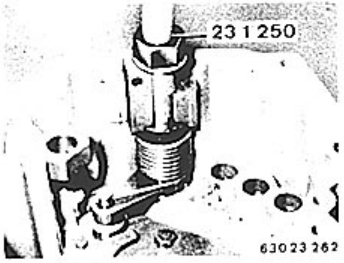
B) Output Shaft, Layshaft in Rear Case Section

Output Shaft:
Unscrew bolt (1).

Caution!
Spring force.

Remove spring (2).

Installation:
Install bolt with a bolt cement**.
Tightening torque*.



Install Special Tool 23 1 250 for removal of the selector arm.

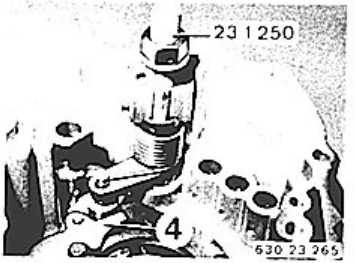
Unscrew socket head screw (3).

Installation:
Install screw with a bolt cement**.
Tightening torque*.

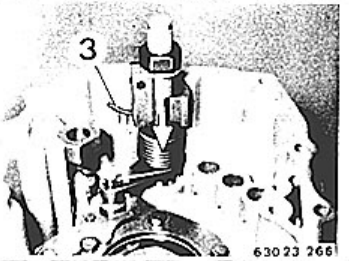
Remove selector arm from above.

Important!
Roller.

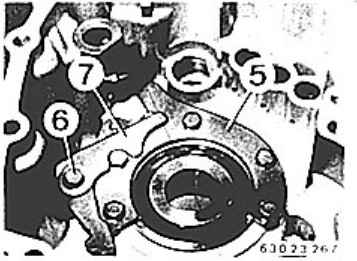
* See Specifications
** Source of Supply: HWB



Installation:
Insert selector arm with Special Tool 23 1 250.
Swing out selector arm with roller over locking lever (4).

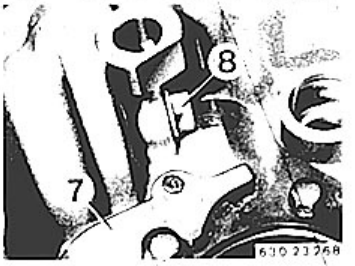


Move end of spring (3) over the raised point into installed position.
Press down on the selector arm in this position (do not knock down).
Install the socket head screw with a bolt cement** and tighten with correct torque* prior to removal of the special tool.



Remove bearing holder (5).

Important!
Do not loosen bolt (6).
Locking lever (7) remains on the bearing holder.

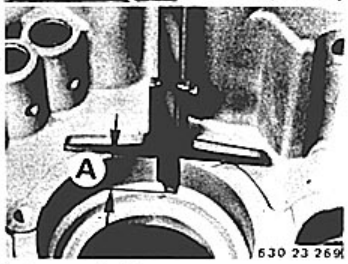


Installation:
Check installed position of locking lever (7) and thrust pin (8).

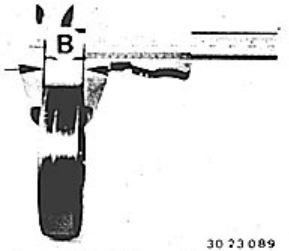
* See Specifications
** Source of Supply: HWB

Lift out radial oil seal.
Drive out grooved ball bearing with Special Tools 23 1 120 and 00 5 500.

Important!
Shim X.



Determine thickness of shim X.
Measure distance (A).



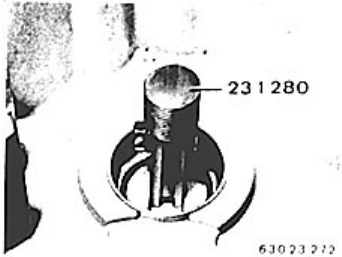
Measure distance (B).

Example:
A = 20.3 mm (0.799")
– B = 20.0 mm (0.787")
X = 0.3 mm (0.012") thick shim

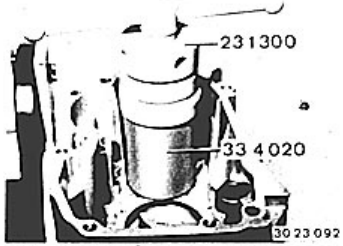
Heat rear case section in area of the grooved ball bearing to about 80° C (175° F) with a hot air blower.
Install shim X.
Install grooved ball bearing.

Important!
The grooved ball bearing inner race has a protrusion which faces the gear wheel set.
If necessary, drive in against the stop with Special Tool 23 1 470.

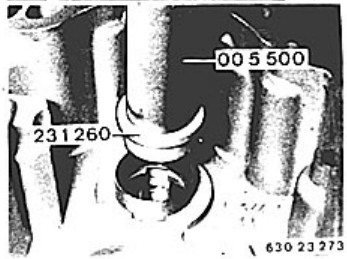
Transmission 260/6:
Split bearing inner races:
The bearing inner race with an opening for a ball (turning lock) must be installed on the output shaft – see "Replacing Output Shaft" in 23 21 554.



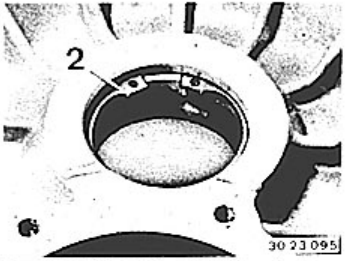
Layshaft:
Insert the stronger end of Special Tool 23 1 280 in the bearing shell.



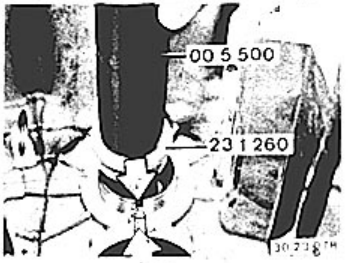
Apply Special Tool 33 4 020.
Screw on Special Tool 23 1 300.
Pull out bearing shell.



Drive in bearing shell with Special Tools 23 1 260 and 00 5 500.

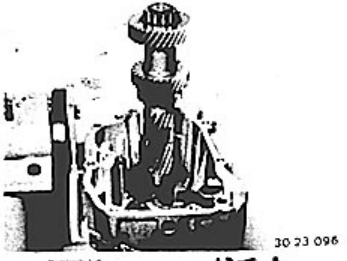


Determining Axial Play of Layshaft:
Install circlip (2).

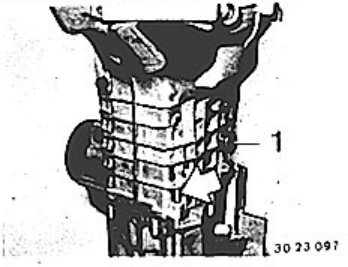


Install old shims.
Drive in bearing shell to fit tight in front case section with Special Tools 23 1 260 and 00 5 500.

Important!
Oil groove must be aligned with groove in the case.

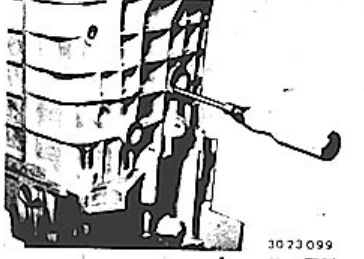


Place layshaft with roller bearings in the rear case section.



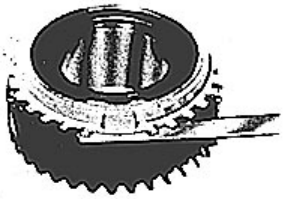
Install and mount front case section with two bolts opposite each other.
Center front case section slightly with the dowel pins.
Unscrew oil filler plug (1).

Mount holder with dial gage.
Dial gage must be applied on a tooth of the layshaft.



Check axial play of the layshaft through the bore for the oil filler plug.
Axial play = 0.13 to 0.23 mm (0.005 to 0.009").
Correct, when necessary, by removing the bearing shell and installing a thicker shim.

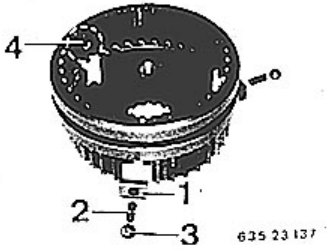
Install gear wheel set.
Determine thickness of shim for input shaft.
Install old shim and circlip.
Reduce play to 0 ... 0.09 mm (0 to 0.0035").
Determine thickness of shim for the guide sleeve – see 23 11 623.



30 23 101

23 23 505 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION – Output Shaft Removed –

Disassemble output shaft – see 23 21 554.
Note:
Only use molybdenum coated synchromesh rings for repairs.
Check distance* between synchromesh ring and clutch.
Measure in area of stops.
Note!
The synchromesh ring must be pressed on by screwing for measurements.
Synchromesh rings must bear uniformly on the entire surface.



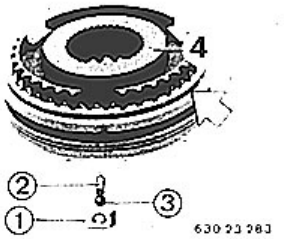
635 23 137

Disassemble synchronization.
Thrust piece (1), spring (2) and ball (3).
Installation:
Bore (4) in operating sleeve must be aligned with ball (3).

30 23 104

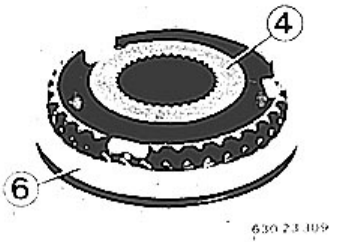
Install all springs, thrust pieces and balls.
Important!
Shouldered end of thrust pieces faces sliding sleeve.
Place guide sleeve halfways in sliding sleeve.
Push in balls far enough until guide sleeve can be pressed into sliding sleeve.

* See Specifications



630 23 083

Modified Synchronization Since 5.85:
Sliding sleeves with asymmetric splines.
Thrust pieces (1), spring (2) and balls (3) in weaker version.
Installation:
Bevelled ends of thrust pieces face the sliding sleeve.
For the 3rd/4th gear guide sleeve it is important to make sure that the bevelled end of sliding sleeve (marked with 3 grooves) faces the long collar (4) of the guide sleeve.



630 23 109

Groove for selector fork is offcenter.
Wide land (6) of sliding sleeve must face long collar (4) of the guide sleeve.

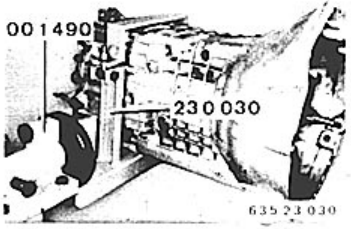
32 23018

23 11 006 REMOVING AND INSTALLING OR SEALING FRONT AND REAR CASE SECTIONS

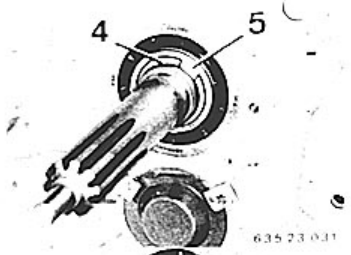
Remove transmission – see 23 00 022 in the Model Repair Manual.
Unscrew rubber mounts.



635 23 030

Mount Special Tool 23 0 030 on Special Tool 00 1 490.
Unscrew filler plug.
Drain oil.
Mount transmission on special tool.

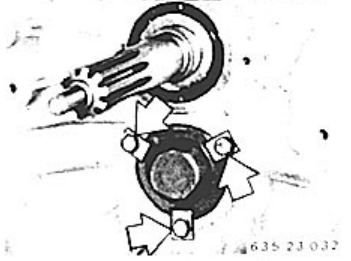
Important!
Use correct oil grade – see Operating Fluids.
Oil volume*.



635 23 031

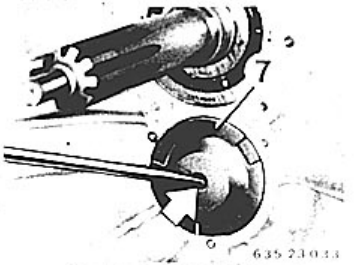
Remove guide sleeve – see 23 11 622.
Lift out snap ring (4).
Take off washer (5).

Installation:
Always replace the snap ring.



635 23 032

Unscrew sealing cover mounting bolts.



635 23 033

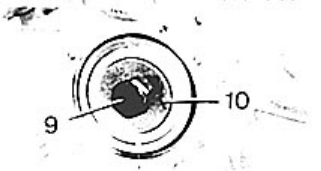
Puncture through the middle of sealing cover (7).
Pry out sealing cover (7) with a screwdriver.

Installation:
Replace sealing cover.

635 23 034

Take off sealing cover.

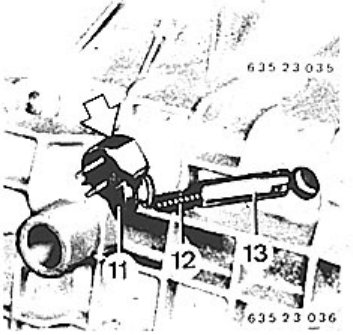
Important!
Shim (8).



635 23 035

Engage 4th gear.
Unscrew bolt (9) while holding the output flange with Special Tool 23 0 020.
Take off washer (10).

Installation:
Install bolt (9) with a bolt cement**.

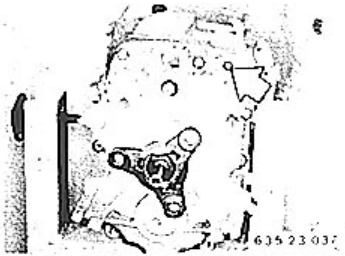


635 23 036

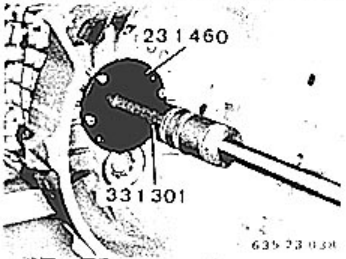
Unscrew backup light switch.
Lift out cover (11).
Pull out spring (12) and lockpin (13).
Check the installed position.

* See Specifications

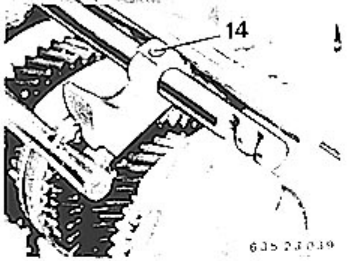
** Source of Supply: HWB



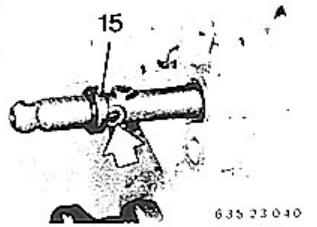
Knock back cylindrical pins.
Unscrew mounting bolts.



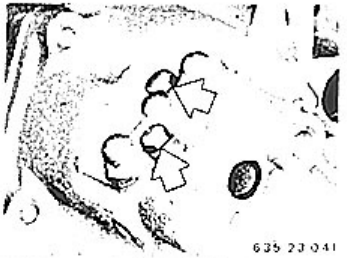
Pull off case front section with Special Tools 23 1 460 and 33 1 301.



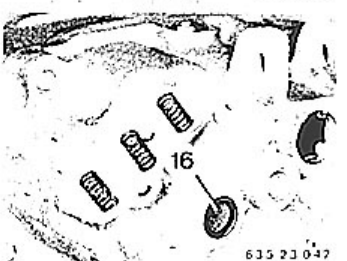
Fourth gear is engaged.
Drive pin (14) out of selector shaft (counterhold).



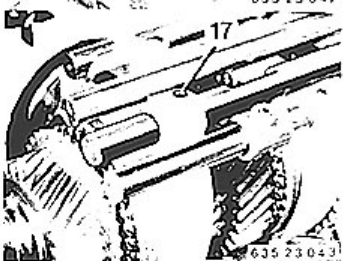
Drive out selector shaft toward rear.
Radial oil seal (15) will also be pulled out.
Important!
Needles on selector shaft.
Take off selector arm.
Installation:
Replace radial oil seal.



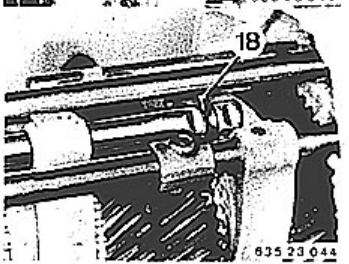
Remove end cap.
Installation:
Install end cap with sealing compound**.



Remove 3 springs.
Remove plug (16).
Installation:
Replace plug.

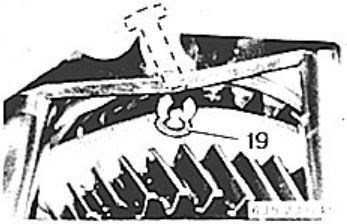


Take out fourth gear.
Drive pin (17) out of 3rd/4th gear selector rod (counterhold).

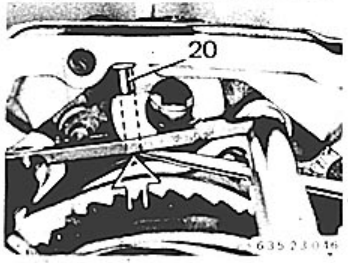


Knock out 3rd/4th gear selector rod toward front.
Important!
Lockpin (18).

** Source: HWB

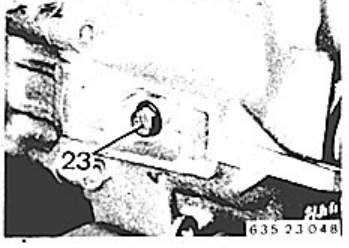


Pull off retainer (19) on shaft bolt for operating lever.



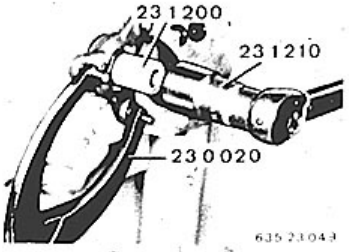
Push up shaft bolt (20).

Pull out selector rail (21) forward.
Take off operating lever (22).
Installation:
Mark on operating lever faces up.

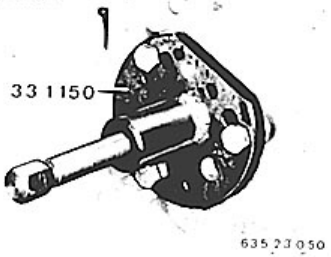


Unscrew bolt (23) for reverse gear shaft.
Installation:
Install bolt with bolt cement**.

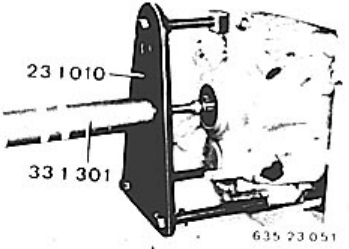
** Source: HWB



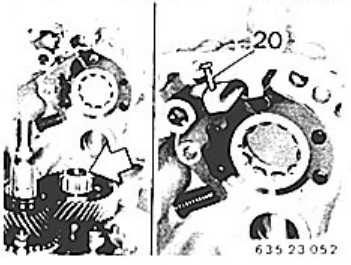
Lift out lockplate.-
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.



Pull off output flange with Special Tool 33 1 150.

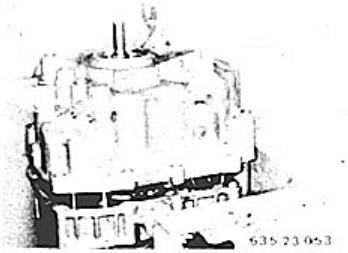


Knock back dowel pins.
Pull off case rear section with Special Tools 23 1 010 and 33 1 301.

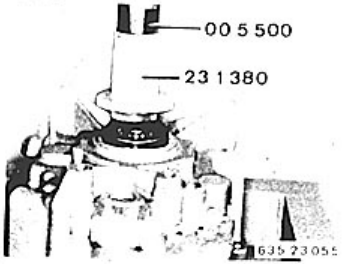


Coat sealing surface with sealing compound**.
Sealing surface cleaned thoroughly and dried of oil.
Install roller bearing with small diameter of plastic cage facing up.
Important!
Shaft bolt (20) for operating lever must be installed and bearing inner race removed, by lifting out radial oil seal, before mounting case rear section.

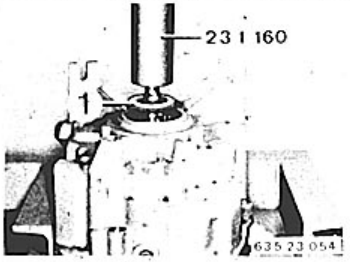
** Source: HWB



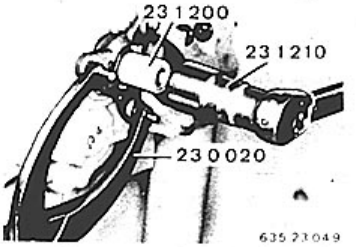
Mount rear case section.
Center 1st/2nd gear selector rod.
Drive in dowel pins.



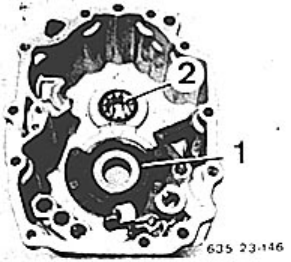
Drive in radial oil seal with Special Tools 23 1 380 and 00 5 500.
Lubricate sealing lip with oil.



Heat bearing inner race (1) to about 80° C (175° F) with a hot air blower and install it on the output shaft, pressing it on with Special Tool 23 1 160 when necessary.

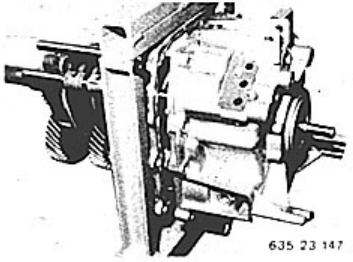


Mount the output flange.
Install collar nut with a bolt cement**
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020 and tighten the collar nut with Special Tool 23 1 210.
Tightening torque*.



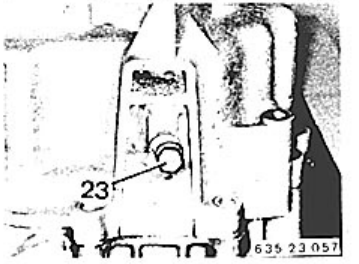
Version with Closed Bearing (1):
Install roller bearing (2) with the large diameter end facing up.
Hold rollers in position with grease.
Coat the sealing surface with a sealing compound**.
Sealing surface must be thoroughly cleaned and dried of oil.

Install lockplate.



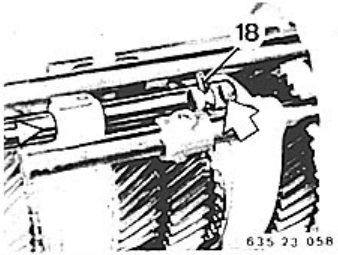
Heat ball bearing inner race to about 80° C (175° F) with a hot air blower.
Mount rear case section in horizontal position of the gear wheel set.
Align 1st/2nd and 5th/reverse gear selector rods with the bores.
Mount cover up to the transfer case.
Turn the gear wheel set during this step to have roller bearing slide into the layshaft.
Drive in dowel pin.

** Source of Supply: HWB

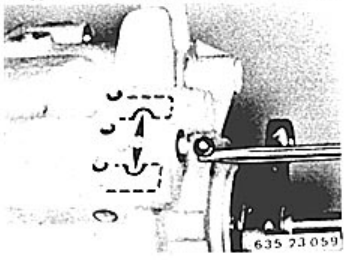


Install bolt (23) for the reverse gear shaft with a bolt cement** and tighten with correct torque*.

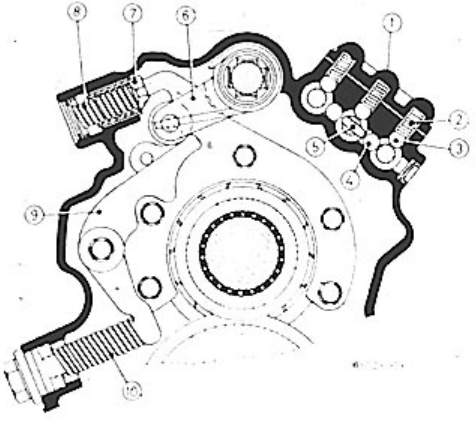
* See Specifications
** Source of Supply: HWB



Push 3rd/4th gear selector rod through the selector fork.
Install lockpin (18) in the selector rod with grease.
Push in selector rod up to the bore.
Opening in selector rod faces up.

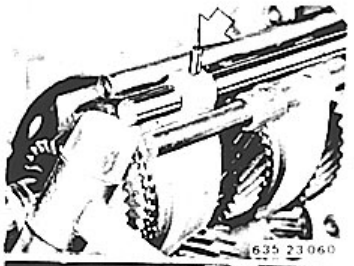


Install two locking balls with grease.
Push in 3rd/4th gear selector rod up to the arrest.



Arrest Layout:

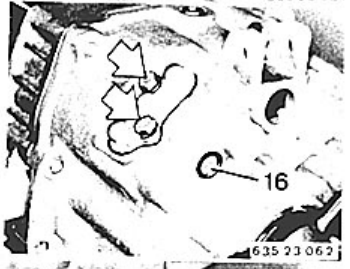
1 End cap
2 Spring
3 Arresting ball
4 Locking ball
5 Lockpin
6 Selector arm
7 Lockpin
8 Spring
9 Locking lever
10 Spring



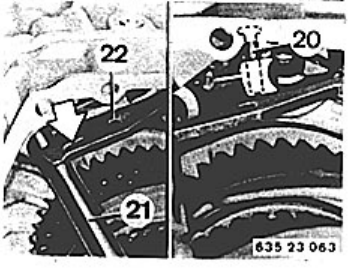
Drive 6 x 26 mm dowel pin into the 3rd/4th gear selector fork (counterhold).

Insert three arresting balls and three springs.

Important!
Check length of spring.
Untensioned length of
springs (1) = 20 mm (0.787") and
spring (2) = 16 mm (0.630").

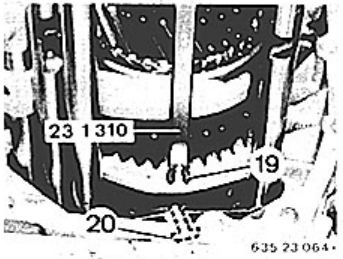


Coat end cap with a sealing compound** and tighten with correct torque*.
Install end cover (16) with a sealing compound**.

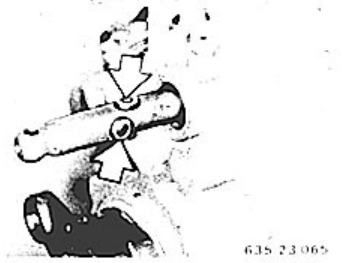


Install shift rail (21).
Push up shaft bolt (20) and install the reversing lever (22) with the mark facing up and toward the shift rail.

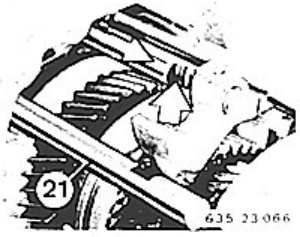
* See Specifications
** Source of Supply: HWB



Set input shaft upright.
Push shaft bolt (20) in direction of the gear wheel set.
Install circlip (19) with Special Tool 23 1 310.

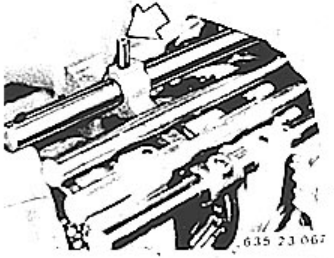


Hold the four rollers in position with grease.

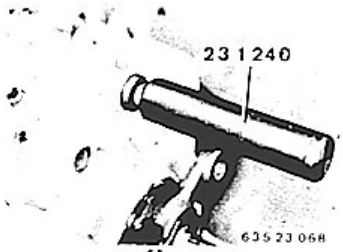


Insert shift arm.
Push in shift shaft.

Important!
Opening in shift shaft faces shift rail (21).

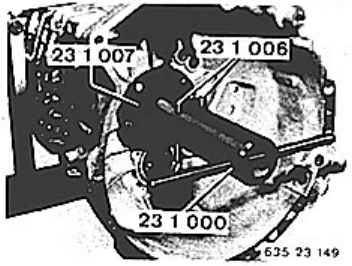


Drive in 6 x 26 mm dowel pin (counterhold).



Lubricate sealing lip of the radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

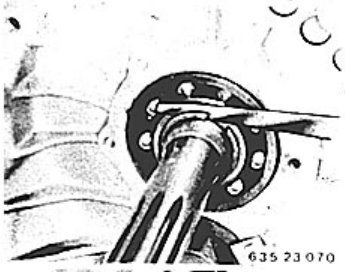
Coat sealing surface with a sealing compound**.
Sealing surface must be thoroughly cleaned and dried of oil.
Heat bearing inner race for input shaft to about 80° C (175° F) with a hot air blower.
Mount front case section while pulling out the input shaft.
Tighten front case section with correct torque*.



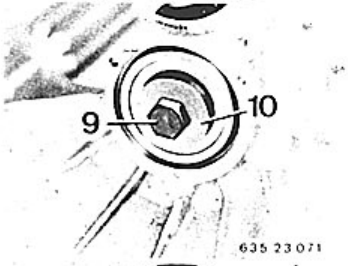
Version with Closed Bearing:
Coat sealing surface with a sealing compound**.
Sealing surface must be thoroughly cleaned and dried of oil.
Heat ball bearing inner race to about 80° C (175° F) with a hot air blower.
Mount case as far as possible.
Mount Special Tool 23 1 007 on the front case section.
Press grooved ball bearing on the input shaft or front case section on the gear wheel set with Special Tools 23 1 000 and 23 1 006.

Important!
Apply Special Tools 23 1 006 (dowel pins) that the flattened ends face the input shaft.

* See Specifications
** Source of Supply: HWB

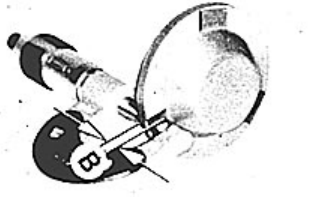


Install shim and circlip.
Reduce any play between the bearing inner race and circlip to 0 ... 0.09 mm (0 to 0.0035").



Engage 4th gear.
Install washer (10) and bolt (9).
Install bolt with a bolt cement**.
Tighten bolt (9) with correct torque* while holding the output flange with Special Tool 23 0 020.

Determine thickness of shim between the bearing outer race of the layshaft and sealing cover.
Measure distance (A) from bearing outer race to case opening for the mounting tabs.



Measure wall thickness (B) of the sealing cover, measuring on the recess for the mounting tab.

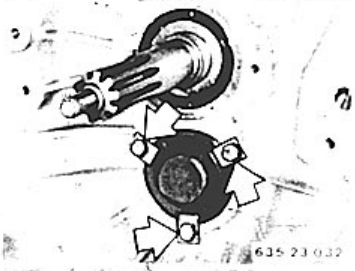
Example:

A = 1.4 mm (0.055")
– B = 0.9 mm (0.035")
0.5 mm (0.020") thick shim

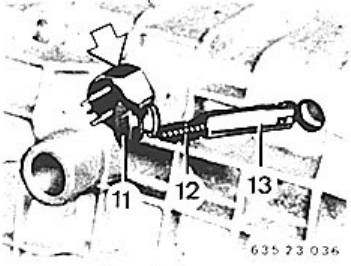
* See Specifications
** Source of Supply: HWB

Hold shim of determined thickness in position with grease.
Drive in sealing cover (7) to fit tight with Special Tool 33 4 020.

Important!
Install sealing cover that recesses on the sealing cover are aligned with openings on the case.

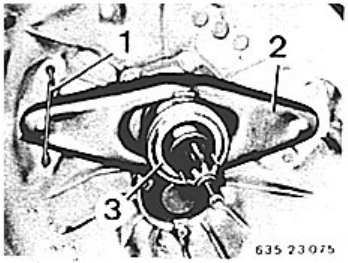


Tighten tabs with correct torque*.
Install bolts with a bolt cement**.



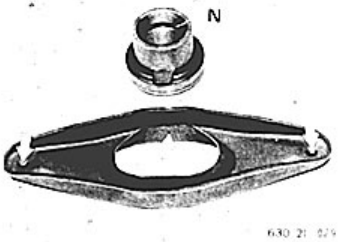
Install lockpin (13), spring (12) and cover (11).
Check installed position of the lockpin.

* See Specifications
** Source of Supply: HWB



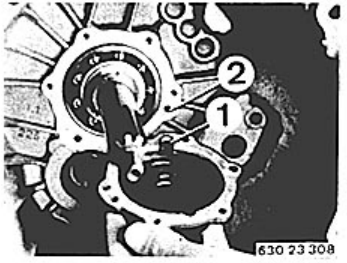
23 11 622 REMOVING AND INSTALLING GUIDE SLEEVE FOR CLUTCH RELEASE
– Transmission Removed –

Lift out spring (1) and remove release lever (2) with thrust bearing (3).



Installation:
Fill lubricating groove N with Molykote Longterm 2.
Coat guides F and bearings L with Molykote Longterm 2.
Non-conformance could cause seizure of the release bearing on the guide sleeve.

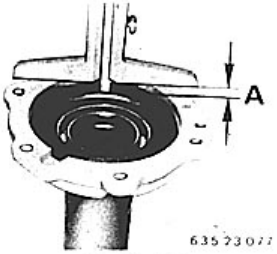
Important!
Use Microlube 261** on version with a double-mass flywheel.



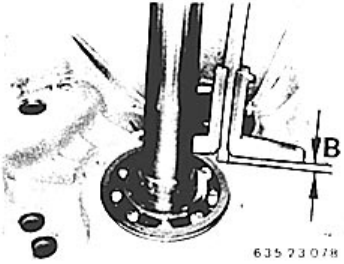
Unscrew guide sleeve.

Important!
Shims.

Installation:
Mount guide sleeve that oil groove (1) is aligned with oil bore (2) in transmission case or arrow on face points to middle of the layshaft.
Install guide sleeve and bolts with a sealing compound**.
Sealing surface and bolts must be cleaned thoroughly and dried of oil.
Tightening torque*.



Installation:
Eliminate any play.
Max. axial preload on bearing outer race = 0.1 mm (0.004").
Determine thickness of shim.
Measure distance (A).

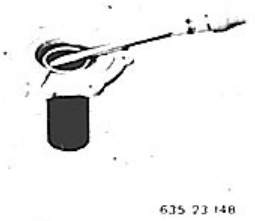


Measure distance (B).

Example:
A = 3.0 mm (0.118")
– B = 2.6 mm (0.102")
0.4 mm (0.016") thick shim

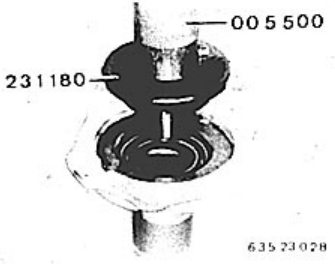
* See Specifications
** Source of Supply: HWB

23 12 502 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT –TRANSMISSION REMOVED–



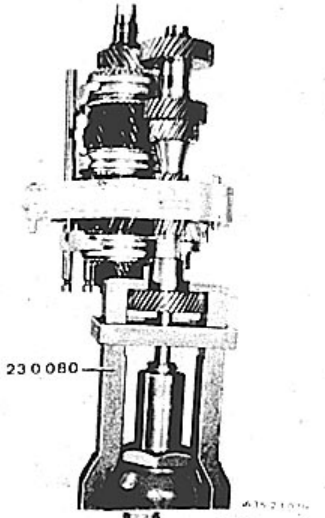
635 23 148

Remove guide sleeve 23 11 622.
Lift out radial oil seal.



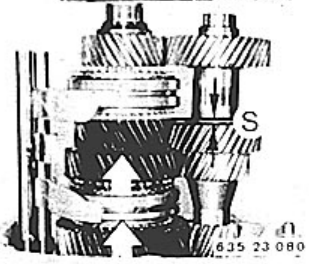
635 23 028

Drive in radial oil seal with Special Tools 23 1 180 and 00 5 500.
Open end faces up.
Lubricate sealing lip with oil.

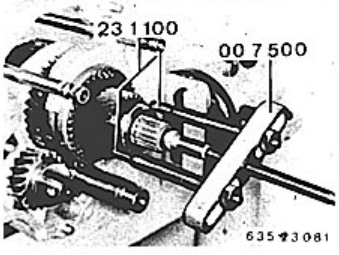


23 21 501 REMOVING AND INSTALLING INPUT/OUTPUT SHAFT ASSY. –CASE FRONT AND REAR SECTIONS REMOVED–

Clamp Special Tool 23 0 080 in a vise.
Take intermediate case with gear set off of Special Tool 23 0 030 and mount on Special Tool 23 0 080.
Pull off 5th gear.
Pulling off force*.

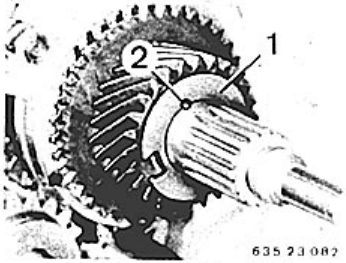


Caution!
To avoid damaging the 3rd gear when pulling off 5th gear, make sure that play (S) is always provided between 3rd gear and layshaft.
Push up output shaft if necessary.

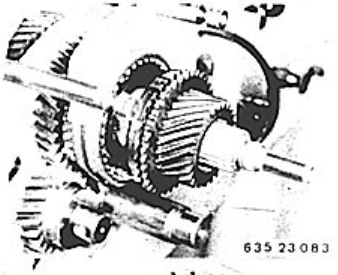


Take up intermediate case with gear set in Special Tool 23 0 030 again.
Pull bearing inner race off of output shaft with Special Tools 23 1 100 and 00 7 500.
Machine pulling hooks accordingly to fit in slots.

* See Specifications

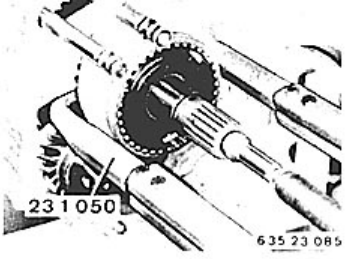


Take off washer (1) and ball (2).

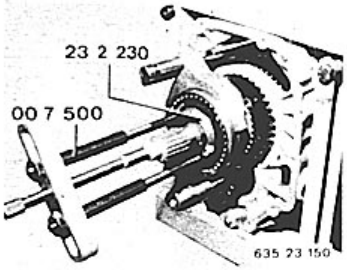


Pull off 5th gear with synchromesh ring and split needle bearing.

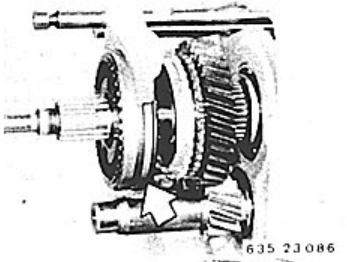
Remove circlip (3).
Installation:
Replace circlip.



Pull off reverse gear with operating rod and guide sleeve, with Special Tool 23 1 050.

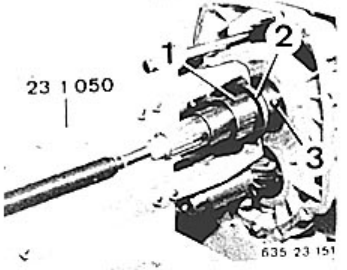


For the version with a pre-tensioned toothed washer on the gear wheel the guide sleeve must be pulled off of the output shaft with help of Special Tool 23 2 230 used together with Special Tool 00 7 500 (Kukko).

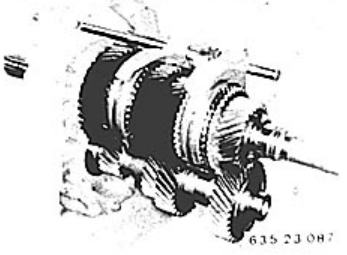


Take guide sleeve with shift fork and shift rod, synchromesh ring, reverse gear and needle bearing off of the output shaft.

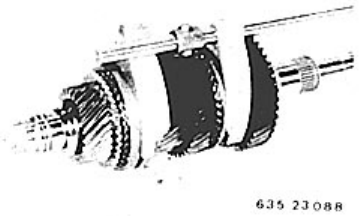
Important!
Installation:
Shouldered end of operating sleeve must face the reverse gear.



Version with Bearing Sleeve:
Drive output shaft forward with light knocks from a plastic hammer until the pulling-off claws can be applied.
Pull bearing sleeve (1) and thrust washer (2) off of the output shaft using Special Tool 23 1 050 (Kukko).
Remove ball (3).

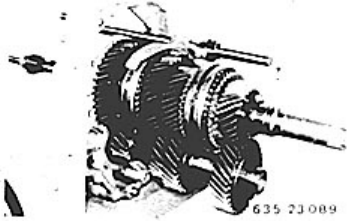


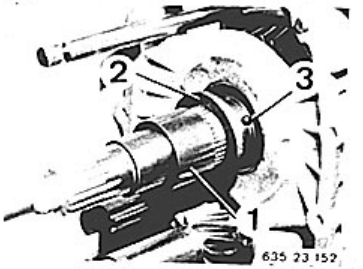
Pull input shaft, output shaft with 1st/2nd gear shift rod, 3rd/4th gear shift fork and layshaft out of the intermediate case.



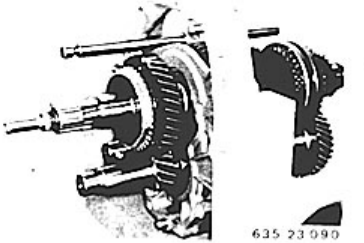
Take shift rod with 1st/2nd gear shift fork and 3rd/4th gear shift fork off of the gear set assembly.

Installation:
Insert input shaft, output shaft with 1st/2nd gear shift rod and layshaft into the intermediate case.



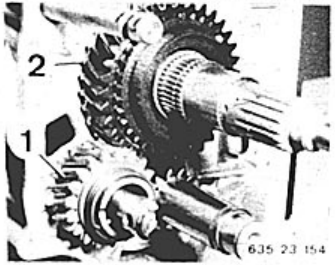


Version with Bearing Sleeve:
Insert ball (3) and push thrust washer (2) on.
Heat bearing sleeve (1) to about 80° C with a hot air blower and push on to the output shaft.

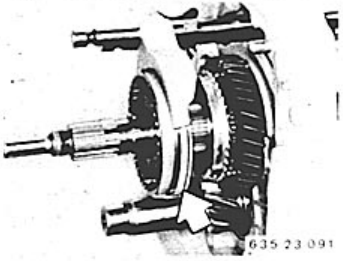


Install needle bearing, reverse gear and synchromesh ring on the output shaft.

Version with Tensioned Tooth Rings:
Install needle bearing and reverse gear wheel.
Push on intermediate wheel (1) up to the tooth ring.
Turn tooth ring on intermediate wheel until the teeth of the intermediate gear wheel and layshaft mesh.

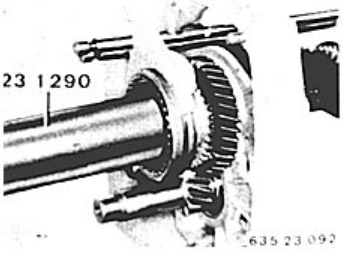


Push on intermediate gear wheel in this position up to the tooth ring of the gear wheel.
Turn tooth ring (2) on the gear wheel until the teeth of the gear wheel and intermediate gear wheel (1) mesh.
Mount intermediate gear wheel against the bearing surface.



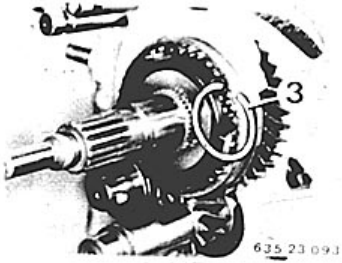
Install guide sleeve with operating sleeve and selector rod with 5th/reverse gear selector fork on the output shaft.

Important!
Stepped end of the operating sleeve must face the reverse gear wheel.



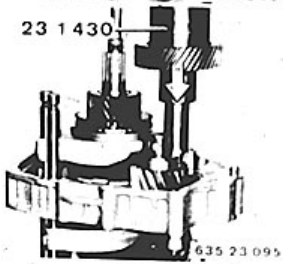
Drive on guide sleeve by applying light knocks with Special Tool 23 1 290.

Important!
Tabs on synchromesh ring must be aligned with openings of guide sleeve.

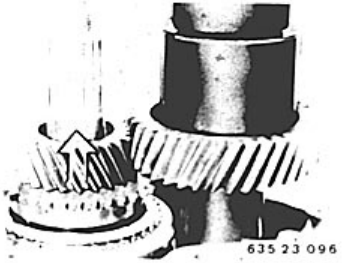


Move operating sleeve in direction of the reverse gear wheel.
Adjust guide sleeve free of play with circlip (3).
Circlips are available from Parts in different thicknesses from 1.7 to 2.0 mm (0.067 to 0.079").
Install circlip (3).

Install synchromesh ring and 5th gear wheel.

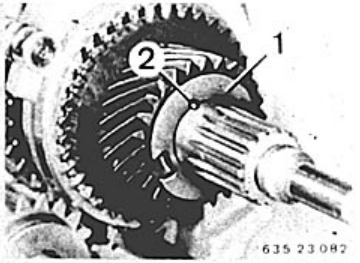


Take transfer case with gear wheel set off of Special Tool 23 0 030 and set up in a press.
Lubricate pressing surface of the layshaft with oil.
Heat 5th gear wheel uniformly to 150° C (300° F), checking temperature with a thermocolor crayon.
Install 5th gear wheel on the layshaft and press on to fit tight with Special Tool 23 1 430.
Pressing-on force*.



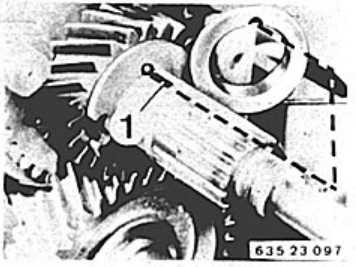
Important!
Lift and turn the 5th gear wheel until the teeth mesh.

* See Specifications



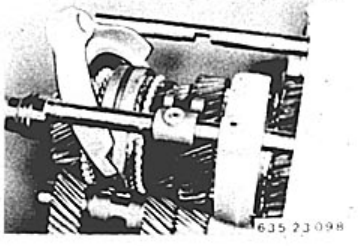
Install split needle bearing.
Insert ball (2) with grease.
Push on washer (1).

Note:
A transmission with code OH does not have a ball.

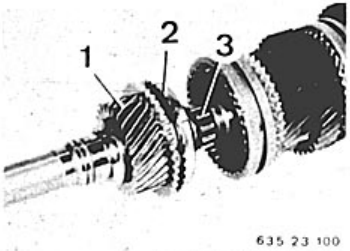


Installation:
Heat ball bearing inner race to about 80° C (175° F) with a hot air blower and push it on the output shaft.

Important!
Turning lock:
Opening on bearing inner race must engage on ball.
Draw line (1) to make installation of the bearing race easier.



Mount 3rd/4th gear selector fork.

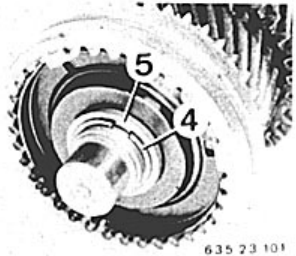


635 23 100

23 21 552 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

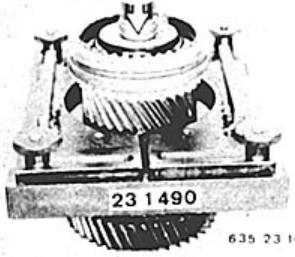
Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).

Note:
To avoid mixing up synchromesh rings while disassembling the output shaft, it is recommended to mark synchromesh rings for pertinent gear wheels.



635 23 101

Lift out circlip (4).
Take off shim (5).



635 23 102

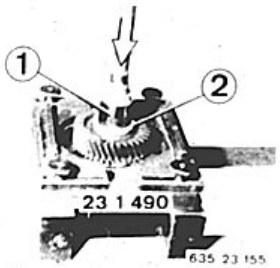
Press off 3rd gear wheel with guide and operating sleeves with Special Tool 23 1 490.
Take off needle bearing.
Pressing-off force*.

635 23 103

Lift out circlip (6).

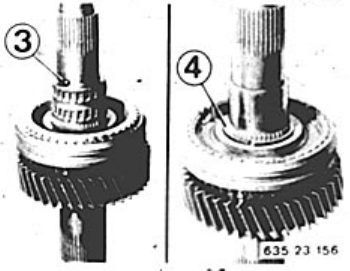
Installation:
Replace circlip.

*** See Specifications**



635 23 155

Version with Bearing Sleeve:
Press 2nd gear wheel with bearing sleeve (1) and thrust washer (2) off of the output shaft with Special Tool 23 1 490.



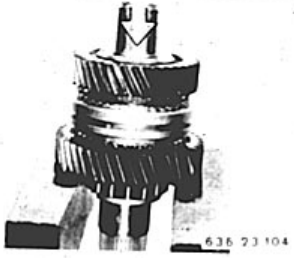
635 23 156

Take off ball (3), needle bearing and 2nd gear synchromesh ring.
Lift out circlip (4).

Installation:
Replace circlip.

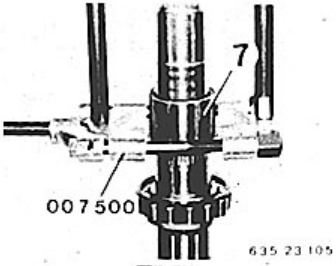
635 23 157

Press guide and operating sleeves for 1st /2nd gears with 1st gear wheel off of the output shaft.
Take off needle bearing.



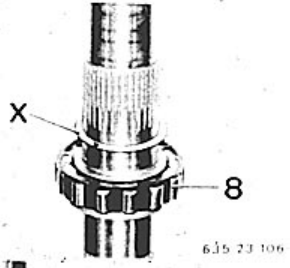
635 23 104

Press 2nd gear wheel, guide sleeve and 1st gear wheel off of the output shaft.



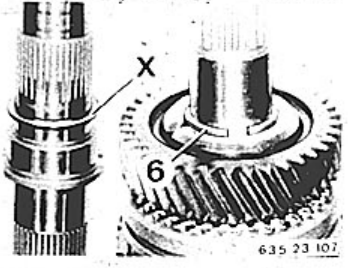
635 23 105

Pull collar (7) off of the output shaft with Special Tool 00 7 500.



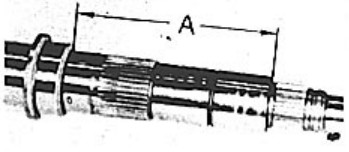
635 23 106

Take off shim (X) and roller bearing (8).



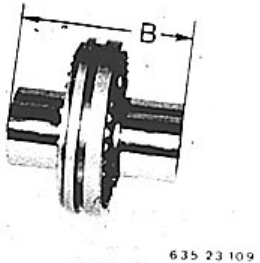
635 23 107

Important!
Determine thickness of shim (X) and circlip (6) before reinstalling the gear wheel set.
Shims are available in thicknesses from 0.3 to 0.5 mm (0.012 to 0.020") and circlips from 1.7 to 1.9 mm (0.067 to 0.075") from Parts.



635 23 108

Determine thickness of shim X.
Measure distance (A) from collar of 3rd/4th gear guide sleeve to bearing surface of 1st gear collar.
For example: 128.3 mm (5.051").

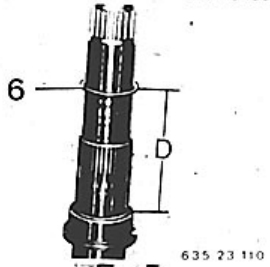


635 23 109

Assemble 1st gear collar, 1st/2nd gear guide sleeve and 2nd gear collar.
Measure distance (B).
For example: 93.1 mm (3.665").

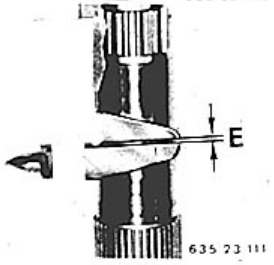
Example:

	A =	128.3 mm (5.051")
–	B =	93.1 mm (3.665")
		35.2 mm (1.386")
–	C =	34.7 mm (1.366") adjustment
	X =	0.5 mm (0.020") thick shim



635 23 110

Determine thickness of circlip (6).
Install old circlip in groove.
Measure distance (D) from bearing surface of 1st gear collar to lower edge of circlip.
Circlip must be pressed firmly in the groove while measuring.
For example: 93.6 mm (3.685").

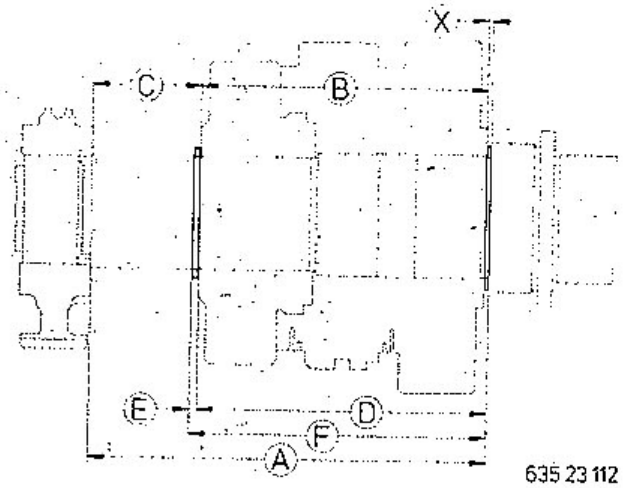


635 23 111

Measure thickness (E) of the circlip.
For example: 1.9 mm (0.075")

Example:

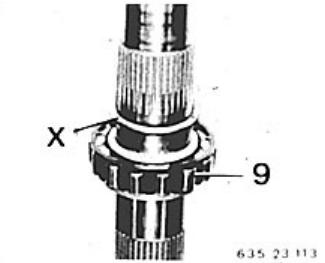
	D =	93.4 mm (3.677")
+	E =	1.9 mm (0.075")
	F =	95.3 mm (3.752")



635 23 112

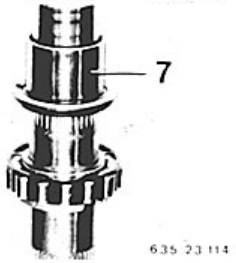
Beispiel:
Example:
B = 93.1 mm
+ X = 0.5 mm (0.020")
G = 93.6 mm (3.685")

F = 95.3 mm (3.752")
G = 93.6 mm (3.685")
E = 1.7 mm (0.067") thick circlip
E = 1.7 mm Sicherungsring



635 23 113

Install roller bearing (9) with the small diameter end of the plastic cage facing the collar.
Install shim (X) of determined thickness.

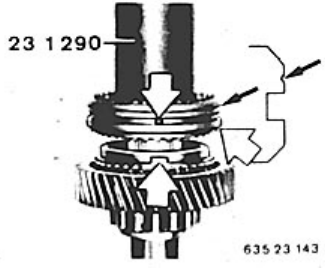


635 23 114

Heat collar (7) to about 80° C (175° F) with a hot air blower.
Install collar.

635 23 115

Install needle bearing, 1st gear wheel and synchromesh ring on the output shaft.

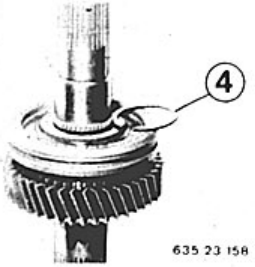


635 23 143

Install 1st/2nd gear guide sleeve with the stepped end of the operating sleeve facing the 1st gear wheel.
Version with Groove:
Groove faces 2nd gear wheel.
Press on guide sleeve to fit tight with Special Tool 23 1 290.
Pressing-on force*.

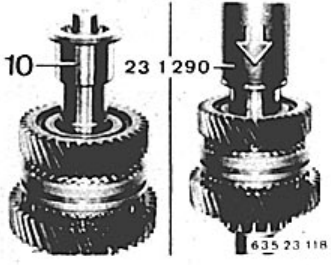
Important!
Make sure tabs on synchromesh ring are aligned with opening in guide sleeve while pressing on.

* See Specifications

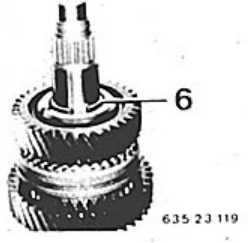


Install circlip (4) if still available. Play of the guide sleeve must be eliminated with the circlip. Circlips are available from Parts in different thicknesses from 1.7 to 1.95 mm (0.067 to 0.077").

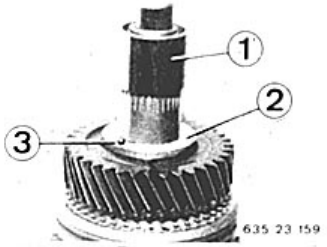
Install synchromesh ring, needle bearing and 2nd gear wheel.



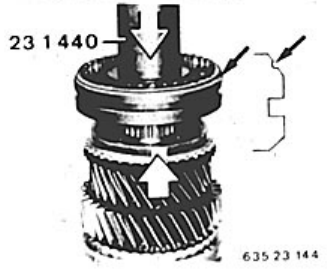
Heat collar (10) to about 80° C (175° F) with a hot air blower and install it on the output shaft, pressing it on to fit tight with Special Tool 23 1 290 when necessary.
Turn the 2nd gear wheel to prevent seizure of the needle bearing.



Install circlip (6) of determined thickness.

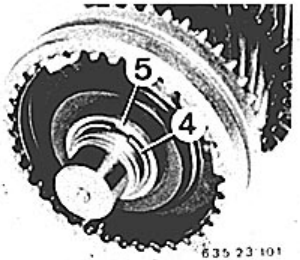


Install ball (3) and thrust washer (2). Heat bearing sleeve (1) to about 80° C (175° F) with a hot air blower and install it on the output shaft.



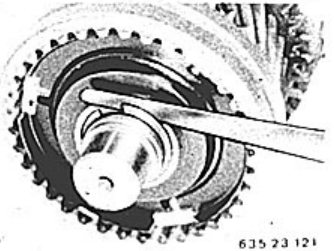
Install needle bearing, 3rd gear wheel and synchromesh ring.
Install 3rd/4th gear guide sleeve with the stepped end facing the 3rd gear wheel and press on with Special Tool 23 1 440.
Version with Groove:
Groove faces the 4th gear wheel.

Important!
Tabs on the synchromesh ring must be aligned with openings in the guide sleeve.



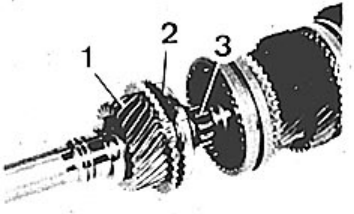
635 23 101

Install shim (5) and circlip (4).



635 23 121

Installation:
Reduce play between the circlip and g
sleeve to 0 ... 0.09 (0 ... 0.0035").



635 23 100

Install needle bearing (3), synchromesh ring (2) and input shaft (1).

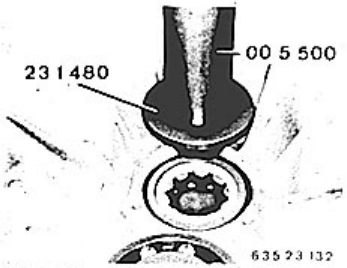
23 21 702 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS –TRANSMISSION REMOVED–

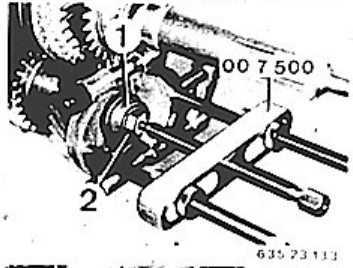
A) Input Shaft, Layshaft in Case Front Section:
Remove case front and rear sections 23 11 006.
Remove input/output shaft assy. 23 21 501.
Drive out bearing with Special Tools 23 1 180 and 00 5 500.

Heat case front section in area of bearing to approx. 80° C (175° F) with a hot air blower.
Important!
Install bearing with rollers facing gear set, driving in to fit tight with Special Tools 23 1 470 and 00 5 500 if necessary.

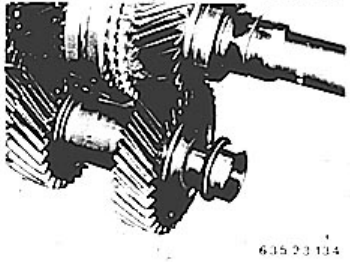
Layshaft:
Drive out roller bearing with Special Tools 23 1 390 and 00 5 500.



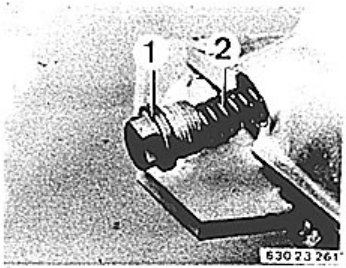
Heat case front section in area of bearing to approx. 80° C (175° F) with a hot air blower.
Drive in roller bearing with Special Tools 23 1 480 and 00 5 500.
Determine thickness of spacer between bearing outer race and sealing cover (see 23 11 006).



Pull bearing inner race (1) off of layshaft with Special Tool 00 7 500.
Caution!
Bolt (2) must be screwed in tapped bore to avoid damage on threads.



Heat new bearing inner race to approx. 80° C (175° F) with a hot air blower and install on layshaft.
If necessary, drive on to fit tight with Special Tool 23 1 160.



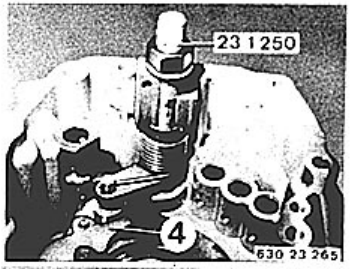
B) Output Shaft, Layshaft in Case Rear Section:
Output Shaft:
Unscrew bolt (1).
Caution!
Spring force!
Remove spring (2).
Installation:
Install bolt with bolt cement**.

Install Special Tool 23 1 250 to remove the selector arm.

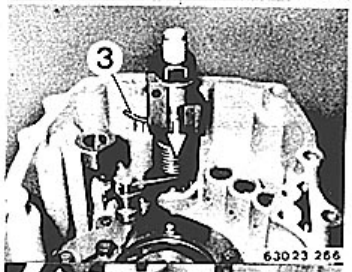
Remove socket head screw (3).
Installation:
Install screw with bolt cement**.
Tightening torque*.

Remove selector arm from above.
Important!
Roller.

* See Specifications
** Source: HWB

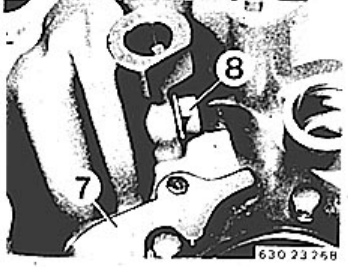


Installation:
Insert selector arm with Special Tool 23 1 250.
Swing out selector arm with roller above locking lever (4).



Move end of spring (3) over boss into installed position.
Push down (do not knock down) selector arm in this position.
Mount selector arm with socket head screw before removing special tool.
Install bolt with bolt cement**.
Tightening torque*.

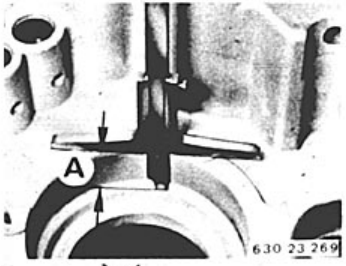
Remove bearing holder (5).
Important!
Don't unscrew bolt (6).
Locking lever (7) remains on bearing holder.



Installation:
Check installed position of locking lever (7) and thrust pin (8).

* See Specifications
** Source: HWB

Lift out radial oil seal.
Drive out grooved ball bearing with Special Tools 23 1 120 and 00 5 500.
Important!
Spacer (D).

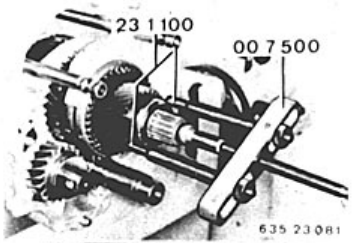


Determine thickness of spacer (D).
Measure distance (A).

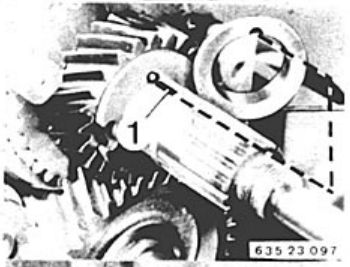
Measure distance (B).
Example:

	A	20.3 mm (0.799")
–	B	20.0 mm (0.787")
	D	0.3 mm (0.012") spacer thickn.

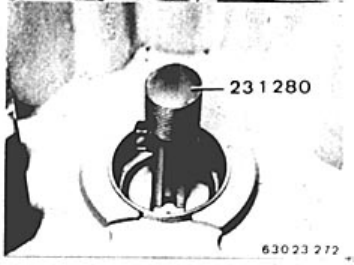
Heat case rear section in area of grooved ball bearing to approx. 80° C (175° F).
Insert spacer (D).
Install grooved ball bearing.
If necessary, drive in bearing against stop with Special Tool 23 1 470.



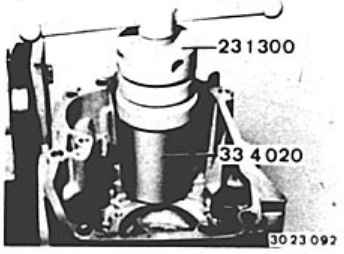
Pull bearing inner race off of output shaft with Special Tools 23 1 100 and 00 7 500.
Machine Special Tools 23 1 100 accordingly to fit in slots.



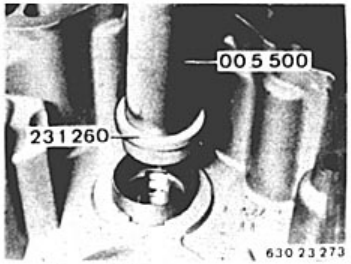
Heat ball bearing inner race to approx. 80° C (175° F) with a hot air blower and install on output shaft.
Important!
Turning lock.
Opening in bearing inner race must engage in ball.
Draw line (1) to make installation of bearing race easier.



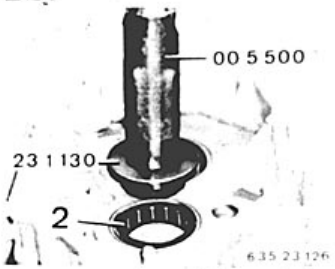
Layshaft:
Insert Special Tool 23 1 280 in bearing shell.



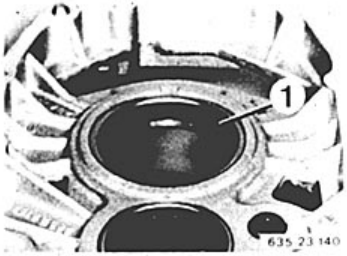
Apply Special Tool 33 4 020.
Screw on Special Tool 23 1 300.
Pull out bearing shell.



Drive in bearing shell with Special Tools 23 1 260 and 00 5 500.

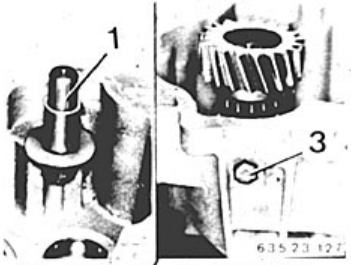


Drive out (and in) roller bearing (2) with Special Tools 23 1 130 and 00 5 500.
The roller bearing must be flush.



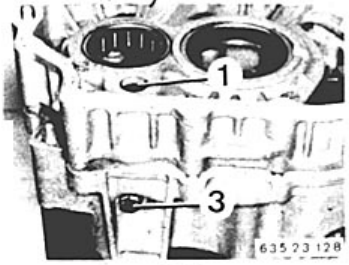
C) Output Shaft, Layshaft, Reverse Gear Wheel in Transfer Case

Output Shaft:
Check whether bearing outer race (1) can be reused.
The bearing outer race can be replaced only together with the complete transfer case.
Replacing the roller bearing on the output shaft requires removal of the output shaft – see 23 21 552.

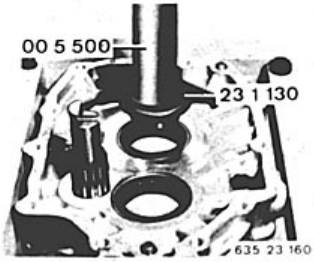


Mount reverse gear shaft (1) on the rear case section with bolt (3).
Install needle bearing and reverse gear wheel.

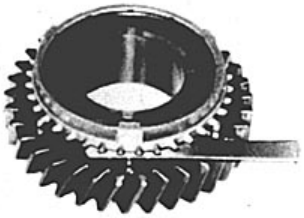
The reverse gear wheel shaft must be removed for removal of the roller bearing of the layshaft.
Press or drive out reverse gear wheel shaft (1).



Take transfer case off of Special Tool 23 0 030.
Heat bore for reverse gear wheel shaft to about 80° C (175° F) with a hot air blower.
Place transfer case on reverse gear wheel shaft (1) and center the bores of the case bolts.
Unscrew bolt (3) and take the transfer case off of the rear case section.



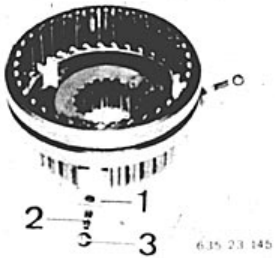
Version with Two Roller Bearings in Transfer Case:
Drive out (and in) both roller bearings with Special Tools 23 1 130 and 00 5 500.
The circlip must be removed for replacement of the needle bearing for the reverse gear wheel.



635 23 136

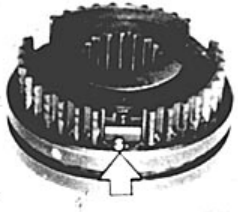
23 23 504 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION – Output Shaft Removed –

Disassemble output shaft – see 23 21 552.
All synchromesh rings are identical and have a molybdenum coat on the inside.
Check distance* between the synchromesh ring and clutch body.
Measure in the area of the stops.
Synchromesh rings should bear uniformly all around on the entire surface.



635 23 145

Disassemble synchronizer.
Thrust piece (1)
Spring (2)
Ball (3)



Installation:
Install all springs, thrust pieces and balls.

Important!
Domed surface of thrust pieces (2) faces the shifting sleeve.
Insert synchronizer in the operating sleeve half its distance.
Press in balls so far that the synchronizer can be pressed into the operating sleeve.

* See Specifications

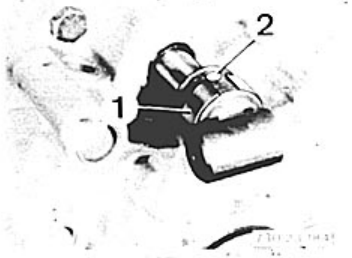
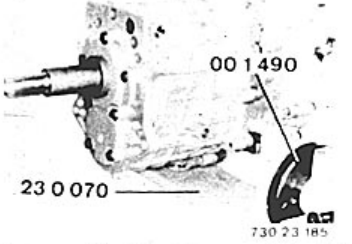
23 11 013 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE FRONT SECTION

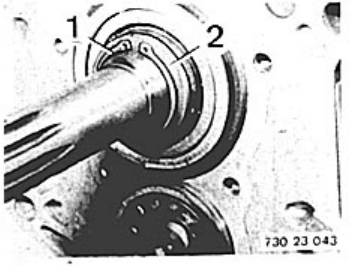
Remove transmission – see 23 00 022 in repair manual for pertinent model series.
Unscrew exhaust holder (3) and cross member (4) with rubber mounts.



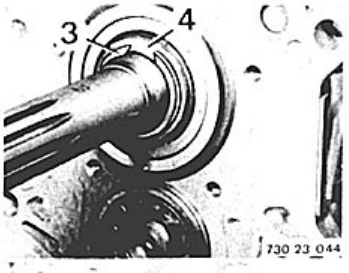
Engage 3rd gear.
Push back spring sleeve (1).
Drive out cylindrical pin (2).
Pull off selector rod.
Pull off selector rod joint.



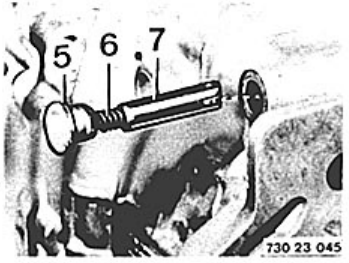
Mount transmission on Special Tool 23 0 070 in conjunction with Special Tool 00 1 490.
Drain oil.



Remove guide flange 23 11 623.
Lift out circlip (1).
Take off grooved washer (2).
Installation:
Position grooved washer that groove faces the circlip.

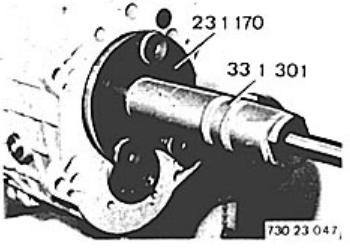


Lift out circlip (3).
Remove washer (4).
Installation:
Always replace circlip.

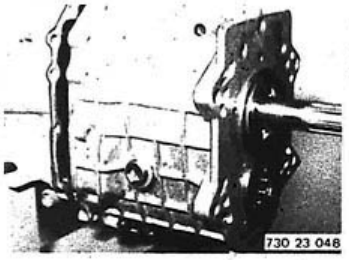


Lift out end cap (5).
Remove spring (6) and lockpin (7).
Installation:
Check installed position.
Remove backup light switch.

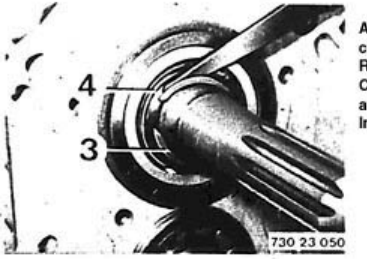
Drive out cylindrical pin.
Unscrew bolts.



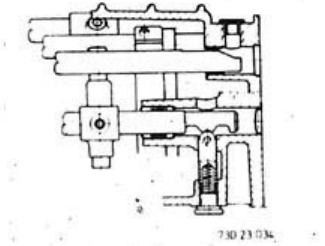
Pull off transmission case front section with Special Tools 23 1 170 and 33 1 301.



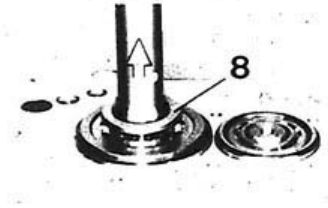
Coat seal surfaces with Loctite 573
Sealing surfaces must be cleaned thoroughly and dried of oil.
Install front portion of transmission*).



Adjust play between washer (4) and circlip (3).
Required max. play 0.09mm.
Circlips (3) in various thicknesses are available from spare parts service.
Install grooved washer and circlip.

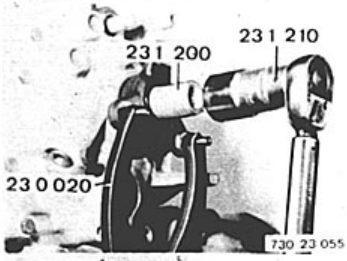


Install retaining bolts and reversing light switch.
Arrangement of retaining bolts.



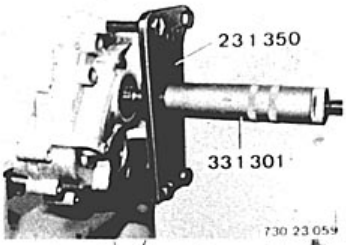
Heat bearing inner race (8) to approx. 80oC using hot air blower, and slide bearing onto driveshaft.
Simultaneously drawing on the driveshaft.

*) See Torque values

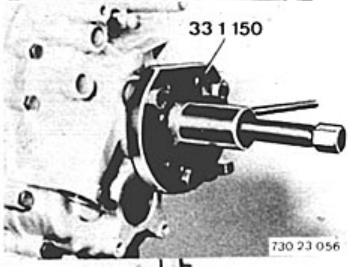


23 11 022 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE REAR SECTION

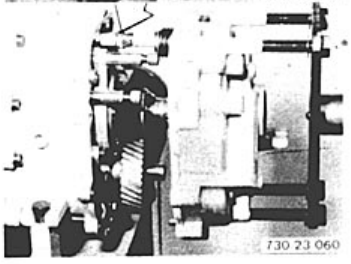
Lift out lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Tightening torque*.



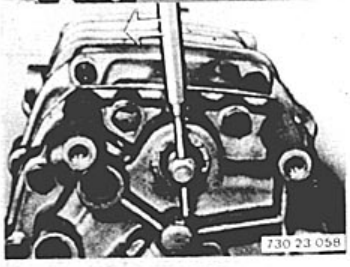
Knock back centering pin.
Pull off transmission case rear section with Special Tools 23 1 350 and 33 1 301.



Pull off output flange with Special Tool 33 1 150 if necessary.

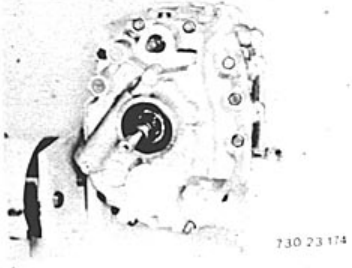


Take off rear section.
Important!
Rollers on selector shaft.

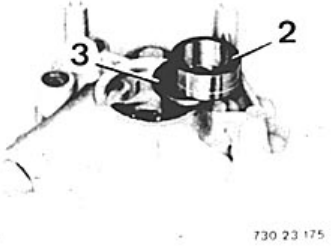


Caution!
Make sure 2nd gear is engaged before pulling off cover.
Swing selector shaft to the left against stop and slide forward.

Lift out radial oil seal.
Installation:
Replace radial oil seal.

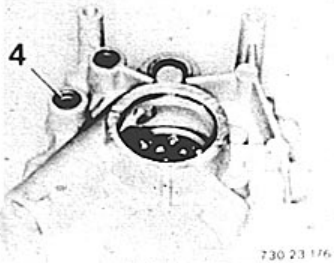


Unscrew rear case section mounting bolts.

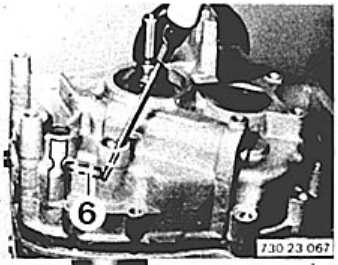


Remove spacer (2) and ball bearing inner race (3).

* See Specifications

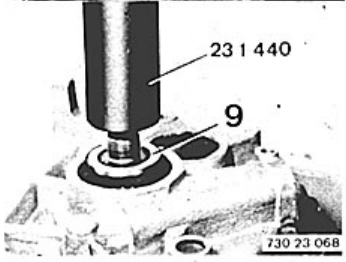


Knock out end cap (4).
Installation:
Replace and install end cap with Loctite No. 573.



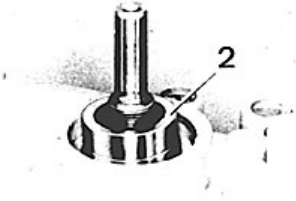
Press lockpin (6) into opening of 1st/2nd gear selector rod.
Push on and bolt down transmission case rear section.
Tightening torque*.
Drive in centering pin.
Install end cap (4).

Position output shaft upright.
Second gear is engaged.
Adjust reverse/5th gear selector rod until opening of 5th gear selector rod is aligned with end of 1st/2nd gear selector rod.

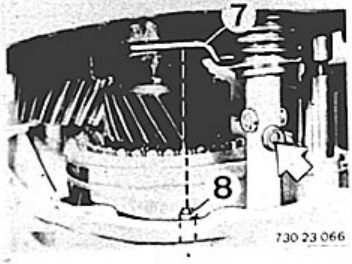


Heat bearing inner race (9) to about 80° C (175° F) with a hot air blower and slide on to output shaft, if necessary knocking on against ball bearing with Special Tool 23 1 440.

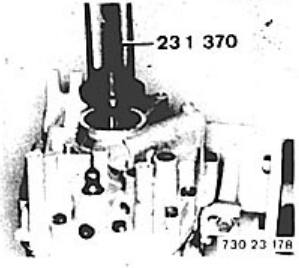
Coat sealing surfaces with Loctite No. 573.
Sealing surfaces must be cleaned thoroughly and dried of oil.
Important!
Lockpin (6) must move easily and face down.



Install spacer (2).

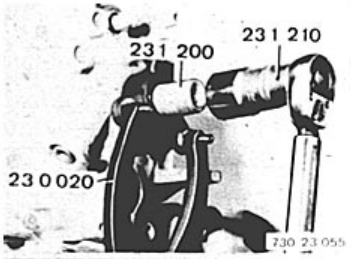


Hold rollers in position with grease.
Mount transmission case rear section.
Make sure spring (7) of selector arm engages on lever (8).

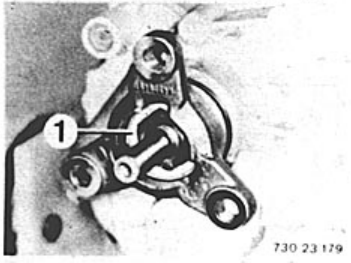


Drive in radial oil seal flush with Special Tool 23 1 370.

* See Specifications

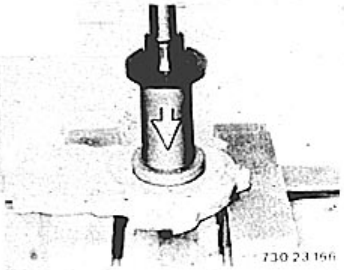


Mount output flange.
Install collar nut with Loctite No. 270.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.



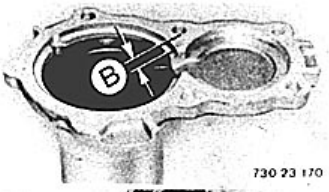
Install lockplate (1).

* See Specifications



23 11 610 REPLACING CLUTCH RELEASE GUIDE TUBE.
– Transmission Removed –

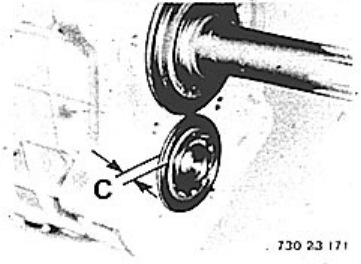
Remove guide flange, see 23 11 623.
Press out guide tube.



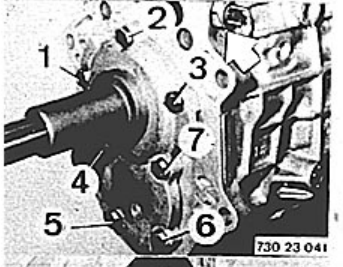
Measure distance (B).
Example:

B	8.1 mm (0.319")
– A	7.8 mm (0.307")
	0.3 mm (0.012") spacer thickness

Heat guide flange to about 80° C (175° F) with a hot air blower.
Install guide tube.
Note:
Check turning lock (1).
Install radial oil seal.

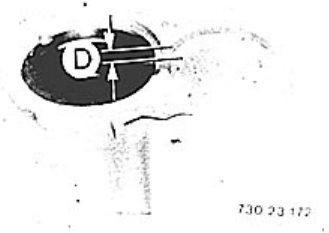


Adjust roller bearing play between layshaft and guide flange.
Measure distance (C) from case to roller bearing outer race.



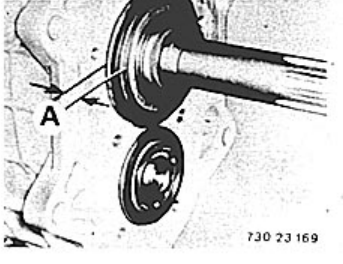
23 11 623 REMOVING AND INSTALLING/ SEALING COVER WITH GUIDE TUBE FOR CLUTCH RELEASE

Unscrew cover.
Important!
Spacers.
Important! – Installation:
Check length of bolts.
Bolts (1 ... 3) = 8 x 30 mm.
Bolts (4 ... 7) = 8 x 22 mm.

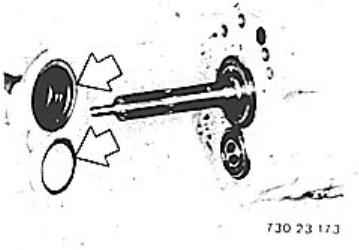


Measure distance (D).
Example:

D	4.8 mm (0.189")
– C	4.3 mm (0.169")
	0.5 mm (0.020")
– 0.1 ...	0.2 mm (0.004 ... 0.008") axial play
	0.3 mm (0.012") spacer thickness

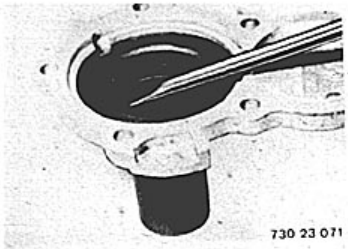


Adjust ball bearing between input shaft and guide flange to 0 ... 0.09 mm (0 to 0.0035").
Measure distance (A) from case to ball bearing.



Coat sealing surfaces with Loctite No. 573.
Sealing surfaces must be cleaned thoroughly and dried of oil.
Hold spacers of calculated thickness in position with grease.
Mount cover.
Install bolts with Loctite No. 573.
Tightening torque*.
Threads cleaned to remove old cement.

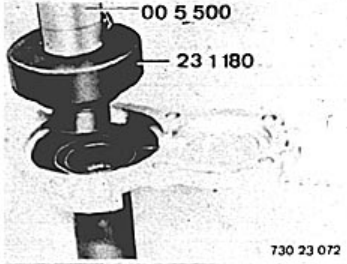
* See Specifications



730 23 071

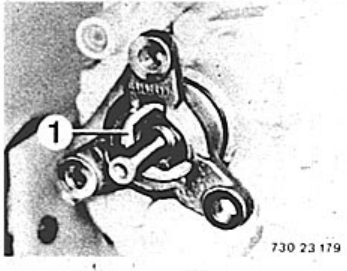
23 12 503 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT
– Transmission Removed –

Remove cover with guide tube 23 11 623.
Lift out radial oil seal.



730 23 072

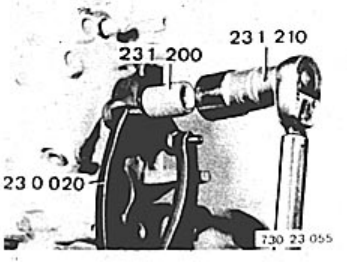
Drive in radial oil seal against stop with Special Tools 23 1 180 and 00 5 500.
Open end faces transmission.
Lubricate sealing lip with oil.



730 23 179

23 12 531 REPLACING RADIAL OIL SEAL FOR OUTPUT FLANGE
– Transmission Removed –

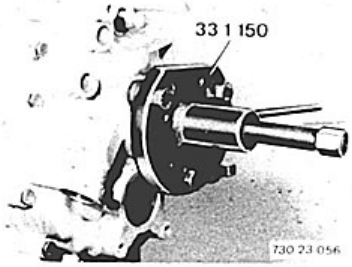
Remove lockplate (1).
Installation:
Replace lockplate.



730 23 055

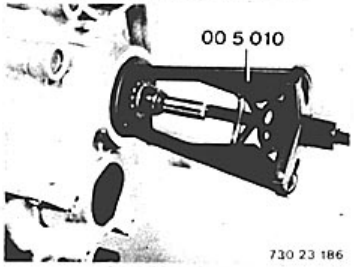
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Installation:
Install collar nut with a bolt cement**.
Tightening torque*.

* See Specifications
** Source: HWB



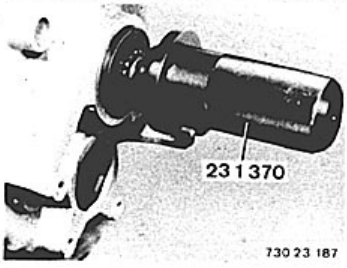
730 23 056

Pull off output flange with Special Tool 33 1 150.



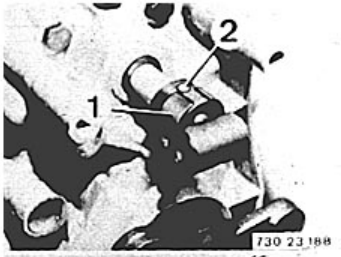
730 23 186

Pull out radial oil seal with Special Tool 00 5 010.



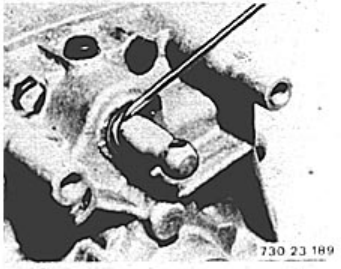
730 23 187

Installation:
Lubricate sealing lip with oil.
Drive in radial oil seal with Special Tool 23 1 370.



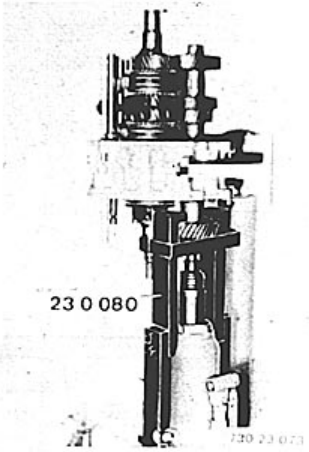
23 12 563 REPLACING RADIAL OIL SEAL FOR SELECTOR SHAFT
– Transmission Removed –

Engage third gear.
Push away locking sleeve (1) and drive out cylindrical pin (2).



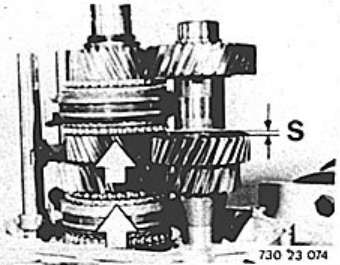
Lift out radial oil seal.

Lubricate sealing lip of radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

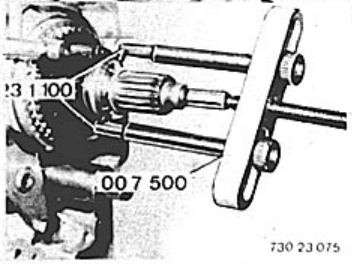


23 21 503 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY
– Transmission Case Front and Rear Sections Removed –

Swing down output shaft.
Pull 5th gear off of layshaft with Special Tool 23 0 080.
Bearing inner race will also be pulled off.
Pressing off force*.
Caution!
Support pulling tool to prevent it from falling down and causing injury.

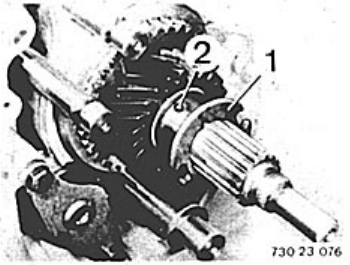


Important!
When installing 5th gear always remember to provide play (S) between 3rd gear and layshaft, to avoid damage to 3rd gear.
Push up output shaft if necessary.



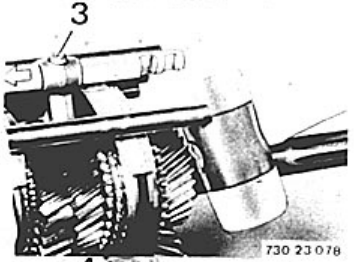
Pull bearing inner race off of output shaft with Special Tools 23 1 100 and 00 7 500.

* See Specifications

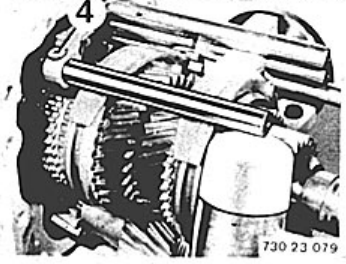


Take off washer (1) and ball (2).

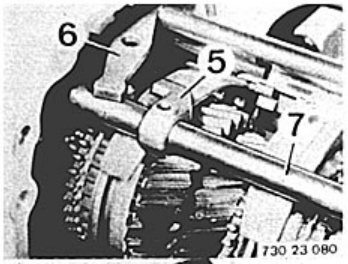
Pull off 5th gear with synchromesh ring and split needle bearing.



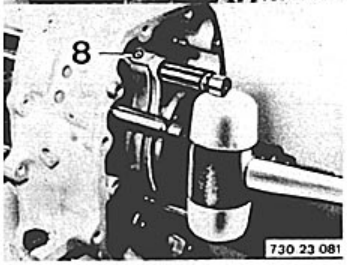
Remove needles on selector shaft.
Drive out pin (3) in selector shaft, while counterholding.
Pull out selector shaft toward rear.
Remove selector arm.
Installation:
Replace pin.



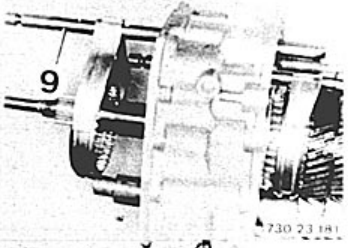
Engage 2nd gear.
Drive out pin (4), while counterholding.
Installation:
Replace pin.



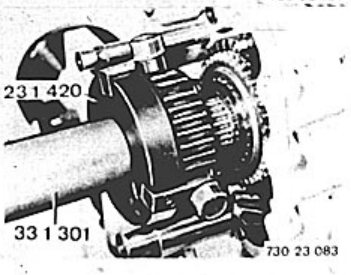
Pull or take off turning lock (5) and reversing lever (6).
Pull out selector rail (7) forward.
Disengage second gear.



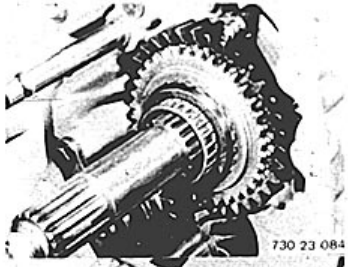
Pull out 5th gear selector rod with selector fork and operating sleeve toward rear far enough, that pin (8) can be driven out while counter-holding.
Important!
Loose balls, springs and slides.
Installation:
Replace pin.



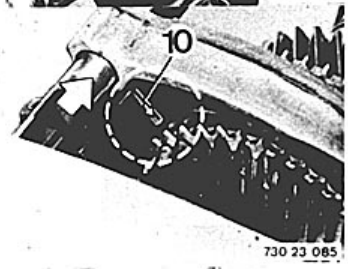
Pull off operating sleeve and 5th gear selector fork.
Pull out selector rod (9) forward.
Important!
Loose balls.



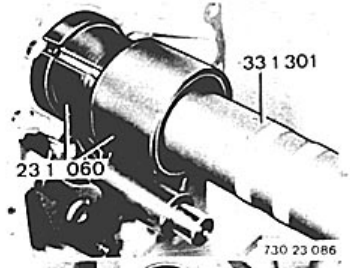
Pull guide sleeve and bearing inner race off of output shaft with Special Tools 23 1 420 and 33 1 301.
Important Information!
Mount knurled head screws in recesses of the guide sleeve with a pliers.



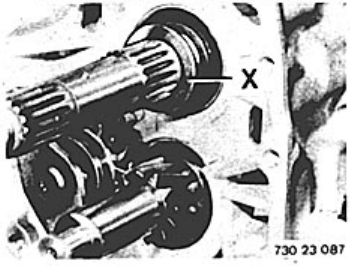
Remove synchromesh ring.
Pull off reverse gear and needle bearing.



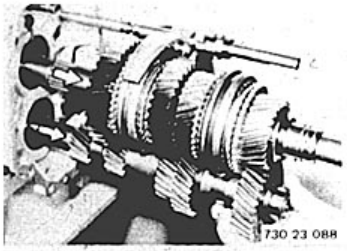
Engage third gear.
Drive out pin (10).
Important!
Drive in pin on to tooth of 3rd gear until selector rod can be pulled out forward.
Remove 3rd/4th gear selector fork.
Loose balls.
Installation:
Replace pin.



Pull out output shaft toward rear far enough, that bearing inner race can be pulled off with Special Tools 23 1 060 and 33 1 301.

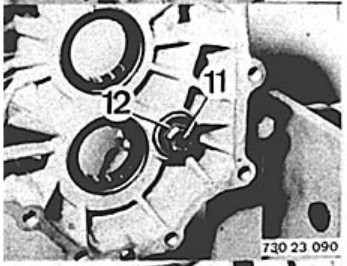


Remove shim X.
Installation:
Determine thickness of shim X – see 23 21 554.

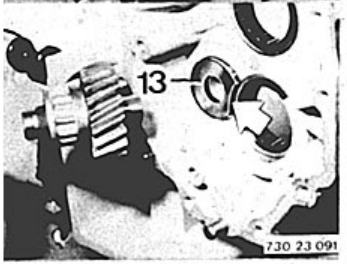


Pull out input and output shaft assembly with layshaft and 1st/2nd gear selector rod in intermediate case.
Important!
Loose balls.

Detach holder.



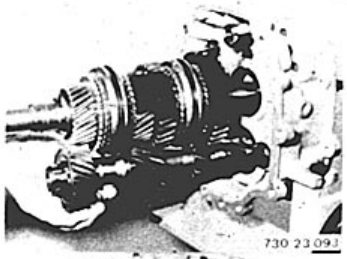
Unscrew bolt (11), while counterholding on front of shaft.
Installation:
Install bolt with Loctite No. 270.
Tightening torque*.
Remove washer (12).



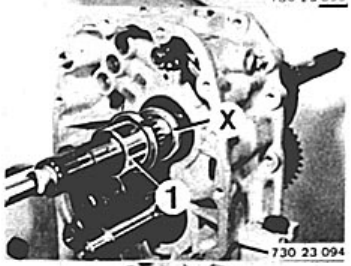
Knock out reverse gear shaft.
Installation:
Check installed position of thrust washer (13).
Check needle bearing, replacing if necessary.
Check condition of all bearings, replacing if necessary (see 23 21 703).

* See Specifications

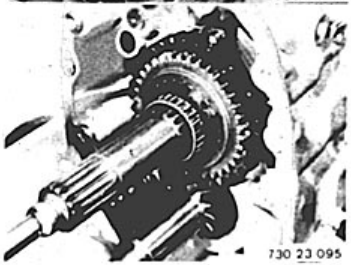
Installation:
Install and mount reverse gear.
Stepped collar of reverse gear faces out.
Tightening torque*.



Install input shaft, output shaft and layshaft in intermediate case.

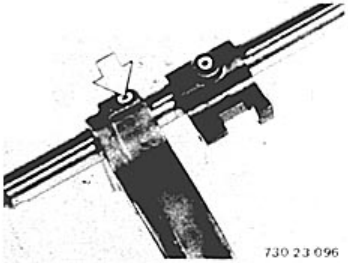


Install shim X.
Heat bearing sleeve (1) to approx. 80° C (175° F) with a hot air blower and install on output shaft.

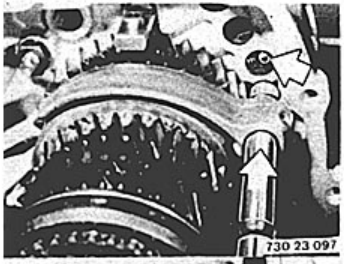


Install needle bearing and reverse gear.

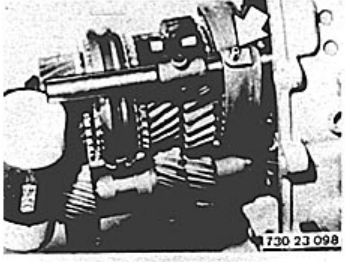
* See Specifications



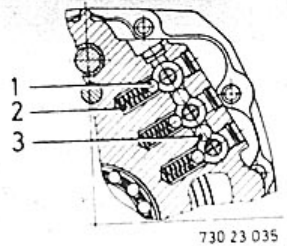
Drive pin out of 1st/2nd gear selector fork.
Installation:
Replace pin.



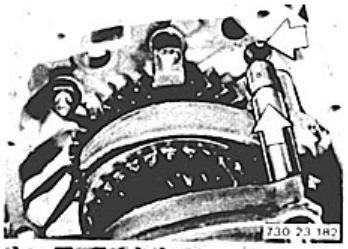
Mount 1st/2nd gear selector fork.
Push in 1st/2nd gear selector rod up to spring.
Insert locking balls and press down.
Push in selector rod against arrest in this position.



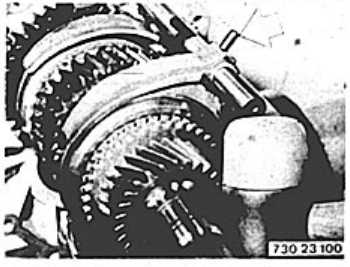
Drive in 6 x 32 mm pin, while counterholding.



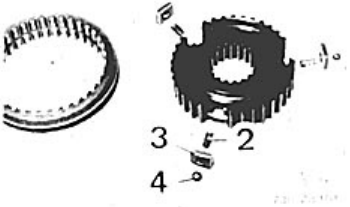
Layout of Selector Arrest:
1 Locking ball
2 Spring
3 Detent ball



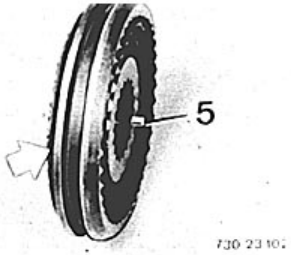
Mount 3rd/4th gear selector fork.
Insert detent ball.
Push in selector rod up to spring.
Insert locking balls and press down.
Push in selector rod against arrest in this position.



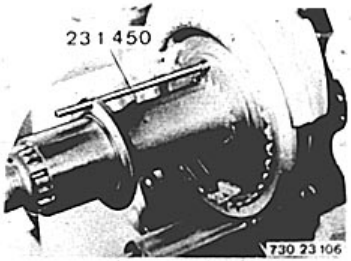
Drive in 6 x 26 mm pin, while counterholding.



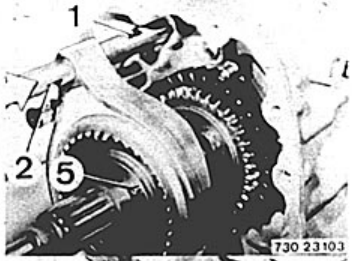
Assemble synchronizer.
Installed Order:
Springs (2), thrust parts (3) and balls (4).
Curved surface of thrust parts (3) faces operating sleeve.



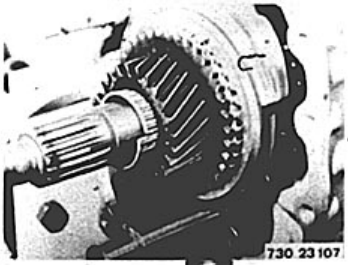
Important!
Stepped end of sliding sleeve must be opposite centering pin (5).



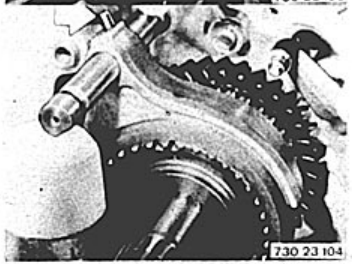
Place Special Tool 23 1 450 in centering pin.
Heat bearing sleeve to about 80° C (175° F) with a hot air blower and push on to output shaft.



Install guide sleeve.
Centering pin (5) faces 5th gear.
Install 5th/reverse gear selector fork.
Install detent ball.
Push in selector rod up to spring.
Insert locking balls and press down.
Push in and turn selector rod that openings (1 and 2) are always opposite locking balls.

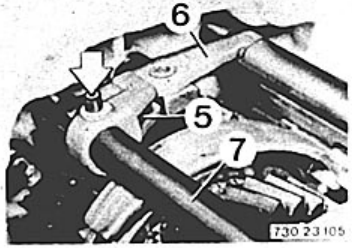


Install split needle bearing, synchromesh ring and fifth gear.

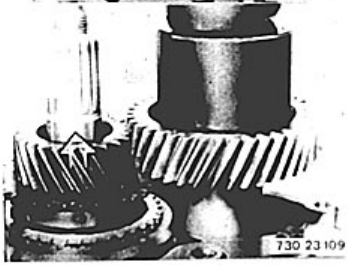


Push in selector rod far enough that 6 x 26 mm pin can be driven in, while counterholding
Push in selector rod and guide sleeve against arrest.

Detach intermediate case on mounting bracket and set up on a press.
Lubricate pressing surface of layshaft with oil.
Heat 5th gear uniformly to correct temperature with a hot air blower.
Press on 5th gear to fit tight with Special Tool 23 1 430.
Pressing on force*.

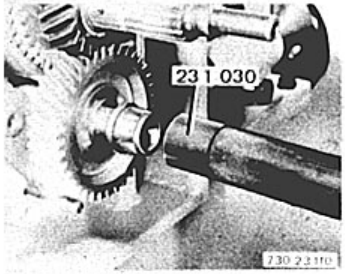


Install reversing lever (6).
Smooth side faces down.
Insert selector rail (7).
Push on turning lock (5).
Lock with a 6 x 26 mm pin.

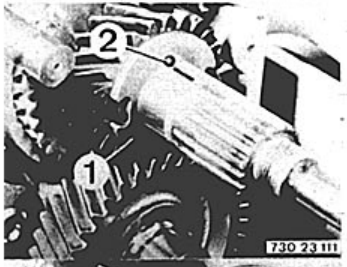


Important!
Lift and turn 5th gear until teeth mesh.

* See Specifications

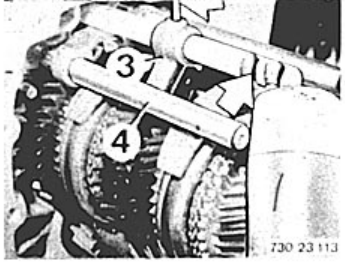


Heat bearing inner race to approx. 80° C (175° F) with a hot air blower and install on layshaft.
If necessary, drive on with Special Tool 23 1 030.
Collar of bearing race faces gear.

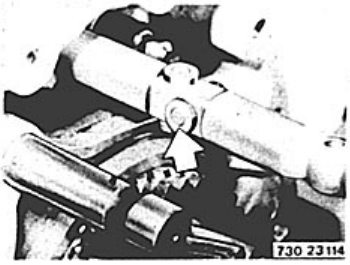


Insert ball (2) with grease.
Push on washer (1).

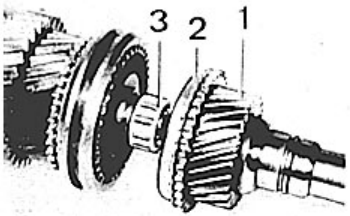
Installation!
Heat ball bearing inner races to about 80° C (175° F) with a hot air blower and install on output shaft.
Important!
Turning lock.
Opening in bearing inner race must engage in ball.
Draw line (1) to make installation of bearing race easier.



Install selector shaft, while pushing on selector arm (3) with long finger facing 3rd/4th gear selector rod.
Important!
Arrest on selector shaft faces selector rail (4).
Drive in 6 x 32 mm pin, while counterholding.



Hold four rollers in position on selector shaft with grease.

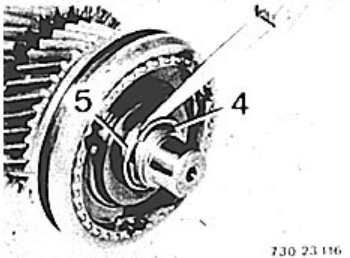


730 23 115

23 21 554 REPLACING OUTPUT SHAFT
– Output Shaft Removed –

Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).

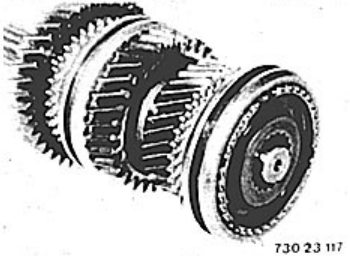
Note:
To avoid mixing up synchromesh rings while disassembling the output shaft. It is recommended to mark the synchromesh rings for pertinent gear wheels.



730 23 116

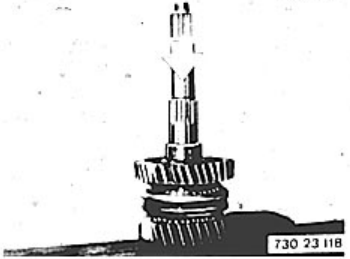
Lift out snap ring (4).
Take off washer (5).

Installation:
Reduce play between the snap ring and guide sleeve to 0 ... 0.09 mm (0 to 0.0035").
Always replace the snap ring.



730 23 117

Pull off guide sleeve, synchromesh ring, 3rd gear wheel and needle bearing.



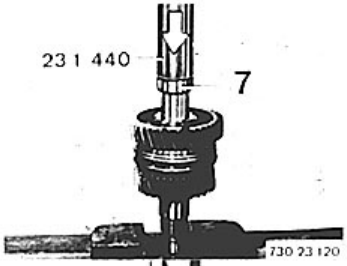
730 23 118

Press 2nd gear wheel, needle bearing, synchromesh ring, guide sleeve, synchromesh ring, 1st gear wheel, needle bearing with bearing sleeve and bearing inner race off of the output shaft.
Check all needle bearings, replacing when necessary.
Check synchromesh ring – see 23 23 505.

730 23 119

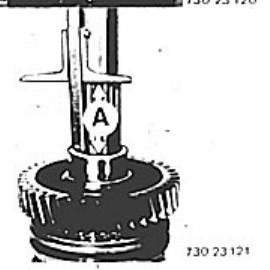
Install needle bearing, 2nd gear wheel, synchromesh ring and guide sleeve with stepped groove facing the 1st gear wheel.
Install bearing sleeve and needle bearing in the 1st gear wheel.
Install synchromesh ring.
Press in output shaft.

Important!
Guide synchromesh ring with tabs into the operating sleeve.



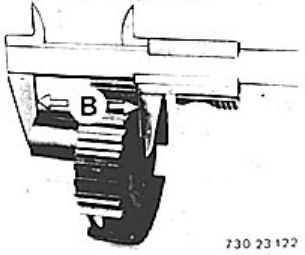
730 23 120

Heat bearing inner race (7) to about 80° C (175° F) with a hot air blower and install it on the output shaft, pressing it on with Special Tool 23 1 440 when necessary.



730 23 121

Determine thickness of shim X.
Measure distance (A) from collar of the output shaft to the bearing inner race.



730 23 122

Place bearing sleeve for the reverse gear in the guide sleeve.
Measure distance (B) from collar of the guide sleeve to the bearing sleeve.

Example:
A = 52.2 mm (2.055")
– B = 52.0 mm (2.047")
X = 0.2 mm (0.008") thick shim

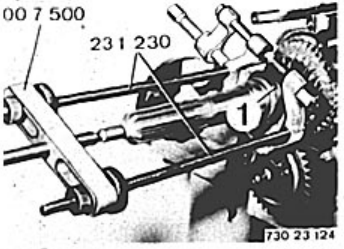
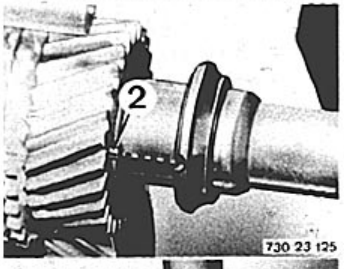
23 21 703 REPLACING BEARING OF ALL TRANSMISSION SHAFTS
– Transmission Removed –

A) Input Shaft, Layshaft in Case Front Section:

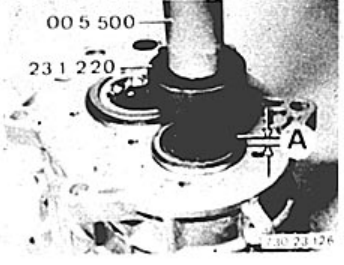
Remove case front section 23 11 013.
Drive ball bearing out of and into case with Special Tools 23 1 190 and 00 5 500.
Important!
Install ball bearing that collar faces out.



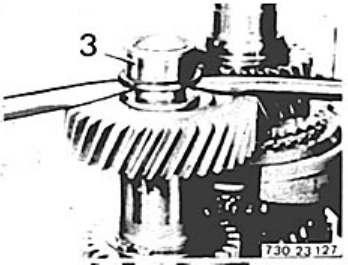
Pull bearing inner race (1) off of input shaft with Special Tools 23 1 230 and 00 7 500.



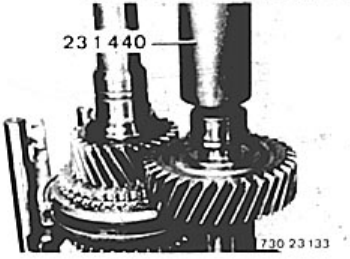
Installation:
Heat bearing inner race to about 80° C (175° F) with a hot air blower and install on input shaft.
Important!
Turning lock.
Pin (2) must be in opening of bearing inner race.



Drive layshaft roller bearing out and in with Special Tools 23 1 220 and 00 5 500.
Protrusion A = approx. 5 mm (0.197").
Install roller bearing that open end faces in.



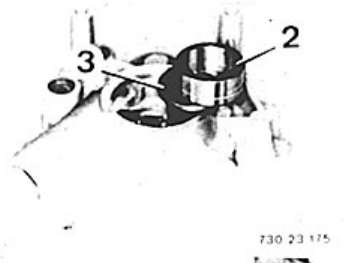
Press bearing inner race (3) off of layshaft with a screwdriver.

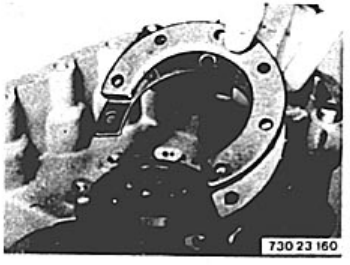


Installation:
Heat bearing inner race to about 80° C (175° F) and install on layshaft, driving on to fit tight with Special Tool 23 1 440 if necessary.
Collar of bearing inner race faces gear.

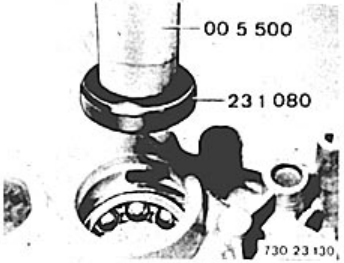
B) Output Shaft, Layshaft in Case Rear Section:

Remove case rear section 23 11 022.
Lift out radial oil seal.
Remove spacer (2) and bearing inner race (3).

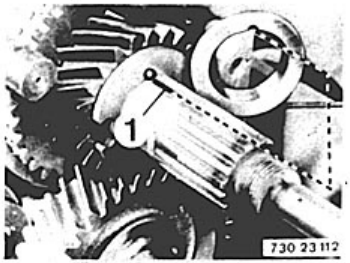




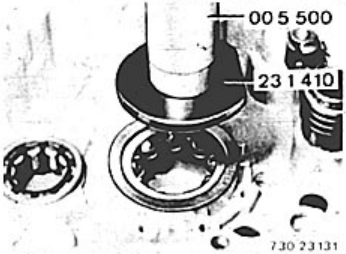
Unscrew bolts.
Remove bearing holder.



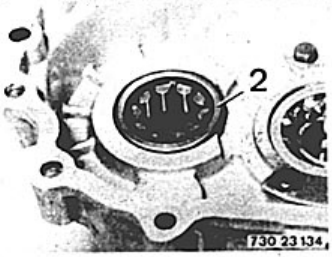
Drive out ball bearing with Special Tools 23 1 080 and 00 5 500.



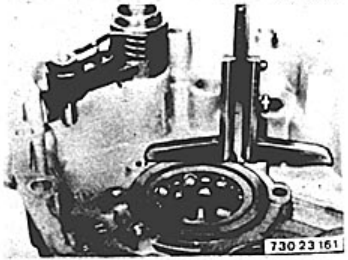
Installation:
Heat ball bearing inner race to about 80° C (175° F) with a hot air blower and slide on to output shaft.
Important!
Opening in bearing inner race must engage in ball.
Draw line (1) to make installation of bearing race easier.



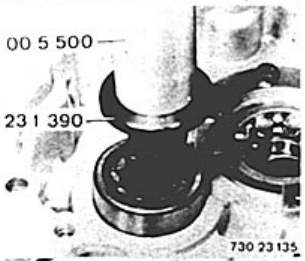
Drive in ball bearing with Special Tools 23 1 410 and 00 5 500.



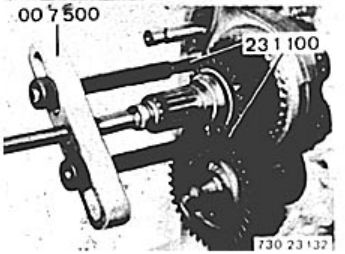
Heat case rear section to approx. 80° C (175° F) with a hot air blower.
Lift out roller bearing (2).
Installation:
Insert bearing that large diameter end of plastic cage faces up.



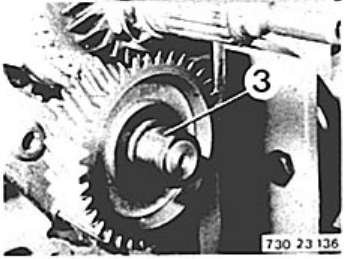
Adjust play between bearing holder and case rear section with shims.
Mount bearing holder.
Tightening torque*



Heat case rear section to about 80° C (175° F) with a hot air blower.
Install roller bearing, driving in with Special Tools 23 1 390 and 00 5 500.

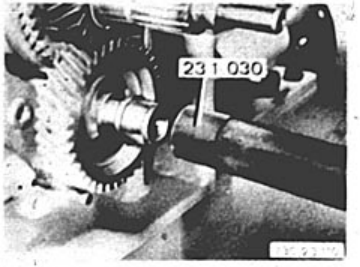


Pull ball bearing inner race off of output shaft with Special Tools 23 1 100 and 00 7 500.

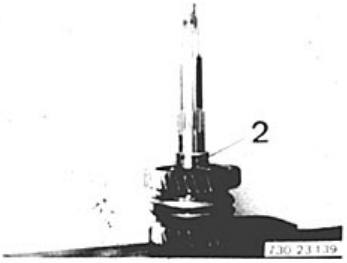


Bearing inner race (3) can only be pulled off together with the 5th gear (see 23 21 503).

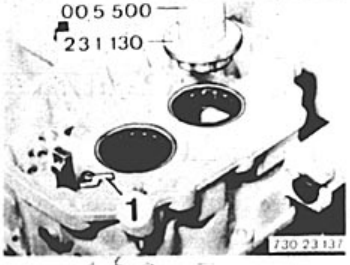
* See Specifications



Heat new bearing inner race to about 80° C (175° F) with a hot air blower and install on layshaft, driving on with Special Tool 23 1 030 if necessary.
Collar of bearing race faces gear.

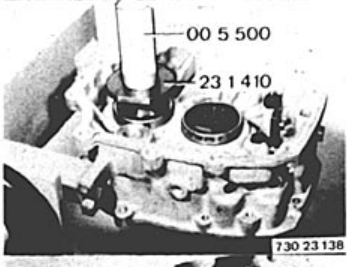


Check condition of bearing inner race (2) on output shaft, replacing if necessary.
If replacement is necessary, press gear set off of output shaft (see 23 21 554).



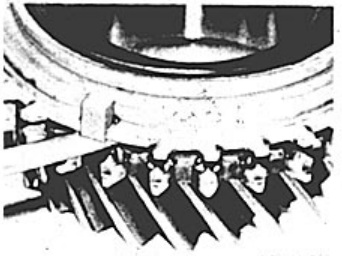
C) Output Shaft, Layshaft in Intermediate Case:

Remove input and output shaft assembly 23 21 503.
Drive roller bearings for input shaft and layshaft out of intermediate case with Special Tools 23 2 130 and 00 5 500.
Important!
Unscrew and turn oil plate (1) in case of roller bearing for output shaft.



Drive roller bearings for output shaft and layshaft into intermediate case with Special Tools 23 1 410 and 00 5 500.
Drive in roller bearings flush.

Bolt down oil plate (1) in vertical installed position.



23 23 505 DISASSEMBLING/ASSEMBLING ENTIRE SYNCHRONIZATION
– Output Shaft Removed –

Disassemble output shaft (see 23 21 554).
All synchromesh rings are identical and coated with molybdenum on the inside surface.
Measure distance between synchromesh ring and clutch body*.
Measure in area of stops.
Synchromesh rings must rest uniformly on entire surface.

Disassemble synchronization.
Thrust piece (1), spring (2) and ball (3).
Installation:
Bore (4) in operating sleeve must be aligned with ball (3).

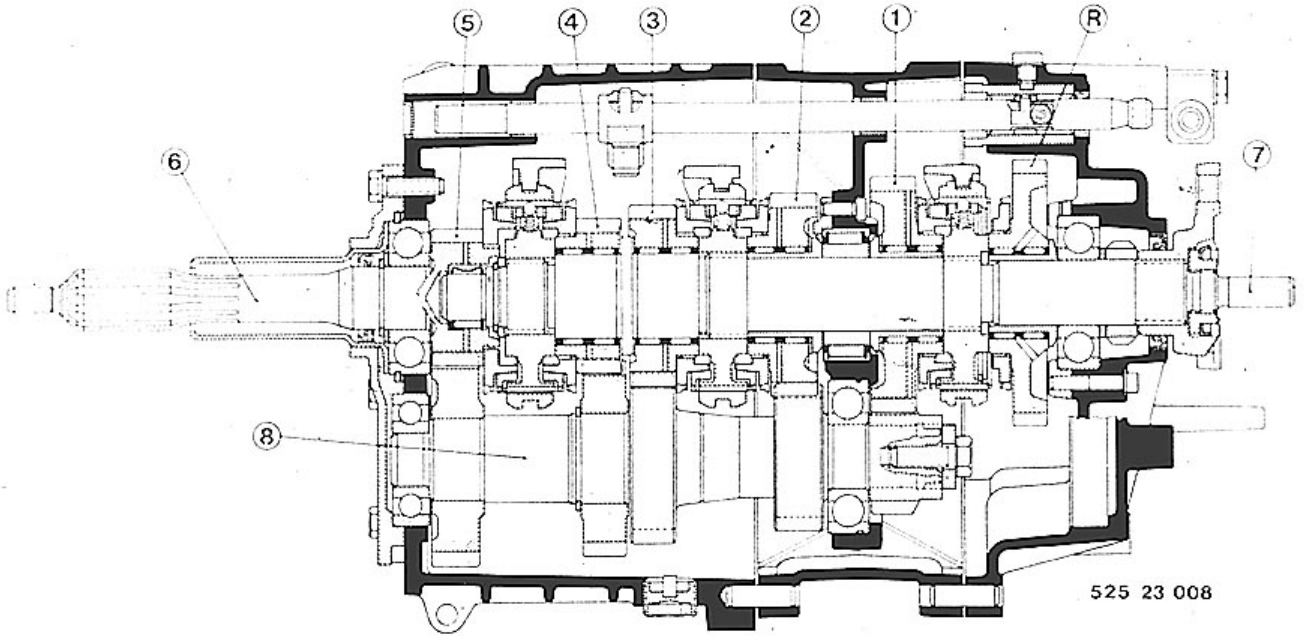
Installation:
Install all springs, thrust pieces and balls.
Important!
Curved surface of thrust pieces faces operating sleeve.
Insert guide sleeve half way in sliding sleeve.
Press in balls far enough that guide sleeve can be pressed into sliding sleeve.

* See Specifications

Construction group 23 Manual transmission

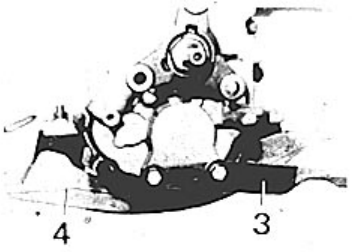
Getrag 265/5 Five speed sport transmission

	Transmission – layout drawing	23- 350
23 11 005	Transmission case front section – remove and install/seal	23- 352
040	Transmission case rear section – remove and install/seal	23- 354
622	Cover with guide tube for clutch release – remove and install/seal	23- 357
23 12 502	Radial oil seal for input shaft – replace	23- 357a
532	Radial oil seal for output flange – replace	23- 357a
562	Radial oil seal for shift shaft – replace	23- 357b
23 21 501	Input and output shaft assembly – remove and install	23- 358
552	Output shaft – replace	23- 361
702	Bearings of all transmission shafts – replace	23- 363
23 23 504	Synchronization – disassemble and assemble	23- 365



Assembly Drawing of 265 Five Speed Manual Transmission (Sport)

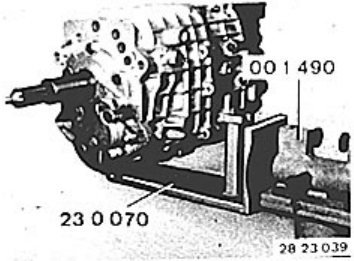
1 First gear
2 Second gear
3 Third gear
4 Fourth gear
5 Fifth gear
R Reverse gear
6 Input shaft
7 Output shaft
8 Layshaft



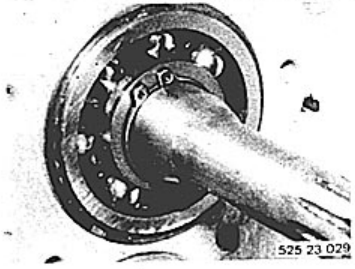
23 11 005 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE FRONT SECTION

Remove transmission – see 23 00 022 in repair manual for pertinent model series.
Unscrew exhaust holder (3) and cross member (4) with rubber mounts.

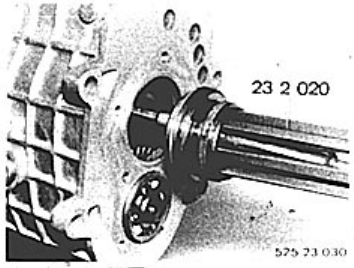
Engage third gear.
Push back spring sleeve (1).
Drive out pin (2).
Pull off selector rod.
Pull off selector rod joint.
Note:
Install selector rod joint with offset side facing left when looking forward in car.



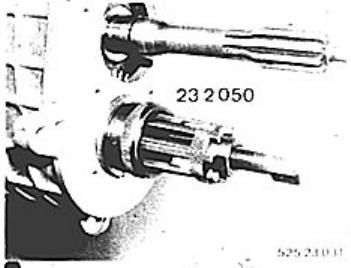
Mount transmission on Special Tool 23 0 070 in Special Tool 00 1 490.
Drain oil.



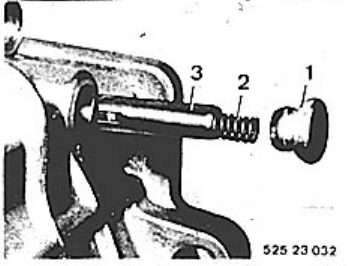
Remove cover with guide tube 23 11 623.
Remove circlip.
Remove spacer.



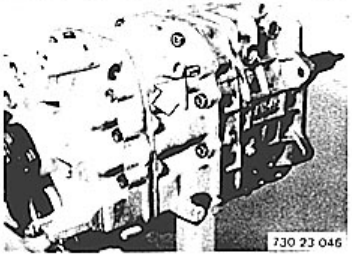
Pull grooved ball bearing out of input shaft with Special Tool 23 2 020.
Important!
Spacer.



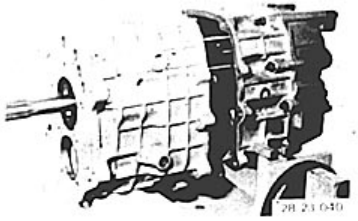
Pull grooved ball bearing out of layshaft with Special Tool 23 2 050.



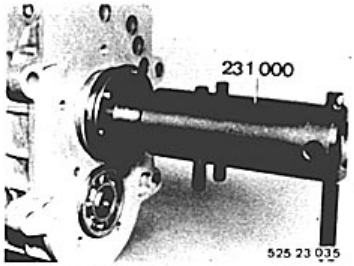
Lift off cap (1).
Remove spring (2) and lockpin (3).
Installation:
Check installed position.
Install cap with sealing compound.



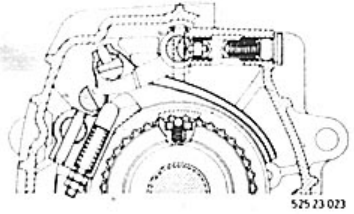
Unscrew backup light switch.
Important!
Seal.
Unscrew case front section on intermediate case.



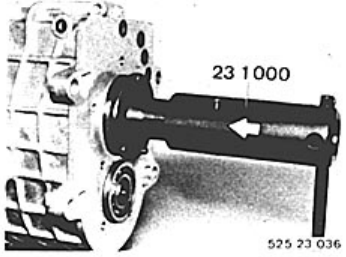
Pull off case front section.
Installation:
Replace gasket.



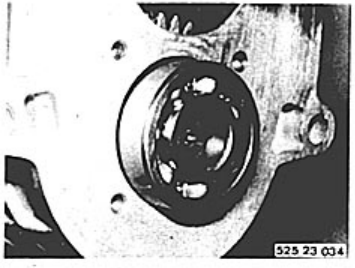
Heat grooved ball bearing inner race to about 80° C (175° F) with a hot air blower and press on to input shaft with Special Tool 23 1 000.



Mount case front section.
Tightening torque*.
Install backup light switch and lockpin.
Check position of lockpin.

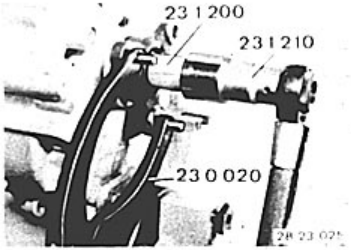


Remove pressure pin.
Drive in grooved ball bearing to fit tight.
Install spacer and circlip.
Mount cover.



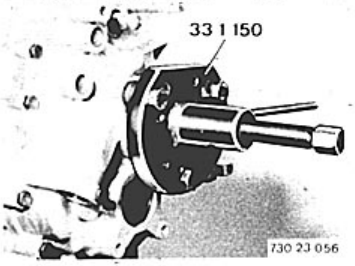
Heat grooved ball bearing inner race and case front section in area of bearing to about 80° C (175° F) with a hot air blower and drive on to layshaft.

* See Specifications

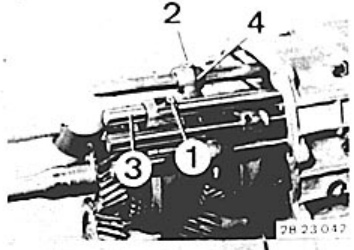


23 11 040 REMOVING AND INSTALLING/ SEALING TRANSMISSION CASE REAR SECTION

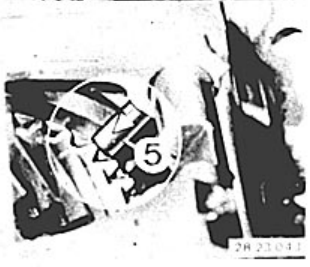
Remove case front section 23 11 012.
Remove lockplate.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 1 020.
Unscrew collar nut with Special Tool 23 1 210.



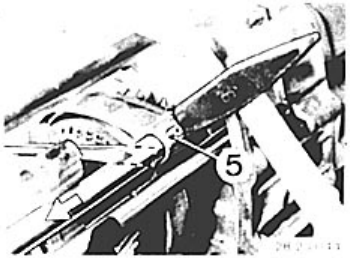
Pull off output flange with Special Tool 33 1 150.



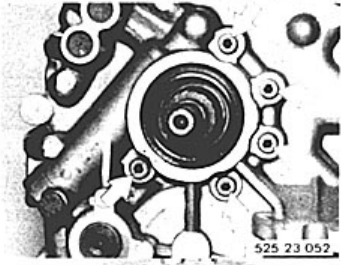
Drive out pins (1 and 2), while counterholding.
Pull out 4th/5th gear selector rod (3).
Swing up and pull selector arm (4) off of selector shaft.
Installation:
Replace pins.



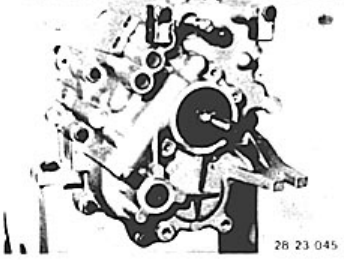
Engage third gear.
Drive out pin (5).
Important!
Drive pin on to center tooth of 3rd gear wheel.
Installation:
Replace pin.
Pull out 2bd/3rd gear selector rod.



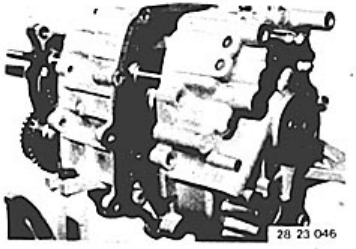
Second Disassembling Method:
Drive out pin (5) from bottom to top far enough while counterholding, and then pull out pin (5).
Installation:
Replace pin.
Pull out 2nd/3rd gear selector rod.



Unscrew bolts.

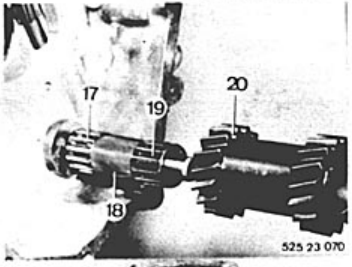


Unscrew bolts.
Knock back dowel pins.

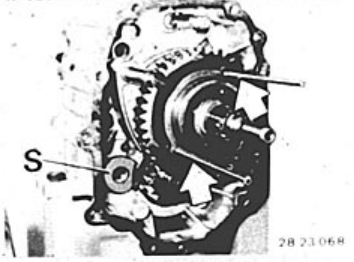


Heat case rear section in area of output shaft and layshaft to about 80° C (175° F) with a hot air blower.
Pull off case rear section.
Replace gasket.

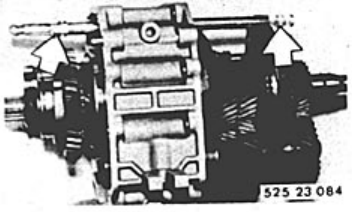
Drive out sealing caps (6 and 7).



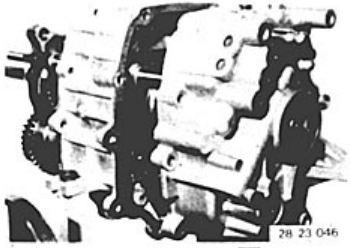
Slide on needle bearing (17), spacer (18), needle bearing (19) and double gear (20).



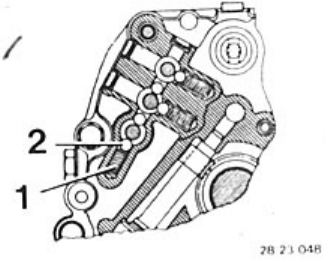
Screw two guide pins in retaining ring.
Hold spacer (S) in position with cement.
Check installed position.



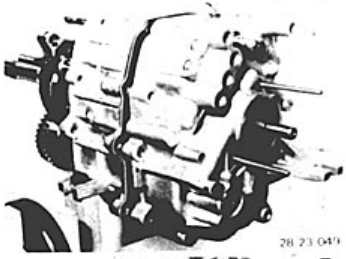
Hold rollers on selector shaft with grease.
Install selector shaft that openings on selector rod face out toward case.



Heat case rear section in area of input shaft and layshaft to about 80° C (175° F) with a hot air blower.
Hold gasket in position with grease.



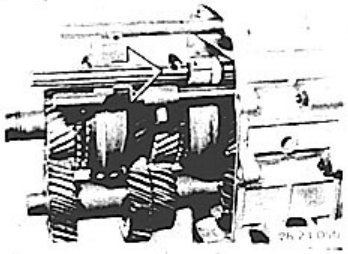
Push on case rear section up to spring (1).
Insert locking ball (2).



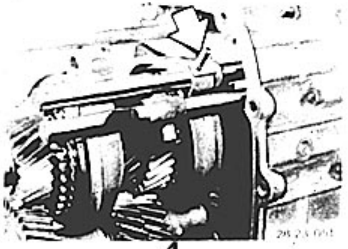
Push on case rear section against intermediate case.

Screw in three bolts.
Remove guide pins and mount support ring on case rear section.
Tightening torque*.

* See Specifications

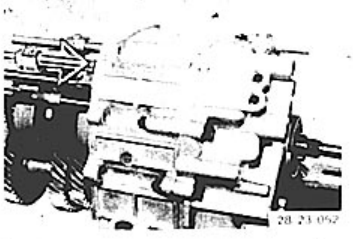


Push in 2nd/3rd gear selector rod up to spring.
Insert locking and detent balls.
Push in selector rod against arrest.

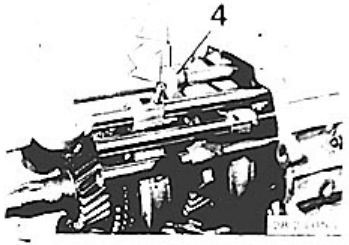


Mount 2nd/3rd gear selector fork with a 6 x 26 mm pin.

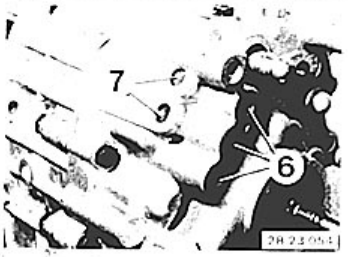
Place selector arm (4) on selector shaft with bevelled side facing down prior to installing the 4th/5th gear selector rod.



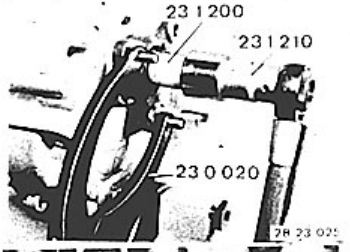
Push in 4th/5th gear selector rod up to spring.
Insert locking and detent balls.
Push in selector rod against arrest.



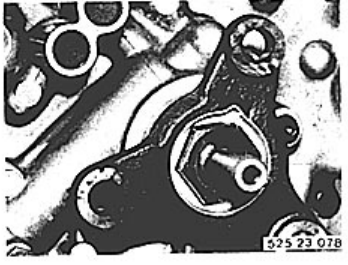
Mount 4th/5th gear selector fork with a 6 x 26 mm pin and selector arm (4) with a 6 x 28 mm pin.



Install new sealing caps (6 and 7) with a sealing compound.

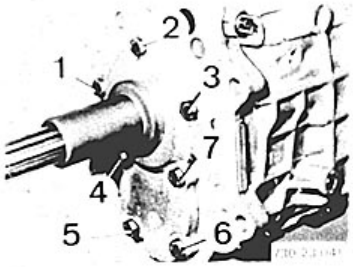


Mount output flange.
Install collar nut with a bolt cement**.
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.



Install lockplate.

* See Specifications
** Source: HWB



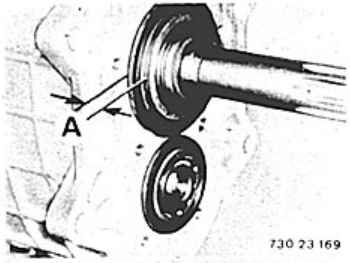
23 11 622 REMOVING AND INSTALLING OR SEALING COVER WITH GUIDE PIPE FOR CLUTCH RELEASE
– Transmission Removed –

Unscrew cover.
Installation:
Replace gasket.

Important!
Gasket is omitted since 9.86.
The cover must be sealed with a sealing compound and the sealing surface must be thoroughly cleaned and dried of oil.**
Note:
The gasket must be installed again on versions with a gasket.

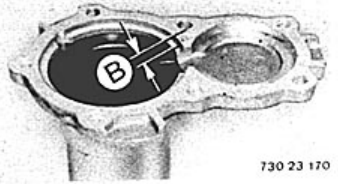
Important!
Shims.

Important! – Installation:
Check length of bolts.
Bolts (1 ... 3) = 8 x 30 mm.
Bolts (4 ... 7) = 8 x 22 mm.



730 23 169

Eliminate ball bearing play between the input shaft and guide flange.
Max. axial preload on the bearing outer race = 0.1 mm (0.004").
Measure distance (A) from case to the ball bearing.



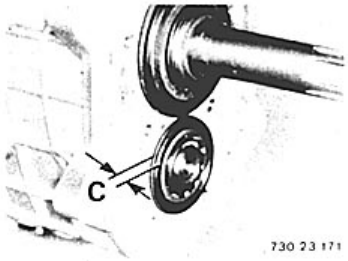
730 23 170

Measure height of collar (B) without gasket.

Important!
Use 0.2 mm (0.008") for thickness of the gasket.

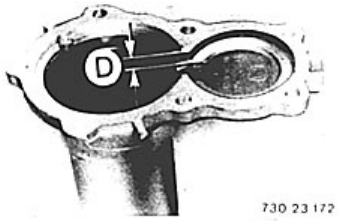
	B	=	8.0 mm (0.315")
–	A	=	7.9 mm (0.311")
			0.1 mm (0.004")
+			0.2 mm (0.008") gasket
			0.3 mm (0.012") shim

** **Source of Supply: HWB**



730 23 171

Eliminate roller bearing play between layshaft and guide flange.
Measure distance (C) from case to roller bearing outer race.

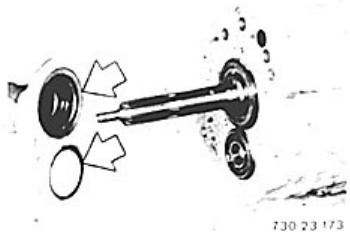


730 23 172

Measure distance (D) without gasket.

Important!
Use 0.2 mm (0.008") for thickness of the gasket.
Example:

	D	=	4.8 mm (0.189")
–	C	=	4.5 mm (0.177")
			0.3 mm (0.012")
+			0.2 mm (0.008") gasket
			0.5 mm (0.020")
–	0.1 ... 0.2 mm (0.004...0.008") axial pl.		
	0.3 ... 0.4 mm (0.012...0.016") shim		



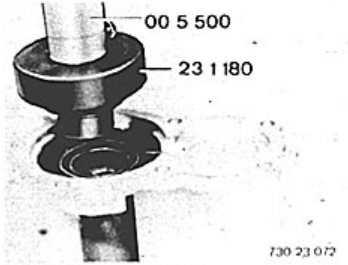
730 23 173

Install new gasket.
Hold shims of determined thickness in position with grease.
Mount cover.
Install bolts with a sealing compound.**
Clean threads of old bolts.
Tightening torque*.

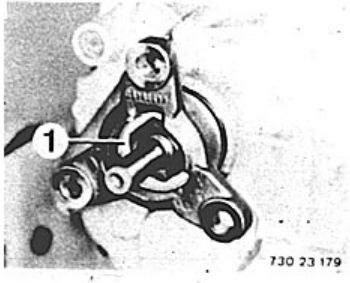
* **See Specifications**
** **Source of Supply: HWB**

23 12 502 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT
– Transmission Removed –

Remove cover with guide pipe – see 23 11 622.
Pry out radial oil seal.



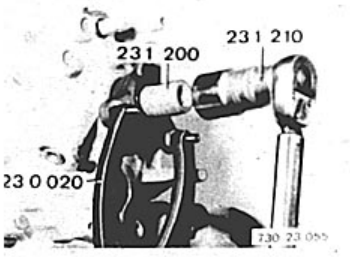
Drive in radial oil seal against the stop with Special Tools 23 1 180 and 00 5 500.
Open end faces the transmission.
Lubricate sealing lip with oil.



23 12 532 REPLACING RADIAL OIL SEAL FOR OUTPUT FLANGE
– Transmission Removed –

Lift out lockplate (1).

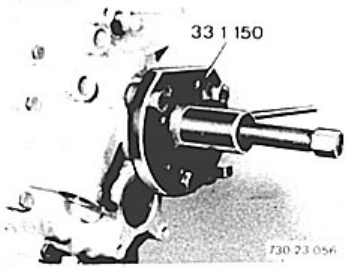
Installation:
Replace lockplate.



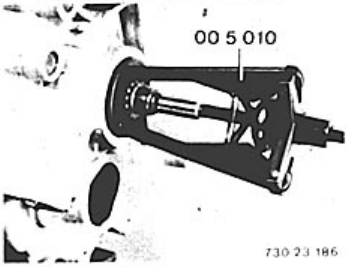
Apply Special Tool 23 1 200.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.

Installation:
Install collar nut with a bolt cement.**
Tightening torque*.

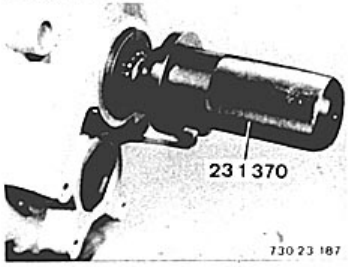
* **See Specifications**
** **Source of Supply: HWB**



Pull off output flange with Special Tool 33 1 150.



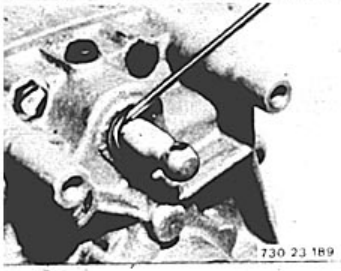
Pull out radial oil seal with Special Tool 00 5 010.



Installation:
Lubricate sealing lip with oil.
Drive in radial oil seal with Special Tool 23 1 370.

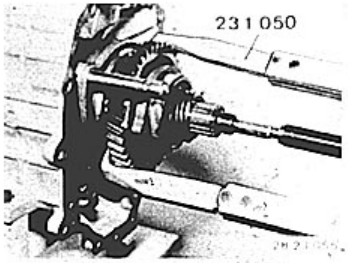
23 12 562 REPLACING RADIAL OIL SEAL FOR SHIFT SHAFT
– Transmission Removed –

Engage 3rd gear.
Push locking sleeve (1) aside and drive out dowel pin (2).



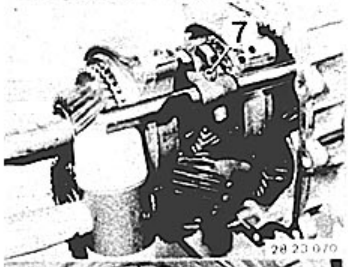
Lift out radial oil seal.

Lubricate sealing lip of the radial oil seal with oil.
Drive in radial oil seal with Special Tool 23 1 240.

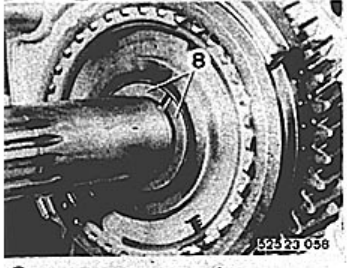


23 21 501 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY
– Front and Rear Case Sections Removed –

Pull out selector shaft.
Use Special Tool 23 1 050 to pull off spacer or, for version with speedometer drive, speedometer drive gear, shim, grooved ball bearing, spacer, support ring and reverse gear on output shaft.

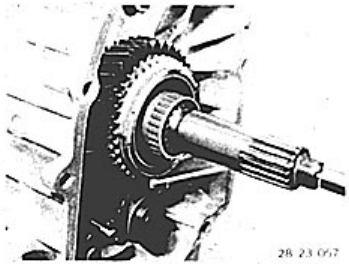


Drive out pin (7) while counterholding.



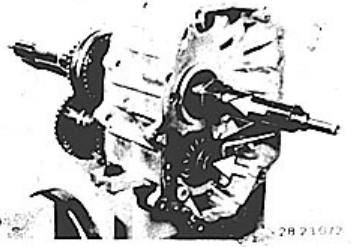
Remove split thrust washer (8).

Pull 1st/reverse gear selector rod with guide sleeve and synchromesh ring off of output shaft, also pulling off drive (9) on the selector rod.

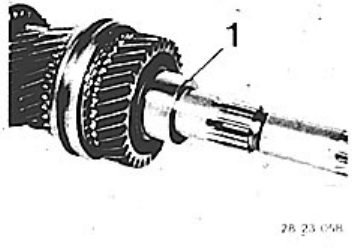


Pull off synchromesh ring, 1st gear and needle bearing.

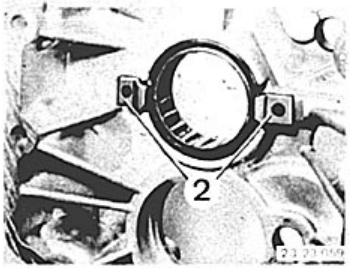
Unscrew bolts.
Move output shaft axially.
Take off retainers.



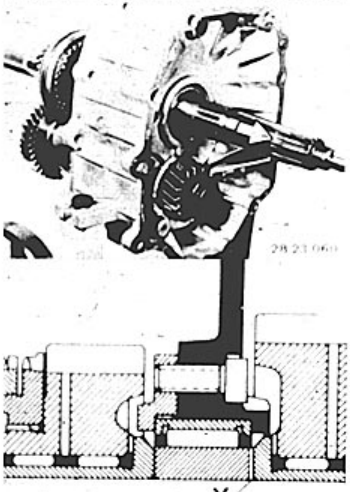
Pull output shaft and layshaft out of intermediate case simultaneously, or knock out if necessary...



Installation:
Press off output shaft (see 23 21 552).
Assemble output shaft up to bearing inner race (1).

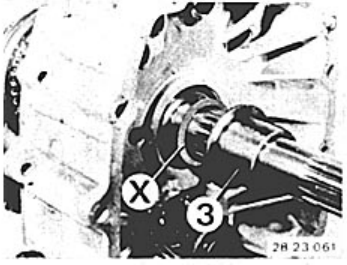


Heat bearing bore of output shaft in intermediate case to approx. 80° C (175° F) with a hot air blower.
Install roller bearing and torque* with holding stories (2).
Install cylinder head bolts with a bolt cement.**



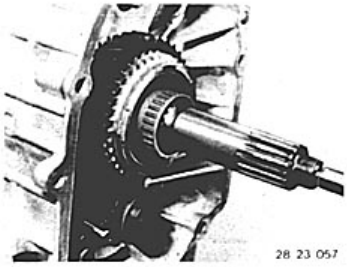
Heat bearing bore of layshaft in intermediate case to approx. 80° C (175° F) with a hot air blower.
Install output shaft and layshaft in the intermediate case simultaneously.

Important!
Determine shim thickness X (see 23 21 702) after installation of the output shaft.

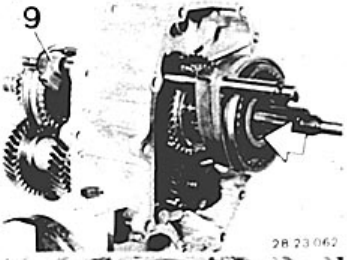


Install shim X if necessary.
Heat collar sleeve (3) to approx. 80° C (175° F) with a hot air blower and install on the output shaft.

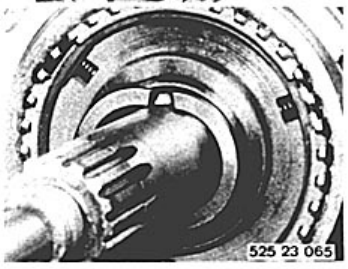
* See Specifications
** Source: HWB



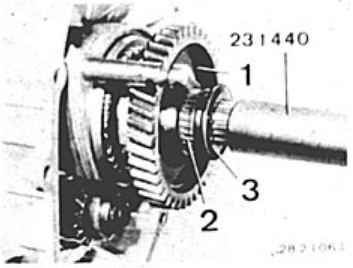
Mount needle bearing, 1st gear wheel and synchromesh ring on output shaft.



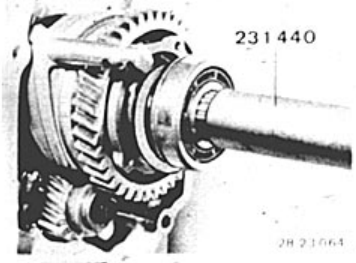
Mount guide sleeve, selector fork and selector rod.
Important!
Stepped end of internal splines/guide sleeve faces reverse gear wheel and stepped end of sliding sleeve faces 1st gear wheel.
Guide tabs on synchromesh ring into openings of guide sleeve.
Slide on dog (9) and secure with a 6 x 32 mm pin.



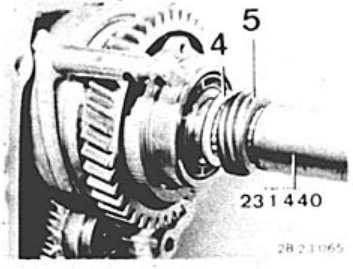
Insert split ring in groove.



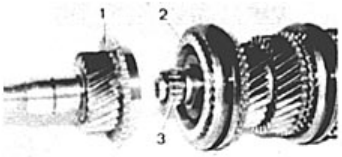
Install synchromesh ring, reverse gear (1), needle bearing (2) and collar (3), driving on to fit tight with Special Tool 23 1 440 if necessary.
Heat collar to about 80° C (175° F) with a hot air blower to make installation easier.



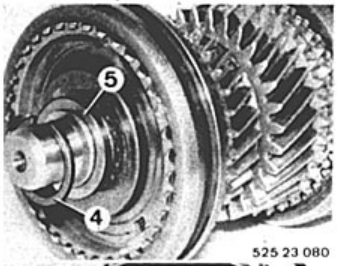
Install a 0.5 mm (0.020") thick shim, support ring, spacer and grooved ball bearing on output shaft, driving on to fit tight with Special Tool 23 1 440 if necessary.



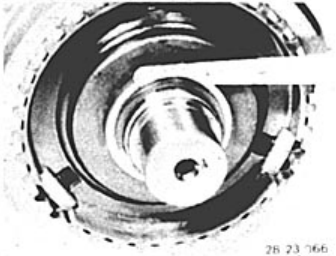
Install spacer or, for version with speedometer drive, 2.5 mm (0.098") thick shim (4) and speedometer drive gear (5) on output shaft, driving on to fit tight with Special Tool 23 1 440 if necessary.



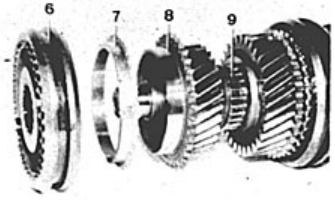
525 23 079



525 23 080



28 23 066



525 23 081

23 21 522 DISASSEMBLING AND ASSEMBLING INPUT AND OUTPUT SHAFTS
– Output Shaft Removed –

Pull input shaft (1), synchromesh ring (2) and needle bearing (3) off of the output shaft.

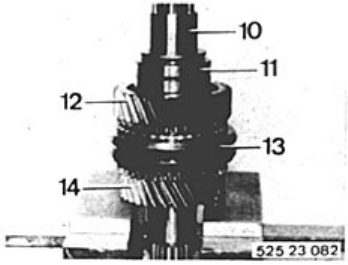
Note:
To avoid mixing up synchromesh rings while disassembling the output shaft, it is recommended to mark synchromesh rings for pertinent gear wheels.

Take off circlip (4) and shim (5).

Installation:
Replace circlip.

Installation:
Eliminate all play between the guide sleeve and circlip with shims.

Pull guide sleeve (6), synchromesh ring (7), 4th gear wheel (8) and needle bearing (9) off of the output shaft.

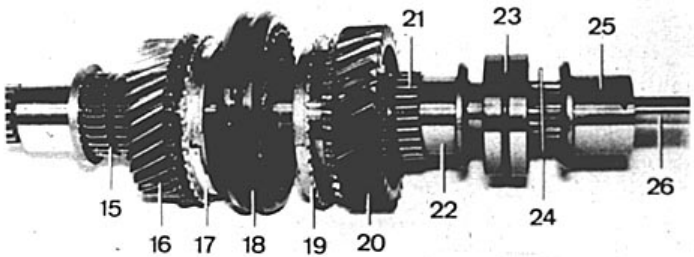


525 23 082

Press collar (10), bearing (11), 2nd gear wheel (12), guide sleeve (13) and 3rd gear wheel (14) off of the output shaft.
Check synchronization – see 23 23 504.

Installed Order:
Needle bearing (15), 3rd gear wheel (16), synchromesh ring (17), guide sleeve (18), synchromesh ring (19), 2nd gear wheel (20), needle bearing (21), collar (22), collar (25) and output shaft (26).
Check roller bearing (23), replacing if necessary.

Important!
Assemble the output shaft without shim (24) and collar (25).



525 23 083

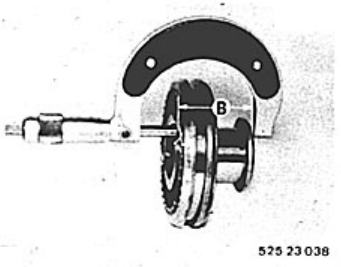
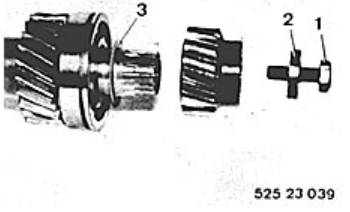
23 21 702 REPLACING BEARINGS FOR ALL TRANSMISSION SHAFTS
– Transmission Removed –

Remove input/output shaft assembly 23 21 501.
Disassemble output shaft 23 21 552.
Determine thickness of shim X.
Install 3rd gear with needle bearing, synchromesh ring, guide sleeve, synchromesh ring, 2nd gear with needle bearing, collar and bearing inner race on output shaft.
Heat bearing inner race to about 80° C (175° F) with a hot air blower.
Measure distance A from collar of output shaft to bearing inner race.
A = 52.6 mm (2.071").

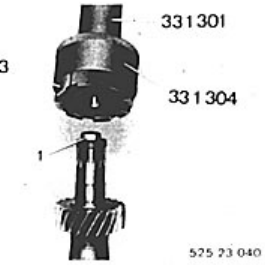


Measure distance B from guide sleeve internal spline to outer edge of collar.
B = 52.4 mm (2.063").
Example:

A	52.6 mm (2.071")	
– B	52.4 mm (2.063")	
X	0.2 mm (0.008")	shim thickness

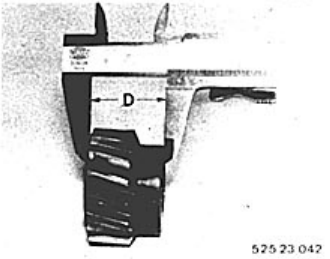


Unscrew bolt (1) and take off washer (2).
Press 1st gear off of layshaft with two screwdrivers.
Important!
Shim (3).



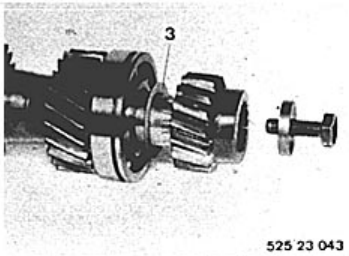
Pull grooved ball bearing off of layshaft with Special Tool 33 1 301 used together with Special Tools 33 1 303 and 33 1 304.
Caution!
Screw in bolt (1) to fit tight to avoid damaging threads.

Press on new bearing.
Measure distance C from layshaft to grooved ball bearing.
C = 34.9 mm (1.374").



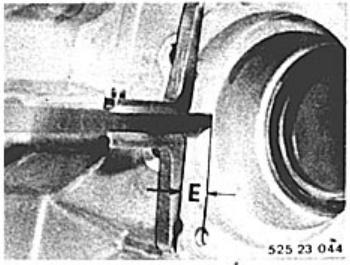
Measure thickness D of 1st gear – layshaft.
D = 34.7 mm (1.366").
Example:

C	34.9 mm (1.374")	
– D	34.7 mm (1.366")	
	0.2 mm (0.008")	shim thickness



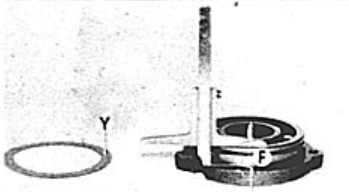
525 23 043

Install shim (3) of determined thickness.
Heat 1st gear wheel to about 80° C (175° F) with a hot air blower and install it on the layshaft.
Install bolt with a bolt cement**.
Tightening torque*.



525 23 044

Eliminate grooved ball bearing play of output shaft between the case and support ring.
Measure case depth E.
E = 13.1 mm (0.516")



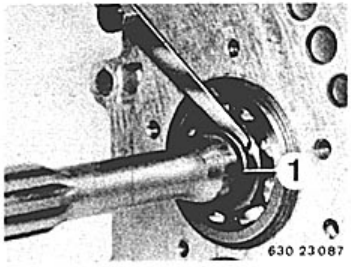
525 23 045

Place grooved ball bearing in support ring and measure distance F from grooved ball bearing to support ring.
F = 12.9 mm (0.508")

Example:

	E	=	13.1 mm (0.516")
–	F	=	12.9 mm (0.508")
	Y	=	0.2 mm (0.008") thick shim

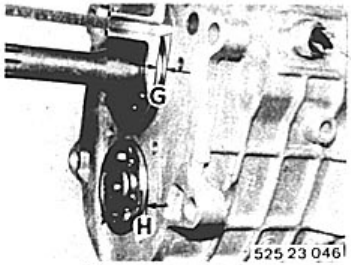
Important!
Shim Y must be installed between the grooved ball bearing and support ring.



630 23 087

Install complete gear wheel set.
Mount front case section.
Install circlip (1).
Measure distance between the circlip and grooved ball bearing inner race and eliminate play with shims.

* See Specifications
** Source of Supply: HWB

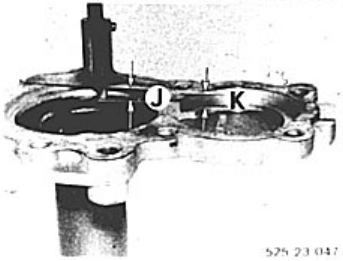


525 23 046

Eliminate play of grooved ball bearings on input shaft and layshaft to the guide flange.
Max. axial preload on bearing outer race = 0.1 mm (0.004").

Input Shaft:
G = 7.0 mm (0.275")

Layshaft:
H = 4.6 mm (0.181")



525 23 047

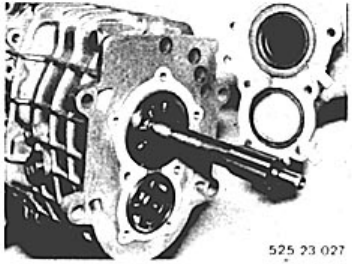
Measure distances J and K without gasket.
J = 7.5 mm (0.295") input shaft
K = 5.1 mm (0.201") layshaft
Important!
Use 0.2 mm (0.008") for thickness of gasket.
Input Shaft:

	J	=	7.5 mm (0.295")
–	G	=	7.0 mm (0.181")
			0.5 mm (0.020")
+			0.2 mm (0.008") gasket
			0.7 mm (0.028") thick shim

Layshaft:

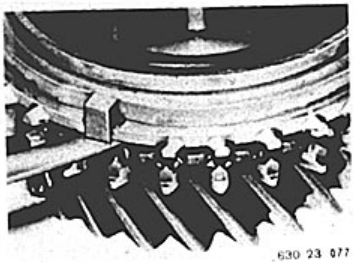
	K	=	5.1 mm (0.201")
–	H	=	4.6 mm (0.181")
			0.5 mm (0.020")
+			0.2 mm (0.008") gasket
			0.7 mm (0.028")
–	0.1 ... 0.2 mm (0.004...0.008") axial pl.		
	0.5 ... 0.6 mm (0.020...0.024") shim		

Hold shim in position with grease.
Install gasket.
Important!
Gasket is omitted since 9.86.
Cover must be sealed with a sealing compound** and sealing surface must be thoroughly cleaned and dried of oil.
Note:
Gasket must be installed again on versions with a gasket.
Mount guide flange.
Install bolts with a sealing compound**.
Note length of bolts.
Tightening torque*



525 23 027

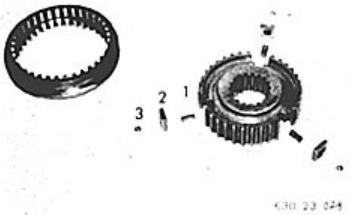
* See Specifications
** Source of Supply: HWB



630 23 077

23 23 504 DISASSEMBLING/ASSEMBLING ENTIRE SYNCHRONIZATION
– Output Shaft Removed –

Disassemble output shaft 23 21 552.
Synchromesh rings for 1st through 4th and reverse gears are machined brass rings, while ring for 5th gear is brass with molybdenum coat.
Note:
Only use molybdenum coated synchromesh rings for repairs.
Check distance* between synchromesh ring and clutch.
Measure in area of stops.
Synchromesh rings should be supported firmly on the entire surface.



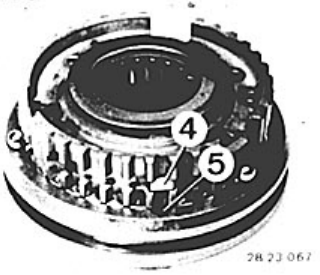
630 23 078

Disassemble synchronization.
Spring (1), thrust piece (2) and ball (3).
Installation:
The flat teeth of the operating sleeve must be aligned with the thrust pieces.

630 23 079

Installation:
Install all springs, thrust pieces and balls.
Important!
Curved surfaces of thrust pieces face operating sleeve.
Insert half of guide sleeve in operating sleeve.
Press in balls far enough that guide sleeve can be pressed into operating sleeve.

* See Specifications



28 23 067

REVERSE GEAR SYNCHRONIZATION (WITH CENTRIFUGAL ARREST)

Install guide sleeve in operating sleeve that tab (4) on locking lever is aligned with opening (5) in operating sleeve.
Shouldered end of internal spline (guide sleeve) and opening (operating sleeve) are mounted in same plane.

Construction group 23 Manual transmission

Five speed transmission – type GS5 D 310/4.20 Z (S5-31)

	Transmission – layout drawing	23- 400
	Front and rear case sections – layout drawing	23- 401
	Gears and shafts – layout drawing	23- 402

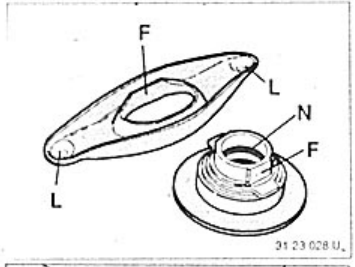
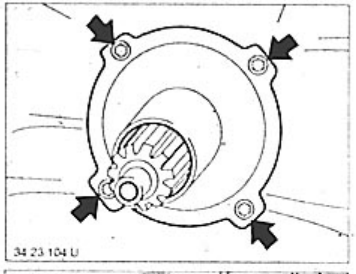
23 12 505 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT

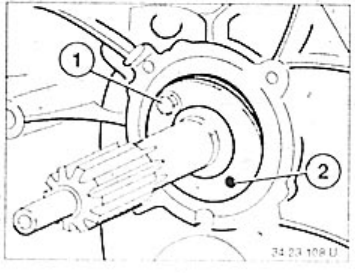
Remove transmission – refer to 23 00 023 in Model Repair Manual.
Lift out spring (1) and remove release lever (3) together with release bearing (2).



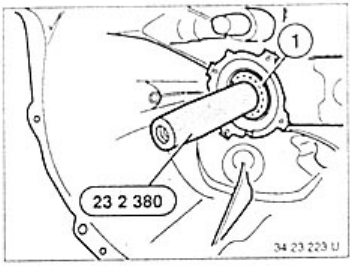
Installation:
Fill lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) with Molykote Longterm 2.
Non-conformance could cause seizure of the release bearing on the guide sleeve.



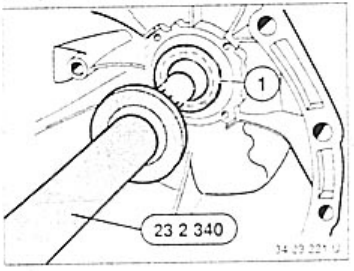
Unscrew guide tube.



Remove radial oil seal.
Locate and puncture bores (1 and 2) with a scriber.
Drive in radial oil seal to one side as far as stop.
Screw a suitable self-tapping screw into the opposite bore.
Remove radial oil seal by pulling out on the self-tapping screw (pliers).

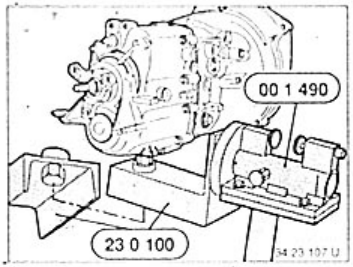


Lubricate sealing lip of radial oil seal with ATF.
Apply Special Tool 23 2 380 on the input shaft.
Slide on radial oil seal (1) as far as case.



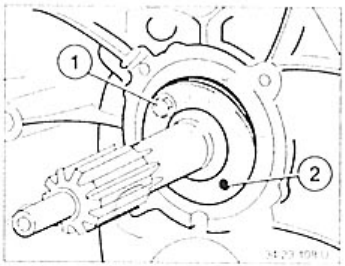
Pull off Special Tool 23 2 380.
Drive in radial oil seal (1) flush with Special Tool 23 2 340.
Mount guide tube.
Tightening torque*.

* See Specifications

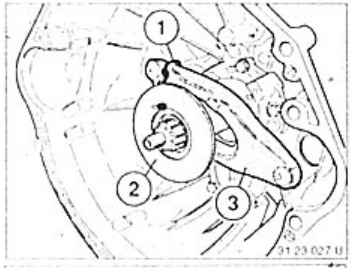


23 21 502 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY

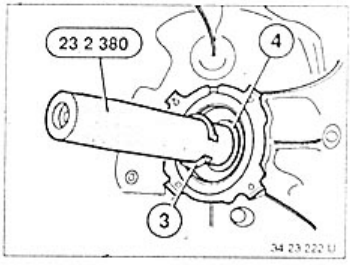
Remove transmission – refer to 23 00 023 in Model Repair Manual.
Unscrew drain plug.
Drain oil.
Screw Special Tool 23 0 100 into drain plug bore and secure.
Take up Special Tool 23 0 100 in Special Tool 00 1 490.



Remove radial oil seal.
Locate and puncture bores (1 and 2) with a scriber.
Drive in radial oil seal to one side as far as stop.
Screw a suitable self-tapping screw into the opposite bore.
Remove radial oil seal by pulling out on the self-tapping screw (pliers).



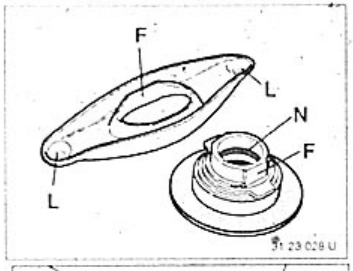
Lift out spring (1) and remove release lever (3) together with release bearing (2).



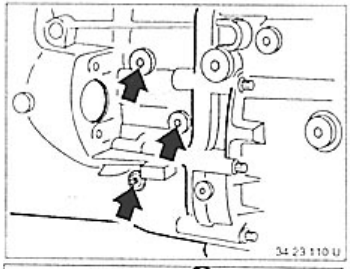
Caution!
Special Tool 23 2 380 must be used on the input shaft to remove circlip (3) so that the input shaft is not damaged.

Lift out circlip (3) and pull off over Special Tool 23 2 380.
Take off spacer (4).

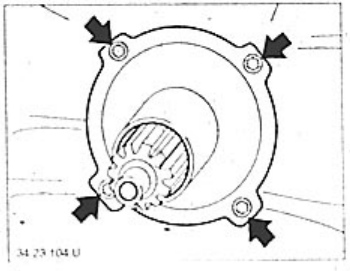
Installation:
Replace circlip (3).



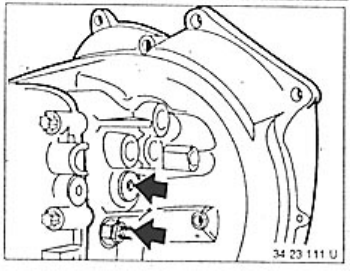
Installation:
Fill lubricating groove (N) with Molykote Longterm 2.
Coat guides (F) and bearings (L) with Molykote Longterm 2.
Non-conformance could cause seizure of the release bearing on the guide sleeve.



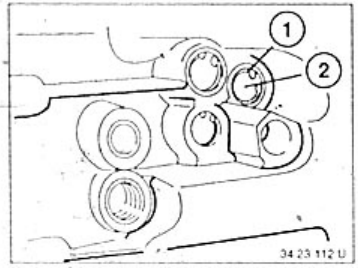
Unscrew left bearing shaft bolt and reverse gear shaft bolt in the front case section.



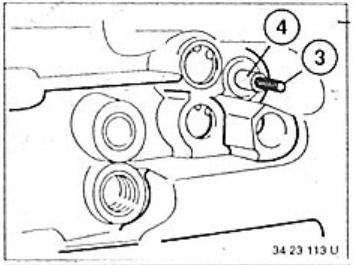
Unscrew guide tube.



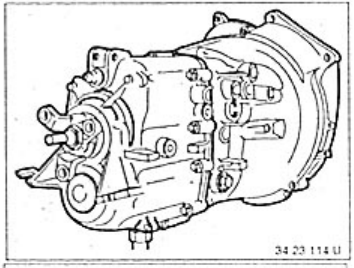
Unscrew reverse gear switch and right bearing shaft bolt in the front case section.



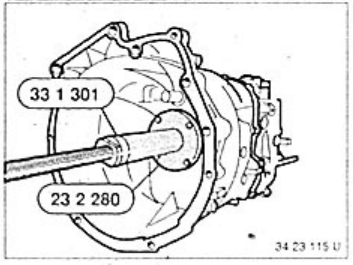
Lift out circlip (1).
Remove sealing cap (2).



Lift out spring (3) and catch pin (4).

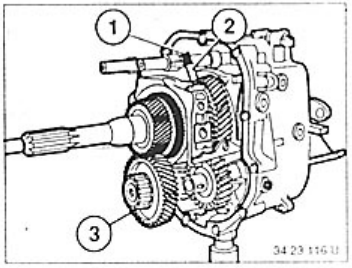


Unscrew case bolts.

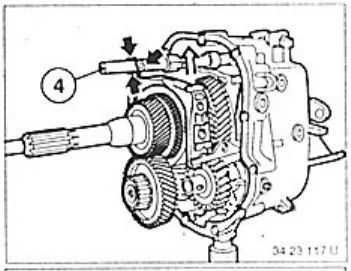


Pull off front case section using Special Tools 23 2 280 and 33 1 301.

Installation:
Bearings or elements of the bearing brackets could be damaged while pulling off the front case section.
Always replace bearings or elements.

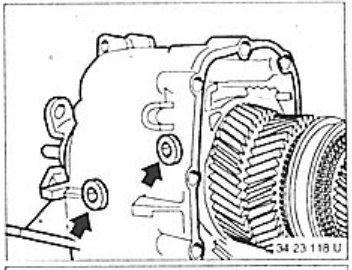


Remove loose spring (1) and thrust pin (2).
Take off needle bearing (3).

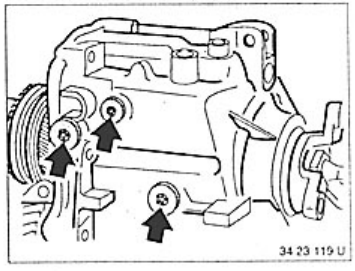


Pull out shift shaft (4).

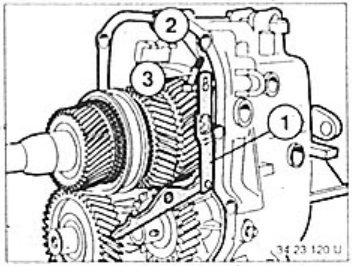
Important!
Needles on shift shaft.
Take off 5th/reverse gear shift arm upwards.



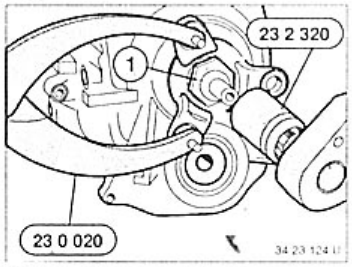
Remove two bearing shafts on the right-hand side.



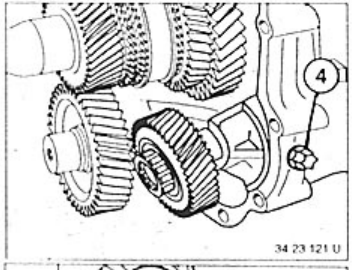
Remove three bearing shafts on the left-hand side.



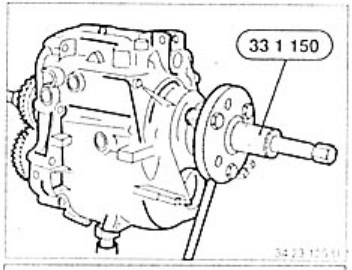
Remove complete locking lever (1).
Remove spring (2) and thrust pin (3).



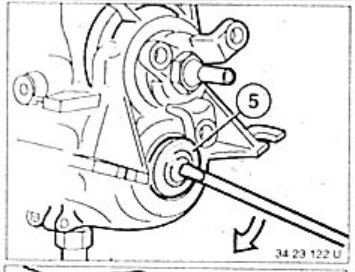
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut (1) with Special Tool 23 2 320.



Unscrew bolt (4).
Remove reverse gear with needle bearings, thrust washer, shaft anf half-shell.

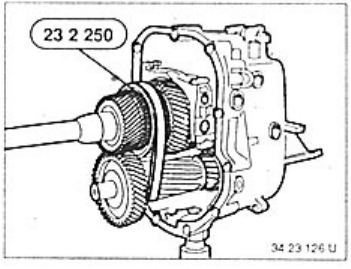


Pull off output flange using Special Tool 33 1 150.

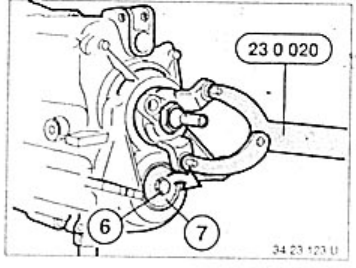


Puncture through middle of sealing cap (5).
Lever out sealing cap (5) with a screwdriver inserted into the hole.

Installation:
Replace sealing cap.



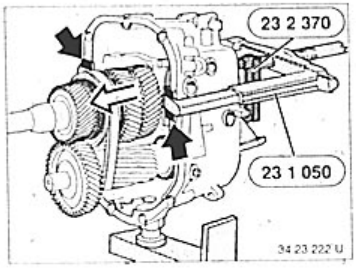
Compress gear set at 5th/reverse gear operating sleeve with layshaft.
Use Special Tool 23 2 250.



Engage a gear by hand.
Hold output flange with Special Tool 23 0 020.
Unscrew bolt (6).

Important!
Left-hand threads.

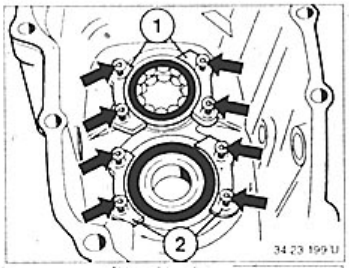
Remove washer (7).
Take out engaged gear.



Apply Special Tool 23 2 370 on output shaft and layshaft.
Apply Special Tool 23 1 050 on case sealing surface and middle of Special Tool 23 2 370.

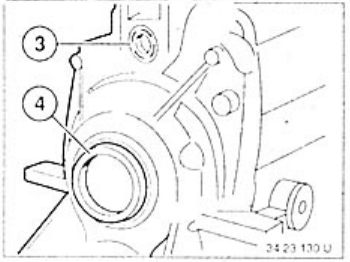
Important!
Use a piece of wood, plastic or similar on the sealing surfaces.
Press out gear set and layshaft uniformly.
Make sure that the gear set and layshaft do not clamp while pressing out.

Installation:
The bearings or elements of the bearing brackets could be damaged while pressing out the input shaft and output shaft.
Always replace bearings or elements after removal.

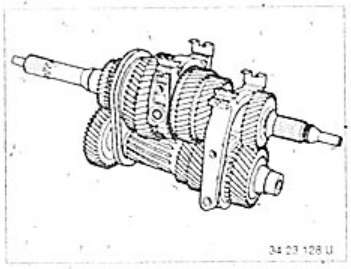


Replace bearings or elements for bearing brackets of the output shaft/layshaft (also refer to 23 21 705).
Screw on elements (1 and 2).

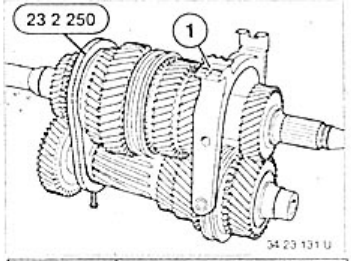
Installation:
Install bolts with a bolt cement**.
Tightening torque*.



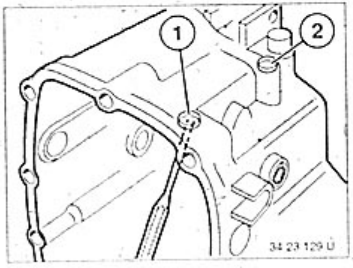
Lever out radial oil seals (3 and 4) for the output shaft and shift shaft.



Take out gear set with 1st/2nd and 3rd/4th gear shift arms and layshaft.

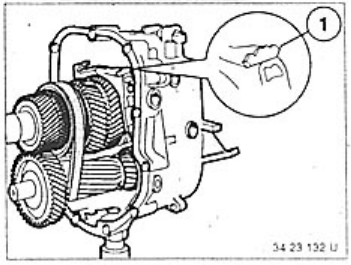


Compress the gear set at the 5th/reverse gear operating sleeve with the layshaft.
Use Special Tool 23 2 250.
Place 3rd/4th gear shift arm with slide on the 3rd/4th gear operating sleeve.
Have the shift arm bear on the 3rd gear of the output shaft.
Install shift arm with lock (1) in direction of the left-hand side input shaft.



Installing:
Clean the case.
Drive out sealing caps (1 and 2) on the rear case section from inside to outside using a mandrel.

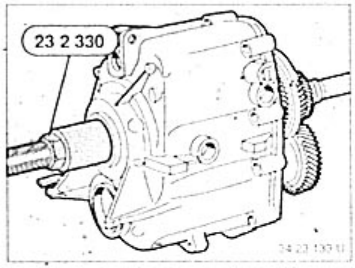
Installation:
Replace sealing caps.



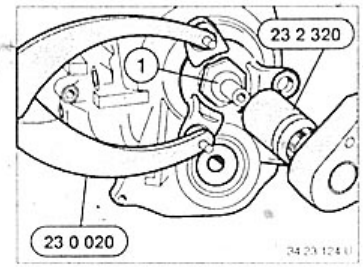
Place gear set with shift arm in the rear case section.
Place 1st/2nd gear shift arm with slide in the 1st/2nd gear operating sleeve.

Important!
Mount the shift arm with lock (1) in direction of the left-hand side input shaft.

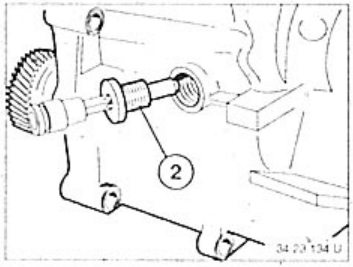
* See Specifications
** Source of Supply: BMW Parts



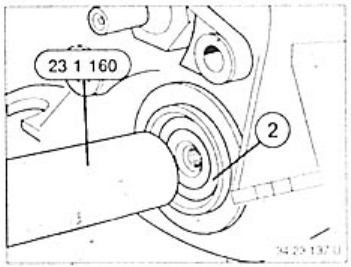
Apply Special Tool 23 2 330 on the output shaft journal.
Pull output shaft in to fit tight with Special Tool 23 2 330.
Make sure that shift arms and layshaft are not canted while pulling in; align if necessary.
Remove Special Tool 23 2 330.



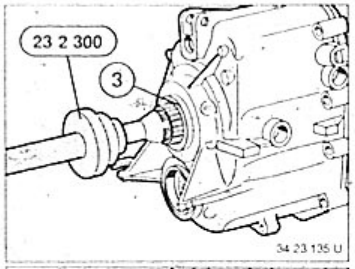
Install collar nut (1) with bolt cement** that its flat side faces the output flange.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 2 320.
Tightening torque*.



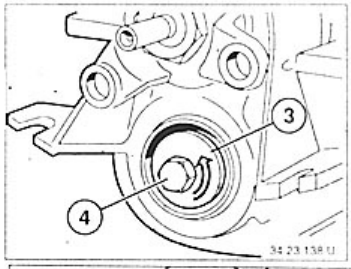
Center the 3rd/4th gear shift arm with the bore in the case by hand.
Screw in bearing shaft (2) on left and right sides separately by hand in this position and then tighten them.
Tightening torque*.



Heat ball bearing inner race (2) for layshaft to about 80° C with a hot air blower.
Press on ball bearing inner race (2) to fit tight with Special Tool 23 1 160; drive on with light knocks if necessary.

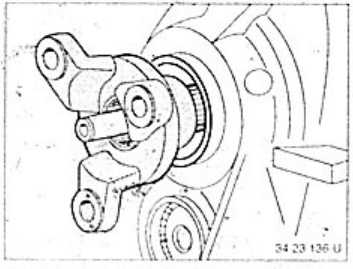


Lubricate sealing lip of radial oil seal with oil.
Drive in radial oil seal (3) for the output flange with Special Tool 23 2 300.

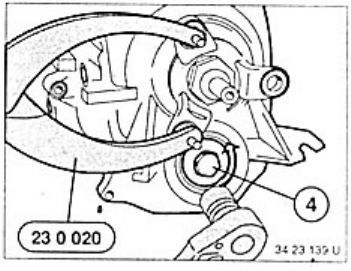


Install washer (3) and bolt (4) with bolt cement**.

Important!
Bolt (4) has left-hand threads.



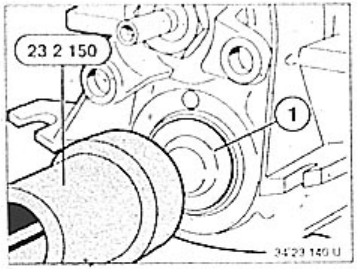
Heat output flange to about 80° C with a hot air blower.
Slide output flange on to the output shaft.
If necessary, drive on to fit tight with Special Tool 23 1 160.



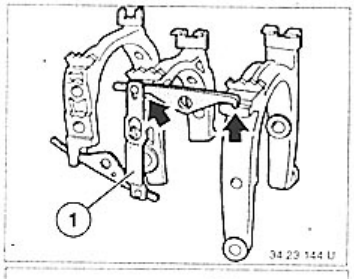
Remove Special Tool 23 2 250 from the gear set.
Engage a gear.
Hold output flange with Special Tool 23 0 020.
Tighten bolt (4).
Tightening torque*.
Disengage the gear.

* See Specifications

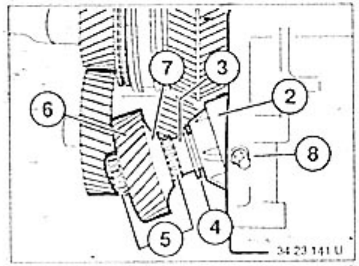
* See Specifications
** Source of Supply: BMW Parts



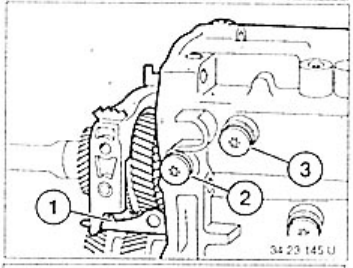
Insert and drive in sealing cap (1) flush with Special Tool 23 2 150.



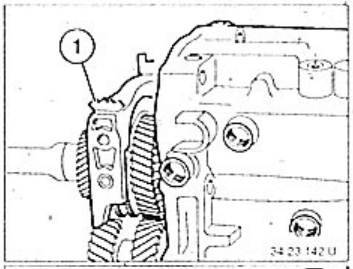
Swing locking lever (1) towards the inside and in so doing attach it in the openings of the 1st/2nd and 3rd/4th gear shift arms.



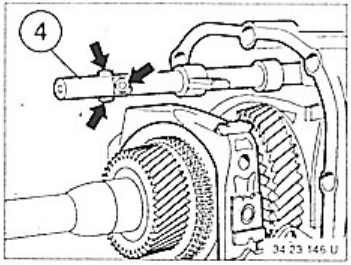
Coat half-shell (2) in area of the bolt bore with a sealing compound** and install.
Install shaft (3), thrust washer (4), needle bearing (5) and reverse gear (6) with shoulder (7) facing the case.
Coat shoulder of the bolt head with sealing compound**.
Install bolt (8) with bolt cement**, but do not tighten.



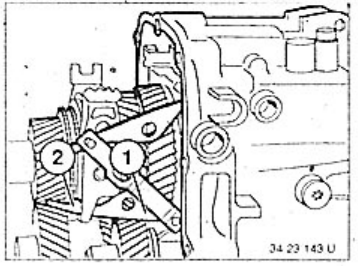
Center locking lever (1) with the bores by hand.
Install bearing shafts (2 and 3) on left and right sides by hand and then tighten them. Tightening torque*.
Check movement of the locking lever.



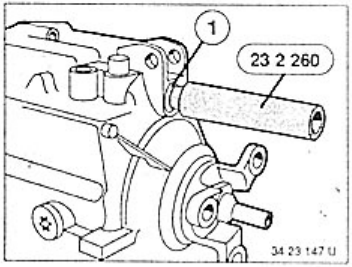
Install 5th/reverse gear shift arm and slide with catch (1) facing to the left in the 5th/reverse gear operating sleeve.



Guide in shift shaft (4) horizontally.
Hold four needles in position with grease.



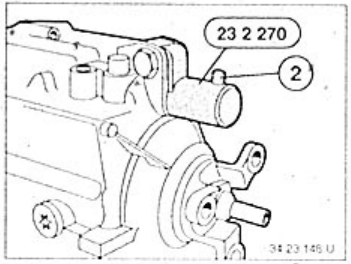
Guide in locking lever (1) with long tongue (2) in the slot of the 5th/reverse gear shift arm.



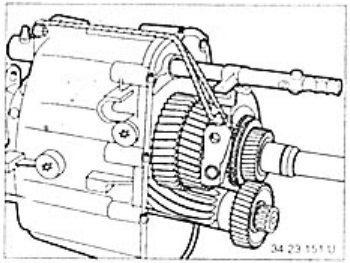
Drive in radial oil seal (1) for the shift shaft with Special Tool 23 2 260.

* See Specifications
** Source of Supply: BMW Parts

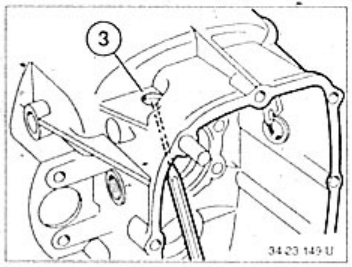
* See Specifications



Hold the shift shaft in neutral position with Special Tool 23 2 270.
Use a 8 mm bolt and cylindrical pin (2) from the shift joint or a suitable mandrel for holding the shift shaft.

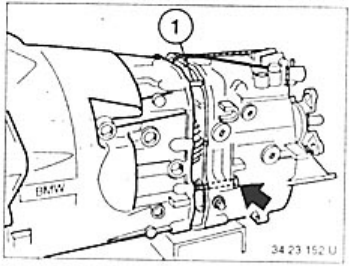


Hold the 5th/reverse gear shift arm in horizontal position with a piece of string to make installation easier.

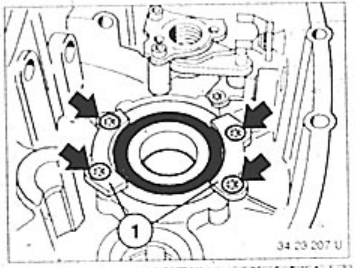


Clean the front case section.
Drive out sealing cap (3) for the catch pin from inside to outside using a punch.

Installation:
Replace sealing cap.

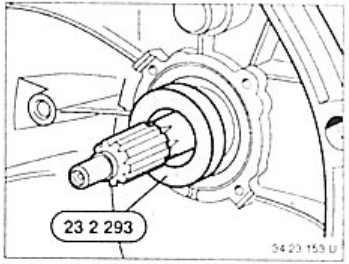


Mount the front case section as far as centering pins (1).
Screw two 8 x 75 mm bolts into the rear case section opposite each other on the left and right sides to center the case.

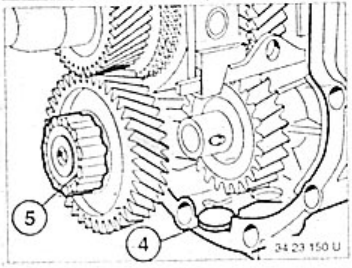


Replace bearings or elements for bearing brackets of the output shaft (also refer to 28 21 705).
Unscrew elements (1).

Installation:
Install bolts with a bolt cement**.
Tightening torque*.



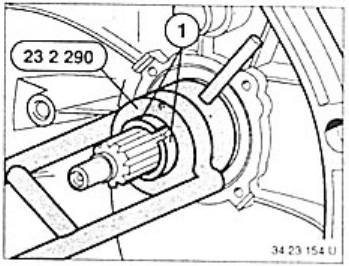
Place Special Tool 23 2 293 (thrust ring) from Special Tool 23 2 290 in the front case section.



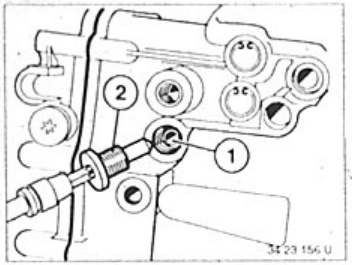
Place magnet (4) in the rear case section.
Install needle bearing (5) with the small diameter end on the outside.

Note:
Coat needles with grease and press them in to avoid canting of the needles when mounting the front case section.
Clean and coat case sealing surfaces with a sealing compound**.

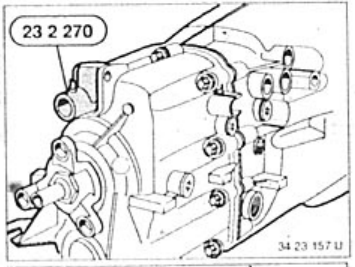
* See Specifications
** Source of Supply: BMW Parts



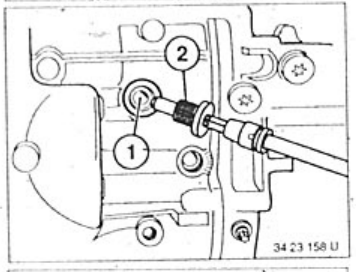
Apply Special Tool 23 2 290 on the input shaft.
Place supporting shells (1) on the input shaft that the tapered sides face in.
Unscrewing the spindle presses the front case section on to the input shaft.



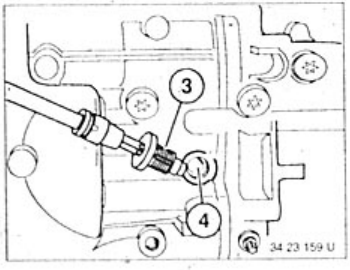
Press the front case section on only so far that the piece of string can still be removed after installation of the right bearing shaft.
Center 5th/reverse gear shift arm (1) with the bore and screw in the right bearing shaft (2) by hand, but do not tighten.
Remove piece of string.
Press on the front case section as far as stop.



Remove complete Special Tool 23 2 290.
Remove centering bolts from case.
Bolt front case section to rear section.
Tightening torque*.
Remove Special Tool 23 2 270 from shift shaft.

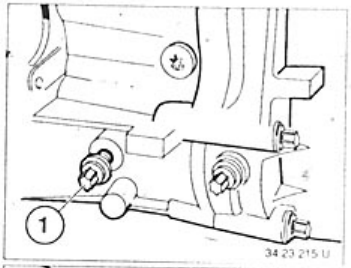


Center 5th/reverse gear shift arm (1) with the bore and screw in the left bearing shaft (2) by hand.
Tighten left and right bearing shafts (2).
Tightening torque*.

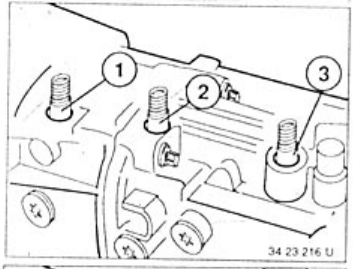


Install bearing shaft (3) for the locking lever.
This requires turning the transmission until bore (4) in the locking lever is aligned with the bore in the case.
In this position screw in bearing shaft (3) by hand and then tighten:
Tightening torque*.

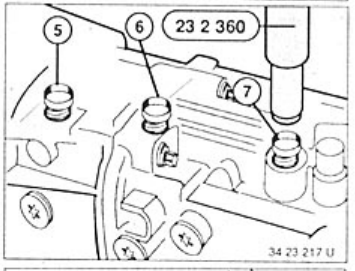
* See Specifications



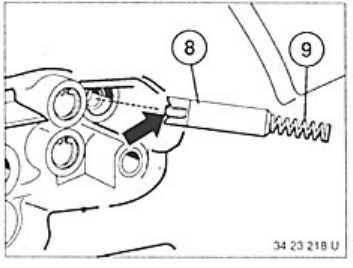
Coat shoulder of the bolt head with a sealing compound**.
Install bolt (1) for the reverse gear shaft bolt with a bolt cement**.
Tighten bolt bolts.
Tightening torque*.



Place catch pins (1 ... 3) with springs in the shift arms.



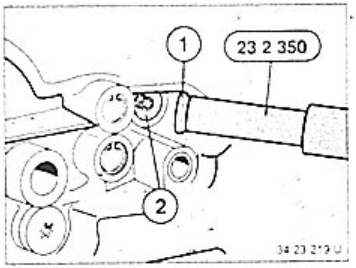
Knock in sealing caps (5 ... 7) with Special Tool 23 2 360.



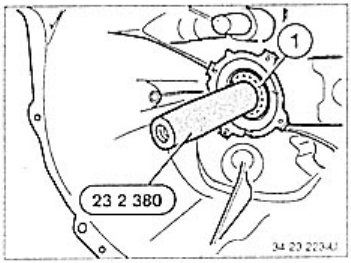
Catch pin (8) and spring (9)

Important!
Check installed position of catch pin (8).
Roller must be horizontal.

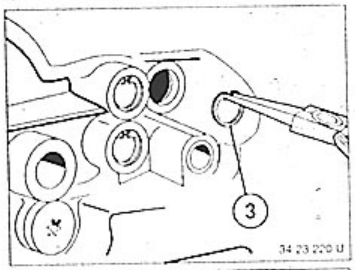
* See Specifications
** Source of Supply: BMW Parts



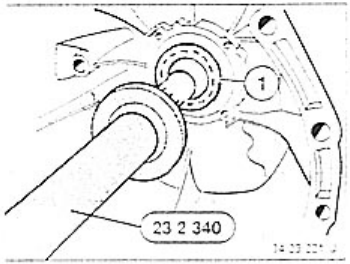
Install sealing cap (1) in bore (2) with help of Special Tool 23 2 350 and push in as far as possible.



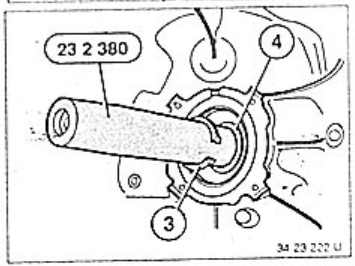
Lubricate sealing lip of the radial oil seal with ATF.
Apply Special Tool 23 2 380 on the input shaft.
Push on radial oil seal (1) as far as the case.



Install circlip (3) and press in as far as groove with Special Tool 23 2 350.
Check for correct seating of the circlip (visual inspection).
Install the reverse gear switch.



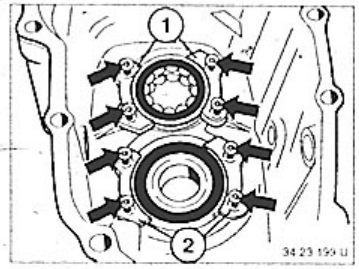
Remove Special Tool 23 2 380.
Drive in radial oil seal (1) flush with Special Tool 23 2 340.
Mount guide tube.
Tightening torque*.



Install spacer (4).

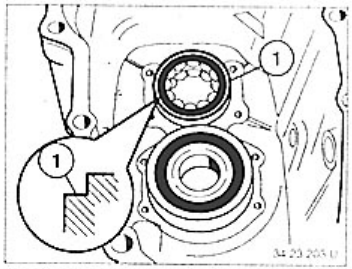
Caution!
Special Tool 23 2 380 must be used on the input shaft while installing circlip (3) to avoid damaging the input shaft.
Slide circlip (3) over Special Tool 23 2 380 and install it in the groove.
The circlip must seat in the groove without play.
Replace circlip with a circlip of correct thickness.
Circlips are available in different thicknesses in steps from 2.2 to 2.6 mm.

* See Specifications

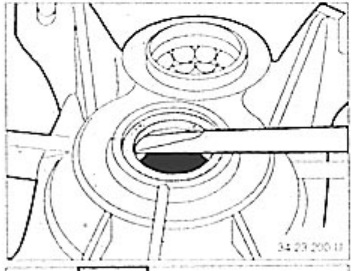


23 21 705 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Input and Output Shafts Removed –

Rear Case Section:
Unscrew bolts.
Remove elements (1 and 2).

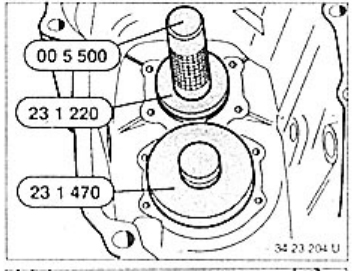


Heat rear case section in area of the ball bearing uniformly to about 80° C with a hot air blower.
Install ball bearings for output shaft and layshaft.
Insert ball bearing for the layshaft with the shouldered end (1) facing in.

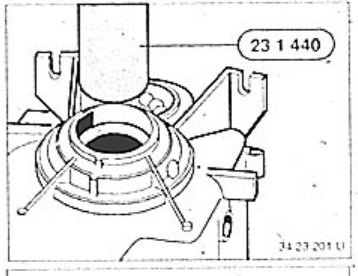


Lever out radial oil seal for the output flange.

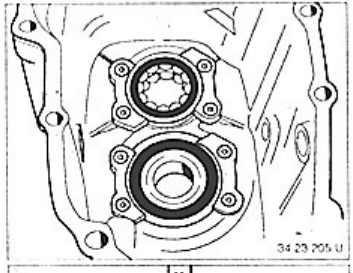
Installation:
Replace radial oil seal.



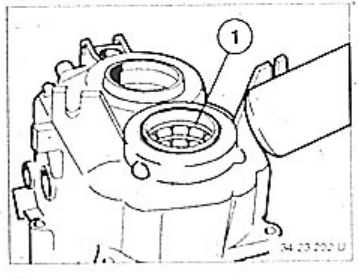
If necessary, drive in ball bearings to fit tight.
Use Special Tool 23 1 470 for the output shaft and Special Tool 23 1 220 for the layshaft in conjunction with Special Tool 00 5 500.



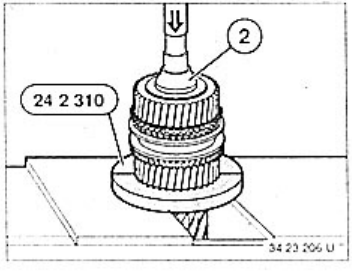
Drive out the ball bearing for the output shaft toward the inside, using Special Tool 23 1 440.



Install elements.
Install bolts with a bolt cement and tighten.**
Tightening torque*.

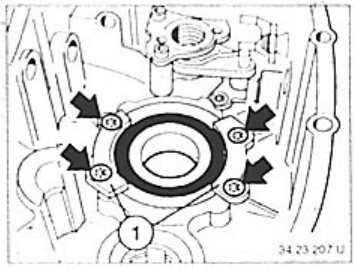


Layshaft:
Heat case in area of the ball bearing to about 80° C with a hot air blower.
Remove ball bearing (1) toward the inside.
Clean the rear case section to remove dirt.



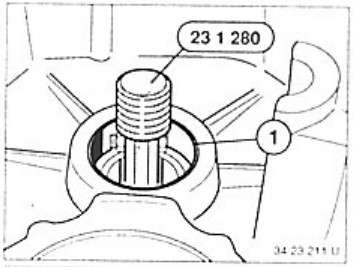
The 3rd/4th gear has to be pressed off with Special Tool 23 2 310 to be able to replace bearing inner race (2).
Removal – refer to "Replacing 3rd/4th Gear Synchronization" in 23 23 507.

* **See Specifications**
** **Source of Supply: BMW Parts**



Bearings in Front Case Section

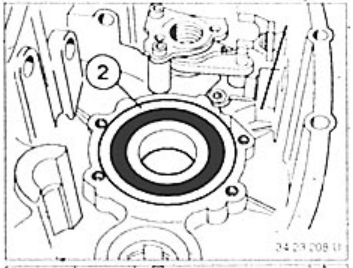
Input shaft:
Unscrew bolts.
Remove elements (1).



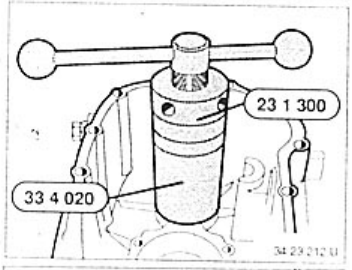
Layshaft:

1 = bearing shell for needle bearing

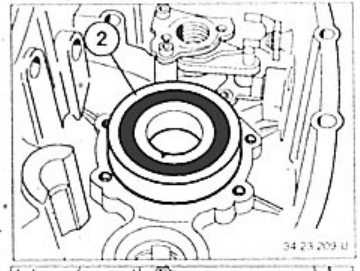
Place Special Tool 23 1 280 in bearing shell (1).



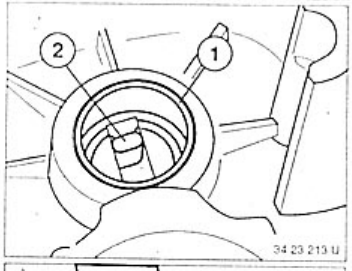
Heat case in area of the ball bearing to about 80° C with a hot air blower.
Pull out ball bearing (2); if necessary drive it out from outside to inside with help of Special Tool 23 1 440.



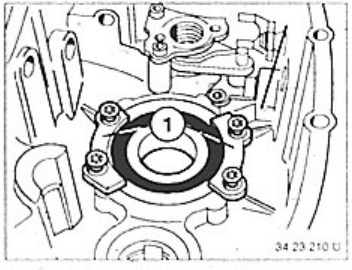
Apply Special Tool 33 4 020.
Screw on Special Tool 23 1 300.
Pull bearing shell out.



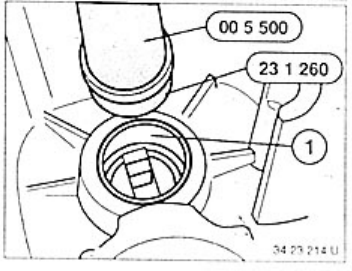
Heat case in area of the ball bearing to about 80° C with a hot air blower.
Install ball bearing (2); if necessary drive it in to fit tight with Special Tool 23 1 470.



Installation:
Insert bearing shell (1) that the slot in the bearing shell is aligned with beads (2) (turning lock) in the case.

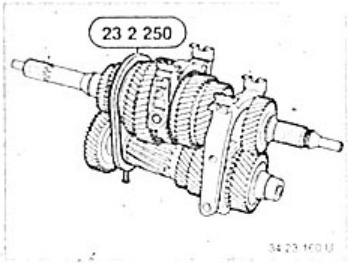


Install elements (1).
Install bolts with a bolt cement and tighten.**
Tightening torque*.



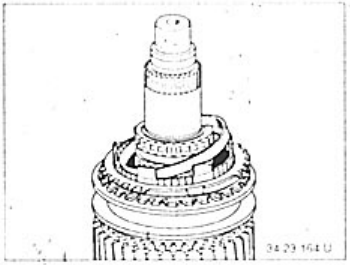
Drive in bearing shell (1) with Special Tools 23 1 260 and 00 5 500.

* See Specifications
** Source of Supply: BMW Parts

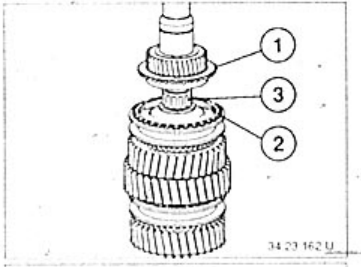


23 23 507 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION

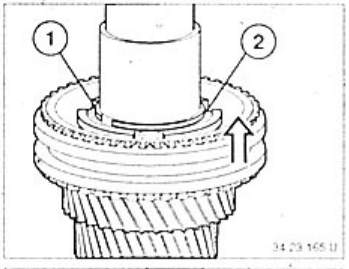
Remove input and output shaft assembly – see 23 21 502.
Pull off 1st/2nd and 3rd/4th gear shift arms.
Remove Special Tool 23 2 250.



Pull off the needle bearing, synchromesh ring, intermediate ring and outer race.



Pull off input shaft (1), synchromesh ring (2) and needle bearing (3).

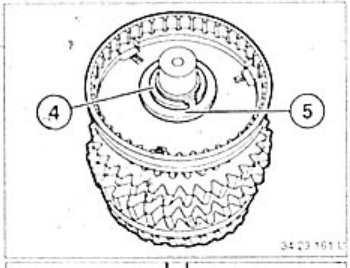


Pull off the 1st/2nd gear operating sleeve.

Important!
Loose thrust pieces, balls and springs.

Lift out circlip (1).
Take off spacer (2).

Installation:
Replace circlip (1).

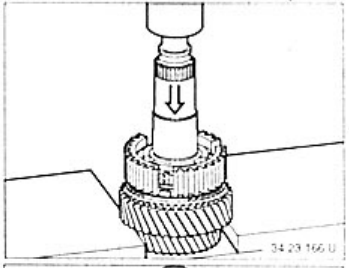


Clamp gear set in a vise fitted with soft jaws on the output shaft.
Pull off the 5th/reverse gear operating sleeve.

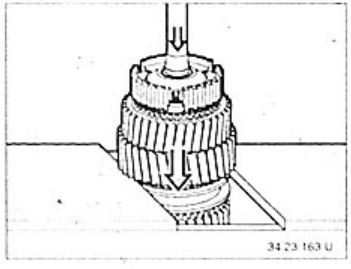
Important!
Loose thrust pieces, balls and springs.

Remove circlip (4) and spacer (5).

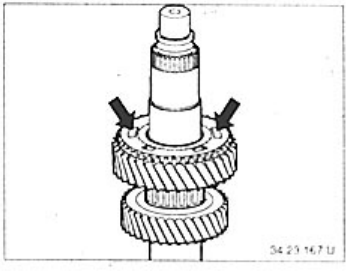
Installation:
Replace circlip (4).



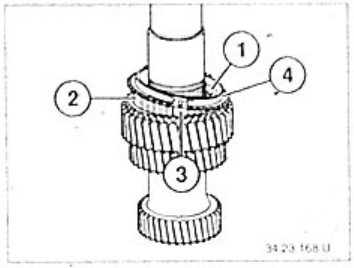
Place pressing-off liners on the 2nd gear.
Press the guide sleeve, 2nd gear with synchromesh ring and needle bearing off of the output shaft.



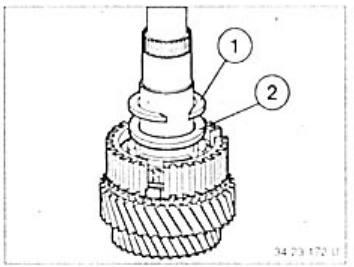
Move the 1st/2nd gear operating sleeve in direction of the 2nd gear.
Place pressing-off liners on the 1st gear.
Press the guide sleeve, reverse gear with synchromesh ring, needle bearing and bearing sleeve, 1st gear and thrust washer off of the output shaft.



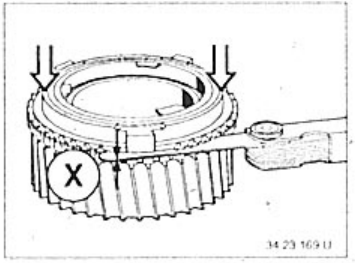
Assembling Gear Set:
Mount needle bearing and 2nd gear with the openings facing up.



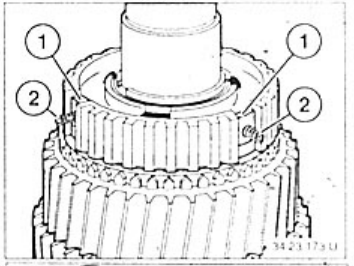
Install synchronization, consisting of:
inner race (1), intermediate ring (2) with dogs (3) in the openings of the 1st gear and synchromesh ring (4).



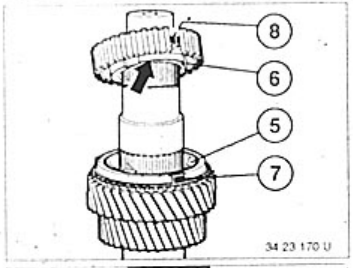
Install spacer (2).
Insert circlip (1).
The circlip must seat in the groove without play; if necessary replace spacer (1).
Spacers are available in different thicknesses in steps from 1.8 to 2.05 mm.



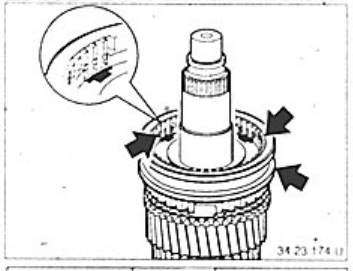
Inspect the 2nd gear synchronization for wear.
Measure distance X between the gear and synchromesh ring.
In so doing press down uniformly on the synchromesh ring by hand.
Specification: at least 0.9 mm.
Actual new part distance: 1.1 ... 1.6 mm.
When replacing, all three parts must be replaced at one time.



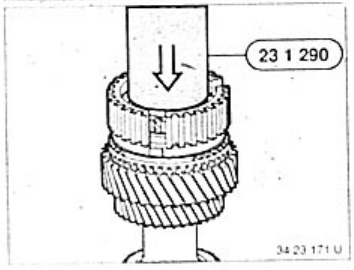
Place three thrust pieces (1) and three springs (2) in the opening of the guide sleeve.



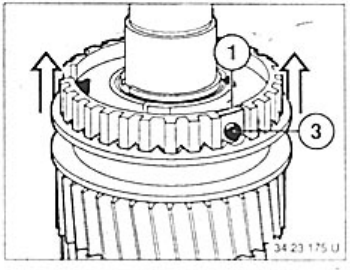
Heat guide sleeve to about 80° C with a hot air blower.
Mount the guide sleeve with the long shoulder facing the 2nd gear.
When mounting make sure that dogs (5) of the inner race are aligned with openings (6) in the gear.
In addition dogs (7) on the synchromesh ring must engage in grooves (8) of the guide sleeve.



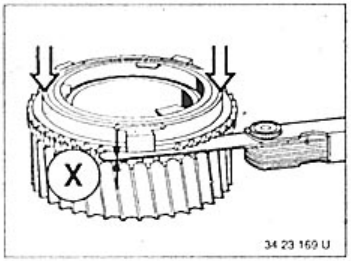
Mount the 1st/2nd gear operating sleeve with the flat side facing up or the bevelled side facing the 2nd gear.
The three set-back or opened teeth must point to the springs



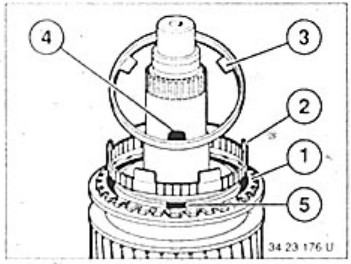
Press on guide sleeve to fit tight with Special Tool 23 1 290.



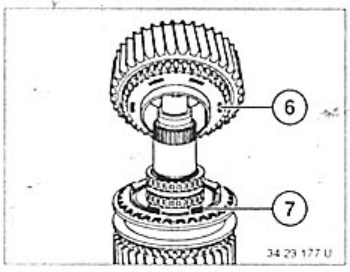
Tilt thrust pieces (1) out of the operating sleeve separately far enough that balls (3) can be placed on the springs.
Push in balls (3) and simultaneously press the thrust pieces into the operating sleeve.
Pull the operating sleeve upwards uniformly as far as the lock (neutral position).



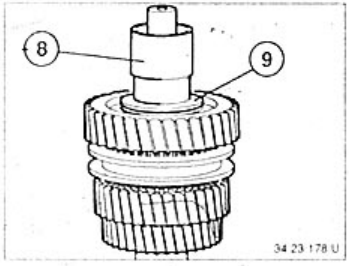
Inspect the 1st gear synchronization for wear.
Measure distance X between the gear and synchromesh ring.
In so doing press down uniformly on the synchromesh ring by hand.
Specification: at least 0.9 mm.
Actual new part distance: 1.1 ... 1.6 mm.
When replacing, all three parts must be replaced at one time.



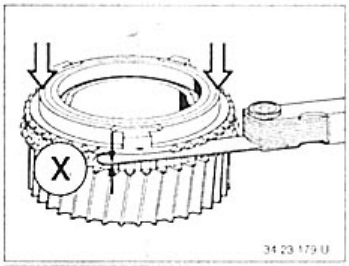
Install synchromesh ring (1), intermediate ring (2) and inner race (3) with dogs (4) in openings (5) of the guide sleeve.



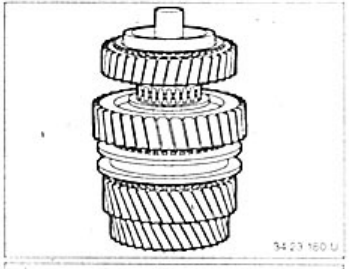
Mount needle bearing.
Install the 1st gear with grooves (6) facing the dogs (7).



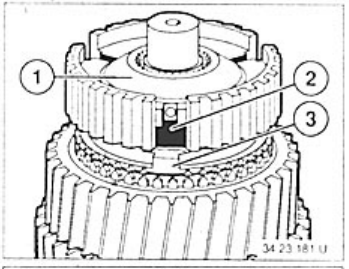
Heat thrust washer (9) and bearing sleeve (8) to about 80° C with a hot air blower and install then on the output shaft, pressing on if necessary.
Use Special Tool 23 1 290 for thrust washer.
Use Special Tool 33 1 342 for bearing sleeve.



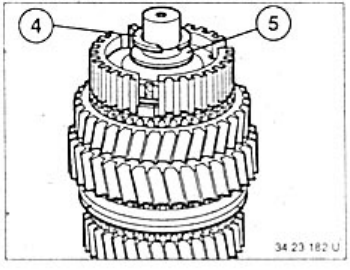
Inspect the reverse gear synchronization for wear.
Measure distance X between the gear and synchromesh ring.
In so doing press down uniformly on the synchromesh ring by hand.
Specification: at least 0.5mm.
Actual new part distance: 0.7 ... 1.15 mm.



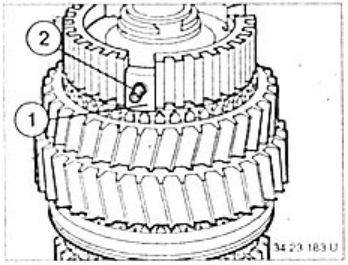
Mount the needle bearing and reverse gear.



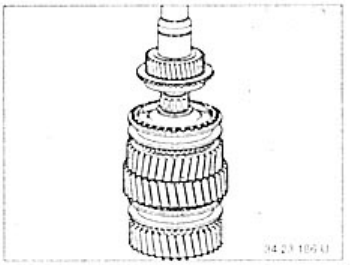
Place the reverse gear synchromesh ring on the reverse gear cone.
Heat the 5th/reverse gear guide sleeve to about 80° C with a hot air blower and install it on the output shaft with conical end (1) facing up; if necessary press on to fit tight with Special Tool 33 1 342.
Make sure that dogs (3) engage in opening (2).



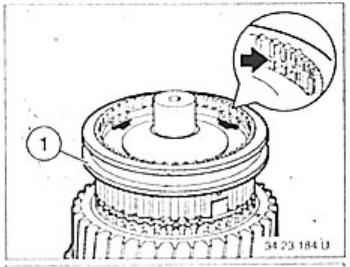
Install spacer (5) and circlip (4).
Circlip (4) must seat in the groove without play; replace spacer if necessary.
Spacers are available in different thicknesses in steps from 3.6 to 4.0 mm.
Knock in the circlip slightly.



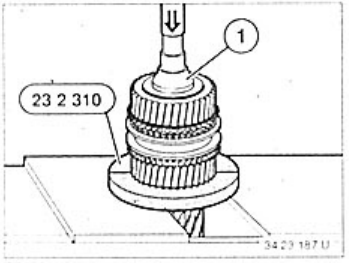
Place three thrust pieces (1) and three springs (2) in the opening of the guide sleeve.



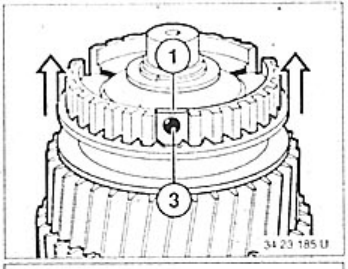
Install synchromesh ring.
Install needle bearing and input shaft with the 5th gear.



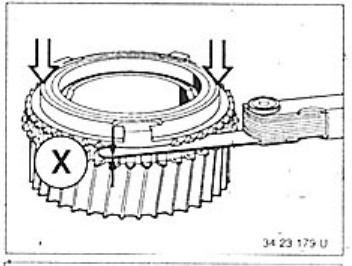
Install the operating sleeve with shouldered end (1) facing the reverse gear.



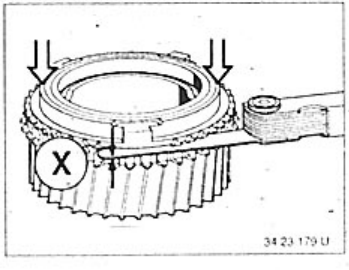
Layshaft:
Replace the 3rd/4th gear synchronization.
Apply Special Tool 23 2 310 on the 3rd gear.
Press bearing inner race (1), thrust washer, 4th gear with needle bearing, synchronization and 3rd gear with needle bearing off of the layshaft.



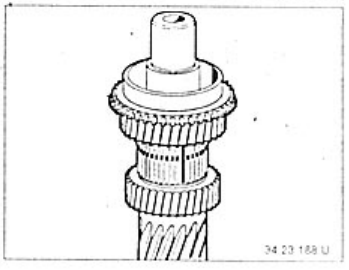
Tilt thrust pieces (1) out of the operating sleeve separately far enough that ball (3) can be placed on the springs.
Press balls (3) in and simultaneously push the thrust pieces into the operating sleeve.
Install the 5th gear synchromesh ring in the operating sleeve.
Pull the operating sleeve upwards uniformly as far as the lock (neutral position).



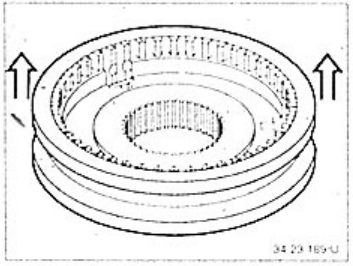
Assembling:
Inspect the 3rd/4th gear synchronization for wear.
Measure distance X between the gear and synchromesh ring.
In so doing press down uniformly on the synchromesh ring.
Specification: at least 0.75 mm.
Actual new part distance: 0.95 ... 1.35 mm.



Inspect the 5th gear synchronization for wear.
Measure distance X between the gear and synchromesh ring.
In so doing press down uniformly on the synchromesh ring.
Specification: at least 0.75 mm.
Actual new part distance: 0.95 ... 1.35 mm.

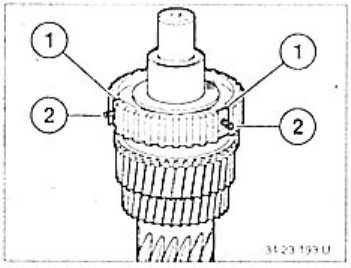


Install needle bearing and 4th gear.

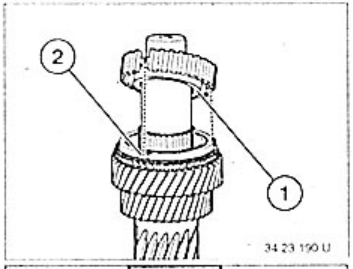


Pull the 3rd/4th gear operating sleeve off of the guide sleeve.

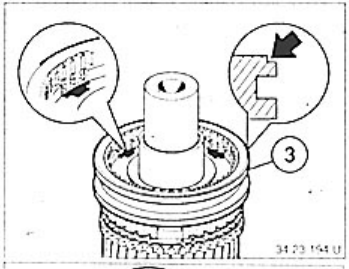
Important!
Loose balls, springs and thrust pieces.



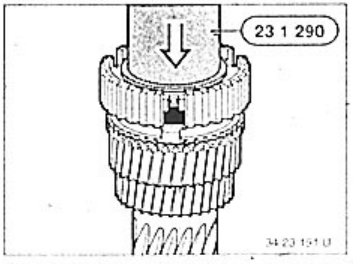
Insert three thrust pieces (1) and three springs (2) into the opening of the guide sleeve.



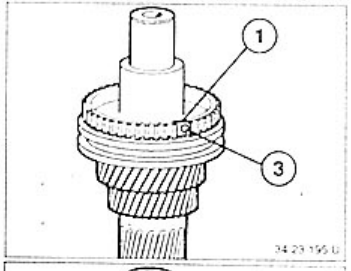
Place the synchromesh ring on the 3rd gear cone.
Heat the 3rd/4th gear guide sleeve to about 80° C with a hot air blower.
Install the guide sleeve with long shoulder (1) facing the 3rd gear.
When installing make sure that dogs (2) are aligned with the openings in the guide sleeve.



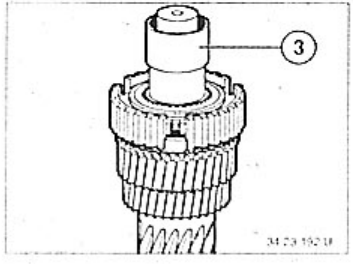
Install the 3rd/4th gear operating sleeve with the shouldered end (3) facing up.
The three set-back or opened teeth must point to the springs.



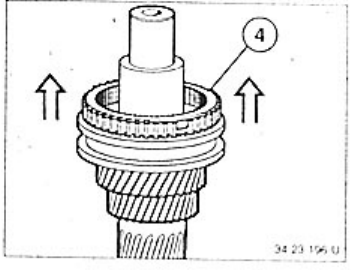
If necessary, press the guide sleeve on to fit tight with help of Special Tool 23 1 290.



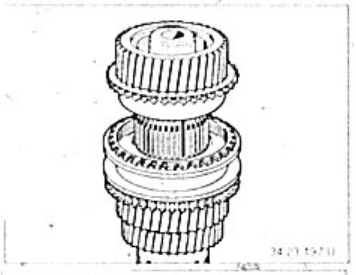
Tilt thrust pieces (1) out of the operating sleeve separately far enough that balls (3) can be placed on the springs.
Press balls (3) in and simultaneously push the thrust pieces into the operating sleeve.



Heat bearing inner race (3) to about 80° C with a hot air blower and install it on the layshaft.
If necessary, press it on to fit tight with help of Special Tool 33 1 342.

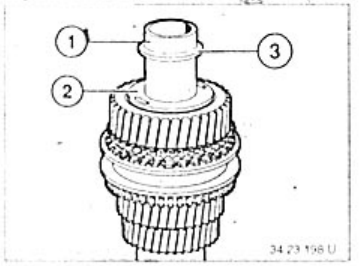


Install synchromesh ring (4) in the openings of the guide sleeve.
Pull the operating sleeve upwards uniformly as far as the lock (neutral position).



Install needle bearing and 4th gear.

Important!
Needle bearings are selected by the manufacturers according to certain tolerances and have a green color code.
Do not mix up with other needle bearings.



Heat thrust washer (2) and bearing inner race (1) to about 80° C with a hot air blower and install on the layshaft with shoulder (3) facing down.
If necessary, press them on to fit tight with help of Special Tool 23 1 160.

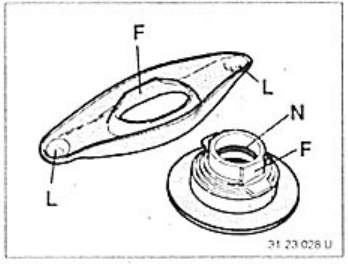
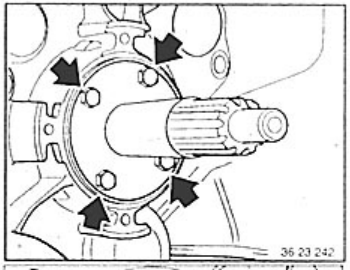
23 12 506 REPLACING RADIAL OIL SEAL FOR INPUT SHAFT

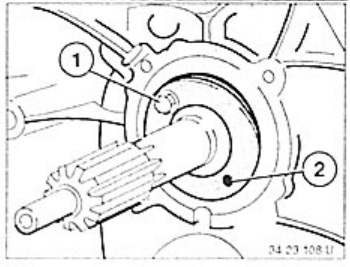
Remove transmission – refer to 23 00 023 in Model Repair Manual.
Lift out spring (1) and remove release lever (3) together with release bearing (2).



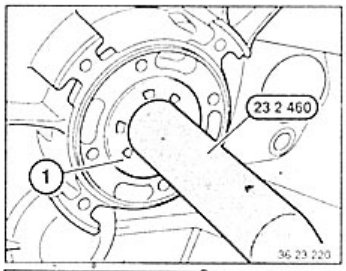
Installation:
Fill lubricating groove (N) with Klüber Microlube GL 261**.
Coat guides (F) and bearings (L) with Klüber Microlube GL 261**.
Non-conformance could cause seizure of the release bearing on the guide sleeve.



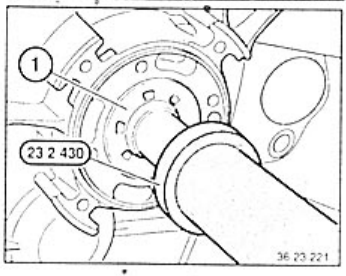
Unscrew guide tube.



Remove radial oil seal.
Locate and puncture through bores (1 and 2) with a scriber.
Drive in radial oil seal to one side as far as stop.
Screw a suitable self-tapping screw into the opposite bore.
Remove radial oil seal by pulling out on the self-tapping screw (use pliers).



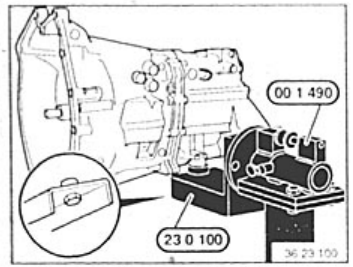
Lubricate sealing lip of radial oil seal with ATF.
Apply Special Tool 23 2 460 on the input shaft.
Slide on radial oil seal (1) as far as case.



Pull off Special Tool 23 2 460.
Drive in radial oil seal (1) flush with Special Tool 23 2 430.
Use a plastic hammer to drive in seal.
Mount guide tube.
Install bolts with bolt cement Loctite No. 242.
Tightening torque*.

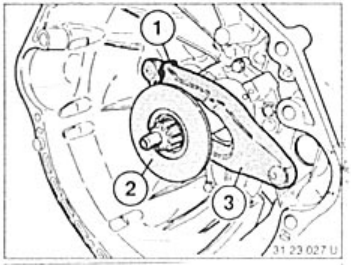
** Source of Supply: BMW Parts

* See Specifications

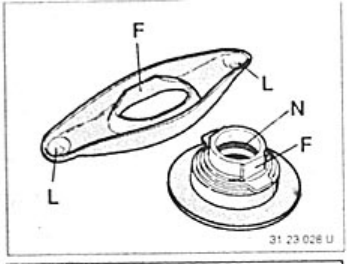


23 21 505 REMOVING AND INSTALLING INPUT AND OUTPUT SHAFT ASSEMBLY

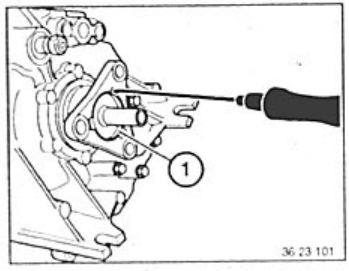
Remove transmission – refer to 23 00 023 in Model Repair Manual.
Unscrew drain plug.
Drain oil.
Screw Special Tool 23 0 100 into oil drain plug bore and secure.
Take up Special Tool 23 0 100 in Special Tool 00 1 490.



Lift out spring (1) and remove release lever (3) together with release bearing (2).



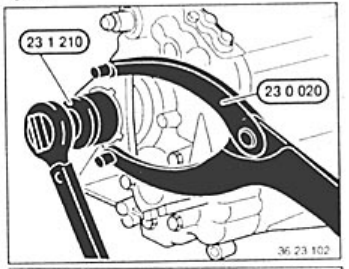
Installation:
Fill lubricating groove (N) with Klüber Microlube GL 261**.
Coat guides (F) and bearings (L) with Klüber Microlube GL 261**.
Non-conformance could cause seizure of the release bearing on the guide sleeve.



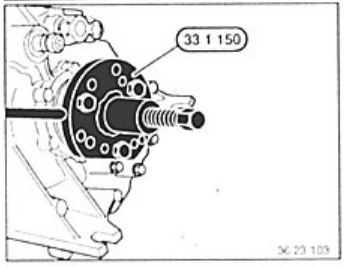
Lift out lock plate (1).

Installation:
Replace lock plate.

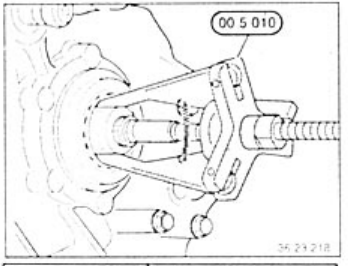
** Source of Supply: BMW Parts



Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.

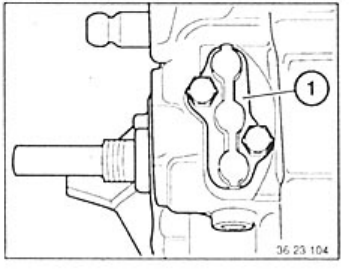


Pull off output flange by hand.
If too difficult, pull off output flange with Special Tool 33 1 150.

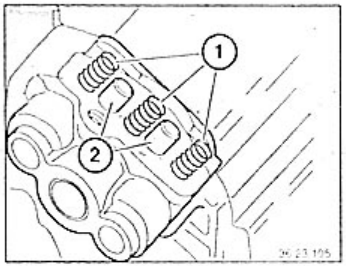


Pull out radial oil seal with Special Tool 00 5 010.

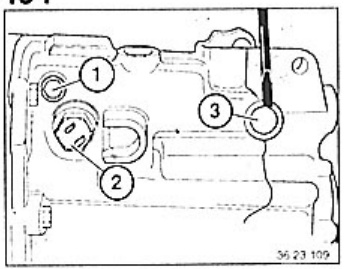
Installation:
Replace radial oil seal.



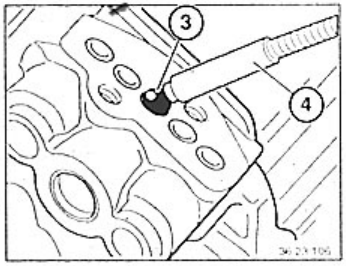
Unscrew end cover (1).



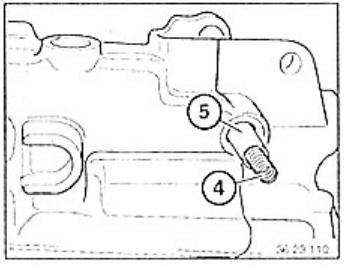
Remove springs (1) and pins (2).



Unscrew bolt (1) and reverse gear switch (2).
Lever out end cap (3).

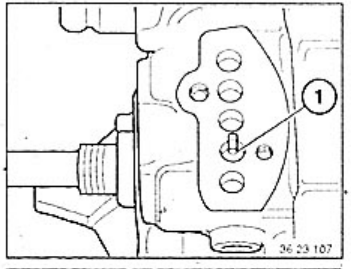


Remove arresting and locking balls (3) with help of magnet (4).

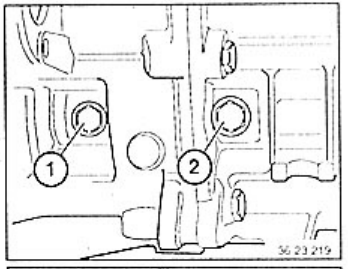


Remove spring (4) and catch pin (5).

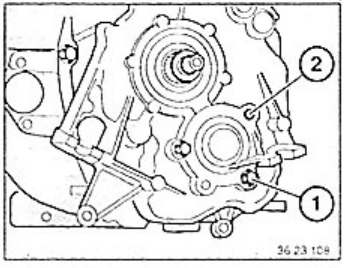
Installation:
Check installed position.



Position lock pin (1) in the middle.
To hold in this position the second gear must be engaged by hand.

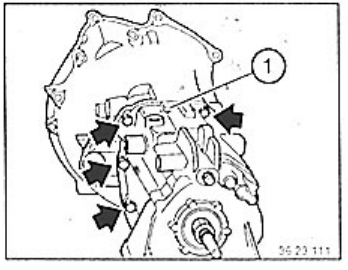


Unscrew reverse gear shaft mounting bolts (1 and 2).

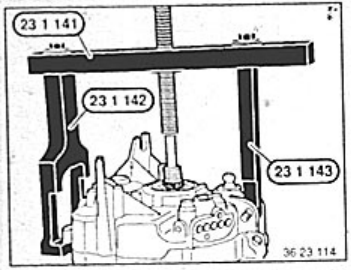


Unscrew four bolts (1) from cover.

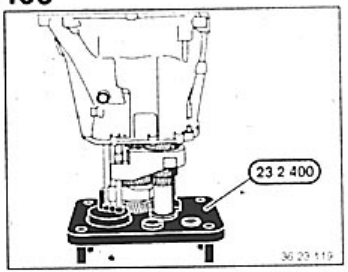
Important!
Pay attention to insulators (2) under heads of bolts.



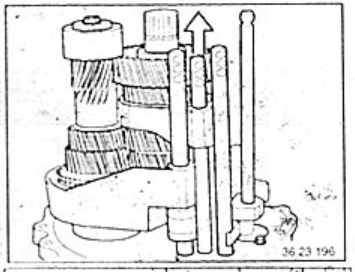
Loosen transmission case bolts.
Drive out two cylindrical pins (1) with a mandrel.



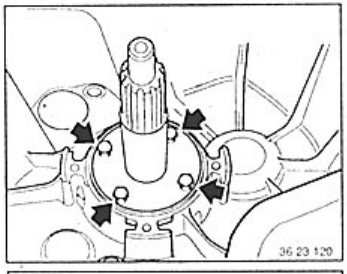
Remove transmission from Special Tool 00 1 490 and turn transmission to have it standing upright.
Mount Special Tool 23 1 141 on lower case section with help of Special Tools 23 1 142 and 23 1 143.
Pull off rear case section.



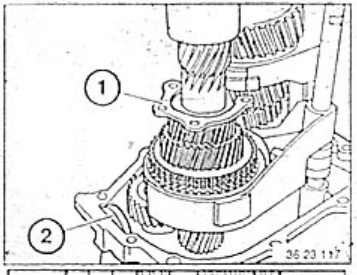
Place gear assembly set and front case section on Special Tool 23 2 400.



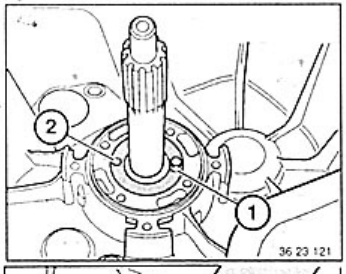
Disengage second gear by hand (neutral).



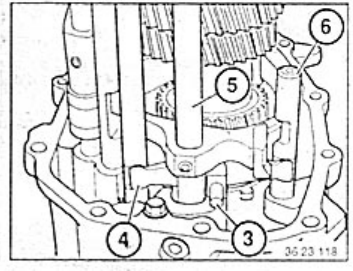
Unscrew guide tube.



Remove holder (1) and magnet (2).

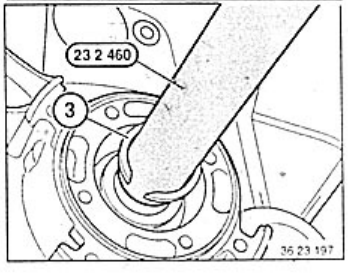


Remove radial oil seal.
Locate and puncture through bores (1 and 2) with a scriber.
Drive in radial oil seal to one side as far as stop.
Screw a suitable self-tapping screw into the opposite bore.
Remove radial oil seal by pulling out on the self-tapping screw (use pliers).



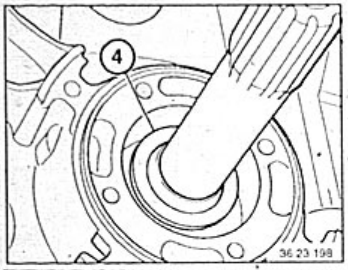
Remove shaft pin (3) and reversing lever (4).
Take off shift rail (6).
Pull out shift shaft (5).

Important!
Rollers.

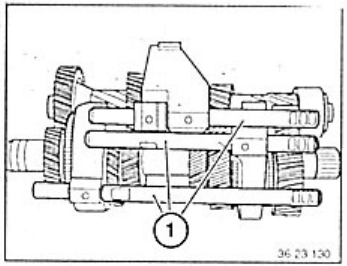


Important!
Special Tool 23 2 460 must be used on the input shaft when removing circlip (3), in order to avoid damaging the input shaft.
Lift out first circlip (3) and pull off over Special Tool 23 2 460.

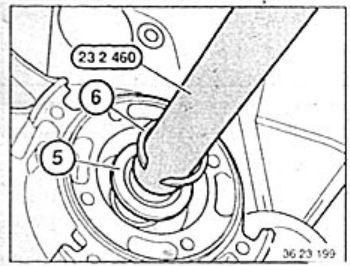
Installation:
Replace circlip (3).



Pull off Special Tool 23 2 460.
Remove locking ring (4).



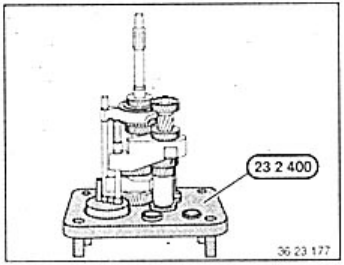
Take gear assembly set with shift rods (1) off of Special Tool 23 2 400.



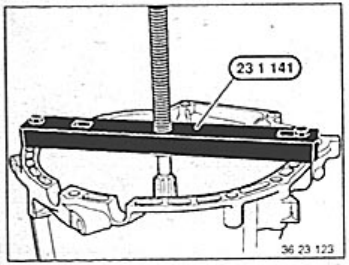
Important!
Special Tool 23 2 460 must be used on the input shaft when removing circlip (6), in order to avoid damaging the input shaft.
Lift out second circlip (6) and secure to Special Tool 23 2 460.
Pull Special Tool 23 2 460 with circlip (6) off of input shaft.

Installation:
Replace circlip (6).

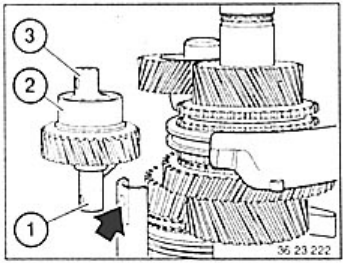
Lift out spacer (5).



Installation:
Place complete gear assembly set with shift rods in Special Tool 23 2 400.

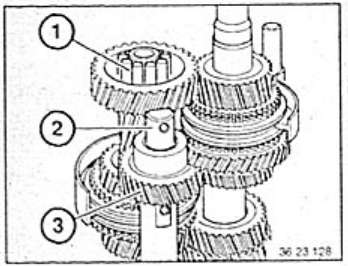


Apply Special Tool 23 1 141 on front transmission case section and secure on outside with two bolts.
Pull front case section off of gear assembly set.

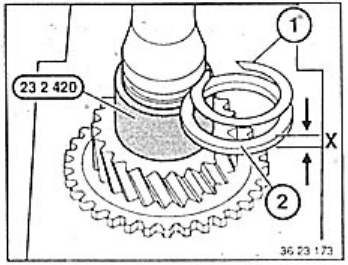


Install reverse gear with collar (2) facing up and shaft with long end (1) in Special Tool 23 2 400 and secure with one bolt.

Important!
Coat outside of short end (3) of reverse gear shaft with Loctite No. 574**.

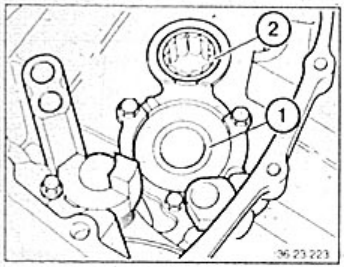


Remove roller bearing (1).
Remove reverse gear (3) and shaft (2).

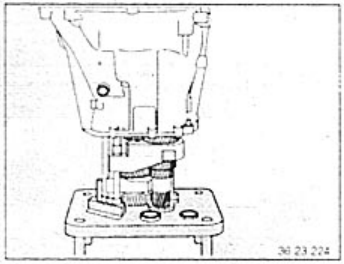


Check axial play of input shaft.
Apply Special Tool 23 2 420 on input shaft.
Install spacer (2) and new circlip (1) in groove.
Measure axial play with a feeler gage blade.
Axial play = 0.04 mm.
Spacer (2) is available from Parts with thickness X of 2.3 to 2.65 mm.

** Source of Supply: BMW Parts

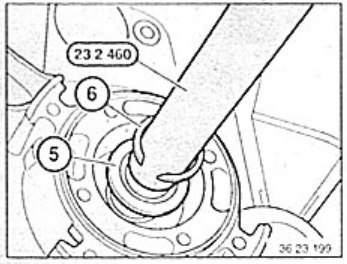


Align shift rods with each other.
Heat bearing inner race (1) of input shaft in front case section to about 110 ... 120° C (with hot air blower).
The heated temperature must be reached precisely — check with a temperature tester**.
Align shift rods with each other.
Insert roller bearing (2) after heating with viscous grease in the bearing sleeve that the large diameter end faces up.



Mount front case section carefully.
Fifth gear synchromesh ring could seize.

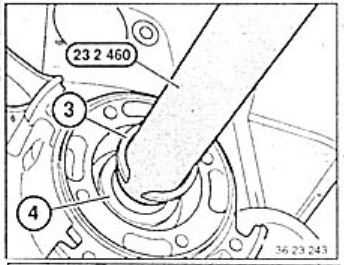
Note!
After assembling the complete transmission the fifth gear synchromesh ring can be loosened again by turning the input or output shaft.



Install spacer (5).

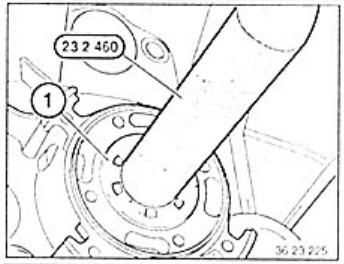
Important!
Special Tool 23 2 460 must be used on the input shaft when installing circlip (6), in order to avoid damaging the input shaft.
Slide circlip (6) over Special Tool 23 2 460 and into the second groove.

** Source of Supply: BMW Parts

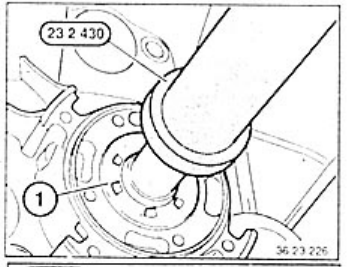


Insert locking ring (4).

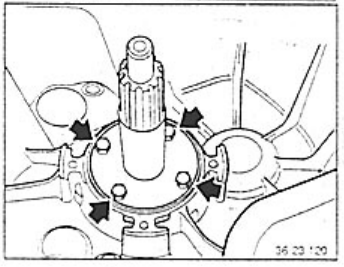
Important!
Special Tool 23 2 460 must be used on the input shaft when installing circlip (3), in order to avoid damaging the input shaft.
Slide circlip (3) over Special Tool 23 2 460 and into the first groove.



Lubricate sealing lip of radial oil seal with ATF.
Slide on radial oil seal (1) over Special Tool 23 2 460 as far as case.
Pull off Special Tool 23 2 460.

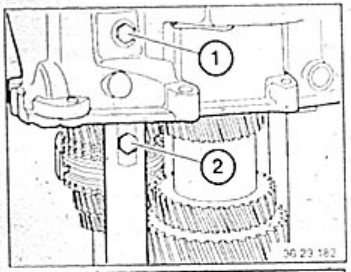


Drive in radial oil seal (1) with Special Tool 23 2 430.
Use a plastic hammer for driving in.

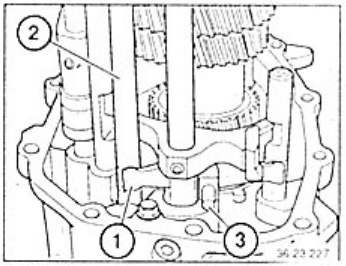


Mount guide tube.
Install bolts with bolt cement Loctite No. 242**.
Tightening torque*.

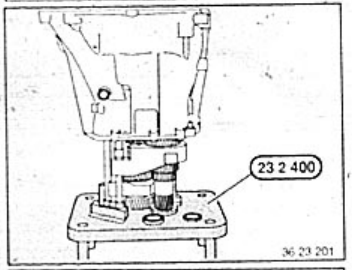
* See Specifications
** Source of Supply: BMW Parts



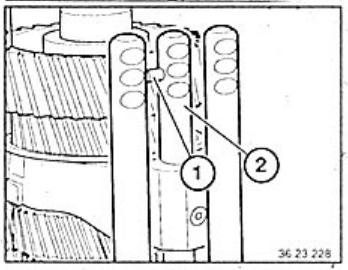
Mount reverse gear shaft on front case section.
Install bolt (1) with bolt cement Loctite No. 242** and tighten.
Tightening torque*.
Loosen bolt (2) on Special Tool 23 2 400.



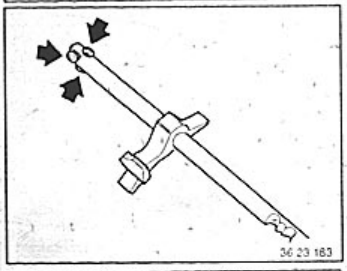
Install reversing lever with large round surface (1) facing 1st/2nd gear shift rod (2).
Ground surface must point towards case.
Hold reversing lever in position with pin (3).



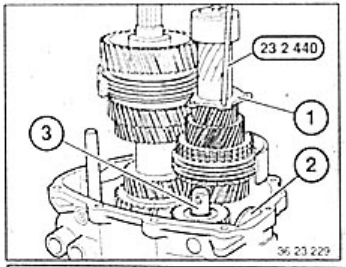
Take front case section with gear assembly set off of Special Tool 23 2 400.
Position front case section with gear assembly set upright.



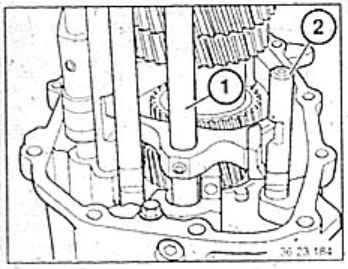
Install lock pin (1) lubricated with grease in 1st/2nd gear shift rod (2) and secure in the middle.



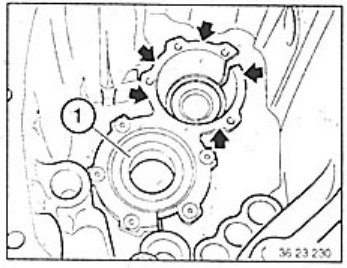
Hold four rollers on the shift shaft with help of grease.



Clean and coat case sealing surfaces with Loctite No. 574**.
Mount holder (1) on 2nd gear of the layshaft with the straight end pointing towards the bearing.
Special Tool 23 2 440 must be screwed in for later assembly work.
Place magnet (2) in opening.
Align shift rods with each other.
Coat outside of reverse gear shaft (3) with Loctite No. 574**.



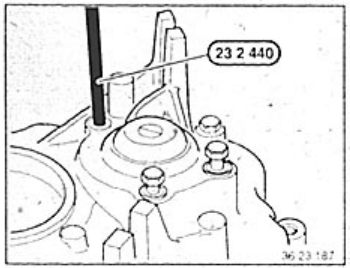
Place shift shaft (1) in front case section.
Install shift rail (2) with opening facing up towards case.



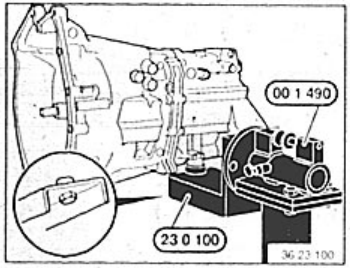
Lift out radial oil seal for shift shaft.
Heat bearing inner race (1) and rear case section in area of bearing to 110 ... 120° C (with hot air blower).
The heated temperature must be reached precisely — check with a temperature tester**.

* See Specifications
** Source of Supply: BMW Parts

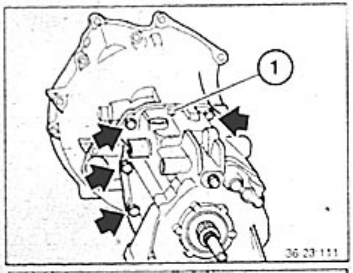
** Source of Supply: BMW Parts



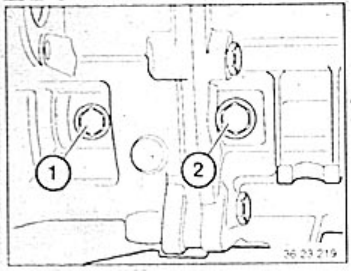
Mount rear case section as far as stop.
Install three bolts with new seals.
Remove Special Tool 23 2 440.
Screw in fourth bolt with a new seal.
Tighten all bolts.
Tightening torque*



Lightly secure front and rear case sections with two bolts located opposite each other.
Take up transmission in Special Tools 23 0 100 and 00 1 490 again.

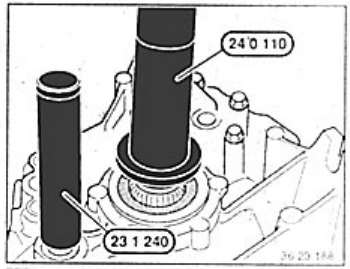


Drive in dowel pins (1).
Screw in and tighten all case bolts.
Tightening torque*.

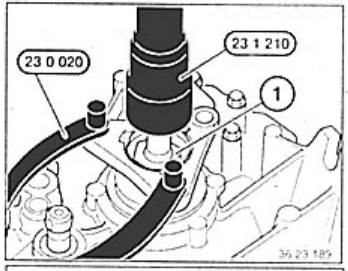


Loosen bolt (1) slightly.
Install reverse gear shaft bolt (2) with bolt cement Loctite No. 242**.
Tighten bolts (1 and 2).
Tightening torque*.

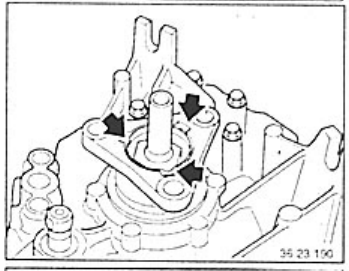
* See Specifications
** Source of Supply: BMW Parts



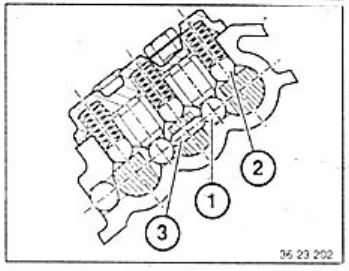
Install radial oil seals for shift shaft and output shaft.
Coat sealing lips with ATF.
Drive in radial oil seal for output shaft with Special Tool 24 0 110 and radial oil seal for shift shaft with Special Tool 23 1 240.
Use a plastic hammer for driving in.



Heat output flange to about 80° C (with hot air blower) and install on output shaft, driving on to fit tight if necessary.
Install collar nut (1) with bolt cement Loctite No. 242**.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.



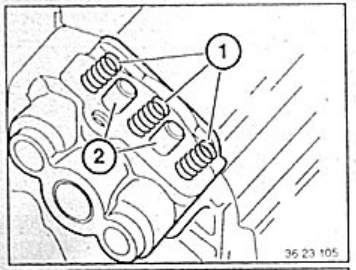
Install and secure lock plate.



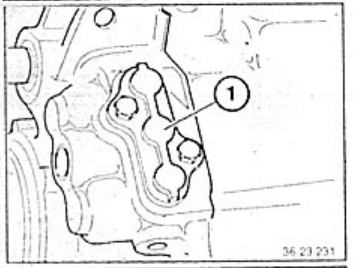
Install arresting and locking balls.

1 = Locking ball
2 = Arresting ball
3 = Lock pin

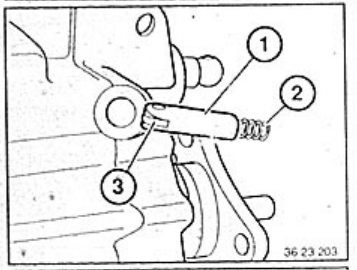
* See Specifications
** Source of Supply: BMW Parts



Install springs (1) and dowel pins (2).

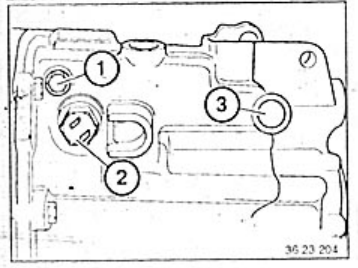


Mount end cover (1).
Install bolts with bolt cement Loctite No. 242** and tighten.
Tightening torque*.



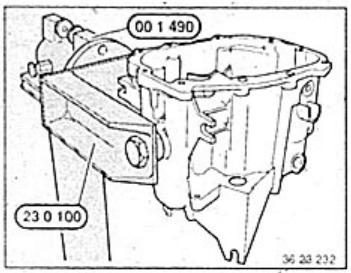
Install catch pin (1) and spring (2).

Important!
Roller (3) must be horizontal in direction of shifting.



Install bolt (1) with bolt cement Loctite No. 242** and tighten.
Screw in reverse gear switch (2).
Tightening torque*.
Drive in end cap (3).

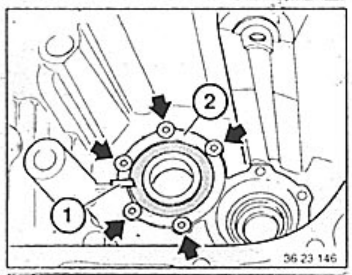
* See Specifications
** Source of Supply: BMW Parts



23 21 706 REPLACING BEARINGS OF ALL TRANSMISSION SHAFTS
– Input and Output Shafts Removed –

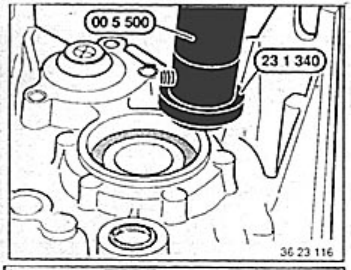
Rear Case Section – Output Shaft Bearing:

Take up rear case section on Special Tools 23 0 100 and 00 1 490.

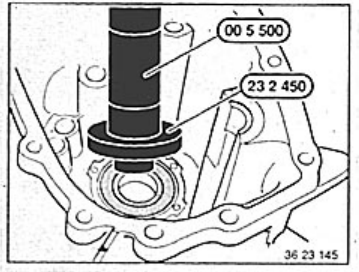


Unscrew holder (2).
Remove oil scraper plate (1) if installed.

Installation:
Also secure oil scraper plate (1).
Install bolts with bolt cement Loctite No. 242.**
Tightening torque*.

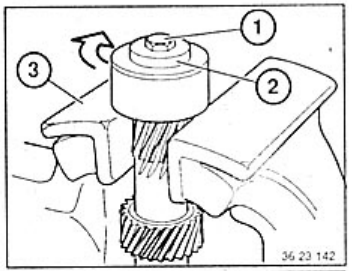


Drive out output shaft bearing from outside to inside with Special Tools 23 1 340 and 00 5 500.



Heat rear case section in area of bearing for output shaft to about 80° C (with hot air blower).
Install bearing, driving it in to fit tight with help of Special Tools 23 2 450 and 00 5 500 if necessary.

* See Specifications
** Source of Supply: BMW Parts



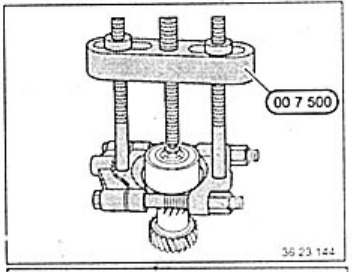
Layshaft Bearing:

Clamp layshaft in a vise fitted with two soft jaws (3).
Remove bolt (1).

Important!
Left-hand threads.

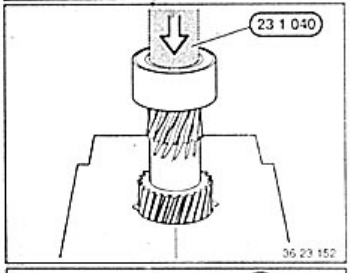
Remove washer (2).
Take layshaft out of vise.

Installation:
Bolt (1) must be replaced.

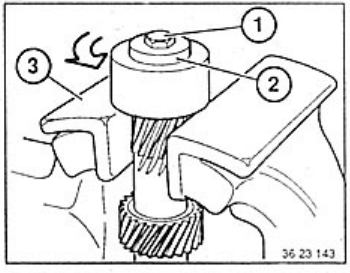


Pull ball bearing off of layshaft with Special Tool 00 7 500.
This requires screwing in the mounting bolt without washer again.

Important!
Bolt has left-hand threads.

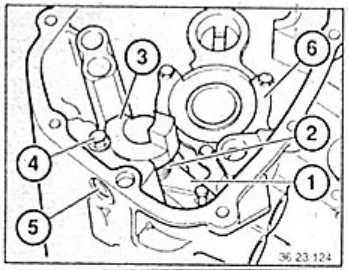


Heat bearing inner race to about 80° C (with hot air blower) and install on layshaft; if necessary press it on with help of Special Tool 23 1 040.



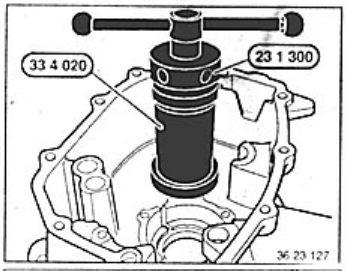
Clamp layshaft in a vise fitted with two soft jaws (3) again to tighten bolt (1).
Install washer (2).
Install new bolt (1) with bolt cement Loctite No. 242 and tighten.**
Tightening torque*.

* See Specifications
** Source of Supply: BMW Parts

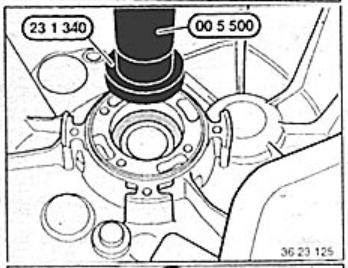


Front Case Section – Input Shaft Bearing:

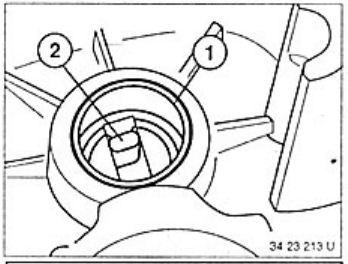
Remove selector arm (1).
This is done by unscrewing bolts (4 and 5) and then removing console (3), spring (2) and selector arm (1).
Unscrew holder (6).



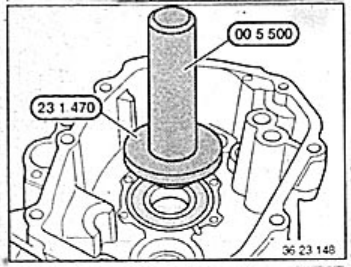
Apply Special Tool 33 4 020.
Screw on Special Tool 23 1 300.
Pull out bearing shell.



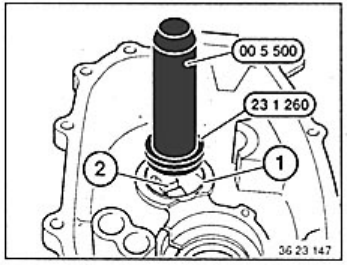
Drive out bearing from inside to outside with Special Tools 23 1 340 and 00 5 500.



Installation:
Install bearing shell (1) that slot in bearing shell is aligned with anti-turning bead (2) in case.

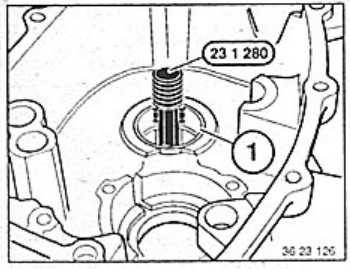


Heat front case section in area of bearing to about 80° C (with hot air blower).
Install bearing; if necessary drive it in to fit tight with help of Special Tools 23 1 470 and 00 5 500.



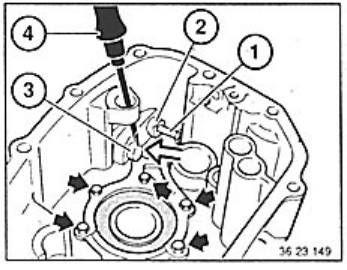
Drive in bearing shell (1) with Special Tools 23 1 260 and 00 5 500.

2 = Anti-turning bead (2)



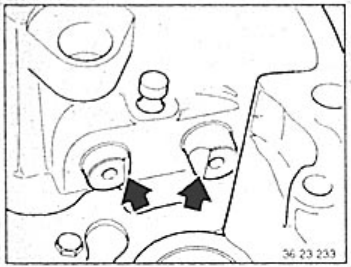
Layshaft Bearing:

Place Special Tool 23 1 280 in bearing shell (1)

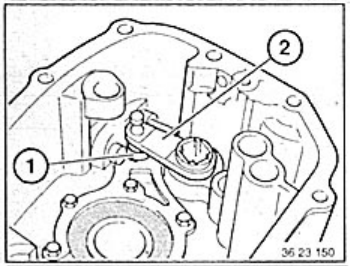


Install holder as follows.
Push lock pin (2) towards outside with bolt (1).
Push lock pin (3) towards outside with screwdriver (4).
Install holder and secure with bolts.
Install bolts with bolt cement Loctite No. 242.**
Tightening torque*.
Remove bolt (1).

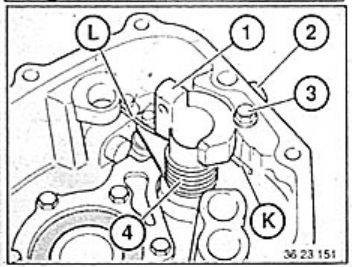
*** See Specifications**
**** Source of Supply: BMW Parts**



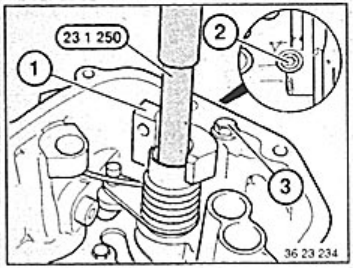
Check installed position of pressure pins.
Bevelled surfaces must point inwards towards each other.



Install roller (1) with selector arm (2).

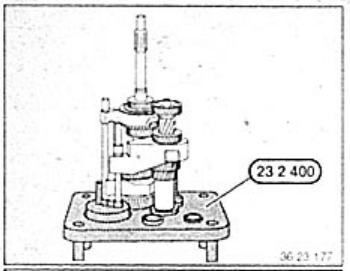


Install spring (4) and sleeve (1).
Attach short arm (K) of spring on case and long arm (L) in groove of selector arm.
Coat head of bolt (2) with Loctite No. 574** on inside.



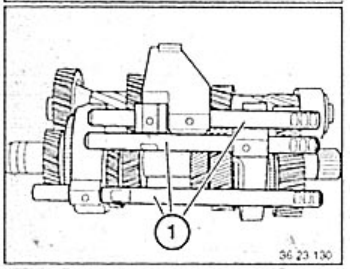
For easier installation (strong spring force) apply Special Tool 23 1 250 in selector arm and press sleeve (1) towards case.
In this position install bolt (2) with bolt cement Loctite No. 242** and tighten lightly.
Tighten bolt (2) to final torque last.
Tightening torque*.

* See Specifications
** Source of Supply: BMW Parts

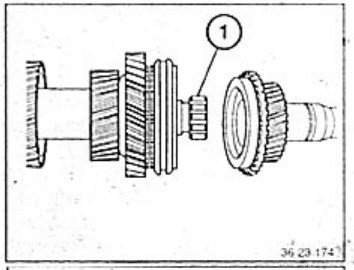


23 23 508 DISASSEMBLING AND ASSEMBLING COMPLETE SYNCHRONIZATION

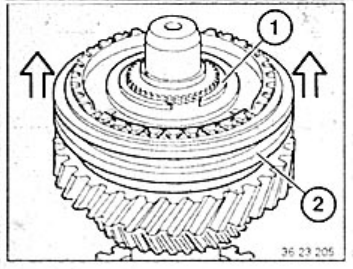
Remove input and output shaft assembly – refer to 23 21 505.
Remove gear assembly set with shift rods from Special Tool 23 2 400.



Pull off shift rods (1).
Remove layshaft from gear assembly set.



Pull off input shaft, needle bearing (1) and 5th gear synchromesh ring.

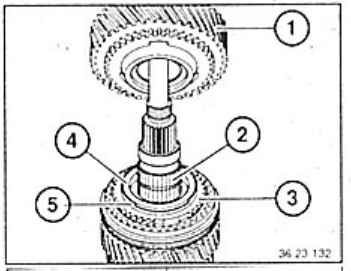


For easier installation, place output shaft in Special Tool 23 2 400.
Pull 5th/reverse gear operating sleeve (2) off of guide sleeve.

Important!
Loose thrust pieces, balls and springs.

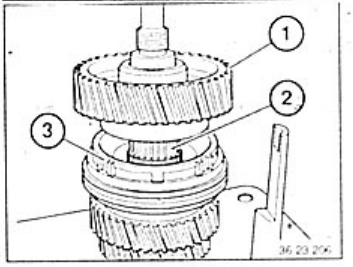
Lift out circlip (1).

Installation:
Replace circlip.

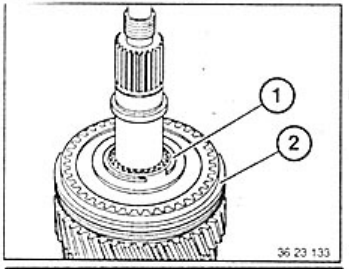


Turn output shaft around so that output end faces up.

Double Taper Synchronization:
Pull 1st gear (1), needle bearing (2), synchromesh ring (3), conical ring (4),and friction ring (5) off of output shaft.



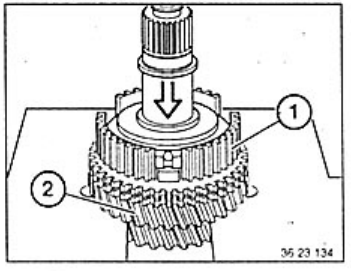
Single Taper Synchronization:
Pull 1st gear (1), needle bearing (2) and synchromesh ring (3) off of output shaft.



Lift out circlip (1).
Pull off 1st/2nd gear operating sleeve (2).

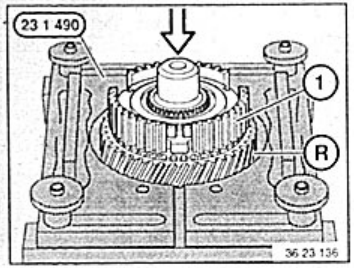
Important!
Loose thrust pieces, balls and springs.

Installation:
Replace circlip (1).

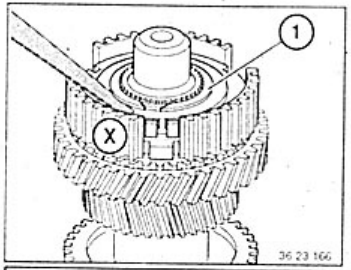


Press 2nd gear (2) and guide sleeve (1) off of output shaft.
Pressing-off force*.

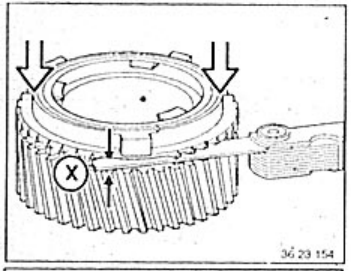
* See Specifications



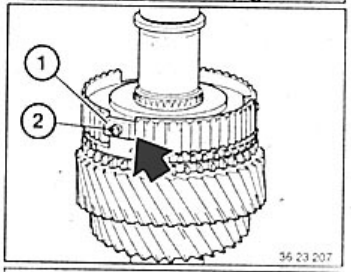
Using Special Tool 23 1 490, press reverse gear, synchromesh ring and guide sleeve (1) off of output shaft.
Pressing-off force*.



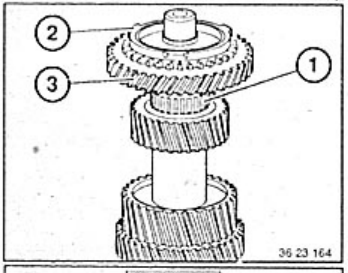
Install suitable circlip (1).
Circlips are available from Parts in thicknesses from 2.0 to 2.3 mm in steps of 0.05 mm.
Max. premissible axial play X = 0.04 mm.



Inspect all synchronization components for wear prior to assembling the gear assembly set.
Also determine gap X between synchromesh ring and concerned gears.
Measure in area of stops.
Press synchromesh ring uniformly in direction of the taper.
Gaps* of different gears.

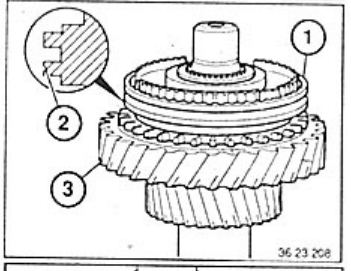


Place three thrust pieces (1) with bevels facing out and springs (2) in opening of guide sleeve.

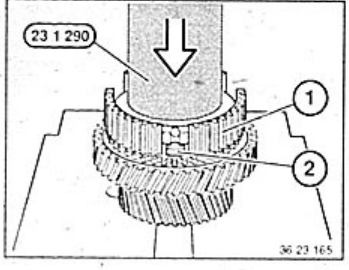


Assembling Gear Assembly Set:
Install needle bearing (1), reverse gear (3) and synchromesh ring (2).

Note:
Lightly lubricate bearing surfaces on needle bearing (1) and synchromesh ring (2) with ATF.

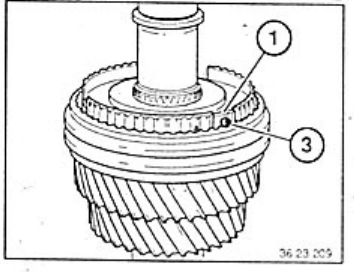


Mount operating sleeve (1) with identification groove (2) facing reverse gear (3).



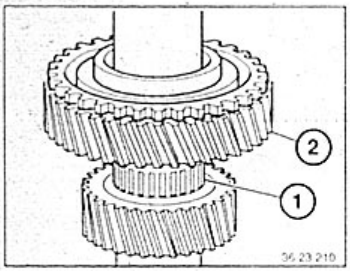
Heat 5th/reverse gear guide sleeve (1) to about 120° C (with hot air blower) and install on output shaft; if necessary press on to fit tight with help of Special Tool 23 1 290.

Important!
Make sure that stops (2) engage in opening of the guide sleeve while pressing on.
Pressing-on force*.



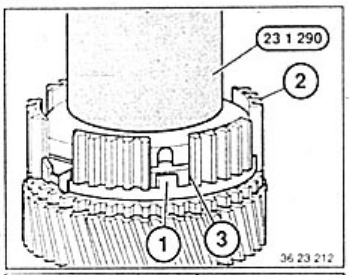
Tilt thrust pieces (1) out of operating sleeve separately far enough that balls (3) can be placed on the springs.
Press balls (3) towards inside and simultaneously press thrust pieces into the operating sleeve.
Place 5th gear synchromesh ring in the operating sleeve.
Pull operating sleeve upwards uniformly as far as lock (neutral position).

* See Specifications



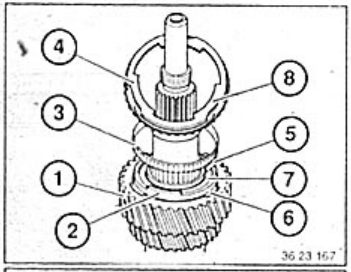
Turn output shaft around so that the output end faces up.
Install needle bearing (1) and 2nd gear (2) on output shaft.

Note:
Lubricate bearing surfaces on needle bearing with ATF.



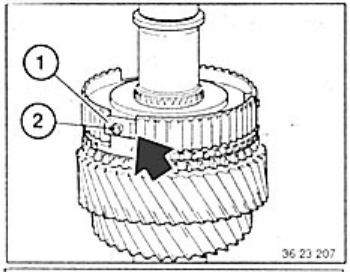
Single Taper Synchronization:

Heat 1st/2nd gear guide sleeve to about 120° C (with hot air blower).
Install guide sleeve that stops (1) point towards opening (3) of guide sleeve (2).
Press on guide sleeve (2) to fit tight with Special Tool 23 1 290.
Make sure that stops (1) engage in opening of the guide sleeve while pressing on.
Pressing-on force*.

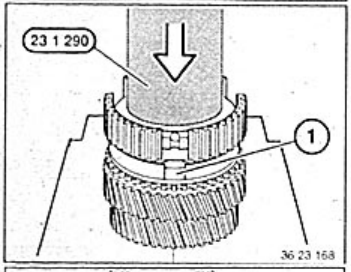


Double Taper Synchronization:

Important!
The complete synchronization must be replaced when it is necessary to replace 1st/2nd gear synchronization.
Install conical ring (2), friction ring (3) and synchromesh ring (4) in such a manner that tabs (5) of friction ring engage in opening (6) of 2nd gear (1).
Tabs (8) on synchromesh ring (4) engage in opening (7).

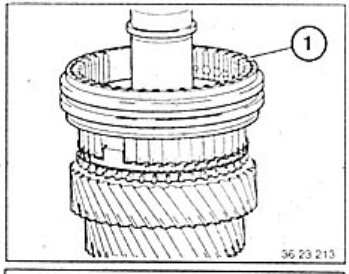


Insert three thrust pieces (1) with bevel facing out and three springs (2) into opening of guide sleeve.



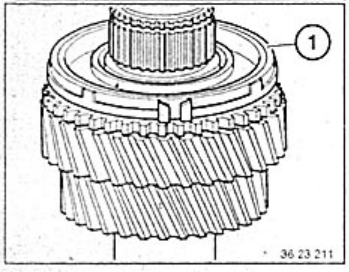
Heat 1st/2nd gear guide sleeve to about 120° C (with hot air blower) and install on output shaft; if necessary press on to fit tight with help of Special Tool 23 1 290.

Important!
Make sure that stops (1) engage in opening of the guide sleeve while pressing on.
Pressing-on force*.



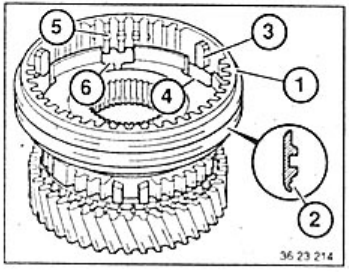
Double Taper Synchronization:

Install operating sleeve (1).



Single Taper Synchronization:

Install synchromesh ring (1).

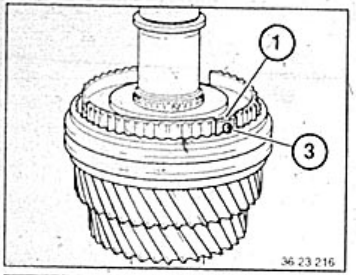


Single Taper Synchronization:

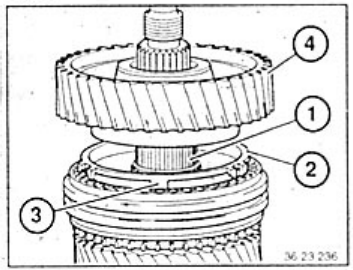
Install operating sleeve (1) with identification groove (2) pointing towards 2nd gear.
Tab (3) on operating sleeve faces center of opening (4) or teeth with grooves (5) towards opening (6) of slides.

* See Specifications

* See Specifications



Tilt thrust pieces (1) out of operating sleeve separately far enough that balls (3) can be placed on the springs.
Press balls (3) towards inside and simultaneously press thrust pieces into the operating sleeve.

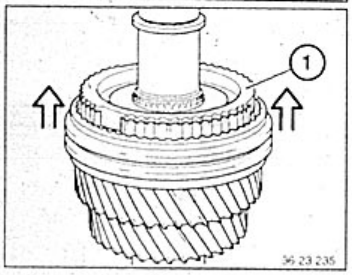


Single Taper Synchronization:

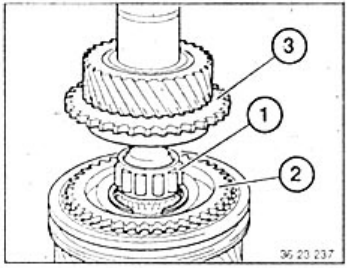
Install needle bearing (1).
Install synchromesh ring (2) with tabs (3) facing the slides.

Note:
Lubricate bearing surfaces on needle bearing and synchromesh ring with ATF.

Install 1st gear (4).



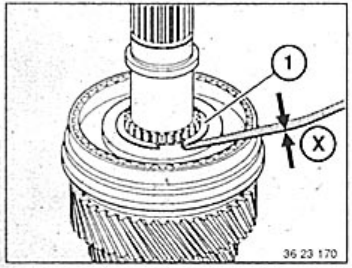
Place 1st gear synchromesh ring (1) into openings of guide sleeve.
Pull up operating sleeve uniformly as far as lock (neutral position).



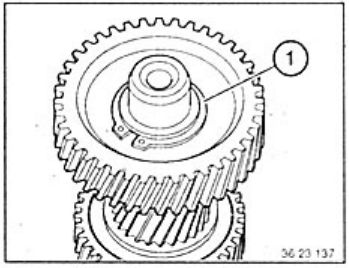
Install roller bearing (1), 5th gear synchromesh ring (2) and input shaft on output shaft (3).

Note:
Lubricate bearing surfaces on needle bearing and synchromesh ring with ATF.

Lift input and output shaft assembly off of Special Tool 23 2 400 and lay aside.



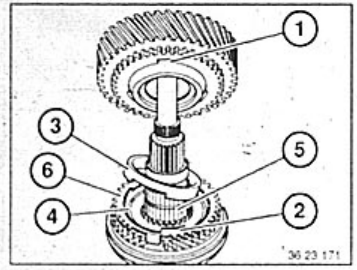
Install suitable circlip (1).
Circlips are available from Parts in thicknesses from 2.0 to 2.3 mm in steps of 0.05 mm.
Max. permissible axial play X = 0.04 mm.



Layshaft:

3rd/4th gear synchronization:
Place layshaft in Special Tool 23 2 400 to install synchronization.
Lift out circlip (1).

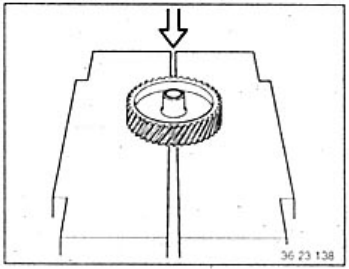
Installation:
Replace circlip (1).



Double Taper Synchronization:

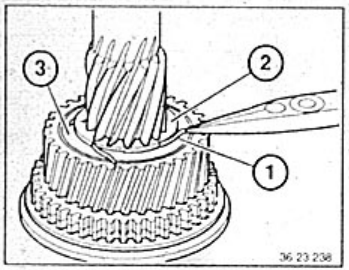
Install needle bearing (5).
Insert synchromesh ring (6), friction ring (4) and conical ring.
Mount 1st gear.

Important!
Tab (3) must engage in opening (4) and tab (2) in opening (1).
Lubricate bearing surfaces on needle bearing and synchromesh ring with ATF.



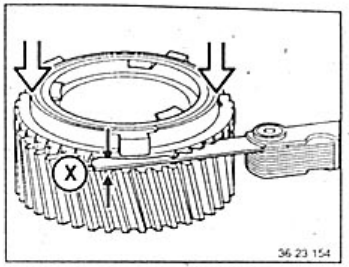
Take up layshaft in a press.
Select bearing surface on constant gear as large as possible.
Press constant gear off of layshaft.
Pressing-off force*.

* See Specifications

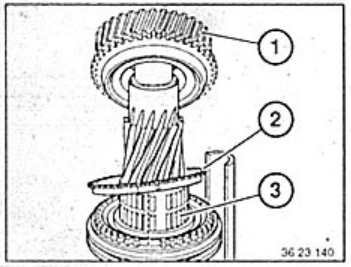


Remove locking ring (1) after unbending four tabs towards outside with a pliers.
Remove support (2) (two parts) and thrust washer (3).

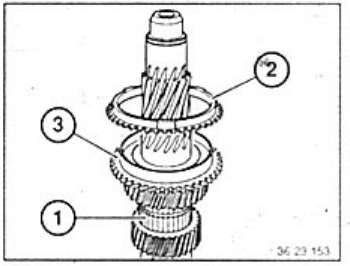
Installation:
Replacing locking ring (1).



Inspect components of synchronization for wear prior to assembling.
Measure gap X between synchromesh ring and concerned gears for this purpose.
Measure in area of stops.
Press synchromesh ring uniformly in direction of taper.
Gap* of different gears.

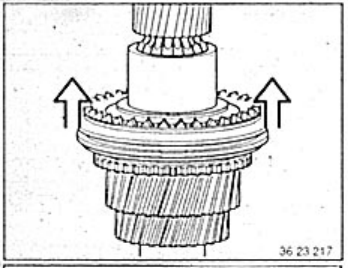


Remove 4th gear (1), synchromesh ring (2) and needle bearing (3).



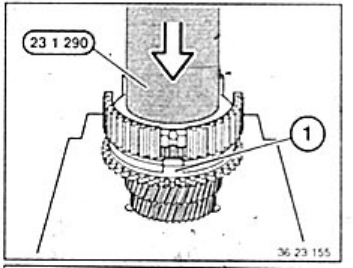
Install needle bearing (1), 3rd gear (3) and synchromesh ring (2).

Note:
Lubricate bearing surfaces on needle bearing and synchromesh ring with ATF.



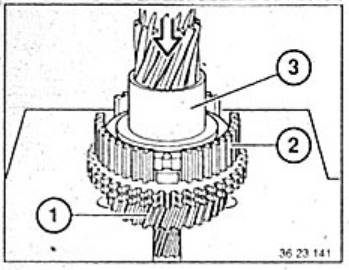
Pull off 3rd/4th gear operating sleeve upwards.

Important!
Loose thrust pieces, balls and springs.

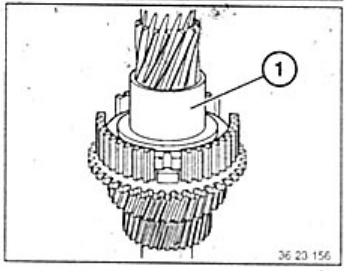


Heat guide sleeves to about 120° C (with hot air blower) and install on layshaft.
Install 3rd/4th gear guide sleeve and press on to fit tight with help of Special Tool 23 1 290.

Important!
Make sure that stops (1) engage in opening of guide sleeve while pressing on.
Pressing-on force*.



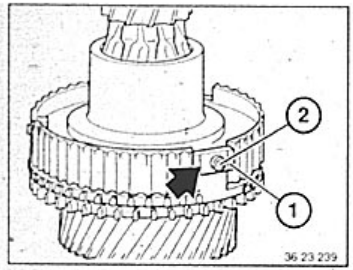
Take up layshaft in a press.
Press 3rd gear (1), guide sleeve (2) and bearing sleeve (3) off of layshaft.
Pressing-off force*.



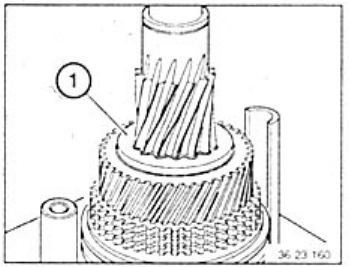
Heat bearing inner race (1) to about 80° C (with hot air blower) and push on to layshaft as far as stop.

* See Specifications

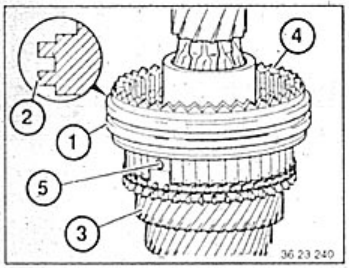
* See Specifications



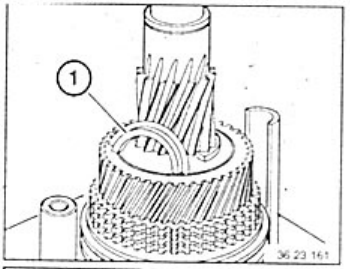
Place three thrust pieces (1) with bevel facing out and three springs (2) in opening of guide sleeve.



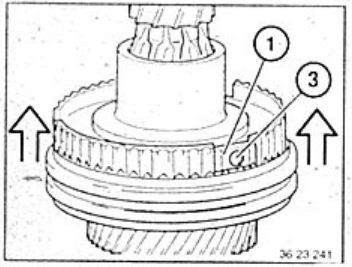
Install thrust washer (1) over splines as far as the bearing surface.



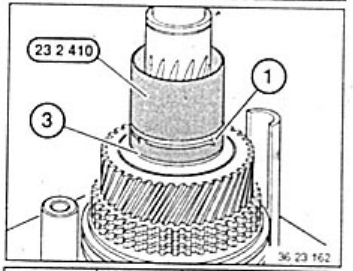
Install operating sleeve (1) with groove (2) pointing towards 3rd gear (3).
Three ground out teeth (4) must point towards springs (5) or slides.



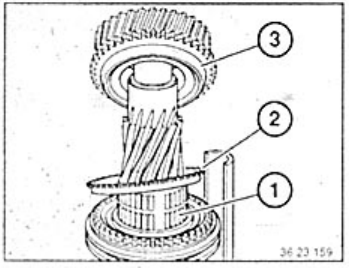
Install support (two parts) with small diameter (1) pointing down in groove.
The axial play must be adjusted after replacing the support.
Max. axial play = 0.04 mm.
Supports are available from Parts in thicknesses from 2.9 to 3.15 mm in steps of 0.05 mm.



Tilt thrust pieces (1) out of operating sleeve separately far enough that balls (3) can be placed on the springs. Press balls (3) towards inside and simultaneously press thrust pieces into the operating sleeve.
Place 3rd gear synchromesh ring in the operating sleeve.
Pull up operating sleeve uniformly as far as the lock (neutral position).

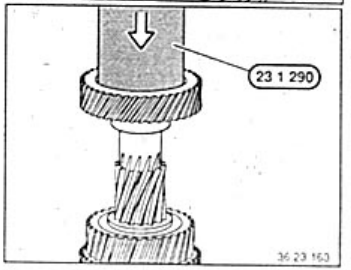


Apply Special Tool 23 2 410 on layshaft.
Clip in locking ring (1) with the four tabs in groove (3).



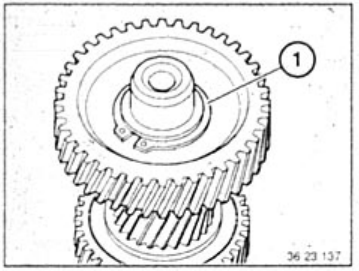
Install needle bearing (1), synchromesh ring (2) and 4th gear (3) on layshaft.

Note:
Lubricate bearing surfaces on needle bearing and synchromesh ring with ATF.

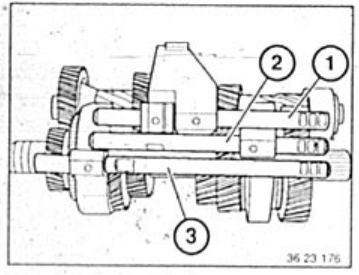


Heat constant gear to about 180° C (with heating plate).
Check temperature with temperature tester**.
Place layshaft in a press.
Install constant gear on layshaft and press on to fit tight with Special Tool 23 1 290.
Pressing-on force*.

* See Specifications
** Source of Supply: BMW Parts



Install circlip (1).



Assemble layshaft with input shaft and output shaft.
Install 3rd/4th gear shift rod (1), 1st/2nd gear shift rod (2) and 5th/reverse gear shift rod (3).

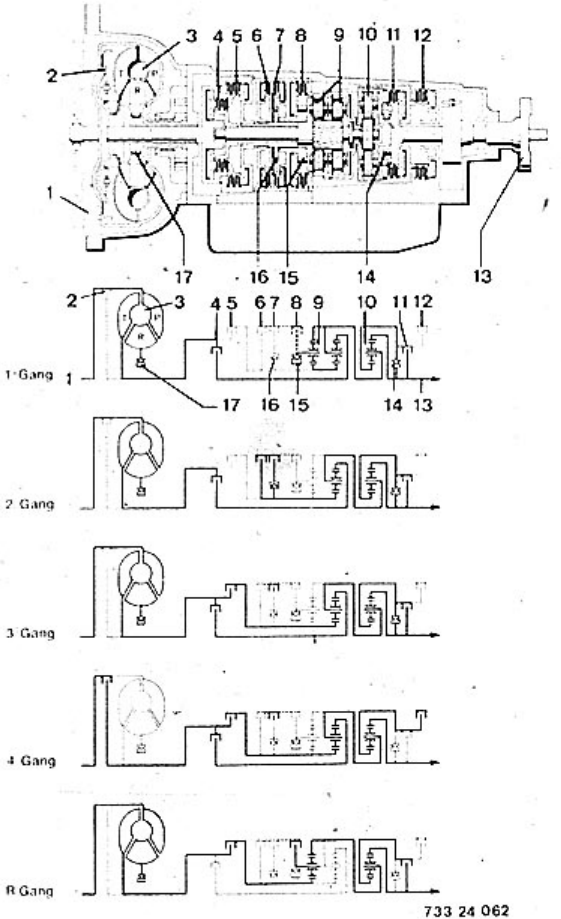
4 HP -22/24 Power Flow Diagrams



1st Gear
Clutches 4 and 11 are engaged.
Front planet gear carrier of gear set 9 supports on one-way clutch 15 during acceleration and is cancelled while coasting.
Planet gear set 10 rotates as a block.
In selector lever position 1 clutch 8 is also engaged in 1st gear, to have engine brake.

2nd Gear
Clutches 4, 6, 7 and 11 are engaged.
One-way clutch 15 is cancelled.
Hollow shaft is fixed with sun gear of planet gear set 9.
Planet gear set 10 rotates as a block.

3rd Gear
Clutches 4, 5, 7 and 11 are engaged.
One-way clutches 15 and 16 are cancelled.
Planet gear sets 9 and 10 rotate as a block at ratio of 1 to 1.

4th Gear
Clutches 4, 5, 7 and 12 are engaged.
One-way clutches 14, 15 and 16 are cancelled.
Planet gear set 9 rotates as a block.
Hollow shaft is fixed with sun gear of planet gear set 10.
Torque converter 3 is locked by clutch 2 as from a certain road speed.

Reverse Gear
Clutches 5, 8 and 11 are engaged.
Output shaft's direction of rotation is reversed via the held front planet gear carrier of gear set 9.
Planet gear set 10 rotates as a block.

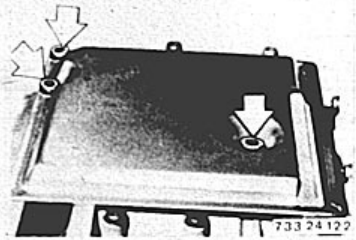
24 00 082 DISASSEMBLING AND ASSEMBLING TRANSMISSION

Remove transmission – see 24 00 022 in Model Repair Manual from 1985 models on.

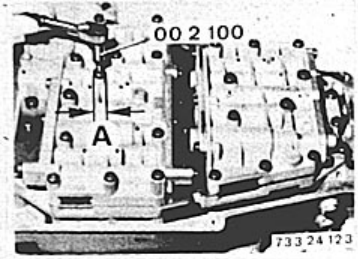
Note:
Stronger 4 HP-24 automatic transmission is included in the following scope. 4 HP-24 transmission is mentioned when procedures are different.
Torque converter is removed.
Mount transmission on Special Tool 24 0 150 in Special Tool 00 1 490.

Caution!
Tighten bolts only finger tight to avoid distorting the transmission case.

A) Disassembling

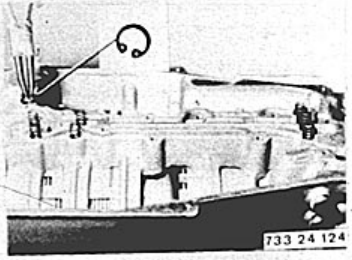


Unscrew oil sump.
Unscrew oil filter screen.
Unscrew Torx bolts with Special Tool 00 2 100.



Unscrew valve body.
Unscrew Torx bolts with Special Tool 00 2 100.

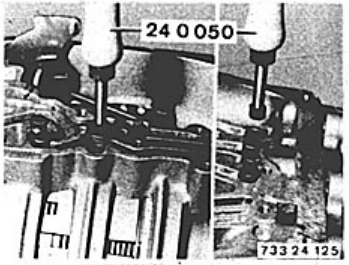
Important!
Only unscrew bolts with head size A = 12 mm (0.472").
The socket for the transmission wire harness must be removed for the EH version.



Lift out eight circlips.
Remove eight springs.

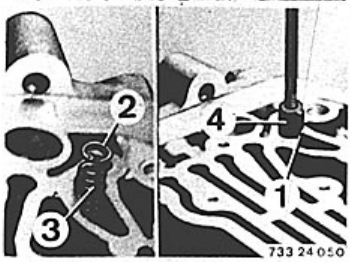
Installation:
Install long springs for the output.

EH Transmission:
Only three circlips and three springs have to be removed for cylinder F (output end).

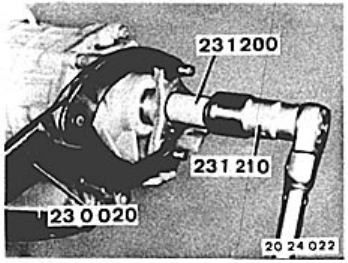


Pull out eight sealing sleeves with Special Tool 24 0 050.

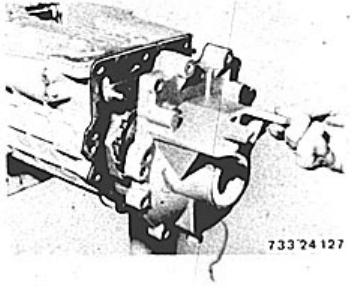
EH Transmission:
Only remove three sealing sleeves for cylinder F (output end).



Important!
Lubricating oil supply for cylinder F gear set was improved gradually since 7.85.
Circlip (2), spring (3) and sealing sleeve (4) must be removed at bore (1) additionally when assembling.
Pull sealing sleeve (4) out of the bore with a M 6 x 65 bolt.
Cant bolt slightly for this purpose.

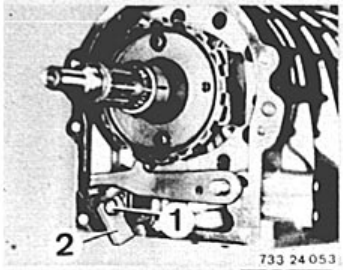


Lift off lockplate.
Use Special Tool 23 1 200 only for the version with a three-hole flange.
Hold output flange with Special Tool 23 0 020.
Unscrew collar nut with Special Tool 23 1 210.
Pull off output flange.

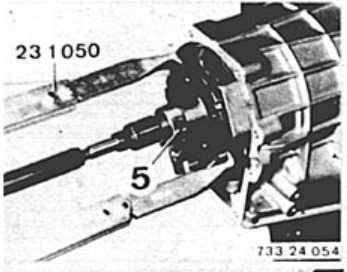


Unscrew transmission extension.

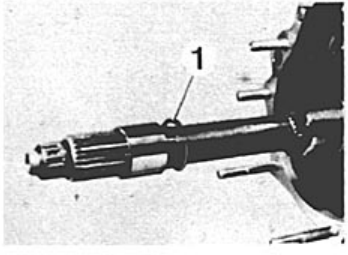
Installation:
Replace gasket.



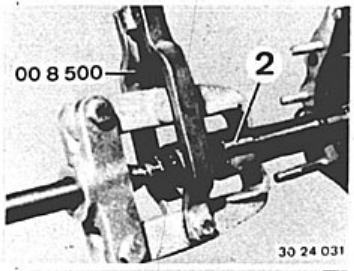
Loosen screw (1) enough with Special Tool 00 2 100 that bracket (2) can be folded down.
Remove parking lock pawl, spring and bearing pin.
Caution!
Spring force.



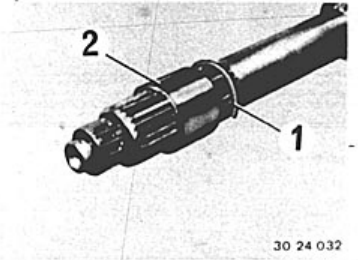
Pull off parking lock gear with regulator.
Note:
Check axial shim between output flange and parking lock gear.
Version with Spacer (5):
The parking lock gear must be pulled off with Special Tool 23 1 050.



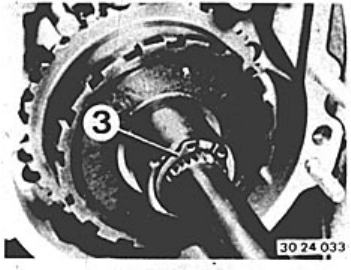
Version with Transfer Box:
Lift out and slide snap ring (1) forward.
Installation:
Replace snap ring.



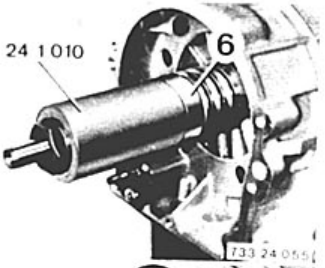
Pull bearing sleeve (2) off of the input shaft with Special Tool 00 8 500.



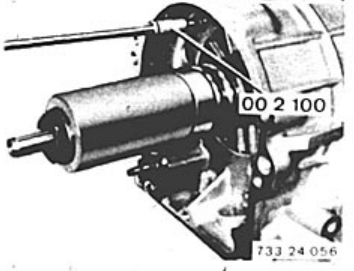
Installation:
Install snap ring (1) in groove of output shaft.
Heat bearing sleeve (2) to approx. 80° C (175° F) with a hot air blower and slide it on to the output shaft against snap ring (1).



Lift out circlip (3).
Pull off parking lock gear with regulator.

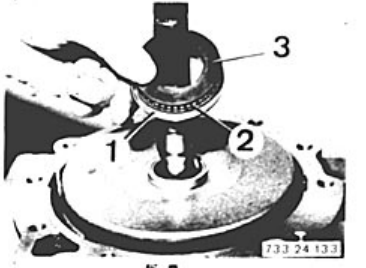


Place Special Tool 24 1 010 on output shaft and secure with collar nut.
Note:
For version with spacer (5) a suitable pipe (6) must be used to take up the distance between case and special tool sleeve.

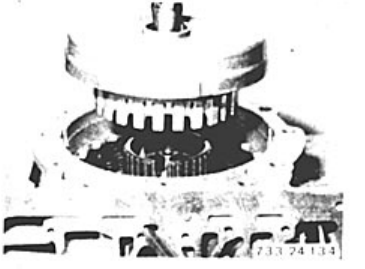


Unscrew Torx screws with Special Tool 00 2 100.

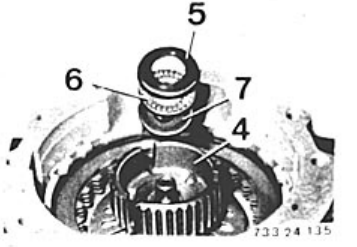
Set transmission upright.
Unscrew converter bell housing and transfer plate.
Note:
Only remove inner bolts of hole circle.



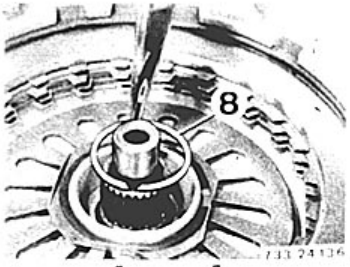
Remove angled washer (1), axial bearing (2) and thrust washer (3).



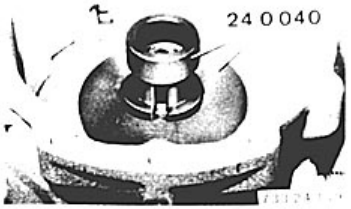
Remove input shaft with clutch A.



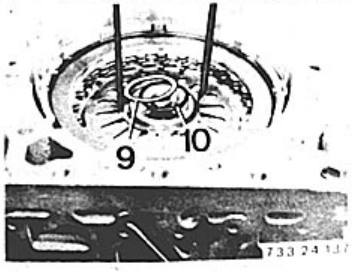
Remove plate carrier (4) for clutch A with angled washer (5), axial bearing (6) and thrust washer (7).



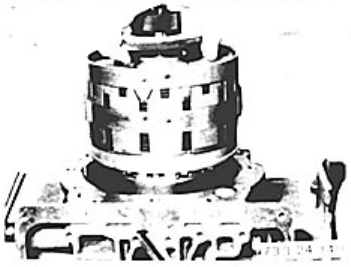
Remove snap ring (8) with help of two screwdrivers.
Installation:
Replace snap ring (8).



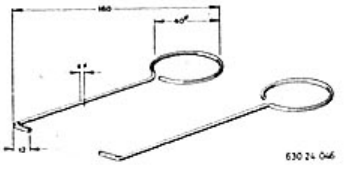
Apply Special Tool 24 0 040 on intermediate shaft.



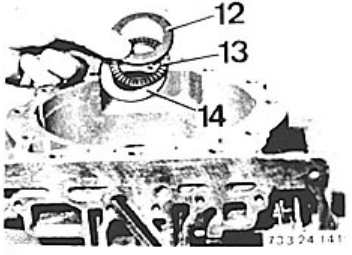
Pull out clutch B with two locally made hooks.
Installation:
Lift clutch until resistance is noticed and push back again.
Pull out clutch with one firm pull.
This will also pull out support (9) and seal (10).



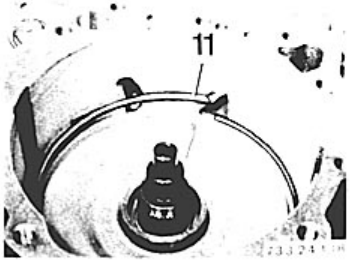
Pull out entire set.



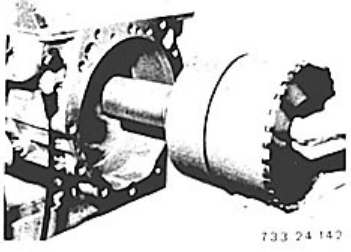
Sketch for local manufacture of hooks.
Dimensions in mm.



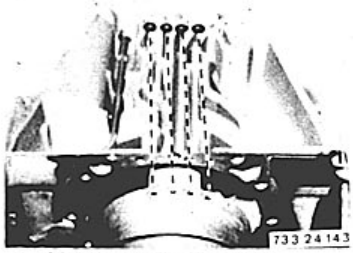
Remove angled washer (12), axial bearing (13) and thrust washer (14).



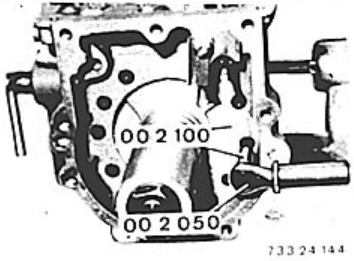
Lift out snap ring (11).



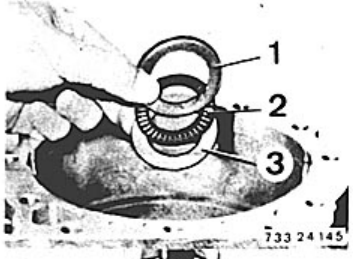
Position transmission case horizontally.
Remove 4th gear clutch set.



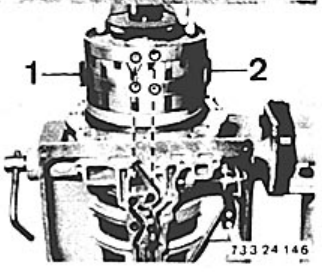
B) Assembling:
Install 4th gear clutch set.
Guide clutch set into transmission case that 4 oil feed bores are aligned with bores in case.



Bolt down clutch set with Special Tools 00 2 100 and 00 2 050.
Tightening torque*.

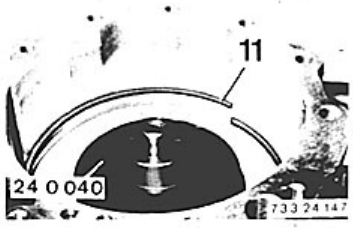


Set transmission upright.
Insert thrust washer (3), axial bearing (2) and angled washer (1) with collar facing up.
If necessary, use vaseline on shaft of clutch set.

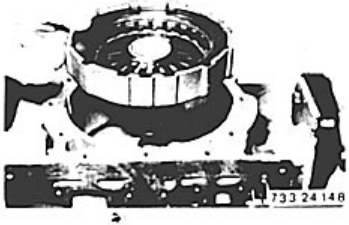


Place entire set in case.
Four oil feed bores must be aligned with bores in case.
Springs (1 and 2) must be in center of cylinder groove.

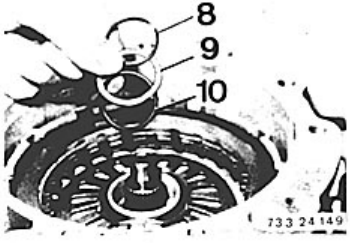
* See Specifications



Insert snap ring (11).
Remove Special Tool 24 0 040.



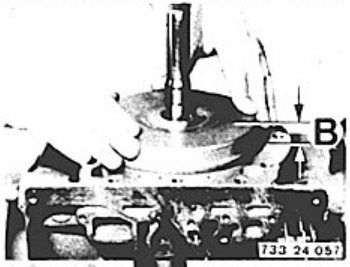
Insert and press clutch B against stop.



Install seal (10), support (9) and snap ring (8).

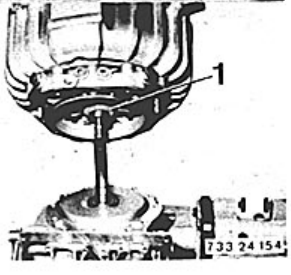
Insert plate carrier (4).
Install thrust washer (7) and axial bearing (6).

Paste angled washer (1) on cylinder A with grease (vaseline).



Insert clutch A and move it back and forth until splines of plate carrier and plates mesh.
Note:
Clutch A is in correct installed position, when distance (B) between cylinder A and case sealing surface is approx. 8 mm (0.315").
4 HP 24:
Distance (B) = approx. 25 mm (1").

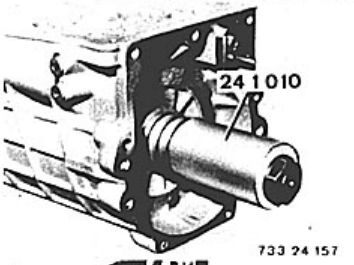
Install angled washer (3) with collar facing up and axial bearing (2).



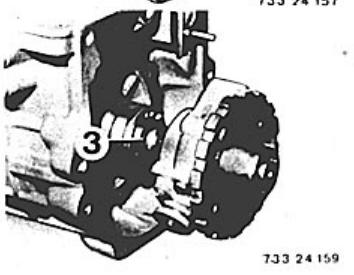
Paste on gasket and thrust washer (1) with grease (vaseline).

Install converter bell housing and tighten all bolts.
Tightening torque*.

Check axial play of input shaft.
Mount Special Tool 24 0 010 to hold input shaft.
Apply Special Tool 00 2 510 (dial gage).
Check axial play by pulling input shaft.
Specification: 0.2 to 0.4 mm (0.008 to 0.016").
If play deviates, take off converter bell housing again and replace thrust washer with a thicker or thinner one.
Recheck axial play.
Bolt down converter bell housing.
Tightening torque*.

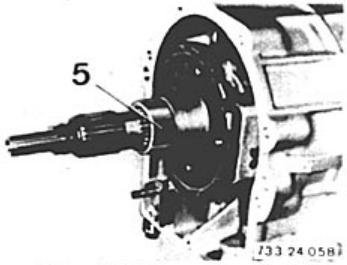


Remove Special Tool 24 1 010.

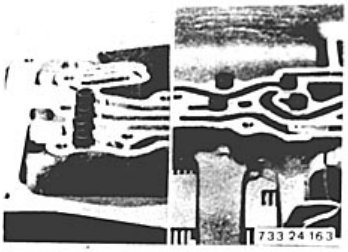


Lubricate O-ring (3) with ATF.
Slide on parking lock gear with regulator.
Note:
Install shim between the regulator and output flange for version without a spacer.

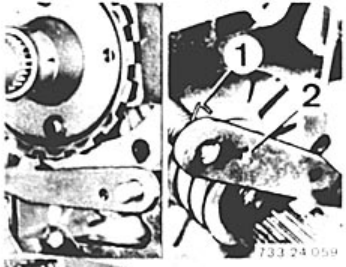
* See Specifications



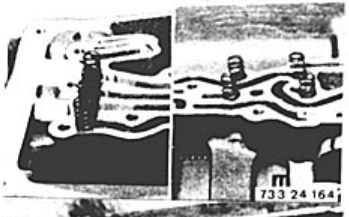
Important!
Version with Spacer (5):
Heat spacer (5) to about 80° C (175° F) with a hot air blower after mounting the parking lock gear and push spacer on to output shaft.



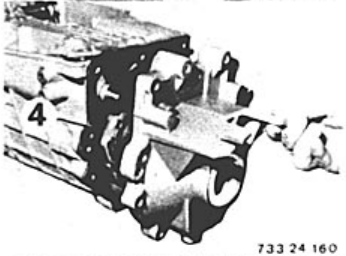
Install 8 sealing sleeves.
Press in sealing sleeves against the stop with a suitable mandrel.
Be careful not to damage the sealing sleeves.
EH Transmission:
Only 3 sealing sleeves have to be installed at cylinder F (output end).



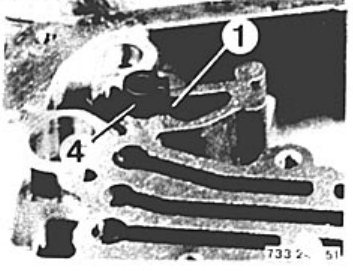
Install parking lock pawl.
Connect return spring (1) in bore (2) of parking lock pawl.



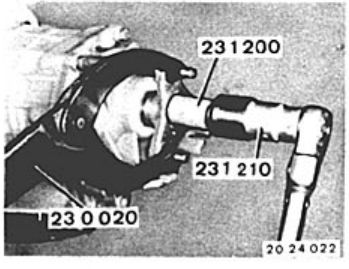
Install 8 springs and 8 circlips.
Important!
Longer springs must be installed to face cylinder F (output end).
EH Transmission:
Only 3 springs have to be installed on cylinder F (output end).



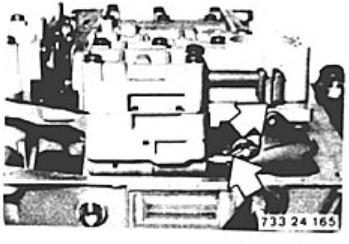
Paste on gasket (4) with grease.
Bolt on transmission extension.
Tightening torque*.



Note:
Version with Improved Lubrication on Cylinder F Gear Set:
Install sealing sleeve (4) in bore (1) with the tab facing the oil bore.
Press in sealing sleeve against the stop with a suitable mandrel.
Install spring and circlip.

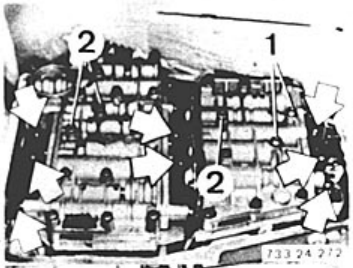


Install output flange.
Screw on collar nut with Hylomar SQ-32 M universal sealing compound.
Apply Special Tool 23 1 200 only for the version with a three-hole flange.
Hold output flange with Special Tool 23 0 020.
Tighten collar nut with Special Tool 23 1 210.
Tightening torque*.
Install lockplate.

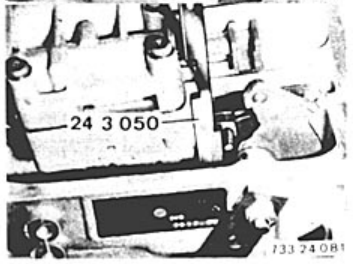


Mount valve body that selector valve can be connected in operating finger of pawl.
This requires pulling throttle cable slightly, so that accelerator cam does not clamp on throttle pressure valve.

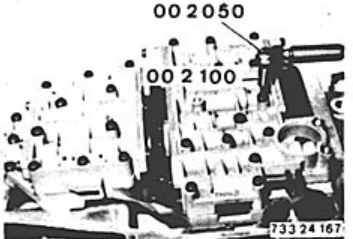
* See Specifications



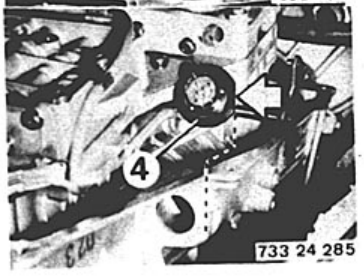
Screw in mounting bolts for valve body.
Important!
Bolts differ in length.
Bolts (1) – 65 mm long.
Bolts (2) – 60 mm long.



Align valve body with Special Tool 24 3 050.
Distance between valve body case and throttle pressure piston must be 11.5 mm (0.453").

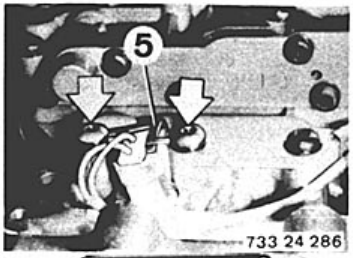


Tighten valve body bolts with correct tightening torque*.
Tighten bolts with Special Tools 00 2 100 and 00 2 050.

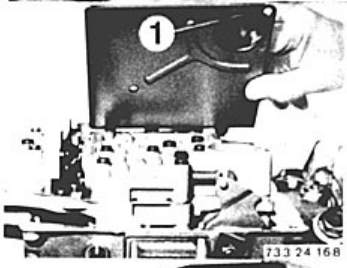


EH Transmission:
Check O-ring (4), replacing if necessary.
Insert socket with flat side facing out and bolt.
Tightening torque*.

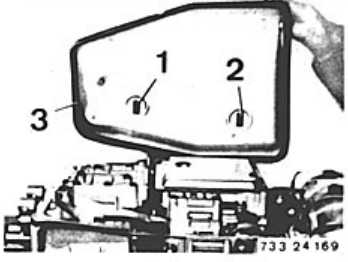
* See Specifications



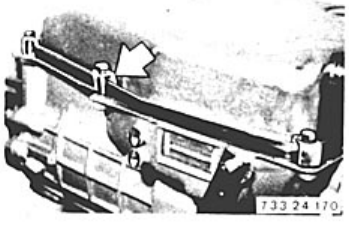
Note:
Also mount pulse transmitter on control unit.
Engage tabs of holder (5) in grooves of plug.



Install O-ring (1) between valve body and oil filter screen.
Install and bolt down oil filter screen.
Tightening torque*.
Check length of bolts.
65 mm long.



Place magnets (1 and 2) in oil sump.
Install gasket (3).



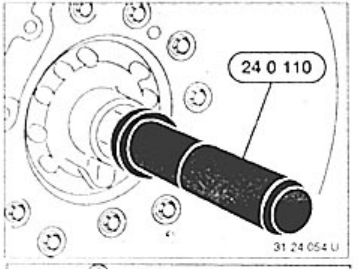
Install oil sump and tighten bolts with brackets.
Tightening torque*.
Important!
Both brackets,with straight, short legs must be mounted on straight side of oil sump.

* See Specifications

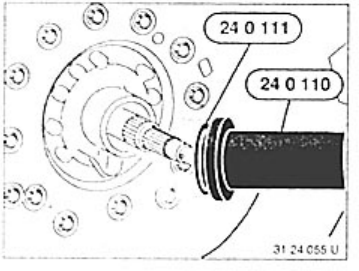
24 12 003 REPLACING RADIAL OIL SEAL FOR TORQUE CONVERTER

Remove torque converter – see 24 40 003.
Lift out radial oil seal.

Lubricate sealing lip with ATF.
Drive in radial oil seal to fit tight with Special Tool 24 0 090.

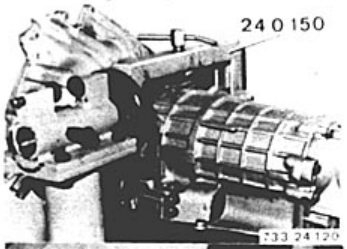


4 HP-24 Transmission:
Drive in radial oil seal to fit tight with Special Tool 24 0 110.
Special Tool 24 0 110 can also be used on 4 HP-22 transmissions.



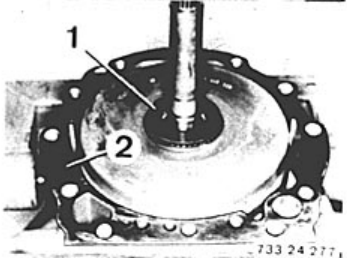
Important!
Modified oil pump body since Transmission No.
1 113 936 for 4 HP-22 or
0 029 160 for 4 HP-24.
Radial oil seal must be installed 1.0 mm (0.039") deeper.
Drive in radial oil seal to fit tight with Special Tools 24 0 110 and 24 0 111.

24 16 502 REPLACING TRANSFER PLATE
– Transmission Removed –

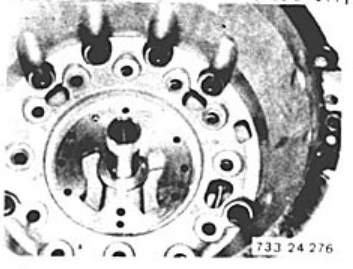


Remove torque converter 24 40 003.
Mount transmission on Special Tool 24 0 150 in conjunction with an assembly stand.
Important!
Only screw in bolts finger tight to avoid case distortion.

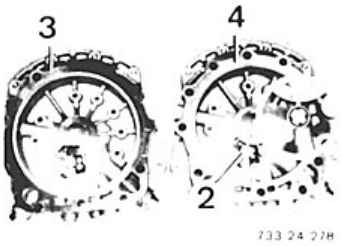
Unscrew converter bell housing and transfer plate, removing the inner bolts only and loosening the outer bolts for this purpose.



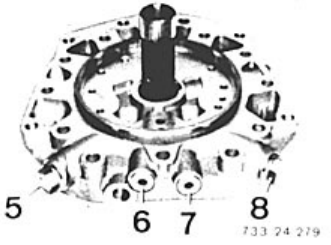
Lift off converter bell housing.
Installation:
Thrust washer (1), needle cage and angled washer.
Note:
Axial play of input shaft can be adjusted with thrust washer (1).
Replace gasket (2).



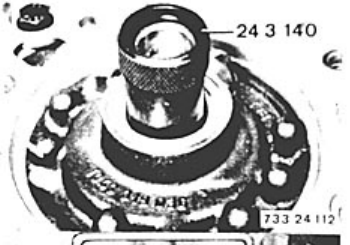
Remove primary pump (see 24 31 002).
Unscrew bolts.
Lift converter bell housing off of transfer plate.



A transfer plate with venting valve (2) is used since Transmission No. 170 195.
The venting valve provides faster clutch A pressure dropping.
Only use transfer plates with a venting valve for repairs.
Transfer plate (3) without venting valve.
Transfer plate (4) with venting valve.

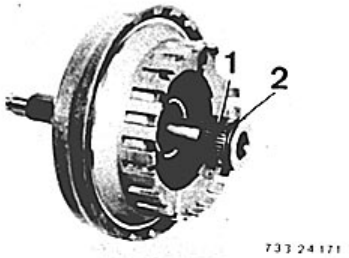


Transfer plugs (5 ... 8).
Check seals, replacing if necessary.
Tightening torque*.



Mount transfer plate on converter bell housing with the outer bolts which must be screwed in finger tight.
Align bores for inner bolts.
Install primary pump and check running with Special Tool 24 3 140.

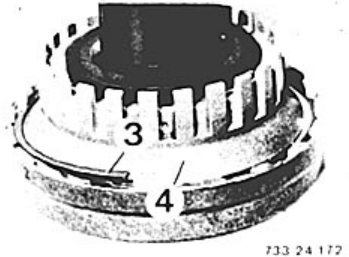
Mount converter bell housing and tighten all bolts to correct torque*.
Check axial play of input shaft.
Hold input shaft with Special Tool 24 0 010.
Apply Special Tool 00 2 510 (dial gage).
Check axial play by pulling input shaft.
Specification: 0.2 to 0.4 mm (0.008 to 0.016").
If play deviates, remove converter bell housing again and install a thicker or thinner thrust washer.
Recheck axial play.
Tighten converter bell housing bolts.
Tightening torque*.
* See Specifications



733 24 171

24 23 022 REPLACING PLATE TYPE CLUTCHES AND BRAKES

Disassemble transmission – see 24 00 080.
Important!
When repairing clutch A, check the transfer plate for an installed ventilating valve – see 24 16 502.
If necessary, install a transfer plate with a ventilating valve.
Clutch A:
Press out input shaft (1).
Check O-ring (2), replacing if necessary.

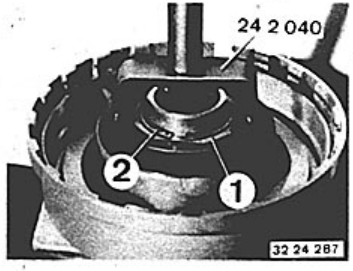


733 24 172

Compress clutch set and remove snap ring (3).
Remove plate carrier (4).

733 24 173

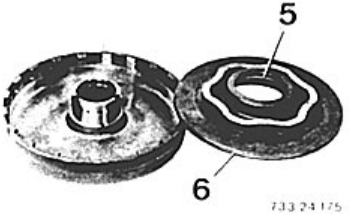
Lift out plate set and diaphragm spring.
4 HP 24:
Without diaphragm spring.
Important!
Note quantity of steel and lined plates.



4 HP 24:
Bend open lockplate (1).
Press down on diaphragm spring with Special Tool 24 2 040.
Lift out snap ring (2).
Installation:
Replace and lock lockplate.
Install diaphragm spring with curved surface facing up.

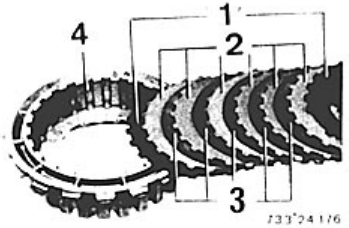
733 24 174

Press out clutch A piston with compressed air applied through oil bore.



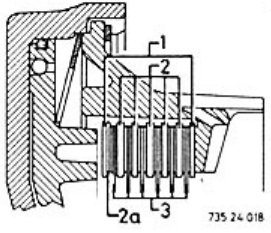
733 24 175

Installation:
Replace O-rings (5 and 6).
Lubricate O-rings with a light coat of ATF to make installation easier.



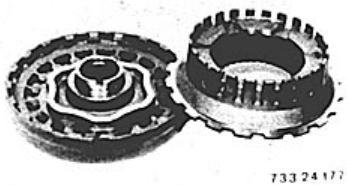
733 24 176

Installed Order of Plates:
Insert noted quantity of removed steel and lined plates alternately, beginning with spring and steel plates.
1 Spring plates
2 Steel plates 1.8 mm (2.1 mm for 750 i)
3 Lined plates
4 Plate carrier



735 24 018

BMW 745 i:
Watch installed order of plates.
1 Spring plates
2 Steel plates 1.8 mm
2a Adjusting plate 1.8 or 1.2 mm
3 Lined plates
Important!
Only use complete installation kit for repairs.

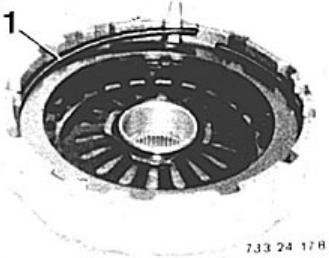


733 24 177

Place diaphragm spring in input shaft case with curved surface facing down.
Insert plate set with plate carrier.
Compress clutch set and insert snap ring.

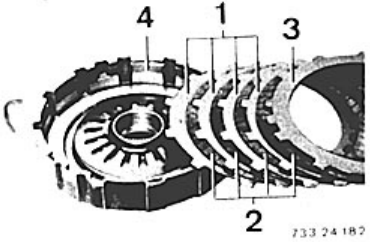
733 24 181

Installation:
Check O-rings (4 and 5), replacing if necessary. Lubricate O-rings with a light coat of ATF to make installation easier.



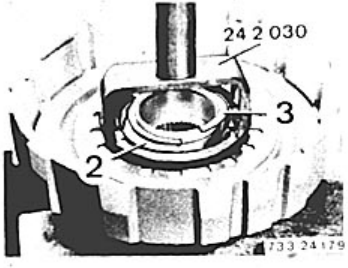
733 24 178

Clutch B:
Remove snap ring (1).
Remove steel and lined plates.
Important!
Note quantity of steel and lined plates.



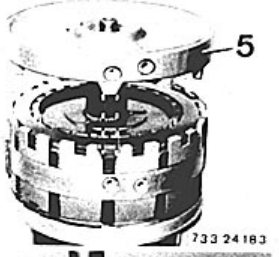
733 24 182

Installed Order of Plates:
Insert noted quantity of removed steel and lined plates alternately, beginning with a steel plate.
1 Steel plates (1.8 mm)
(2.1 mm for BMW 635 CSi, 735i, 745i, 750i)
2 Lined plates
3 End plate (4.5 mm)
(3.0 mm for BMW 750 i)
4 Housing
Important!
Insert end plate with ground surface facing lined plate.



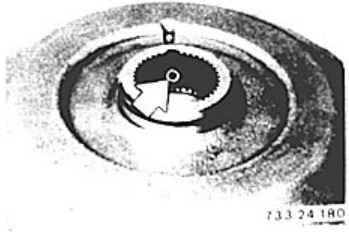
733 24 179

Bend open lockplate (2).
Press down on diaphragm spring with Special Tool 24 2 030 and remove snap ring (3).
Installation:
Replace and lock lockplate.
Install diaphragm spring with curved surface facing up.



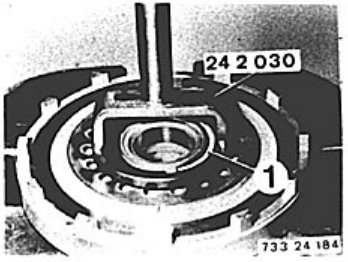
733 24 183

Clutch C' and C:
To make this step easier, place complete set in a suitable pipe and clamp in a vise.
Remove Special Tool 24 0 040.
Lift off centering plate (5).
Installation:
Bevelled beads must engage in bevelled openings.



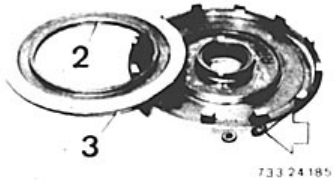
733 24 180

Press out clutch B piston with compressed air applied through oil bore.



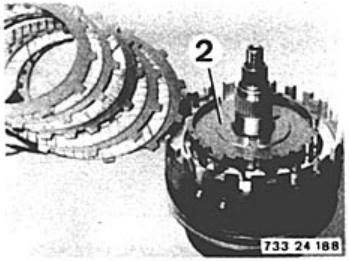
733 24 184

Press down on diaphragm spring with Special Tool 24 2 030 and lift out split retaining ring (1).
Installation:
Insert diaphragm spring with curved surface facing up.



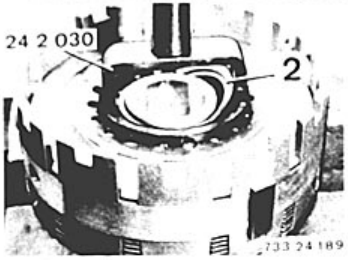
Press out piston for clutch C' with air pressure applied through the oil bore.

Installation:
Check O-rings (2 and 3), replacing if necessary.
Coat O-rings lightly with ATF to make installation easier.



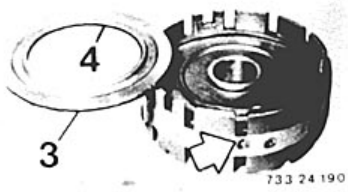
Remove all steel and lined plates.

Note:
Note number of steel and lined plates.
Pull out one-way clutch (2).



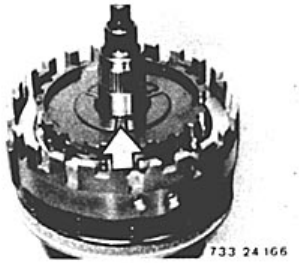
Press down disc spring with Special Tool 24 2 030 and lift out split retaining ring (2).

Installation:
Install disc spring with curved surface facing up.



Press out piston for clutch C with air pressure applied through the oil bore.

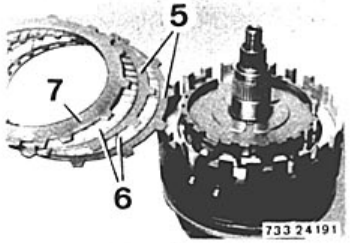
Installation:
Check O-rings (3 and 4), replacing if necessary.
Coat O-rings lightly with ATF to make installation easier.



Install one-way clutch.

Important!
Bent tabs or the word "oben" (= top) must be visible.

4 HP-24:
Rivet heads must be on top.

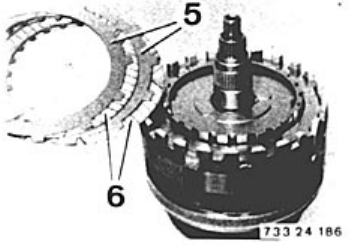


Installed Order:
Install noted number of removed steel and lined plates alternately, beginning with a steel plate.
5 Steel plates (1.8 mm)

Important!
Thickness of steel plates is different for 635 CSi and 735 i cars (1.5 mm and 2.1 mm).
4 HP-24: 1.8 mm and 2.1 mm.
2.1 mm for all plates since Transm. No. 21 250.
Thinner steel plate (1.5 mm) must be mounted on the piston end.

6 Lined plates
7 End plate (4.5 mm)

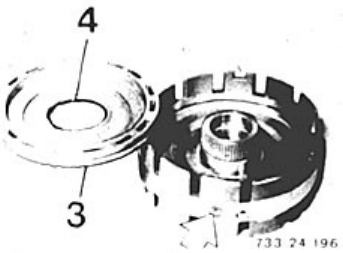
Important!
Install end plate that the middle tooth of a group of three teeth bears in the opening of the cylinder.



Installed Order for C':
Install noted number of removed steel and lined plates alternately, beginning with a steel plate.
5 Steel plates (1.8 mm)
6 Lined plates

Important!
Thickness of steel plates is different for 635 i and 735 i cars (1.5 mm and 2.1 mm). Thinner steel plate (1.5 mm) must be mounted on the piston end.
4 HP-24: 1.8 mm and 2.1 mm.

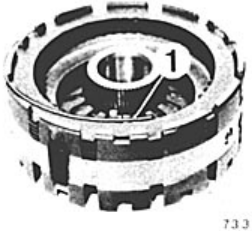
6 Lined plates
Important!
External splines of steel plates must not be placed in bevelled openings of cylinder.



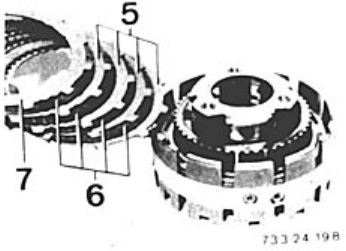
Press out clutch D piston with compressed air applied through oil bore.
Installation:
Check O-rings (3 and 4), replacing if necessary. Lubricate O-rings with a light coat of ATF to make installation easier.

Clutch D:
Clutches C' and C removed.
Lift clutch member with clutch D off of planet gear set.

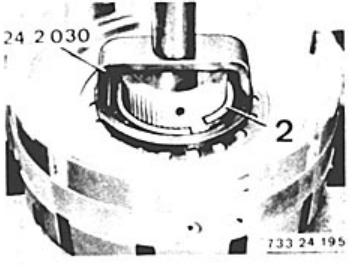
Place planet plate with one-way clutch on hub of cylinder D.



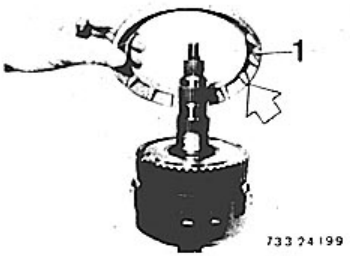
Remove snap ring (1).
Remove outer and lined plates.
Important!
Note quantity of steel and lined plates.



Installed Order of Plates:
Insert noted quantity of removed steel and lined plates alternately, beginning with a steel plate.
5 Steel plates (1.8 mm)
1,2 mm for BMW 745 i, 750 i
6 Lined plates
7 End plate (1.2 mm)
Insert clutch body with clutch D in planet gear set.



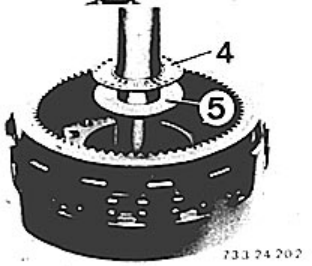
Press down on diaphragm spring with Special Tool 24 2 030 and lift out snap ring (2).
Installation:
Insert diaphragm spring with curved surface facing up.



Disassemble planet gear set.
Remove support ring (1).
Installation:
Mount support ring with fins facing down.

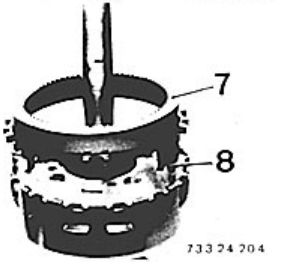
Take off planet gear set (2).

Pull out sun gear shaft (3).



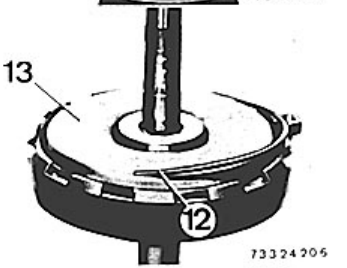
Remove axial bearing (4) and thrust washer (5).

Lift out snap ring (6).



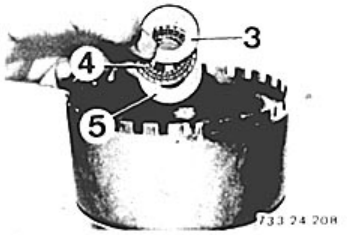
Remove hollow gear (7) and planet plate (8).

Remove thrust washers (9) and axial bearing (10).
Take off spacer (11).

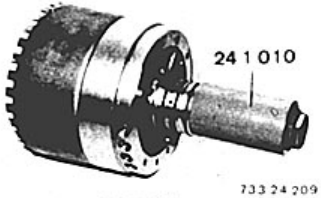


Lift out snap ring (12).
Take off hollow gear (13).

Clutches E and F:
Remove sun gear (1) and planet carrier (2).



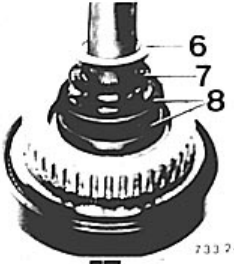
Remove angled washer (3), axial bearing (4) and thrust washer (5)
Installation:
Install angled washer (3) with collar facing planet carrier.



Take off Special Tool 24 1 010.

Lift cylinder F off of cylinder E.

Lift off cylinder E on output shell.

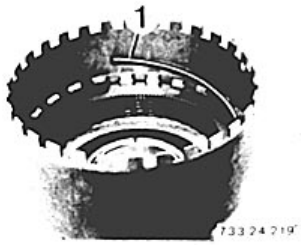


Take off thrust washer (6), axial bearing (7) and steel/copper angled washer (8).

Installation:
Mount cylinder E and turn until it rests on stop.
Cylinder must rest on copper angled washer.
When holding output shaft it must now be possible to turn cylinder E clockwise.
It should lock in opposite direction.

Clutch F:
Lift out snap ring (1).

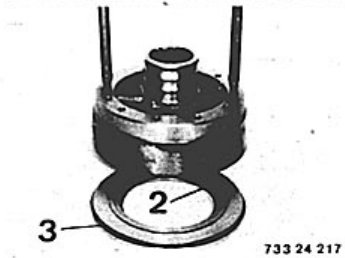
Remove plate set.
Important!
Note quantity of steel and lined plates.



Clutch E:
Lift out snap ring (1).

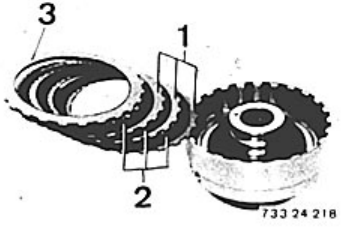
Remove piston for clutch F.
Press down on diaphragm spring with Special Tool 24 2 020 and lift out the split retaining ring (1).
Installation:
Insert diaphragm spring with curved surface facing up.

Remove plate set.
Important!
Note quantity of steel and lined plates.

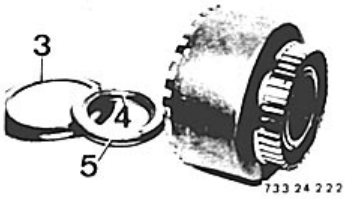


Press out piston for clutch F with two suitable mandrels.
Installation:
Check O-rings (2 and 3), replacing if necessary. Lubricate O-rings with a light coat of ATF to make installation easier.

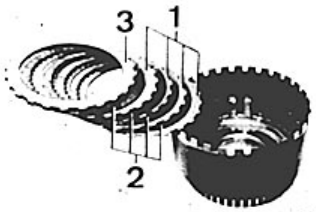
Remove piston for clutch E.
Press down on diaphragm spring with Special Tool 24 2 020 and remove the split retaining ring (2).
Installation:
Insert diaphragm spring with curved surface facing up.



Installed Order of Plates:
Insert noted quantity of removed steel and lined plates alternately, beginning with a steel plate.
1 Steel plates (2.1 mm)
2 Lined plates
3 End plate (4.5 mm)

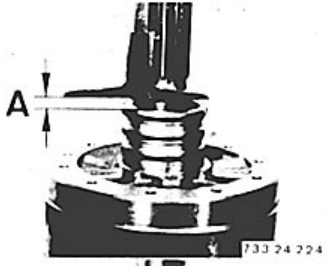


Lift off thrust plate (3).
Press out clutch E piston with compressed air applied through oil bore.
Installation:
Check O-rings (4 and 5), replacing if necessary. Lubricate O-rings with a light coat of ATF to make installation easier.



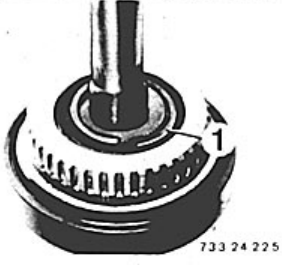
733 24 223

Installed Order of Plates:
Insert noted quantity of removed steel and lined plates alternately, beginning with a steel plate.
1 Steel plates (1.5 mm)
2 Lined plates
3 End plate (4.5 mm)



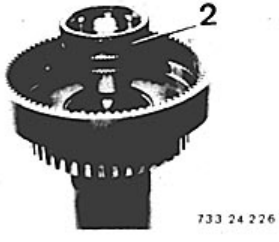
733 24 224

Connect cylinders E and F by turning.
Collar on output shaft will protrude by distance A = approx. 10 mm (0.394") when installed correctly.
Apply Special Tool 24 1 010.
Install planet gear carrier and sun gear



733 24 225

Removing One-way Clutch:
Lift out snap ring (1).



733 24 226

Press out output shaft (2).

733 24 227

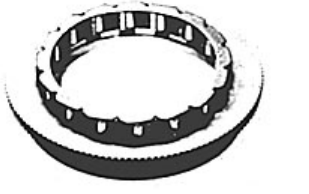
Lift off plate carrier (3).

733 24 228

4 HP - 22:
Lift out snap ring (1).
Lift off one-way clutch.

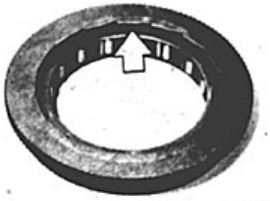
733 24 228

Pull or press off one-way clutch.



733 24 229

Press one-way clutch cage out of outer race carefully.
Caution!
Needles could pop out of cage.



733 24 230

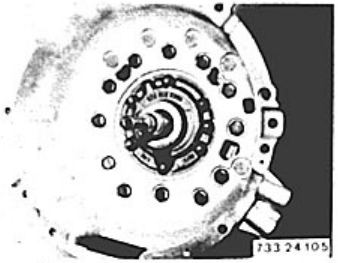
Installation:
Place one-way clutch cage on outer race and align.
Press in one-way clutch cage against stop and then turn until metal edge engages in holding groove of outer race.

733 24 231

Use plate carrier (3) to turn one-way clutch outer race clockwise and mount race on inner race.

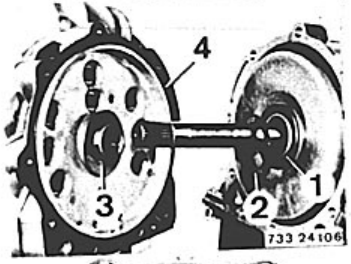
733 24 232

Clearance between one-way clutch inner race and outer race should be at least 0.1 mm (0.004").

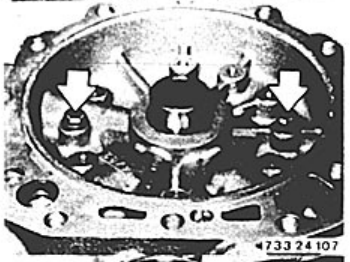


24 31 002 REMOVING AND INSTALLING PRIMARY PUMP

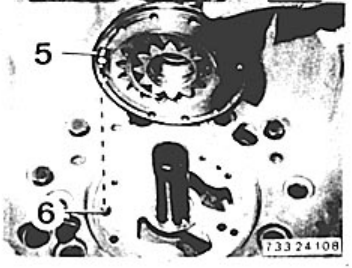
Remove torque converter – see 24 40 003.
Take off converter bell housing with connecting plate.



Installation:
Mount angled washer (1) with collar facing needle bearing (2) on input shaft.
Hold thrust washer (3) on converter bell housing with grease.
Replace gasket (4).

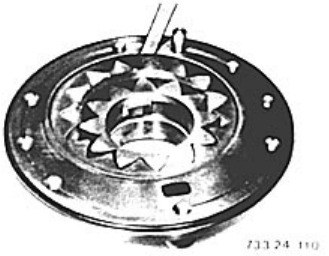


Unscrew primary pump on converter bell housing.
Loosen two bolts opposite each other by only several turns.
Loosen primary pump on converter bell housing with several light knocks.



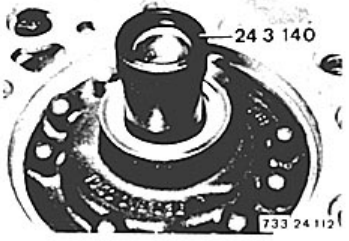
Remove primary pump.
Installation:
Centering pin (5) must engage in bore (6).

Installation:
Primary pump, consisting of pump body (7), hollow gear (8) and impeller (9), may only be replaced as an assembly.
Check O-ring (10), replacing if necessary.
Important!
Install hollow gear (8) and impeller (9) that punch marks face up.



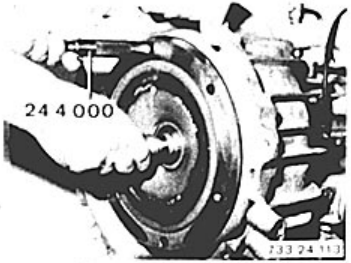
Check radial play* between driven gear and pump body, while turning gear 360°.

Check axial play* of both gears to face surface with a precision depth micrometer.



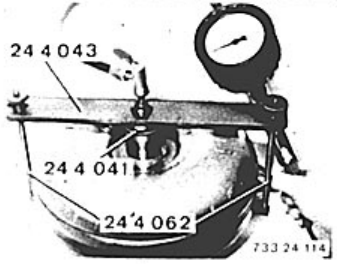
Check running of primary pump with Special Tool 24 3 140.

* See Specifications



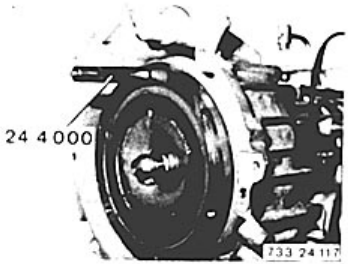
24 40 003 REMOVING AND INSTALLING TORQUE CONVERTER

Remove transmission – see 24 00 022 in pertinent model repair manual microfiche beginning with 1985 models.
Pull torque converter out of primary pump carefully with Special Tool 24 4 000.
Caution!
Escaping ATF.

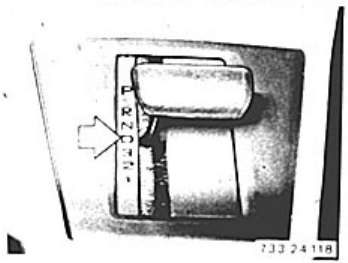


Installation:
Check torque converter for leaks with Special Tools 24 4 041, 24 4 043 and 24 4 062 or 24 4 044 for 4 HP 24.
Test pressure: 0.5 bar (7 psi).
Important!
Always use Special Tool 24 4 043 to prevent injury.

A torque converter must be replaced when bearing surface on converter shaft is damaged.



Turn slightly to guide openings on converter into primary pump carefully, using Special Tool 24 4 000.
Important!
Be careful not to damage converter bearings and seal while guiding in.
Converter is in its correct installed position, if drive ring is below case edge.



Checking Installed Torque Converter:
Engine and transmission oil must have operating temperature.
Engine must produce full rated power.
Start engine.
Pull on parking brake and operate brake pedal firmly.
Move selector lever to D and press accelerator pedal to full throttle.
Read stall speed* from tachometer.

Important!
Never test stall speed longer than 10 seconds to prevent damage from excessive heat.

Stall Speed Much Above Specified Value*:
a) Converter oil volume insufficient – correct oil level.
b) Slip in clutches – check clutches.

Stall Speed Much Below Specified Value*:
a) Engine power insufficient – check engine.
b) Converter or pump defective – replace converter or check pump.

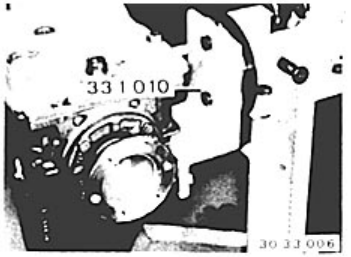
Torque converters cannot be cleaned with conventional workshop equipment and must be replaced when a transmission had been defective or an oil filter screen torn.
Converter identification*.

* See Specifications

Construction group 33 Rear axle

Transmission type K = side cover with 4 bolts

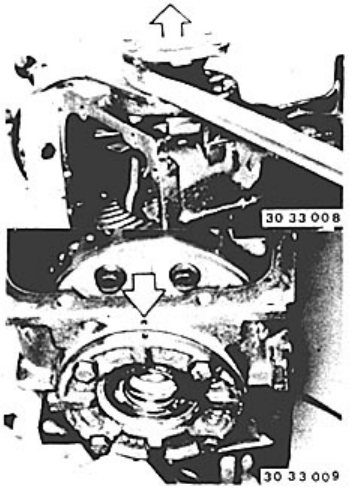
33 11 011	Shaft seal and input flange of final drive – replace	33- 101
512	Shaft seal for input flange – replace	33- 103
621	Shaft seal for drive flange – replace	33- 105
731	Both bearings for differential case – replace	33- 106
33 12 526	Bearing for drive pinion – replace	33- 111
551	Drive pinion with ring gear – replace	33- 117
	Basic information on tooth contact pattern adjustments	33- 126
33 13 611	Differential gears – replace	33- 128
	Limited slip differential (25 %) – general information	33- 130
33 14 520	Limited slip differential assembly – replace	33- 130
593	Limited slip differential – disassemble and assemble	33- 136



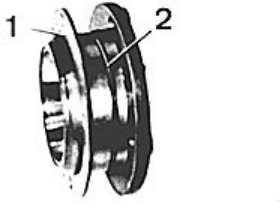
33 11 011 REPLACING SHAFT SEAL FOR FINAL DRIVE INPUT FLANGE

Remove final drive – see 33 10 010 in pertinent model repair manual microfiche beginning with 1985 models.
Mount final drive on Special Tool 33 1 010.
Drain oil.
Take off case cover.
Installation:
Replace gasket. Tightening torque*.
Add oil. Oil volume*.
Refer to Gr. 33 in Operating Material Binder for approved oil.

Press off drive flanges with a tire iron.



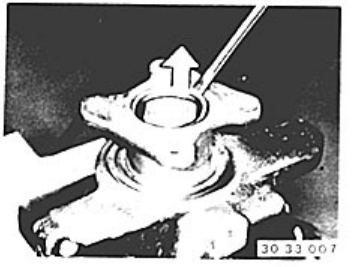
Punch mark both bearing caps.
Unscrew both bearing caps.
Important!
Don't mix up bearing caps and spacers.
Secure spacers on bearing cap with a piece of wire, if necessary.
Installation:
Tightening torque*.



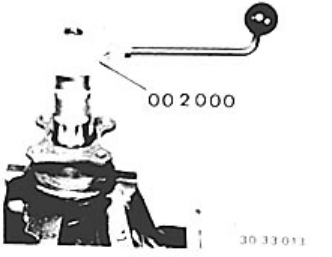
Differential case bearings and backlash are adjusted with shims (1).
Check O-ring (2), replacing if necessary.

* See Specifications

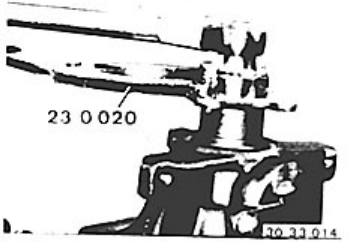
Remove differential assembly.
Important!
Don't bend pulse spider!



Remove lockplate.

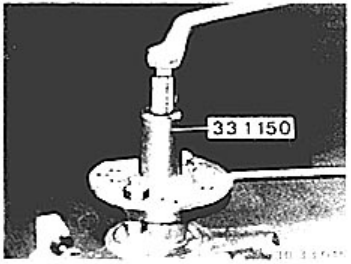


Measure friction torque with torque meter 00 2 000 and note value.
Important!
The measured friction torque value + friction torque of new shaft seal (20 Ncm/1.7 in. lbs.) must be reached when assembling, but not exceeded.

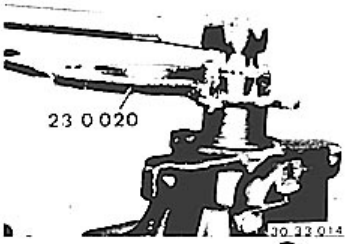


Hold input flange with Special Tool 23 0 020 and unscrew collar nut.
Installation:
Tightening torque*.

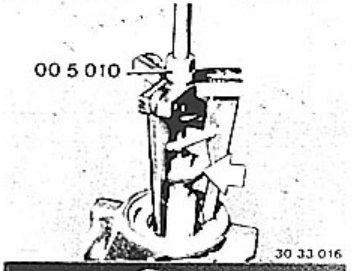
* See Specifications



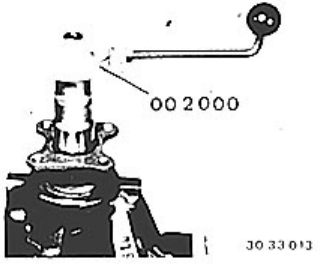
Pull off input flange with Special Tool 33 1 150.



Tighten input flange with the collar nut in steps, measuring the friction torque between steps.

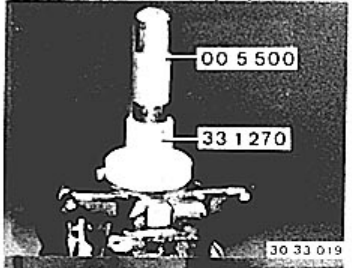


Pull out shaft seal with Special Tool 00 5 010 and thrust piece.

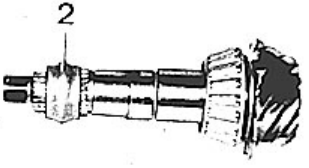


Adjust drive pinion bearing to friction torque value measured prior to disassembling and add 20 Ncm (2 in. lbs.) for new shaft seal.
Example:

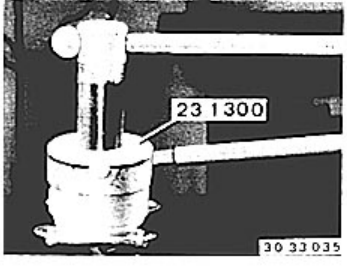
Measured torque		60 Ncm (5 in. lbs.)
New shaft seal	+	20 Ncm (2 in. lbs.)
Pinion bearing adjusted to		80 Ncm (7 in. lbs.)



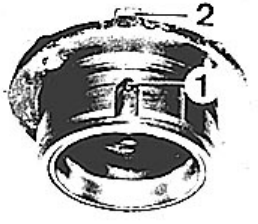
Dip shaft seal in final drive gear lube and drive in seal flush with Special Tools 33 1 270 and 00 5 500.



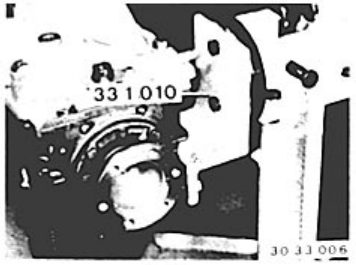
If friction torque value (see example) is exceeded, replace bushing (2) and repeat measuring procedures.
This requires removing and installing drive pinion – see 33 12 551.
Installation:
DRive in new lockplate with Special Tools 33 4 050 and 00 5 500.



Press new input flange on to input shaft with Special Tool 23 1 300, do not tighten.
The bushing does not have to be replaced when replacing the input flange.

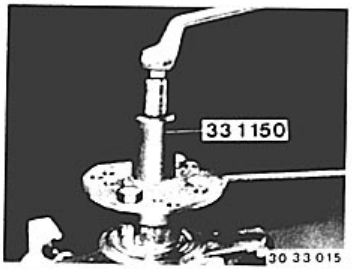


Installation:
Install complete differential again, checking for correct installation of bearing caps.
The differential bores (1) always face up when the differential is installed correctly and this can be seen on the outside by way of tab (2).
If applicable, check backlash and tooth contact pattern.
See 33 12 551 for additional information.



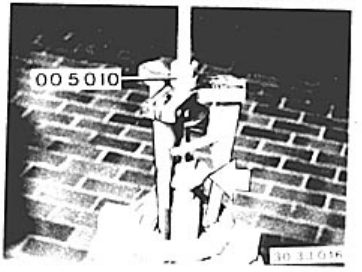
33 11 512 REPLACING SHAFT SEAL FOR INPUT FLANGE
– Final Drive Removed –

Removing and installing final drive – see 33 10 010 in pertinent model repair manual beginning with 1985 models.
Mount final drive on Special Tool 33 1 010.
Drain oil.
Installation:
Pour in oil – oil volume*.
Refer to Gr. 33 in Operating Material Binder for approved oil.

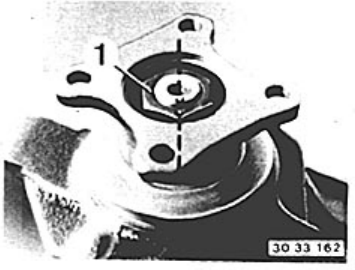


Pull off input flange with Special Tool 33 1 150.

Lift out lockplate.
Installation:
Drive in new lockplate with Special Tools 33 4 050 and 00 5 500.

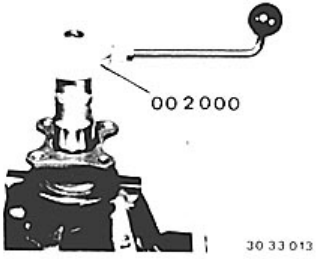


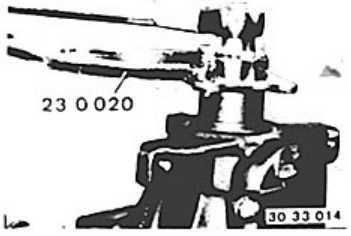
Pull out shaft seal with Special Tool 00 5 010 and a suitable thrust piece.



Punch-mark position of nut (1) to input shaft.

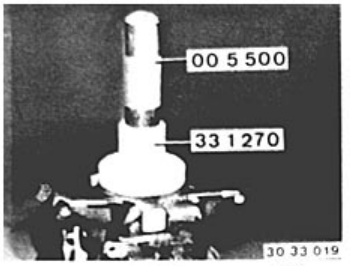
Installation:
If bearing surface on input flange is scored seriously, replace the input flange.
Important!
If the input flange has to be replaced, measure the friction torque with the old input flange.
If applicable, tighten nut to the punch mark, measure and note friction torque value – see 33 11 011.
The old shaft seal does not have to be installed for measuring.





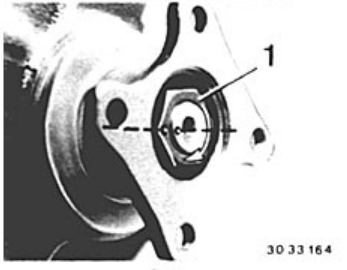
Unscrew nut (1), counterholding on flange with Special Tool 23 0 020.

* See Specifications



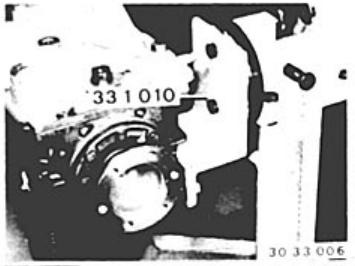
Dip new shaft seal in final drive gear lube** and drive in seal flush with Special Tools 33 1 270 and 00 5 500.

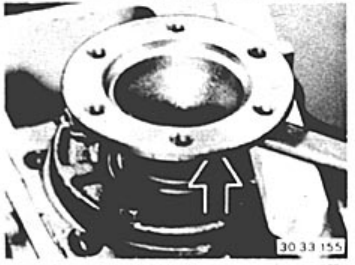
Press on input flange, if necessary with Special Tool 23 1 300; do not tighten.



Tighten input flange with collar nut (1) and then turn nut further until punch marks are aligned precisely.
Caution!
Never tighten collar nut past the punch marks and then back again, since then the bushing will have to be replaced – see 33 12 551.
Installation:
Replace lockplate.
Pour in final drive gear lube**.

** See Gr. 33 in Operating Material Binder





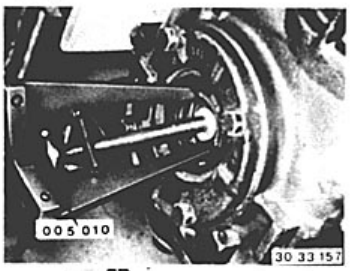
33 11 621 REPLACING SHAFT SEAL FOR DRIVE FLANGE

– Final Drive Removed –

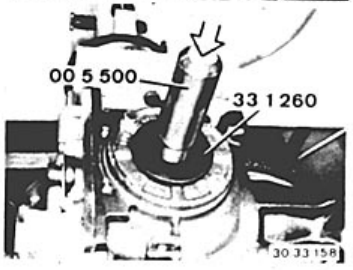
Remove final drive – see 33 10 010 in pertinent model repair manual microfiche beginning with 1985 models.
Mount final drive on Special Tool 33 1 010.

Press off drive flange with tire irons.

Installation:
Prior to installation of drive flange, place wire snap ring (1) in groove of differential case that both ends of wire snap rings are recessed in groove.
This will prevent lateral bending of ring.
Press in drive flange by hand and turn slightly until wire snap ring is heard to engage.
Replace stretched snap rings.



Pull out shaft seal with Special Tool 00 5 010 in conjunction with a pressure piece.

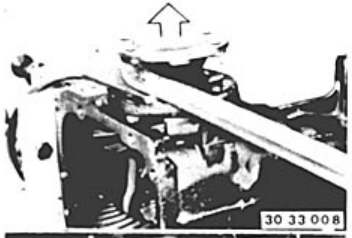


Installation:
Dip shaft seal in final drive oil.
Drive in shaft seal against stop with Special Tools 33 1 260 and 00 5 500.
Replace drive flange with a seriously scored bearing surface.

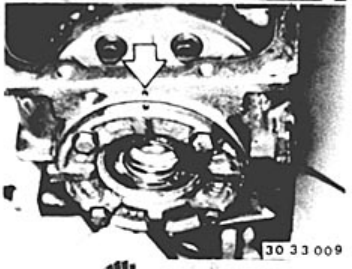
* See Specifications

33 11 731 REPLACING BOTH BEARINGS FOR DIFFERENTIAL CASE
– Final Drive Removed –

Remove final drive – see 33 10 010 in repair manual microfiche for models beginning with 1985 models.
Mount final drive on Special Tool 33 1 010.
Drain oil.
Unscrew case cover.
Installation:
Replace gasket.
Tightening torque*.
Add oil – oil volume*.
See Group 33 in Operating Material Binder for grade of oil.



Remove differential – see 33 13 010.
Pry off drive flanges with a tire iron for this purpose.

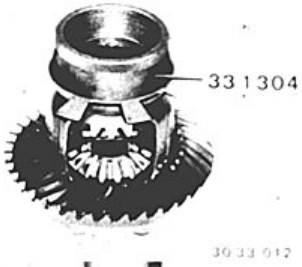


Mark bearing cap with punch marks and unscrew.
Important!
Don't mix up bearing caps and shims to make friction torque adjustments easier.

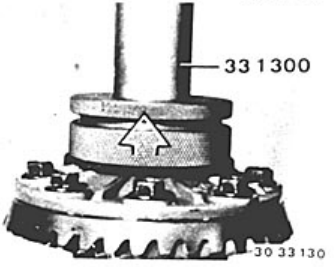
Remove complete differential case.
Important!
Don't bend the pulse spider.

* See Specifications

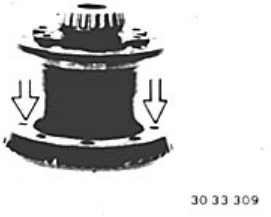
Press pulse spider off of differential case.
Important!
Don't bend the pulse spider.



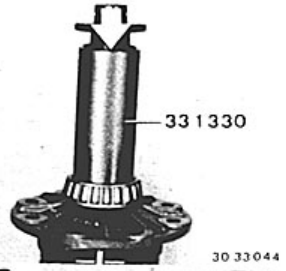
Installation:
Press on pulse spider with Special Tool 33 1 304.



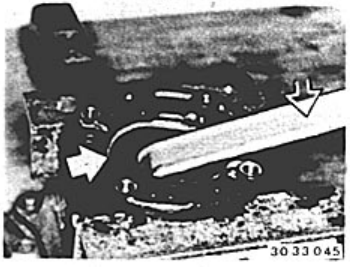
Pull off tapered roller bearing on differential case with Special Tool 33 1 300.



Remove ring gear (cold).

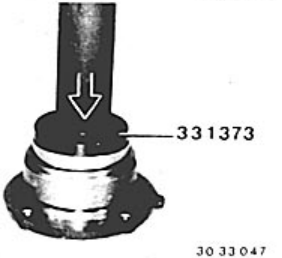


Installation:
Press on new tapered roller bearings cold with Special Tool 33 1 330.
Important!
Always only use both bearings of one make.

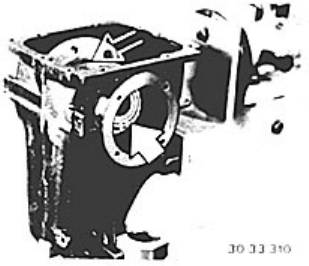


Lift shaft seals out of both bearing caps.

Press out bearing outer race with Special Tools 33 1 350 and 33 1 351.
Important!
Special Tool 33 1 351 must engage in the bearing outer race.

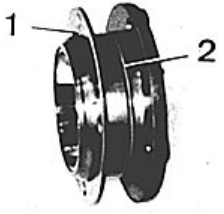


Installation:
Press in new bearing outer races with Special Tool 33 1 373.

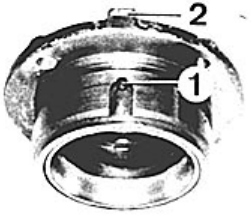


If only the differential bearings are being replaced, the drive pinion can remain installed and the differential case is installed without the ring gear for determination of shim thickness.
Important!
Note make of bearings – this is required to determine the friction torque.

Lubricate new bearings with approved final drive gear lube** thoroughly and let them drip dry.



Install side bearing caps marked with belonging shims (1), but at first without O-rings (2). Tighten bearing cover bolts on the side opposite the ring gear uniformly.
Tightening torque*.

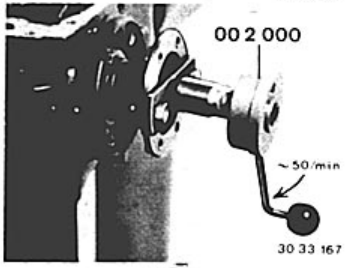


The compensating bore (1), which is recognized on the outside by tab (2), always faces up in installed position of the transmission.

* See Specifications
** See Gr. 33 in Operating Material Binder

30 33 311

The initial axial force of the differential case bearings (4000 N = 882 lbs.) can be determined with the friction torque*.
Tighten bolts of the second bearing cap uniformly only enough, that the differential can still be turned easily.

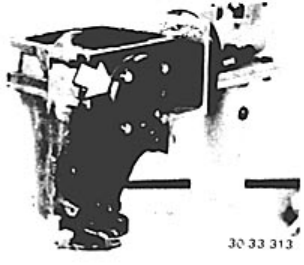


30 33 167

Apply an output flange on the side tightened to the tightening torque and measure the friction torque with a locally made clamp with a welded nut and friction torque meter 00 2 000.
Turn friction torque meter at speed of approx. 50 rpm.

30 33 312

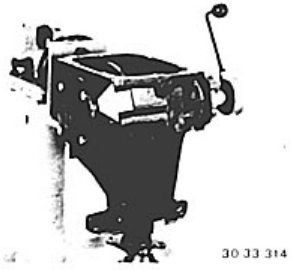
The friction torque* specified in the differential case bearing* table should be reached, but not exceeded.
If new shaft seals have already been installed, 20 Ncm (2 in. lbs.) must be added for each seal in which an output shaft runs while measuring.



30 33 313

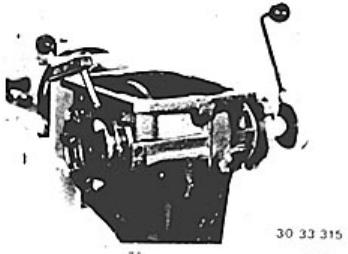
If the specified friction torque is not reached, even though both bearing caps are tigthened with correct tightening torque*, a thinner shim must be installed opposite the ring gear end and the measurement repeated.

* See Specifications



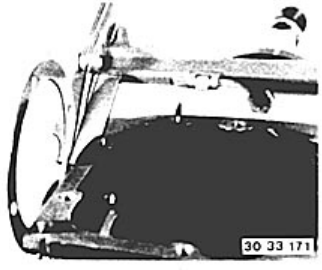
30 33 314

If the friction torque is reached, even though the second bearing cap has not yet been tightened to the correct tightening torque*, a thicker shim must be used on the ring gear end and the measuring procedures repeated.



30 33 315

To make finding the shim thickness easier, the distance between the shim and case can be measured with a feeler gage blade and added to the thickness of the used shim.

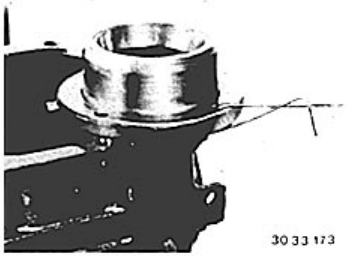


30 33 171

Example:
Second bearing cap not bolted tight (bolts screwed in uniformly).
Specified friction torque* (e.g. 190 Ncm = 16.5 in. lbs.) is reached and new shaft seals have not yet been installed.

Gap measured with blade	0.20 mm (0.008")
Used shim	1.40 mm (0.055")
Install shim of thickness and repeat measurement.	1.60 mm (0.063")

* See Specifications



30 33 173

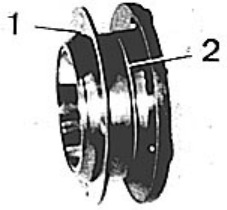
Remove differential.
Match side covers and shim of determined thickness, and don't mix them up.

30 33 041

Installation:
Clean tapped bores thoroughly (tapper).
Heat ring gear to max. 100° C (212° F), checking temperature with a thermo-color pencil.
Mount ring gear with two locally manufactured staybolts for guiding.

30 33 042

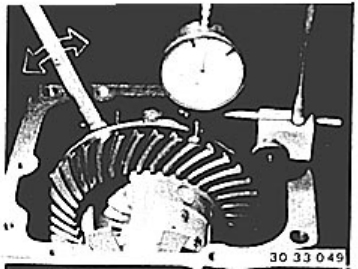
Install new bolts with Loctite No. 270 and tighten in order of 1 ... 8.
Tightening torque*.
Then tighten bolts with correct torque angle*.



30 33 048

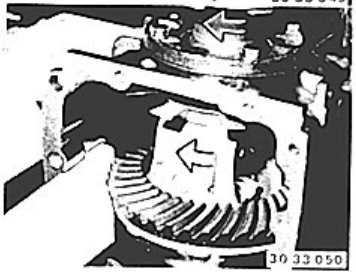
Install differential with ring gear and pulse gear.
Install side cover as marked with corresponding washers (1) and new O-rings (2).
Tightening torque*.

* See Specifications



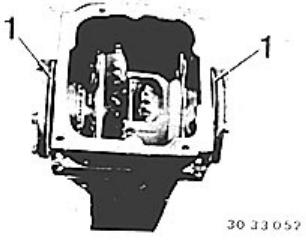
30 33 049

Backlash / Tooth Contact Adjustment:
Mount Special Tool 00 2 500 and measure the backlash*.
Important!
The tooth contact pattern is always most important for a perfectly adjusted pinion/ring gear. See "Replacing Drive Pinion with Ring Gear" – 33 12 551 – for basic information on tooth contact pattern adjustments.



30 33 050

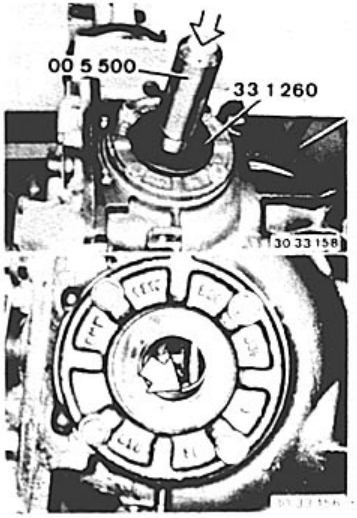
To check the tooth contact pattern, coat the ring gear teeth with printer's ink, turn in both directions several times and stop ring gear suddenly with a piece of hard wood.



30 33 052

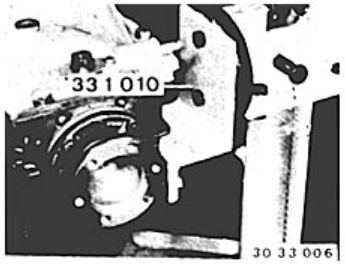
Correct backlash* and tooth contact pattern by changing the thickness of both shims (1).
If backlash is excessive, use a thinner shim on the ring gear end.
If backlash is too small, use a thicker shim on the ring gear end.
An axial displacement of the ring gear by 0.01 mm (0.0004") will cause a change in backlash of 0.0076 mm (0.0003").
Important!
The total thickness of both shims must not be changed.
If a thinner or thicker shim is required to correct the tooth contact pattern, the total thickness must be corrected with the second shim, since otherwise the friction torque of bearings would be changed again.

* See Specifications



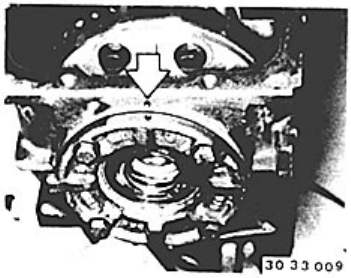
Installation:
Dip shaft seal in final drive oil.
Drive in shaft seal against stop with Special Tools 33 1 260 and 00 5 500.
Replace drive flange with a seriously scored bearing surface.

Installation:
Prior to installation of drive flange, place wire snap ring (1) in groove of differential case that both ends of wire snap rings are recessed in groove.
This will prevent lateral bending of ring.
Press in drive flange by hand and turn slightly until wire snap ring is heard to engage.
Replace stretched snap rings.

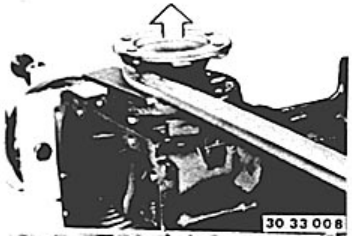


33 12 526 REPLACING BEARINGS FOR DRIVE PINION
– Final Drive Removed –

Remove final drive – see 33 10 010 in repair manual microfiche for models beginning with 1985 models.
Mount final drive on Special Tool 33 10 010.
Drain oil.
Unscrew case cover.
Installation:
Replace gasket.
Tightening torque*.
Pour in oil – oil volume*.
See Group 33 in Operating Material Binder for approved oil grades.

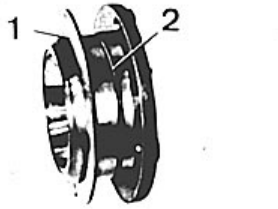


Punch mark both bearing caps.
Unscrew bolts of both bearing caps and take off bearing caps (turn if necessary, since seals suck tight).
Important!
Don't mix up bearing caps and shims.
If necessary, fasten shims on bearing caps with pieces of wire.
Installation:
Tightening torque*.

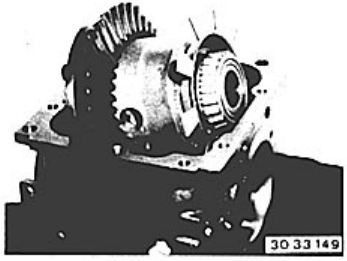


Pry off drive flanges with a tire iron.

Installation:
Prior to installation of drive flange, place wire snap ring (1) in groove of differential case that both ends of wire snap rings are recessed in groove.
This will prevent lateral bending of ring.
Press in drive flange by hand and turn slightly until wire snap ring is heard to engage.
Replace stretched snap rings.



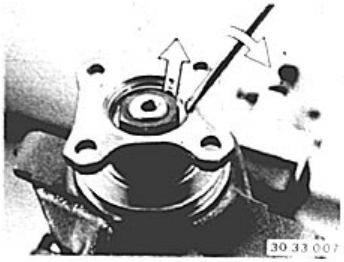
The axial initial force (4000 N = 882 lbs.) of differential bearings and the backlash of the ring gear and pinion are adjusted with shims (1).



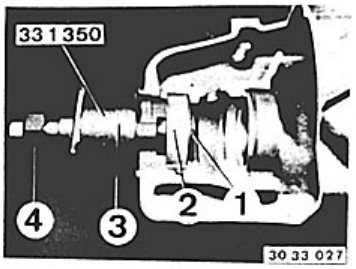
Remove complete differential case.
Important!
Don't bend the pulse spider.

* See Specifications

* See Specifications

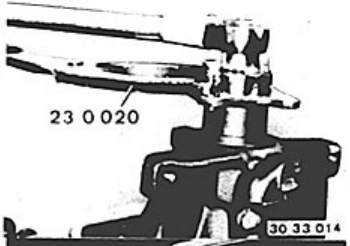


Lift out lockplate.

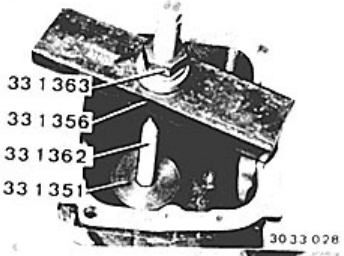


Pull out front bearing outer race with Special Tool 33 1 350.

1 Spreader
2 Front bearing outer race
3 Puller bell housing
4 Pressure bolt



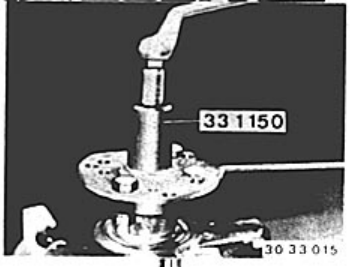
Hold input flange with Special Tool 23 0 020 and unscrew collar nut.



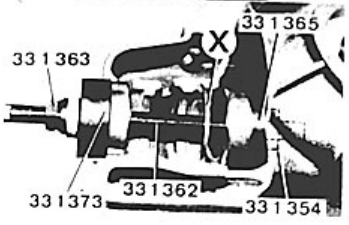
Pull out rear bearing outer race with Special Tool 33 1 360.

Puller head	33 1 361
Threaded spindle	33 1 362
Bearing bridge	33 1 356
Pressure nut	33 1 363

Important!
Shim (X) is located underneath the rear bearing outer race.
It will be needed again for pinion/ring gear adjustments.

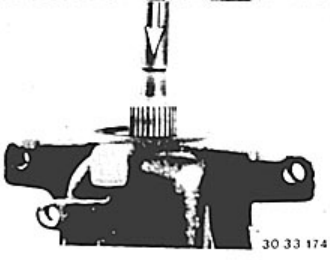


Pull off input flange with Special Tool 33 1 150.
Friction torque* is specified for the new bearings and friction torque of the old bearings does not have to be measured.



Install old shim (X) in front of the rear bearing outer race.
Pull in bearing outer races with Special Tool 33 1 360.
Puller consists of:

Puller disc for front outer race	33 1 373
Puller disc for rear outer race	33 1 365
Threaded spindle	33 1 362
Pressure nut	33 1 363
Nut	33 1 354

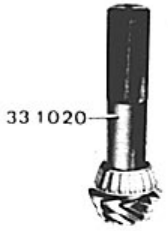


Press out drive pinion.
Caution!
Be careful not to damage threads.

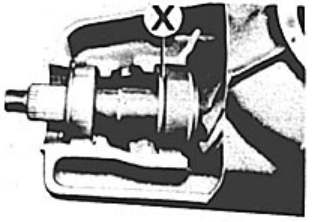
Pull tapered roller bearing off of the drive pinion with Special Tool 33 1 300.
Caution!
Don't damage the pinion – use soft aluminum jaws or pieces of wood.

* See Specifications

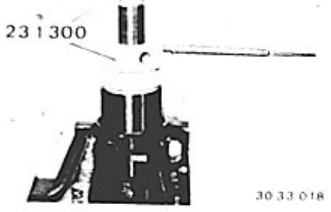
* See Specifications



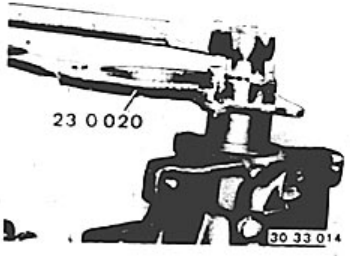
Press new tapered roller bearing on to the drive pinion with Special Tool 33 1 020.
Important!
Always only use same make bearings for both.



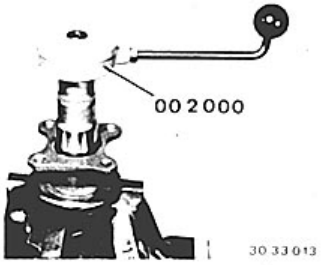
Install the drive pinion with new tapered roller bearings, but without a clamping sleeve, to determine the correct thickness of shim (X).



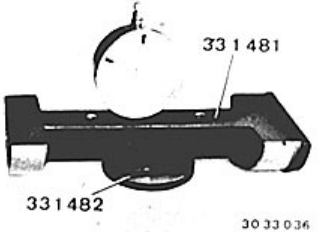
Install drive pinion in the rear bearing outer race.
Pull front tapered roller bearing on to the drive pinion with Special Tool 23 1 300 in conjunction with a spacing sleeve.



Mount input flange.
Adjust the friction torque of the drive pinion tapered roller bearings to 250 Ncm (22 in. lbs.) by tightening the collar nut carefully.



Important!
Measure the friction torque continuously while tightening at certain intervals with Special Tool 00 2 000.



Block Distance of Drive Pinion:
Mount dial gage in Special Tool 33 1 481.
Place Special Tool 33 1 481 with dial gage on Special Tool 33 1 482 and adjust the dial gage to zero (0) with preload.

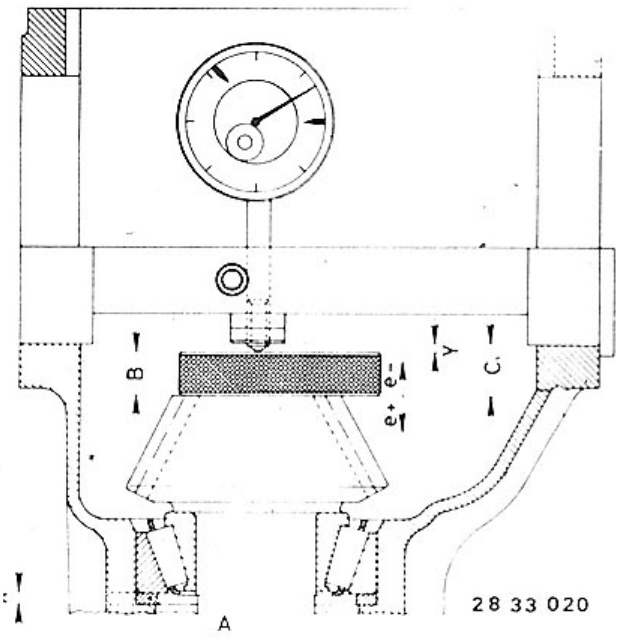
Place Special Tool 33 1 482 on the drive pinion.
Place Special Tool 33 1 481 in the case.
Determine value Y:
Basic distance C = 9.02 mm (0.355")
Master disc B B = 7.00 mm (0.275")

Examples for Determination of Correct Thickness for Shim (X)

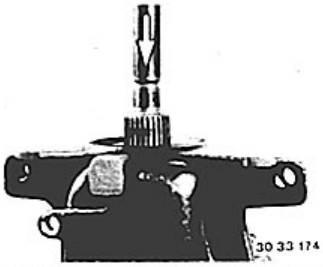
Example I		Example II	
C	9.02 mm (0.355")	C	9.02 mm (0.355")
e +	0.10 mm (0.004")	e –	0.10 mm (0.004")
C nominal	9.12 mm (0.359")	C nominal	8.92 mm (0.351")
Y measured on dial gage	1.92 mm (0.075")	Y measured on dial gage	2.12 mm (0.083")
+ master disc thickness B	7.00 mm (0.276")	+ master disc thickness B	7.00 mm (0.276")
C actual	8.92 mm (0.351")	C actual	9.12 mm (0.359")
C nominal	9.12 mm (0.359")	C actual	9.12 mm (0.359")
C actual –	8.92 mm (0.351")	C nominal –	8.92 mm (0.351")
a	0.20 mm (0.008")	a	0.20 mm (0.008")
Master disc A	4.10 mm (0.161")	Master disc A	3.90 mm (0.153")
a –	0.20 mm (0.008")	a +	0.20 mm (0.008")
Thickness of shim X	3.90 mm (0.153")	Thickness of shim X	4.10 mm (0.161")

If C nominal is greater than C actual, "a" is subtracted from thickness of shim "X" (–).

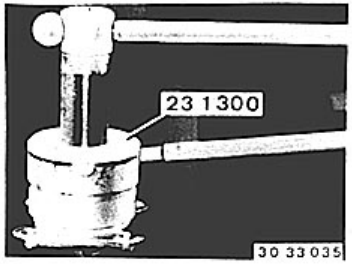
If C nominal is smaller than C actual, "a" is added to thickness of shim "X" (+).



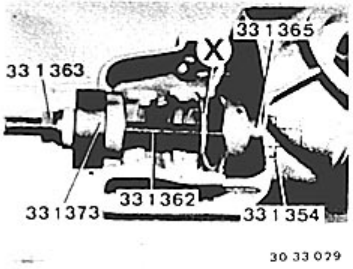
Permissible tolerances for thickness (X) result from the tolerances for shims depending on their thickness; 0.01 to 0.03 mm (0.0004 to 0.0012").



Remove drive pinion after determining the thickness of shim (X).
Important!
Note make of bearings – this information is needed for determination of the friction torque.

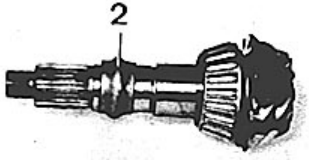


Press (don't pull) input flange on to the input shaft with Special Tool 23 1 300.
The axial preload force of pinion tapered roller bearings (5000 N = 1102 lbs.) can be determined with help of the friction torque.

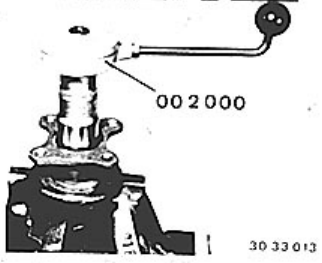


Remove rear bearing outer race and install again with shim (X) in determined thickness.

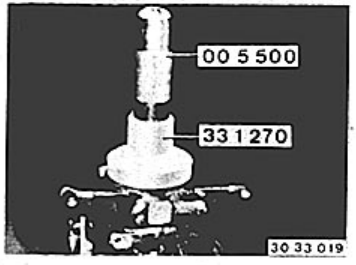
Tighten input flange with the collar nut in steps, measuring the friction torque after each step (see below).



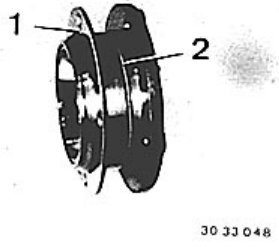
Install drive pinion with a new clamping sleeve (2).



Measure friction torque* with Special Tool 00 2 000 and a suitable socket.
Important!
The relation between friction torque and preload force differs depending on the make of bearings.
Refer to the pinion bearing table* for specified friction torque and add 20 Ncm (2 in. lbs.) for the new shaft seal.

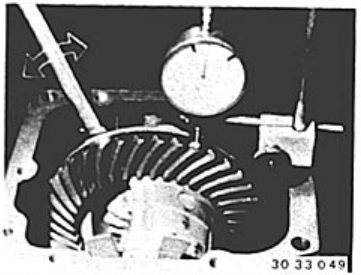


Dip shaft seal in final drive gear lube and drive in flush with Special Tools 33 1 270 and 00 5 500.



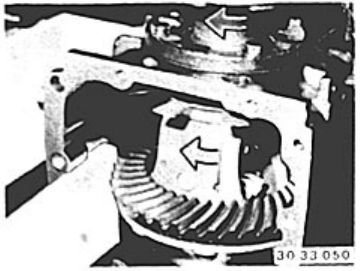
Install differential.
Install side covers as marked with corresponding washers (1) and new O-rings (2).
Tighten bolts uniformly.
Tightening torque*.

* See Specifications

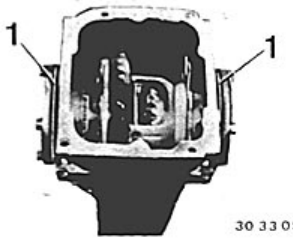


– Backlash/Tooth Contact Pattern Adjustment –
Mount Special Tool 00 2 500 and measure backlash* with dial gage.
Important!
The tooth contact pattern is always most important for a perfectly adjusted pinion/ring gear set.

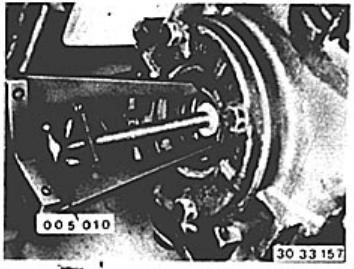
Refer to 33 12 551 "Replacing Drive Pinion with Ring Gear" for basic information on tooth contact pattern adjustments.



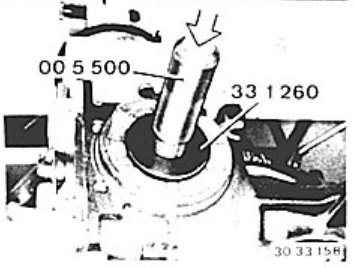
To check the tooth contact pattern, coat the ring gear teeth with printer's ink, turn in both directions several times and stop ring gear suddenly with a piece of hard wood.



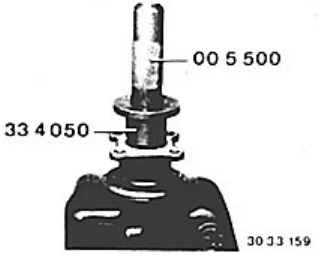
Correct backlash* and tooth contact pattern by changing the thickness of both shims (1).
If backlash is excessive, use a thinner shim on the ring gear end.
If backlash is too small, use a thicker shim on the ring gear end.
An axial displacement of the ring gear by 0.01 mm (0.0004") will cause a change in backlash of 0.0076 mm (0.0003").
Important!
The total thickness of both shims must not be changed.
If a thicker or thinner shim is required on the one side to correct the tooth contact pattern, the other shim must also be changed again to have the original total thickness – if not, the friction torque of the bearings would be changed.
Determine friction torque of differential bearings – see 33 11 731 "Replacing Differential Bearings".



Pull out old shaft seals with Special Tool 00 5 010 in conjunction with a thrust piece.

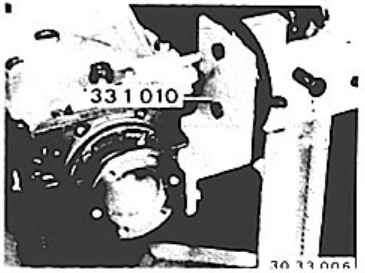


Installation:
Dip new shaft seals in final drive gear lube. Drive in shaft seals against the stop with Special Tools 33 1 260 and 00 5 500. Replace a drive flange with seriously scored bearing surfaces.



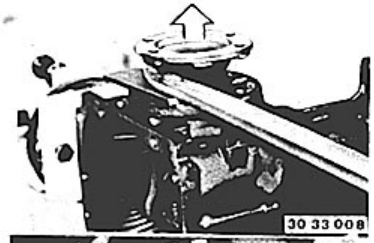
Drive in new lockplate with Special Tools 33 4 050 and 00 5 500.

* See Specifications

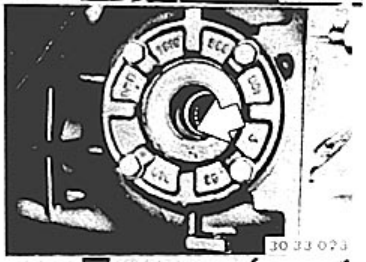


33 12 551 REPLACING DRIVE PINION WITH RING GEAR
– Final Drive Removed –

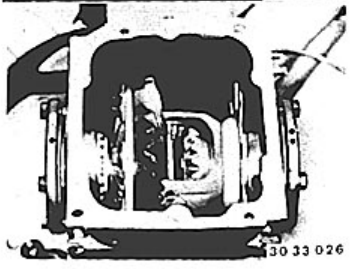
See 33 10 010 in microfilmed repair manual of cars beginning with 1985 models for information on removing and installing final drive.
Mount final drive on Special Tool 33 1 010.
Drain oil.
Unscrew case cover.
Installation:
Replace gasket.
Tightening torque*.
Pour in oil – oil volume*.
See Group 33 in Operating Material Binder for approved oil.



Press off both drive flanges with a tire iron.

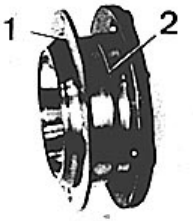


Installation:
Place round wire snap ring (1) in groove of differential case prior to installation of the drive flange, that both ends are recessed in the groove.
This prevents lateral bending of the ring.
Press in drive flange by hand and while turning slightly, until the round wire snap ring is heard to engage.
Replace stretched snap rings.



Punch mark both bearing caps.
Unscrew and remove both bearing caps.
Important!
Don't mix up bearing caps and shims.
Fasten shims, if applicable, on bearing caps with pieces of wire.
Installation:
Tightening torque*.

* See Specifications



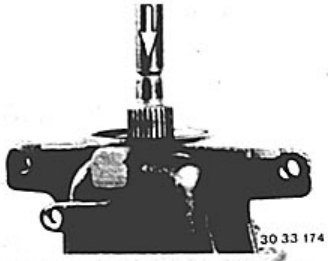
Differential case bearings and backlash are adjusted with shims (1).
Check O-ring (2), replacing if necessary.

Remove complete differential case.
Caution!
Don't bend the pulse spider.

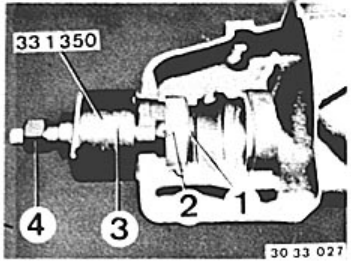
Lift out lockplate.
Hold with Special Tool 23 0 020 and unscrew nut (1).

Pull off input flange with Special Tool 33 1 150.
Specified friction torque* is given for the new drive pinion bearings and the friction torque of the old bearings does not have to be measured.

* See Specifications

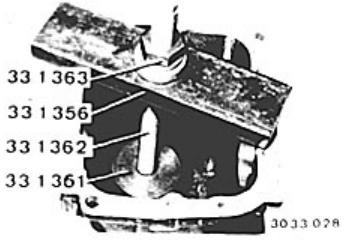


Press out drive pinion.



Pull out front bearing outer race with Special Tool 33 1 350.

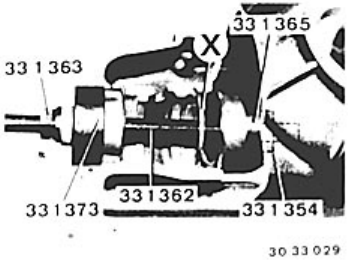
1 Spreader
2 Front bearing outer race
3 Puller bell housing
4 Pressure bolt



Pull out rear bearing outer race with Special Tool 33 1 360.
Puller consists of:

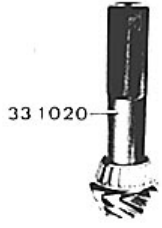
Puller head	33 1 361
Threaded spindle	33 1 362
Bearing bridge	33 1 356
Pressure nut	33 1 363

Important!
Shim (X) is located underneath the rear bearing outer race.
It will be needed again for pinion/ring gear adjustments.



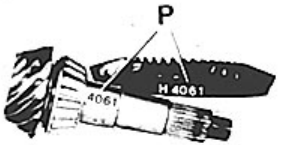
Install old shim (X) in front of the rear bearing outer race.
Pull in bearing outer races with Special Tool 33 1 360.
Puller consists of:

Puller disc for front outer race	33 1 373
Puller disc for rear outer race	33 1 365
Threaded spindle	33 1 362
Pressure nut	33 1 363
Nut	33 1 354



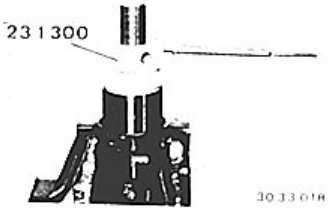
Press new tapered roller bearing inner race on to the new drive pinion with Special Tool 33 1 020.

Important!
Replace both drive pinion bearings, using only one make.



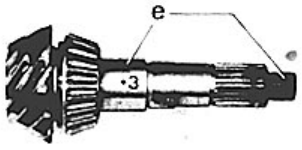
30 33 031

Important!
Drive pinions and ring gears are paired for optimal smooth running in special machines. Pairing code (P) is inscribed electrically on the pinion and ring gear.
Never install ring gear and drive pinion with different pairing codes (P) together.
H = Gleason hypoid teeth (helical shape).



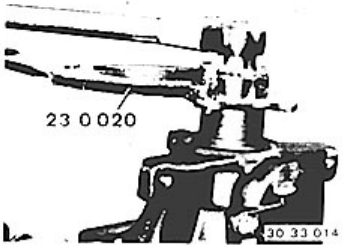
30 33 018

Install drive pinion in rear bearing outer race. Press (don't pull) front tapered roller bearing on to drive pinion with Special Tool 23 1 300 and a suitable spacing sleeve.



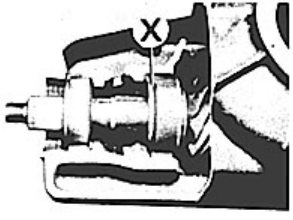
30 33 032

The inscribed number with "+" or "–" is the deviation from basic distance C in hundreths of millimeters and is required for adjustment of the tooth contact pattern with shims.
+ e is added to C.
– e is subtracted from C.



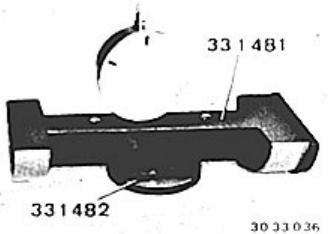
30 33 014

Mount input flange.
Tighten the collar nut in steps, measuring the friction torque after each step with Special Tool 00 2 000 and adjusting the friction torque to 250 Ncm (22 in. lbs.) with the collar nut.



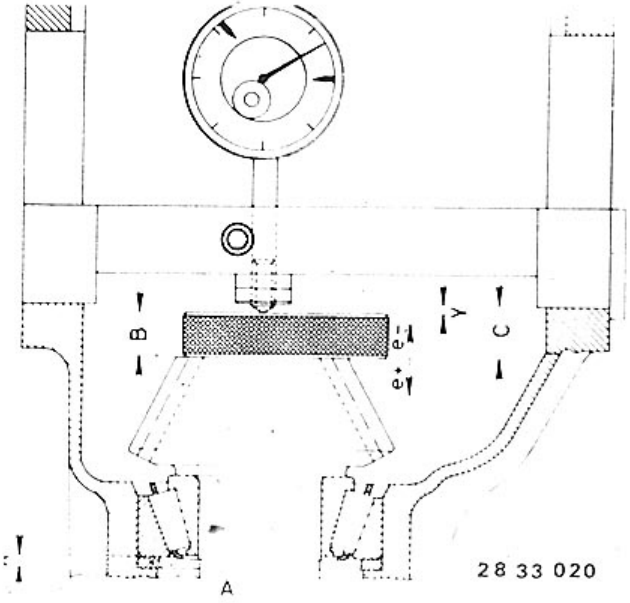
30 33 033

To determine the thickness of shim (X), install drive pinion with new tapered roller bearings, but without bush.



– Drive Pinion Block Distance –
Mount dial gage in Special Tool 33 1 481.
Place Special Tool 33 1 481 with dial gage on Special Tool 33 1 482 and set dial gage to 0 (zero) with pre-load.

Place Special Tool 33 1 482 on drive pinion.
Insert Special Tool 33 1 481 in case.
Determine value Y.
Basic distance C = 9.02 mm (0.355")
Gage disc B = 7.00 mm (0.276")



Example I

C	9.02 mm (0.355")
e +	0.10 mm (0.004")
C nominal	9.12 mm (0.359")
Y measured on dial gage	1.92 mm (0.075")
+ gage thickness B	7.00 mm (0.276")
C actual	8.92 mm (0.351")
C nominal	9.12 mm (0.359")
C actual –	8.92 mm (0.351")
a	0.20 mm (0.008")
Gage A	4.10 mm (0.161")
– a	0.20 mm (0.008")
Shim thickness X	3.90 mm (0.153")

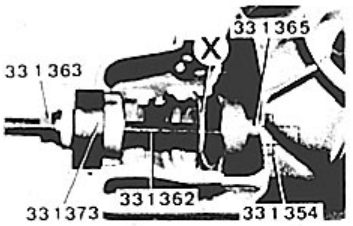
If C nominal is larger than C actual, "a" is subtracted (–) from shim thickness X.

Example II

C	9.02 mm (0.355")
e –	0.10 mm (0.004")
C nominal	8.92 mm (0.351")
Y measured on dial gage	2.12 mm (0.083")
+ gage thickness B	7.00 mm (0.276")
C actual	9.12 mm (0.359")
C actual	9.12 mm (0.359")
C nominal –	8.92 mm (0.351")
a	0.20 mm (0.008")
Gage A	3.90 mm (0.153")
+ a	0.20 mm (0.008")
Shim thickness X	4.10 mm (0.161")

If C nominal is smaller than C actual, "a" is added (+) to shim thickness X.

Permissible tolerances for distance (X) result from the tolerances for pertinent shim thickness available in steps from 0.01 to 0.03 mm (0.0004 to 0.0012").



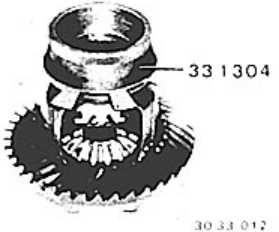
30 33 029

Remove drive pinion and rear bearing outer race.
Press in shim (X) of determined thickness and bearing outer race.

Important!
Do not install the drive pinion at this point, since it is first necessary to measure and adjust the friction torque of the new differential case bearing.

30 33 011

Press pulse spider off of differential case.
Caution!
Be careful not to bend the pulse spider.



30 33 012

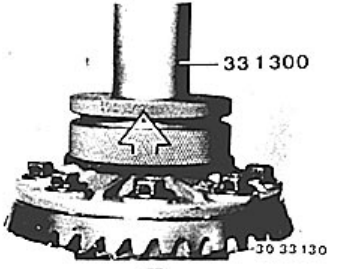
Installation:
Press on pulse spider with Special Tool 33 1 304.

30 33 041

Remove ring gear (cold).
Installation:
New:
Heat ring gear to max. 100° C (212° F), checking temperature with a thermochrome pencil.
Mount ring gear with two locally made stay-bolts as guides.

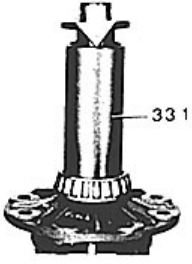
30 33 042

Install new bolts with Loctite No. 270 and tighten in order of (1 ... 8).
Tightening torque*.
Tighten bolts to torque angle*.



30 33 130

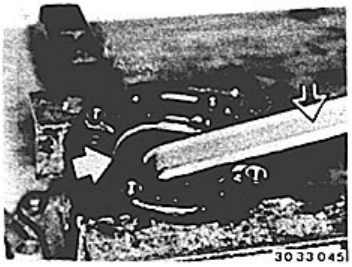
Pull off tapered roller bearing on differential case with Special Tool 33 1 300.



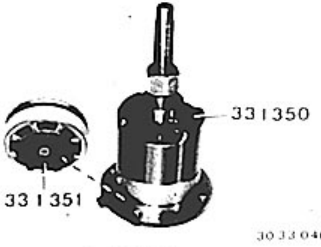
30 33 044

Installation:
Press on new tapered roller bearing inner races cold with Special Tool 33 1 330.

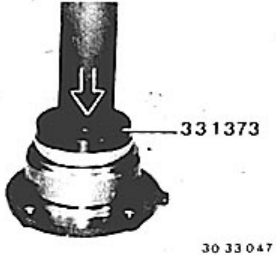
* See Specifications



Lift shaft seals out of both bearing caps.

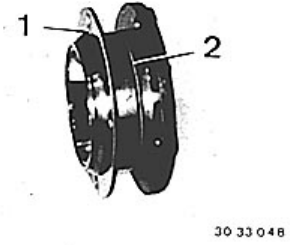


Press out bearing outer race with Special Tools 33 1 350 and 33 1 351.
Important!
Special Tool **33 1 351** must engage in the bearing outer race.

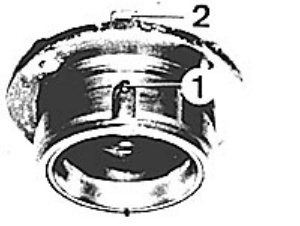


Installation:
Press in new bearing outer races with Special Tool 33 1 373.
*

The following 12 steps can only be omitted, if the differential case bearings were not replaced.
Install differential case with new ring gear and new bearings.
Lubricate bearings thoroughly with approved final drive gear lube** and let them drip dry.

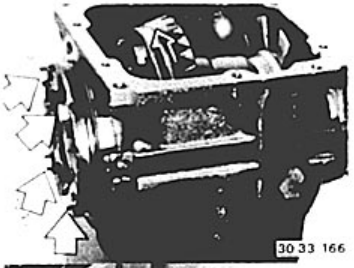


Install side bearing caps as marked with corresponding shims (1), but without O-rings (2) at first.
Tighten mounting bolts of bearing cap opposite the ring gear end uniformly with the correct tightening torque*.

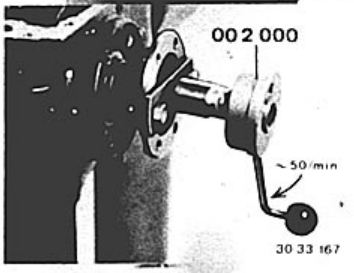


The compensating bore (1), which is recognized on the outside by tab (2), always faces up in installed position of the transmission.

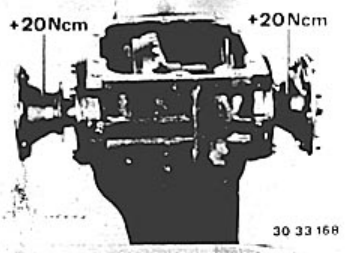
* See Specifications
** See Gr. 33 in Operating Material Binder



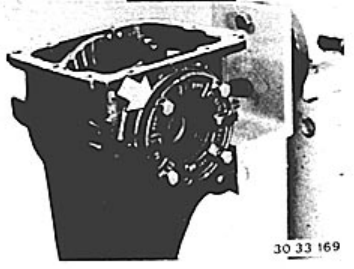
Determining Friction Torque of New Differential Case Bearings:
The axial preload force of differential case bearings (4000 N = 882 lbs.) can be determined with help of friction torque*.
Tighten bolts of second bearing cap uniformly only enough, that the differential can still be turned easily.



Install an output flange on the side opposite the ring gear and determine the friction torque with help of a locally manufactured holder and welded nut as well as friction meter 00 2 000.
Drive friction tester at speed of approx. 50 rpm.

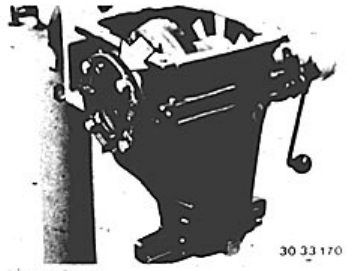


The friction torque* specified in the differential case bearing table* should be reached, but not exceeded.
If new shaft seals had already been installed, 20 Ncm (2 in. lbs.) must be added for each seal in which the output shaft runs while measuring.



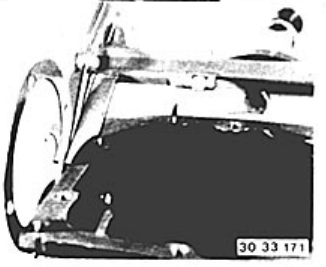
If the given friction torque is not reached, even though both bearing caps are tightened to the correct tightening torque*, install a thinner shim opposite the ring gear and repeat the measuring procedures.

* See Specifications



If the friction torque is reached, even though the second bearing cap has not yet been tightened to the correct thightening torque*, a thicker shim must be used on the ring gear end and the measuring procedures repeated.

To make finding the shim thickness easier, the distance between the shim and case can be measured with a feeler gage blade can added to the thickness of the used shim.

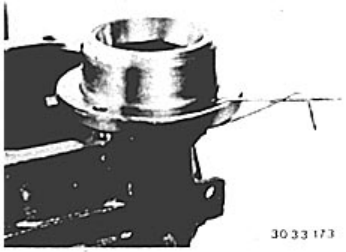


Example:
Second bearing cap not tightened (bolts screwed in uniformly).
Specified friction torque* (e.g. 190 Ncm = 16.5 in. lbs.) reached and shaft seals not yet installed.

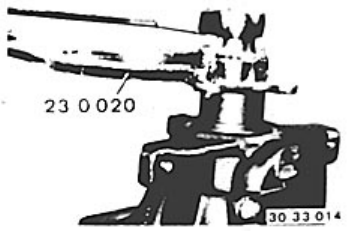
Gap measured with blade of feeler gage	0.20 mm (0.008")
Used shim thickness	1.40 mm (0.055")
Install shim of thickness	1.60 mm (0.063")

and measure friction torque again.

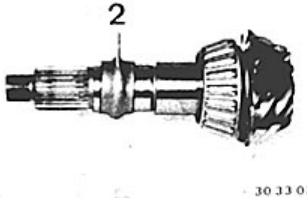
* See Specifications



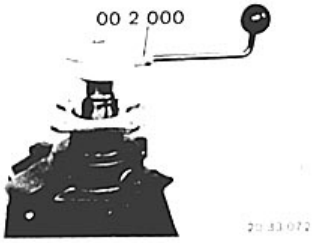
Remove differential for installation of the drive pinion.
(If differential case bearings had not been replaced, proceed from this point.)
Important!
Match side covers and corresponding shims of determined thickness; don't mix them up.



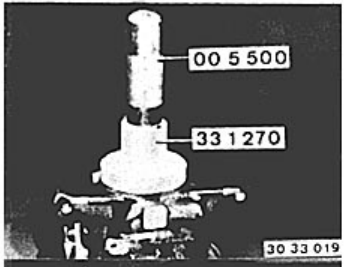
Tighten input flange with the collar nut in steps, measuring the friction torque after each step (see below).



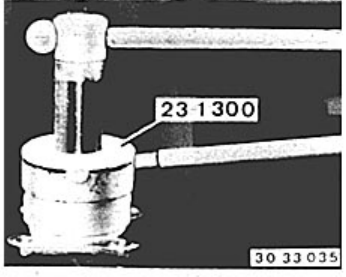
Install drive pinion with new clamping sleeve (2).



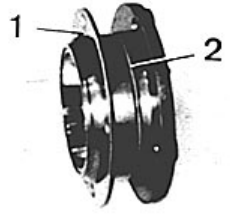
Measure friction torque* with Special Tool 00 2 000 and a suitable wrench socket.
Important!
The relation between friction torque and preload differs depending on the make of bearings.
Take the friction torque specified in the pinion bearing table* and add 20 Ncm (2 in. lbs.) for the new shaft seal.



Dip shaft seal in final drive gear lube and drive in flush with Special Tools 33 1 270 and 00 5 500.

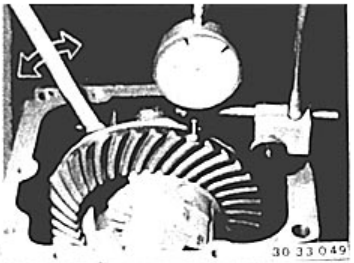


Press (don't pull) input flange on to the input shaft with Special Tool 23 1 300.
The axial preload force of drive pinion bearings (5000 N = 1102 lbs.) can be determined with help of the friction torque.



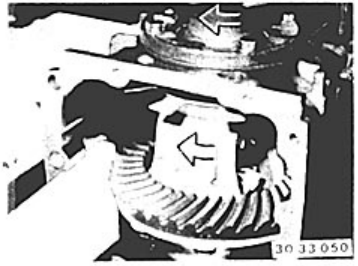
Install differential.
Install side covers as marked with corresponding washers (1) and new O-rings (2).
Tighten bolts uniformly.
Tightening torque*.

* See Specifications

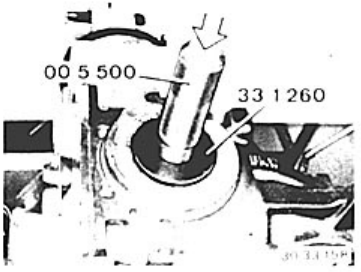


– Backlash/Tooth Contact Pattern Adjustment –
Mount Special Tool 00 2 500 and measure backlash* with dial gage.
Important!
The tooth contact pattern is always most important for a perfectly adjusted pinion/ring gear set.

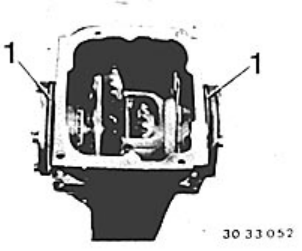
See following pages for general information on tooth contact pattern adjustments.



To check the tooth contact pattern, coat the ring gear teeth with printer's ink, turn in both directions several times and stop ring gear suddenly with a piece of hard wood.



Installation:
Dip new shaft seals in final drive gear lube. Drive in shaft seals against the stop with Special Tools 33 1 260 and 00 5 500. Replace a drive flange with seriously scored bearing surfaces.



Correct backlash* and tooth contact pattern by changing the thickness of both shims (1).
If backlash is excessive, use a thinner shim on the ring gear end.
If backlash is too small, use a thicker shim on the ring gear end.
An axial displacement of the ring gear by 0.01 mm (0.0004") will cause a change in backlash of 0.0076 mm (0.0003").
Important!
The total thickness of both shims must not be changed.
If a thinner or thicker shim is required to correct the tooth contact pattern, the total thickness must be corrected with the second shim, since otherwise the friction torque of bearings would be changed again.

Drive in new lockplate with Special Tools 33 4 050 and 00 5 500.

* See Specifications

GENERAL INFORMATION ON TOOTH PATTERN ADJUSTMENTS

Gleason Teeth

A Correct tooth pattern without load.

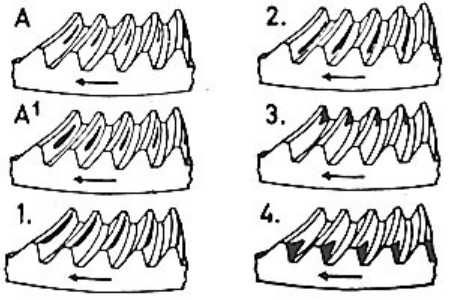
A 1 Loads will shift tooth contact pattern outward slightly.
Moving the ring gear will mainly change the backlash, but will also displace the contact pattern in longitudinal direction of the teeth.
Moving the drive pinion will displace the contact pattern in favor of tooth height, but the backlash will be altered just very slightly.
Here are the four basically incorrect contact patterns, which usually occur in combination.
Knowing these patterns will facilitate making adjustments.

1. High, narrow contact pattern (tip contact) on ring gear. Move drive pinion toward ring gear shaft and perhaps correct backlash by backing ring gear off of drive pinion.

2. Deep, narrow contact pattern (root contact) on ring gear. Move drive pinion away from ring gear shaft and perhaps correct backlash by moving in ring gear.

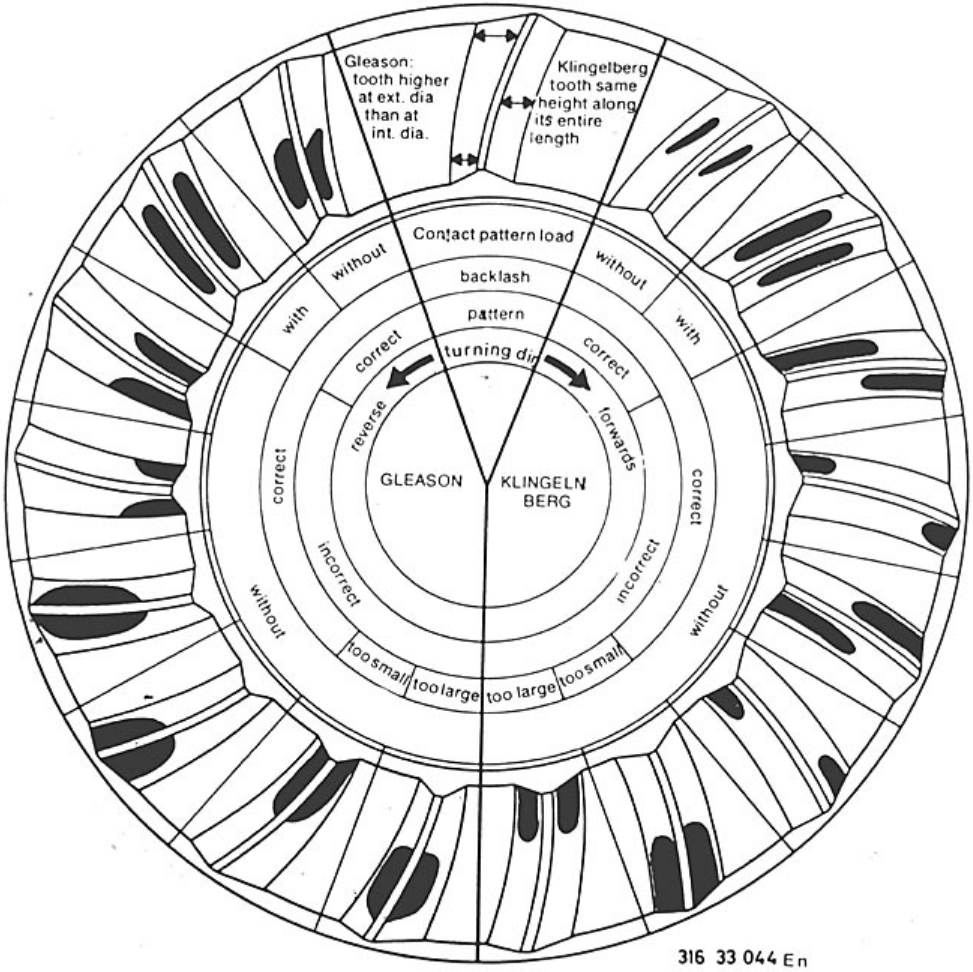
3. Short contact pattern on small tooth end (toe contact) of ring gear. Move ring gear away from drive pinion. Maybe move pinion closer to ring gear shaft.

4. Short contact pattern on large tooth end (heel contact) of ring gear. Move ring gear toward drive pinion. Perhaps back drive pinion away from ring gear shaft.



2H 33 030

Adjustment of contact pattern



30 33 012

33 13 611 REPLACING DIFFERENTIAL SIDE GEARS
– Differential Removed –

See 33 12 551 "Replacing Drive Pinion and Ring Gear" for removal of differential.
Press off the pulse spider.
Installation:
Press on pulse spider with Special Tool 33 1 304.

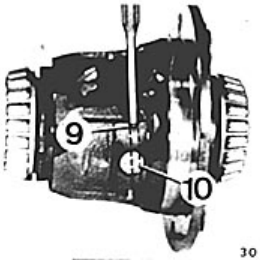
30 33 041

Remove ring gear (cold).
Important!
If the bearings must also be replaced, install the ring gear only after determination of the friction torque – see "Replacing Bearings for Differential Case – 33 11 724.
Installation:
Clean tapped bores thoroughly (tapper).
Heat ring gear to max. 100° C (212° F), checking temperature with a thermo-color pencil.
Mount ring gear with two locally manufactured staybolts for guiding.
Important!
Use new ring gear bolts.

30 33 042

Installation:
Install new bolts with Loctite No. 270 and tighten in order of 1 through 8.
Tightening torque*.
Tighten bolts to torque angle*.

* See Specifications

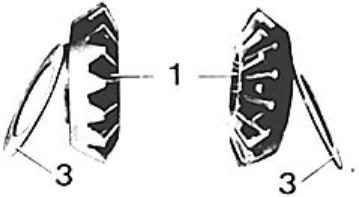


30 33 053

Drive out key (9) and differential shaft (10).
Installation:
The bore in differential shaft (10) is countersunk on one end.
Drive in key (9) from this end.

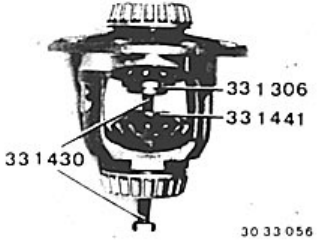
30 33 054

Turn out differential bevel gears with drive flange.
Remove differential side gears with shims (2).



30 33 108

Install both new differential side gears (1) with diaphragm springs (3) (Part No. 33 13 1 201 538), but without shims (2), to measure the thickness of shims.
Center differential side gears with the drive flange.
(If there are 2 diaphragm springs and 2 shims in this transmission as an exception, refer to measuring procedures on page 228).



30 33 056

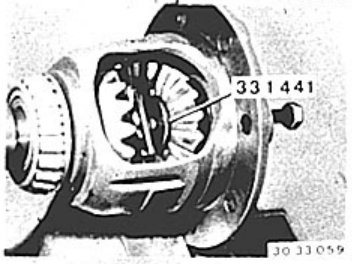
Insert Special Tool 33 1 306 on one side.
Screw in Special Tool 33 1 441 with Special Tool 33 1 431.
Tighten special tool bolt to spread differential side gears so far apart, that the drive flange can just barely be turned.

30 33 057

Install differential bevel gears exactly opposite each other.
Move differential gears to installed position by turning drive flange.
Remove special tools.

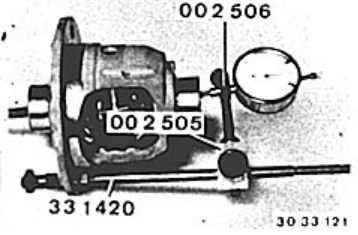
30 33 058

Drive in differential gear shaft.
Turn differential bevel gears with the drive flange and stop them at the highest point of tooth mesh (hardest to turn).



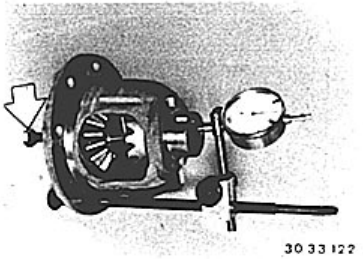
30 33 059

Install Special Tools 33 1 441 and 33 1 431 for measuring.
If applicable, open up Special Tool 33 1 441 slightly to make it easier to insert the dial gage.
Screw in bolt far enough, that the shaft gear is on "block".



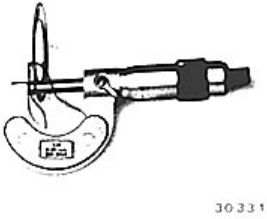
30 33 121

Mount dial gage with holder, consisting of Special Tools 33 1 420, 00 2 505 and 00 2 506, on the differential case.
Set dial gage on blocked shaft gear to zero with pre-load.



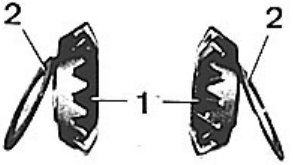
30 33 122

Loosen Special Tool 33 1 431.
Read dial gage and note value as well as end.
For example:
Ring gear end 0.36 mm (0.014").
Repeat measurement on opposite shaft end and note value, for example
0.28 mm (0.011").



30 33 123

Remove differential side gears and diaphragm springs.
Important!
Don't mix up differential side gears and diaphragm springs.
Measure diaphragm springs with a micrometer and note values as well as ends.
For example:
1.16 mm (0.046") ring gear end and
1.18 mm (0.047") opposite end.
Determine correct shim thickness with consideration for play of 0.02 to 0.07 mm (0.0008 to 0.0028").



30 33 055

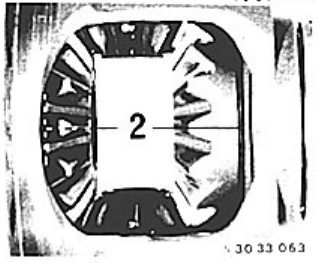
Example:

	Ring Gear End	Opposite End
Diaphragm spring	1.16 mm	1.18 mm
+ measured value	0.36 mm	0.28 mm
	1.52 mm	1.46 mm
– play	0.02 mm	0.02 mm
	1.50 mm	1.44 mm

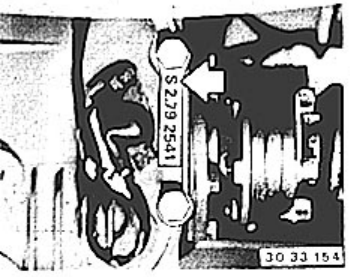
Thickness of shims:
1.50 mm and 1.45 mm

Shims (2) are available in 0.05 mm thickness steps.

Install shims (2) of determined thickness.



30 33 063



LIMITED SLIP DIFFERENTIAL WITH 25 % LOCKING RATIO

The limited slip differential is marked with a "S" on the case or data plate.
A limited slip differential has the following advantages.

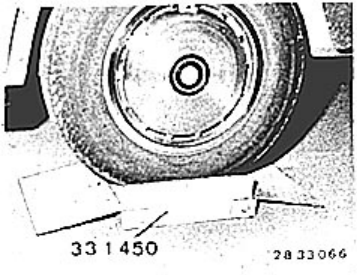
a) Prevention of wheel slip when driving on rough road surfaces.

b) Prevention of wheel slip when moving off with different traction underneath left and right sides of car wheels.

c) Prevention of wheel slip when driving fast on wet roads.

d) Prevention of wheel slip on inside of curve when driving fast in curves.

e) Prevention of slip when driving fast on roads with different traction between left and right.



Checking Function Without Removing:

a) Level workshop floor.

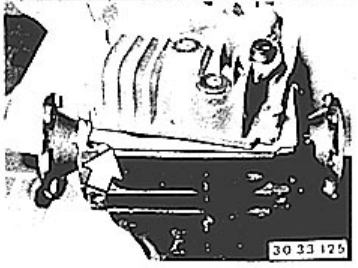
b) Drive car with left wheel on Special Tool 33 1 450.

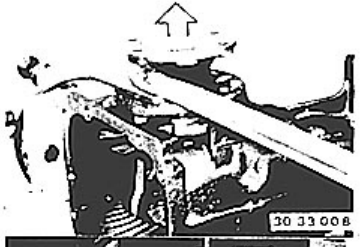
c) Release parking brake completely.

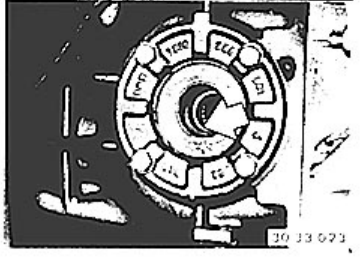
d) Engage 1st gear and accelerate engine.

e) Function of limited slip differential is okay, if the car can be driven off of Special Tool 33 1 450.

Important!
Drive off of fixture slowly!







33 14 520 REPLACING LIMITED SLIP DIFFERENTIAL ASSEMBLY – Final Drive Removed –

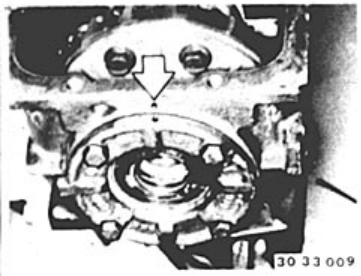
Remove final drive – see 33 10 010 in repair manual of pertinent model series beginning with 1985 models.
Drain oil.
Mount final drive on Special Tool 33 1 010.
Installation:
Add oil. Oil volume*.
Refer to Gr. 33 in Operating Material Binder for approved oil.

Detach transmission cover.
Installation:
Replace gasket.
Tightening torque*.

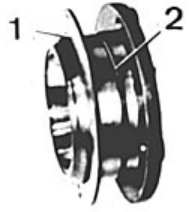
Pry off both drive flanges with a tire iron.

Installation:
Before installation of the drive flange, place round wire snap ring (1) in groove of the differential case that both ends are recessed in groove.
This prevents lateral bending of the ring.
Push in and turn drive flange slightly by hand until round wire snap ring is heard to engage.
Replace stretched snap rings.

* See Specifications

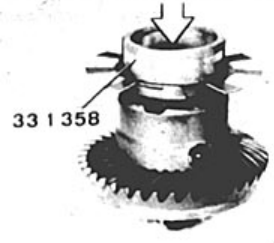


Unscrew both bearing caps.
Important!
Mark bearing caps – don't mix up bearing caps and shims.
Installation:
Tightening torque*.



Differential case bearings and backlash are adjusted with shims (1).
Check O-ring (2), replacing if necessary.
Important!
Changing the total thickness of shims (1) will change the friction torque value.
After adjusting the friction torque, the backlash and tooth contact pattern will have to be adjusted again – see 33 12 551.

Remove complete limited slip differential.
Installation:
Don't bend the pulse spider.

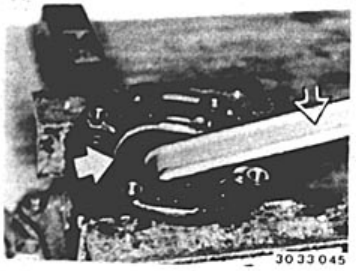


Press off pulse spider.
Installation:
Press on pulse spider with Special Tool 33 1 304.

* See Specifications

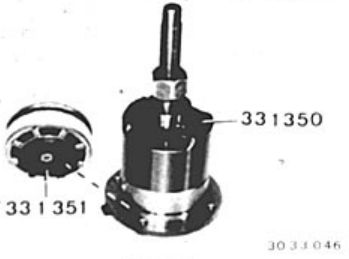
Remove ring gear (cold).

Press new tapered roller bearings on to new differential case with limited slip cold with Special Tool 33 1 330.
Important!
Only install both bearings of same make.
Note make, which is needed later to determine the friction torque.

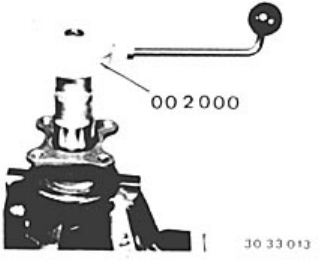


Lift shaft seals out of both bearing caps.

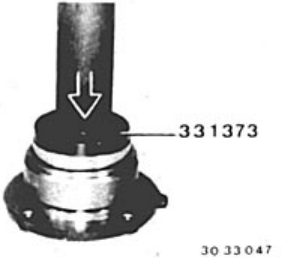
If applicable, replace shaft seal for input flange – see 33 11 512.



Press out bearing outer race with Special Tools 33 1 350 and 33 1 351.
Important!
Special Tool 33 1 351 must engage in bearing outer race.



If applicable, replace drive pinion – see 33 12 551.

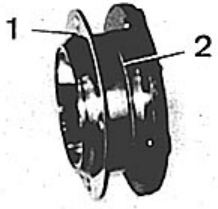


Installation:
Press in new bearing outer races with Special Tool 33 1 373.
Important!
Only use same make bearings for both bearings.

30 33 319

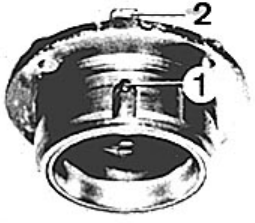
Install new limited slip differential with new bearings.
Use both bearings of same make.
Note make.

Lubricate new bearings with approved final drive gear lube** thoroughly and let them drip dry.



30 33 048

Install side bearing caps as marked with corresponding shims (1), but without O-rings (2) at first.
Tighten bolts of bearing cap opposite the ring gear end uniformly to correct tightening torque*.



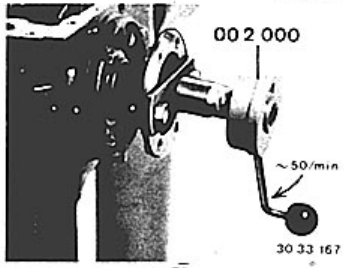
30 33 148

The compensating bore (1), recognized on the outside by tab (2), always faces up in installed position of the transmission.

* See Specifications
** See Gr. 33 in Operating Material Binder

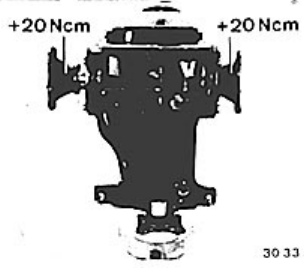
30 33 311

Axial preload force of differential case bearings (4000 N = 882 lbs.) can be determined with help of the friction torque*.
Tighten bolts of second bearing cap only enough, however uniformly, that the differential can still be turned easily.



30 33 167

Install an output flange on the end opposite the ring gear and determine the friction torque with help of a locally manufactured holder with welded nut and friction tester 00 2 000.
Turn friction tester at approx. 50 rpm.



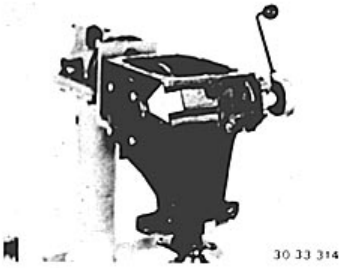
30 33 312

The friction torque* specified in the differential case bearing table* should be reached, but must not be exceeded.
If new shaft seals had already been installed, 20 Ncm (2 in. lbs.) must be added for each seal in which the output shaft runs while measuring.

30 33 313

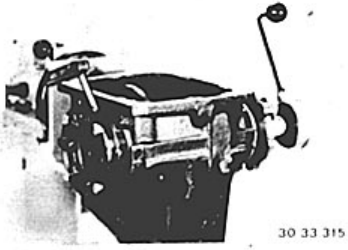
If the given friction torque is not reached, even though both bearing caps are tightened to the correct tightening torque*, a thinner shim must be used on the end opposite the ring gear and the measuring procedures repeated.

* See Specifications



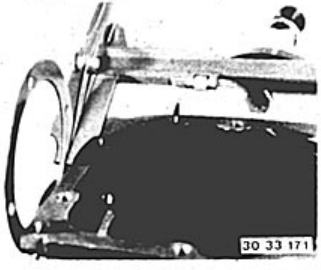
30 33 314

If the friction torque is reached, even though the second bearing cap is not yet tightened to correct tightening torque*, use a thicker shim on the ring gear end and repeat the measuring procedures.



30 33 315

To make finding the thickness of shims easier, the distance between the shim and case can be measured with a feeler gage blade and this value is then added to the thickness of the used shims.

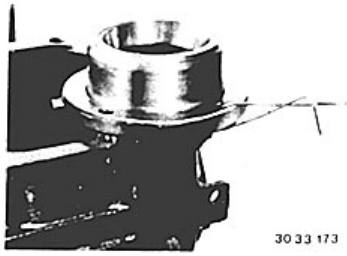


30 33 171

Example:
Second bearing cap not tightened fully (bolts screwed in uniformly).
Specified friction torque* (e.g. 190 Ncm = 16.5 in. lbs.) is reached, but without shaft seals.

Gap measured with blade of feeler gage	0.20 mm (0.008")
Used shim thickness	1.40 mm (0.055")
Install shim of thickness and measure again.	1.60 mm (0.063")

* See Specifications



30 33 173

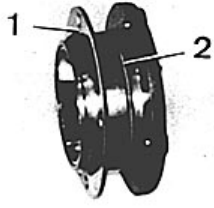
Remove differential case.
Arrange side covers and shims of determined thickness – don't mix them up.

30 33 126

Installation:
Clean tapped bores thoroughly (with tapper).
Heat ring gear to max. 100° C (212° F), checking temperature with a thermo-color pencil.
Mount ring gear with two locally manufactured staybolts for guiding.

30 33 127

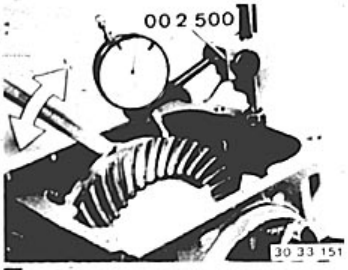
Install new bolts with Loctite No. 270 and tighten in order of 1 ... 8.
Tightening torque*.
Then tighten to torque angle*.



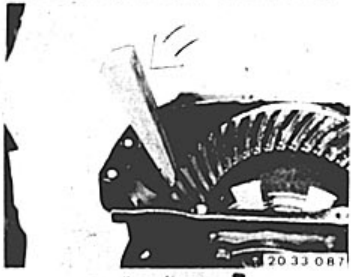
30 33 048

Install differential with ring gear and pulse gear.
Install side covers as marked with corresponding washers (1) and new O-rings (2).
Tightening torque*.

* See Specifications

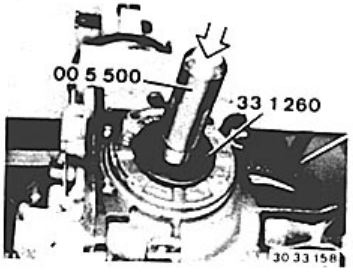


Backlash/Tooth Contact Adjustments:
Mount Special Tool 00 2 500 and measure the backlash*.
Important!
The tooth contact pattern is always most important for a perfectly adjusted pinion/ring gear set.
See "Replacing Drive Pinion with Ring Gear" in 33 12 551 for general information on tooth contact pattern adjustments.



To check the tooth contact pattern, coat ring gear with printer's ink, turn several times in both directions and then stop the ring gear suddenly with a piece of hard wood.

The backlash* and tooth contact pattern are corrected by changing the thickness of both shims (1).
If the backlash is too large, install a thinner shim on the ring gear end.
If the backlash is too small, install a thicker shim on the ring gear end.
An axial displacement of the ring gear by 0.01 mm (0.0004") will change the backlash by 0.076 mm (0.0003").
Important!
The total thickness of both shims may no longer be changed.
If a thicker or thinner shim was required to correct the tooth contact pattern, the total thickness must be corrected with the second shim, since otherwise the friction torque of the bearings would be changed again.



Installation:
Dip shaft seal in final drive gear lube.
Drive in shaft seal against the stop with Special Tools 33 1 260 and 00 5 500.
Replace a drive flange with seriously scored bearing surfaces.

* See Specifications

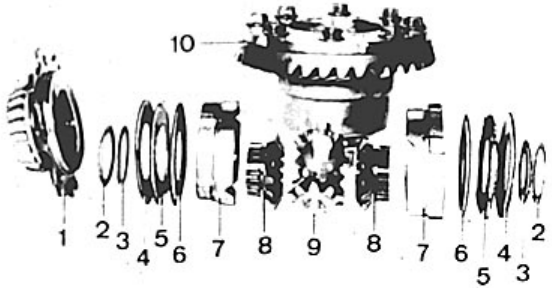
30 33 131

33 14 593 DISASSEMBLING/ASSEMBLING LIMITED SLIP DIFFERENTIAL – Final Drive Removed –

Remove limited slip differential – see Replacing Limited Slip Differential – 33 14 520.
Unscrew case cover mounting bolts.
Take off case cover.

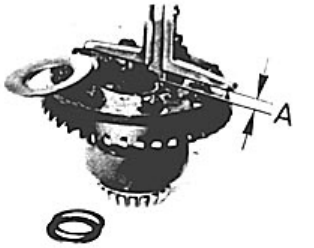
30 33 132

Turn case upside down and let parts slide out.
Installed Order:
(1) case cover, (2) diaphragm spring, (3) thrust washer, (4) diaphragm spring, (5) outer plate, (6) inner plate, (7) thrust ring, (8) differential side gear, (9) differential gears with differential shafts, (10) differential case.



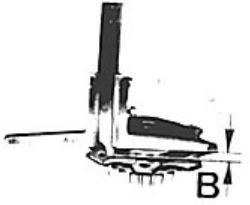
30 33 133

Check all parts for wear, e.g. molybdenum coat, splines, etc..
Installation:
Lubricate all parts with approved final drive oil before assembling.



30 33 134

Install following parts in correct installed order to measure the pre-load.
Outer plates (5), inner plates (6), thrust rings (7), differential side gears (8) and differential gears with differential shafts (9).
Measure distance A from case edge to outer plate, e.g. A = 10.8 mm (0.425").



30 33 135

Measure distance B on cover, e.g. B = 6.8 mm (0.268").

30 33 136

Place both diaphragm spring curved surfaces together.
Measure distance C on diaphragm springs, e.g. C = 3.6 mm (0.142").

An installed clearance of 0.1 to 0.4 mm (0.004 to 0.016") is required to prevent pressing the diaphragm springs flat.

Example:

B (cover)	6.8 mm (0.268")
C (diaphr. sprg.)	3.6 mm (0.142")
A (case)	10.8 mm (0.425")
Sum of B + C	10.4 mm (0.409")
Installed clearance D	0.4 mm (0.016")

Correct any deviation in installed clearance D by installing outer plates of correct thickness.

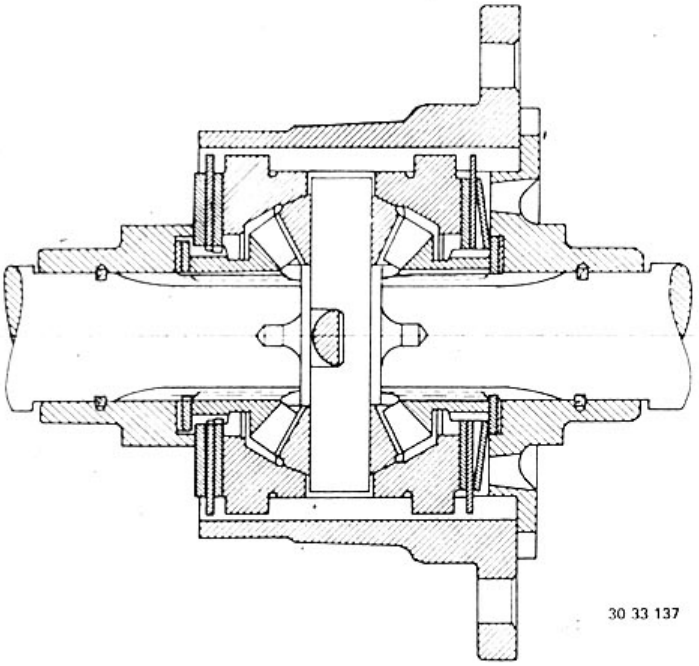
30 33 138

Remove all parts from case and insert with the additional parts, diaphragm springs (2) and thrust washers (3).

Mount case cover (10) and press on firmly, but do not bolt.

The pre-load of small diaphragm springs (2) should produce an uniform gap all around (check with a feeler gage blade).

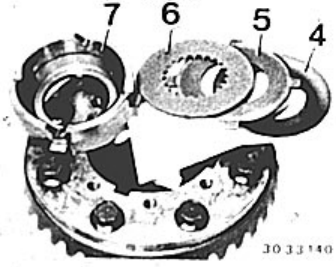
If there is no clearance between cover and case, check diaphragm springs (2) and thrust washers (3).



30 33 137

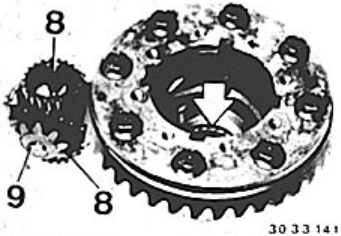
30 33 139

Installed Order:
Install diaphragm spring (2) with inside curved surface facing up to differential shaft.
Insert thrust washer (3) with oil pockets facing up to differential shaft.



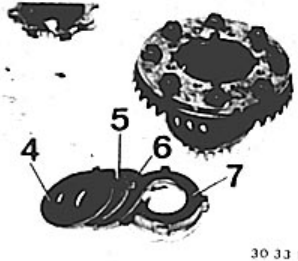
30 33 140

Insert diaphragm spring (4) with inside curved surface facing differential shaft and outer plate (5) with four tabs.
Insert molybdenum coated inner plate (6) and thrust ring (7).



30 33 141

Install differential side gear (8) by turning into guides or splines of inner plate.
Install differential gears with shafts (9) and a second differential side gear (8).



30 33 142

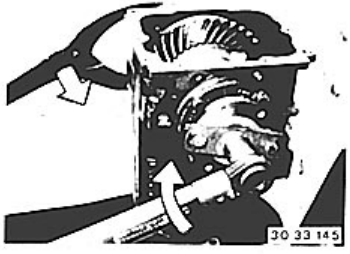
Install thrust ring (7), molybdenum coated inner plate (6) and outer plate (5).
Insert diaphragm spring (4) with inside curved surface facing down to differential shaft.

30 33 143

Install diaphragm spring (2) with inside curved surface facing up and thrust washer (3) with oil pockets facing up in case cover, using grease.

30 33 144

Mount case cover with washers (being careful that washers do not slide out).
Install bolts with Loctite No. 270 and tighten cover uniformly.
Installation:
Tightening torque*.



30 33 145

Check slip torque* of differential lock by holding one and driving other differential side gear.
Make up tool locally for this purpose by, for example, welding a nit on a drive flange which is no longer required.

* See Specifications

CONVERSION AND COMPARISON TABLE OF STANDARD UNITS OF MEASUREMENT

11 00 ... Engine Oil Consumption

Oil consumption can be measured for the first time after the car has been driven approximately 7,500 km. Oil consumption will be stable only after this distance. Measuring oil consumption requires that the engine does not leak.

Precise consumption can be determined by weighing. Drain engine oil having operating temperature. Allow 5 minutes drip time. Weigh and pour in specified amount of new engine oil. Drive car 1,000 km. Drain engine oil at operating temperature and weigh. Allow 5 minutes drip time. Engine oil density at room temperature is approx. 0.9 km/cubic dm (dm^3).

Max. permissible oil consumption when measured* by weighing: 0.07 ltr. / 100 km.

Example:

Poured in oil	—	drained oil	=	consumed oil.
4,500 g	—	3,600 g	=	900 g

900 : density 0.9 = 1,000 cm^3 = 1 liter per 1,000 kilometers

Possible Causes for Excessive Oil Consumption:

1. Running-in process not completed.
2. Seals for valve stems damaged.
3. Pistons seized.
4. Piston rings installed wrong, broken or worn.
5. Excessive running clearance between valve stem and valve guide.

11 00 ... Engine Oil Consumption

DETERMINING OIL CONSUMPTION

Oil consumption can be measured for the first time after the car has been driven approximately 7,500 km. Oil consumption will be stable only after this distance. Measuring oil consumption requires that the engine does not leak.

Precise consumption can be determined by weighing. Drain engine oil having operating temperature. Allow 5 minutes drip time. Weigh and pour in specified amount of new engine oil. Drive car 1,000 km. Drain engine oil at operating temperature and weigh. Allow 5 minutes drip time. Engine oil density at room temperature is approx. 0.9 km/cubic dm (dm^3).

Max. permissible oil consumption when measured* by weighing: 0.07 ltr. / 100 km.

Example:

Poured in oil	—	drained oil	=	consumed oil.
4,500 g	—	3,600 g	=	900 g

900 : density 0.9 = 1,000 cm^3 = 1 liter per 1,000 kilometers

Possible Causes for Excessive Oil Consumption:

1. Running-in process not completed.
2. Seals for valve stems damaged.
3. Pistons seized.
4. Piston rings installed wrong, broken or worn.
5. Excessive running clearance between valve stem and valve guide.

Power (to DIN 70020) at engine speed	KW/rpm	63 / 4600	85 / 4800
Max. engine speed	rpm	5150 + 100	5350 ± 100
Max. constant engine speed	rpm	4600	4800
Max. torque at engine speed	Nm(ft lbs)/rpm	152 (110) / 2500	220 (159) / 2400
Compression (approx. same value for all cylinders)	bar (psi)	> 20 (284)	

11 00 ... Engine Oil Consumption

DETERMINING OIL CONSUMPTION

Oil consumption can be measured for the first time after the car has been driven approximately 7,500 km. Oil consumption will be stable only after this distance. Measuring oil consumption requires that the engine does not leak.

Precise consumption can be determined by weighing. Drain engine oil having operating temperature. Allow 5 minutes drip time. Weigh and pour in specified amount of new engine oil. Drive car 1,000 km. Drain engine oil at operating temperature and weigh. Allow 5 minutes drip time. Engine oil density at room temperature is approx. 0.9 km/cubic dm (dm^3).

Max. permissible oil consumption when measured* by weighing: 0.07 ltr. / 100 km.

Example:

Poured in oil	—	drained oil	=	consumed oil.
4,500 g	—	3,600 g	=	900 g

900 : density 0.9 = 1,000 cm^3 = 1 liter per 1,000 kilometers

Possible Causes for Excessive Oil Consumption:

1. Running-in process not completed.
2. Seals for valve stems damaged.
3. Pistons seized.
4. Piston rings installed wrong, broken or worn.
5. Excessive running clearance between valve stem and valve guide.

Compression pressure (approx. same value for all cylinders)	bar (psi)	at least 10 to 11 (142 to 156)

11 00 ... Engine Oil Consumption

DETERMINING OIL CONSUMPTION

Oil consumption can be measured for the first time after the car has been driven approximately 7,500 km. Oil consumption will be stable only after this distance. Measuring oil consumption requires that the engine does not leak.

Precise consumption can be determined by weighing. Drain engine oil having operating temperature. Allow 5 minutes drip time. Weigh and pour in specified amount of new engine oil. Drive car 1,000 km. Drain engine oil at operating temperature and weigh. Allow 5 minutes drip time. Engine oil density at room temperature is approx. 0.9 km/cubic dm (dm^3).

Max. permissible oil consumption when measured* by weighing: 0.07 ltr. / 100 km.

Example:

Poured in oil	—	drained oil	=	consumed oil.
4,500 g	—	3,600 g	=	900 g

900 : density 0.9 = 1,000 cm^3 = 1 liter per 1,000 kilometers

Possible Causes for Excessive Oil Consumption:

1. Running-in process not completed.
2. Seals for valve stems damaged.
3. Pistons seized.
4. Piston rings installed wrong, broken or worn.
5. Excessive running clearance between valve stem and valve guide.

11 00 ... Engine Oil Consumption

DETERMINING OIL CONSUMPTION

Oil consumption can be measured for the first time after the car has been driven approximately 7,500 km (4,500 miles). Oil consumption will be stable only after this distance. Measuring oil consumption requires that the engine does not leak.

Permissible oil consumption could be up to 0.15 liter/100 kilometers.

Precise consumption can be determined by weighing. Drain engine oil having operating temperature. All 5 minutes drip time. Weigh and pour in specified amount of new engine oil. Drive car 1,000 km (600 miles). Drain engine oil at operating temperature and weigh. Allow 5 minutes drip time. Engine oil density at room temperature is approx. 0.9 km/cubic dm.

Example: poured in oil – drained oil = consumed oil.

4,500 g – 3,600 g = 900 g

900 : density 0.9 = 1,000 cu. cm = 1 liter per 1,000 kilometers (600 miles).

Possible Causes for Excessive Oil Consumption:

1. Running-in process not completed.
2. Seals for valve stems damaged.
3. Pistons seized.
4. Piston rings installed wrong, broken or worn.
5. Excessive running clearance between valve stem and valve guide.

		3 Series E 30	3 Series E 36	5 Series E 34	6 Series E 24	7 Series E 32	8 Series E 31
12 41 ... Solenoid Switch							
Current consumption at term. 50 (with rated voltage)							
With rated power of 1.1 ... 1.7 KW							
Pull-in winding	A	40					
Hold-in winding	A	7.5					
With rated power of 2.2 KW							
Pull-in winding	A	60					
Hold-in winding	A	10					

	3 Series E 30	3 Series E 36	5 Series E 34	6 Series E 24	7 Series E 32	8 Series E 31
12 61 ... Oil Pressure Switch						
Switch-on pressure bar	**0.2 ... 0.5**					
Oil Level Switch						
Note: **Max. 200 mA testing load.**						
Measured against vehicle ground						
Level okay	**1 kΩ ± 1 %**					
Static at connection 1						
Level too low	**0 ... 0.2 Ω**					
Level okay	**0 ... 0.2 Ω**					
Dynamic at connection 2						
Level too low	**∞ Ω**					

		3 Series E 30	5 Series E 34
12 62 ... Coolant Temperature Sender			
Coolant temperature resistance between conn. G 1 and ground		*M 21*	*M 21*
at 60° C	- G 1 Ω	134 ± 13.5	134 ± 13.5
at 90° C	- G 2 Ω	51.2 ± 4.3	51.2 ± 4.3
12 62 ... Heating Time Control			
Heating time control resistance between conn. G 2 and ground		*M 21*	*M 21*
at 20° C	Ω	1134 ± 125	1134 ± 125
at 60° C	Ω	272 ± 27	272 ± 27
at 90° C	Ω	114 ± 11	114 ± 11

12 63 ... Temperature Sender for Cold Start Aid

		M 21	*M 21*
Operating voltage	V	9 ... 15	9 ... 15
Switch-off temperature	° C	17 ± 2	17 ± 2
Switch-on temperature	° C	11 ... 14	11 ... 14
Fuel Preheating Temperature Switch 5.5° C		*M 21*	*M 21*
Switch-on temperature (with dropping temperature)	° C	5.5 ± 2.5	5.5 ± 2.5
Switch-off temperature (with rising temperature)	° C	- 0.5 ± 2.5	- 0.5 ± 2.5

		3 Series E 30	5 Series E 34
12 64 ... Fuel Filter Heater			
Current consumption of heating element 5 seconds after switching on	A	*M 21* 9 ± 2	*M 21* 9 ± 2
Testing voltage	V	12 ± 0.5	12 ± 0.5
Current consumption with max. heating output	A	*M 51* 12.5 ± 1	*M 51* 12.5 ± 1
Testing voltage	V	12 ± 0.5	12 ± 0.5

31 33 ... Springs

Important!
Only install pairs of springs with the same BMW number (located on end of spring) and same color code (either with or without stripe of red paint) on one axle.
Refer to the parts microfiche for a survey of springs to vehicle type and,if applicable, special equipment (such as: air conditioner, sport suspension, etc.) and date of introduction.

Part numbers can be determined with help of the BMW number on springs and therefore a spring found in the parts microfiche for a certain vehicle type.

Example:

1. Spring with red color code:
   number on spring, e.g. 1 125 332
   add 1 = part number 1 125 333

2. Spring without red color code:
   number on spring, e.g. 1 125 332
   add 2 = part number 1 125 334

Also refer to Model Repair Manual.

33 52 ... Shock Absorbers						
Shock absorber test values	refer to Service Information of Gr. 37					

33 53 .. Coil Springs

Important!
Install only pairs of springs with same BMW number (located on end of spring) and same color code (either *with* or *without* stripe of red paint) on one axle.
Refer to the parts microfiche for a survey of springs to vehicle type and, if applicable, special equipment (e.g. air conditioner, sport suspension, etc.) as well as introduction dates.

The BMW number on the spring can be used to determine the part number and therefore springs on the parts microfiche belonging to a car.

Example:

1. Spring *with* red color code:
   number on spring, e.g. = 1 125 326
   add 1 for part number = 1 125 327

2. Spring *without* red color code:
   number on spring, e.g. = 1 125 326
   add 2 for part number = 1 125 328

Tightening Torque Reference Values

Applicable only for shank bolts with standard and fine metric threads to DIN 13, sheet 13, and nuts with a nut height of 0.8 x d to DIN 934 and exclusively for μ total = 0.125 (bolt phosphated, nut without surface treatment or galvanized; lubricated state: not lubricated or also lubricated with oil).

The tightening torque for cadmium-plated bolts or nuts (μ total ≈ 0.08 to 0.09) must be ≈ 30 % less than that in the table when the degree of bolt material exploitation is the same.

The values given in this table are applicable to bolted connections conforming with the conditions described above.

Not applicable with use of different surface treatment or lubricated state of threads as well as with deviating nut height.

Not applicable for bolts with expansion shanks, self-locking bolts or nuts as well as for the bolting together of parts made of different materials.

34 11	Front Wheel Brakes			
1AZ	Brake disc to wheel hub		All	16
2AZ	Brake caliper to steering knuckle (bolts oiled lightly)		E30 325iX, E36, E34, E32, E31	110
			E21, E12, E24, E23	95
			E28, E24 after 5.82, E30	123
3AZ	Guide bolt	wrench size 7 mm	E28, E34, E24 after 5.82, E30, E32, E31, E36	30 - 5
4AZ	Bolts to guidepin (always replace)		E30	35

			Type	Nm
34 21	Rear Wheel Brakes			
1AZ	Brake drum/disc to wheel hub		All	16
2AZ	Wheel cylinder to brake backplate		All	10
3AZ	Brake backplate to trailing arm		All	65
4AZ	Brake caliper to trailing arm / brake backplate		All	67
5AZ	Guide bolt	wrench size 7 mm	All	30 - 5

34-3 Brakes

			Type	Nm
34 31	**Master cylinder**			
1AZ	Master cylinder to vacuum booster		E 30	24
			E 32	21
			E 28, E 34, E 36	26
2AZ	Master cylinder to hydraulic booster		E 24, E 28, E 31*, E 32*, E 34*	28
34 32	**Brake lines**			
1AZ	Brake hose couplings	M 10 x 1	all	19
		M 12 x 1	all	17

* Replace Allen bolt with a 6-point bolt, see BMW Parts Service

		Type	Nm
34 33	Brake Booster		
10AZ	Hydraulic pipe to pressure reservoir on power flow regulator	E32, E31	47
11AZ	Hydraulic pipe to pressure reservoir	E32, E31	40
12AZ	Brake booster to pedal assembly console	All	22
34 50	Antislip Control Systems (ABS, ASC)		
	ASC + T filter bowl to filter head	E31, E32, E34	15

		Type	Nm
35 11	Pedal Assembly Console		
1AZ	Console to body	All	22
2AZ	Nut on shaft	All	27

		Type	Nm
35 21	Brake Pedal and Linkage		
1AZ	Piston rod lock nut	All	27
2AZ	Nut on shaft	All	27
3AZ	Pull rod Nut for pivot	All	27
4AZ	Left and right reversing lever Nut on shaft bolt	All	27
5AZ	Support to console Brake booster	All	22
6AZ	Support to console Reversing lever	All	27

		Type	Nm
35 31	Clutch Pedal and Linkage		
1AZ	Piston rod lock nut		
2AZ	Spring lock nut	All	6
3AZ	Piston rod shaft bolt	All	22
4AZ	Master cylinder to pedal assembly console	All	9
5AZ	Spring-pedal shaft bolt	All	22
6AZ	Clutch pedal Nut on eccentric bolt	All	22

		Type	Nm
35 41	Accelerator Pedal and Linkage		
1AZ	Full throttle stop	All	10

		Type	Nm
36 10	Wheels		
1AZ	Wheel bolts	All	100 ± 10

		Type	Nm
36 11	Wheel Rims		
1AZ	Blade rim to base rim (bolts coated with blue Loctite No. 243)	All	9

			Type	Nm
37 12	Ride Level Control System			
1AZ	Pressure pipe connections (electrical system)		All	14
2AZ	Pressure pipe connections (circulating system)		E32, E34	20
3AZ	Pressure pipe connection on tandem pump		E32, E34	31
4AZ	Nuts on angled joint of regulating linkage		E32, E34	3
5AZ	Regulating arm to stabilizer		All	9
6AZ	Nut on regulating rod threads		E32	2
7AZ	Ride level control valve holder to rear axle	M8	E32, E34	22
		M6	E32, E34	9
8AZ	Ride level control valve to holder		E32, E34, E30 touring	9

		Type	Nm
37 14	Electric Components		
1AZ	Wheel camber warning switch to console	E32, E34	9
2AZ	Angled joint of jointed rod	E32, E34	5
3AZ	Hydraulic switch to distributor	E24, E32	25
4AZ	Hydraulic switch to hydraulic control unit	E24, E32	27
5AZ	Solenoid valve to hydraulic control unit	E24, E32	55
37 21	Pressure Reservoir		
1AZ	Pressure reservoir to body	All	9

			Type	Nm
51 11	Front Bumper			
1AZ	Bumper to bracket	M6	E32	9
		M8	E36	22
		M10	E34	43
2AZ	Bumper with bracket to impact absorber	M10	E31	22 *
		M10	E36	55 *
		M12	E30 mod. '88, E32, E34	48
3AZ	Impact absorber / bracket to engine carrier		E30, E24	23
		M6	E31, E32, E34, E36	9
		M10	E32, E34	48

* Install bolts with bolt cement

		Type	Nm
51 11	Front Bumper		
4AZ	Bumper to side panel	E30	7
5AZ	Bracket to side panel	E36	6
6AZ	Bumper support (behind front fog lamp)	E36	3
7AZ	Front fog lamp bracket	E36	2.5

			Type	Nm
51 12	Rear Bumper			
1AZ	Bumper to bracket	M10	E31	40
		M8	E32, E34, E36	22
		M10	E34	42
2AZ	Bumper with bracket to impact absorber	M10	E36	42 *
		M12	E30 mod. '88, E31, E32, E34	48
3AZ	Impact absorber / bracket to body		E30, E24	23
		M6	E31, E32, E34	9
		M8	E36	22

* Install bolt with bolt cement

		Type	Nm
51 12	Rear Bumper		
4AZ	Bumper to side panel	E30	7
5AZ	Bracket to side panel	E36	3
6AZ	Lower trim panel bracket to body	E36	8.5
7AZ	Lower trim panel screw	E36	2.5

			Type	Nm
51 16	Mirrors, Finishers, Ashtrays, Consoles			
1AZ	Mirror to front door		E31, E36	6
2AZ	Center console	plastic nut	E30	5
51 21	Front Door Locks			
1AZ	Door lock to front door		E31, E36	9 *
2AZ	Outside handle to front door		E31, E36	10
3AZ	Door striker to body		E24, E30	24
			E31, E32, E34	28

* Install bolt with bolt cement.

		Type	Nm
51 22	Rear Door Locks		
1AZ	Door lock to rear door	E36	9 *
2AZ	Outside handle to rear door	E36	10
3AZ	Door striker to body	E32, E34	24
51 26	Central Lock Drive		
1AZ	Central lock drive to lock	All	2

* Install bolt with bolt cement.

			Type	Nm
54 12	Mechanical Sun Roof Components			
1AZ	Cable cover to cassette		E36	1.3
2AZ	Lid to gate		All	6 *
			E34 touring	5 *
3AZ	Rail to cassette	M4	E31, E32, E34	1.8
		M5	E32, E34	2.8
4AZ	Cable cover to cassette		E36	1.3
5AZ	Floating roof liner to gate		E36	3.5
6AZ	Cassette to body	M5	E34 touring, E36	3.5

* Replace screw or nut.

		Type	Nm
54 13	Electric Sun Roof Components		
1AZ	Motor to cassette	E31, E32, E34, E36	2.8
		E34 touring	3.5
54 34	Power Convertible Top		
1AZ	Hydraulic pipes on electric/hydr. top	E30	8.5
2AZ	Valves on hydraulic control unit	E30	2.0

54-3 Tilt sunroof, convertible top

			Type	Nm
54 34	Electrically operated convertible top			
3AZ	Motor and gear unit Top actuating mechanism to body/mount		E 30	10
4AZ	Motor and gear unit Top actuating mechanism to body		E 30, E 36	10*
5AZ	Drive lever to motor and gear unit	M 6	E 30	3
6AZ	Crank arm to motor and gear unit	M 12	E 30	12,5
7AZ	Slide rods to drive lever	M 4	E 30	1,2
8AZ	Slide rods to convertible top	M 10	E 30	25

* Coat bolts with locking fluid prior to assembly

			Type	Nm
61 13	Plug Connections			
1AZ	Door plug connection to body		All	5
2AZ	Fuse box Screws for safety fuse	M6	All	5
3AZ	Ground or positive connection points		All	5

61-2 General vehicle electrical system

			Type	Nm
61 31	Switches			
1AZ	Temperature switch	91 °C	all	14
		99 °C	all	14
2AZ	Oil presure switch Note: Lubricate threads		M 10, M 40, M 42 M 21, M 51 M 20, M 30, M 50 M 60, M 70, S 70	40
			M 88-3, S 14, S 50, S 38 M 43	20
3AZ	Reversing lamp switch		all	20
4AZ	Light switch on instrument panel		E 36	2
5AZ	Transmission switch to shift console		all	4.5

			Type	Nm
61 61	Windshield Wipers			
1AZ	Wiper motor to wiper console	M6	E31	6
			E36	10
2AZ	Parked position stop to wiper console		E31	15
3AZ	Wiper contact pressure motor to wiper console		E31	6
4AZ	Motor crank to wiper motor	M8	All	27
5AZ	Wiper shaft nut to body		E31, E36, E32, E34	12
6AZ	Holder to firewall	M6	E31	9
	screws in firewall		E36 Coupe	10

		Type	Nm
62 16	Car Electrical System Senders		
1AZ	Screws for speedometer sender	All	6.6 ... 8.4

			Type	Nm
64 12	Additional Heater with Controls			
1AZ	Additional heater to body floor		All	4.5
2AZ	Glow plug		E24	17.5
			E31, E32, E34	4
3AZ	Temperature sensor		E31, E32, E34	0.5
4AZ	Oil control plug and oil filler plug		All	16
5AZ	Mounting screws	M5	All	6
		M6	All	10
		M8	All	24
		M10	All	48
6AZ	Screws for filter cover		All	0.9

		Type	Nm
64 21	Air and Water Hoses / Pipes		
1AZ	Studs on heat exchanger	E36	3
2AZ	Studs on double-pipe	E36	2
3AZ	Nuts on double-pipe	E36	3.5
64 51	Air Conditioner (Evaporator), Control Units		
1AZ	High / medium pressure pressostat	All	25 *
2AZ	Low pressure pressostat	All	19 *
3AZ	Three-way safety switch	All	25

* Bolt cement, Part No. 81 22 9 407 144

		Type	Nm
64 52	Compressor		
1AZ	Compressor to engine	all	22
2AZ	Solenoid clutch spring plate	all	20
3AZ	Torque wrench pretension for new poly-V-belt	M40, M42, M43, M51	7...8.5
		S50	16...17
	for used poly-V-belt	M40, M42, M43, M51	5...6.5
		S50	12
4AZ	Special tool pretension for new poly-V-belt	M40, M42, M43, M51	77...83 scale graduations
		S50	100 scale graduations
	für gelaufene Keilrippenriemen	M40, M42, M51	66...73 scale graduations
		S50	70 scale graduations

			Type	Nm
64 53	Condenser and Drier with Pipes			
1AZ	Pipe connections	5/8"	All	20
		3/4"	All	39
		7/8"	All	42
		11/16"	All	48

		Type	Nm
65 11	Radio		
1AZ	Headless screw for radio installation	All	0.5

72 - 1	EQUIPMENT AND ACCESSORIES FOR BODY	Type	Nm
72 11	Seat Belts		
1AZ	Seat belt to body or seat	All	48
2AZ	Belt height control bolts	All	24
3AZ	Seat belt to seat	E31	47 *
4AZ	Seat belt to backrest	E31	24
5AZ	Headrest to backrest	E31	24

* Install bolt with bolt cement
